Second, Arendt undercuts the assumption, most famously asserted by Weber, that the state possesses a monopoly on the legitimate use of violence (1970, 35). Weber equates violence and force in a way that Arendt rejects. Institutions such as the military and police, when they enjoy the support of the citizenry they protect, do not, as a matter of course, resort to *violence* for purposes of protecting citizens, keeping the peace, upholding the law, and defending against external threats. They may, however, employ *force*, impose other forms of *coercion*, or even resort to *war*. To extend Arendt's thought, such collective actions are entirely political: they are subject to public deliberation and accountability; limited by domestic and international law, including rules of deadly force; and embedded in moral vocabularies such as "just war" reasoning as well as religious beliefs, political traditions, and social conventions. With such limits in place, force that is proportional and discriminate (i.e. does not target bystanders and noncombatants) should be distinguished from violence, no matter how lethal both may be. So, too, is punishment a political act that, unlike violence, is carried out by a designated authority on behalf of the collective it serves and represents. When it fails to respect the values of citizens – all or even significant parts of them – punishment's legitimacy wanes. The extent to which citizens object to or disagree about the justice of law enforcement and

criminal punishment – police tactics, capital punishment, criminal sentencing, solitary confinement – hastens the erosion of power, turning force and punishment into violence.

A final implication of the relation between power and violence pertains to uprising and revolt. There are occasions when citizens – as individuals or groups – might themselves justifiably resort to extralegal violence. “Under certain circumstances,” Arendt contends, “violence – acting without argument or speech and without counting the consequences – is the only way to set the scales of justice right again” (1970, 64). She invokes the classic example of Billy Budd’s homicidal reprisal against a man who bears false witness against him. His violence is justifiable and rational given the offense against him. But it is also antipolitical, for he takes the action in his capacity as a private individual. By contrast, the punitive response undertaken by the ship’s captain is political – authorized and permitted by law. Budd’s action is violent. His punishment is not.

How might such an analogy apply to a crowd of protesters or a mob? A crowd that expresses its outrage at a police officer’s use of excessive force against an unarmed man – itself a form of individual violence – by burning down a police precinct building resorts to a form of mob violence. The crowd’s rage is emotionally appropriate and also quite rational, while still remaining violent. Righteous indignation notwithstanding, such acts “in which men take the law into their own hands for justice’s sake are in conflict with the constitutions of civilized communities.” To act “without argument or speech and without counting the consequences” is antipolitical and violent. Moreover, protesters who turn to rioting, looting, and destruction against “substitutes” such as private property have allowed their rage and violence to become irrational – no longer connected to the righteous cause inciting their rage (1970, 64). Just as the use of force requires proportionality and moral commensurability between means and ends, so, too, does a crowd’s actions. Violence, then, correlates to the extent that actions are disproportionate, individually undertaken (not in concert), irrationally misdirected, spontaneous and unstrategic, and unaccompanied by justificatory argumentation.

A revolutionary movement or militia will heed these concerns if it hopes to gain power and persuade others of its legitimacy. The case of revolution differs fundamentally from mob violence in that it constitutes a *political* movement whereby citizens act in concert to alter or replace a government that lacks power and legitimacy. On Arendt’s logic, as the pursuit of power through collective action grows and garners legitimacy – from protest to rebellion to revolution – *violence* declines inversely. Successful democratic movements in Eastern Europe, Asia, Latin America, and Africa often have followed this approach.

Imperiled governments, which lack power and seek to establish or retain control through violence, aim to discredit opposing forces by pointing to their violence – often labeling them “terrorists.” Such has been the strategy of President Trump who blamed “terrorists” for violence that broke out at protest sites. Trump benefited directly from such violence, which allowed him to adopt the mantle of “law and order” and to ignore the demands of nonviolent protesters calling for an end to police violence (Oprysko 2020).

Brutal authoritarians such as Bashar al-Assad and Moammar Ghaddafi in Syria and Libya respectively also classified their citizens as “terrorists,” in their cases to justify ruthless forms of repression and retaliation. Of course, rebels and militias also are capable of employing violence, as when Libyan rebels apprehended Ghaddafi and viciously executed him on the spot. Their grievances may have been legitimate, but the tortuous violence they perpetrated against his body served no political end or purpose. Unlike the lengthy trial and execution of Saddam Hussein, the revenge killing of Ghaddafi was *antipolitical* violence, not punishment.

In short, Arendt's political reckoning with power and violence provides an inchoate moral framework for forming judgments about the actions that different governments and their citizens have taken. Tyranny, she reasons, invoking Montesquieu, is the "most violent and least powerful of forms of government" (1970, 41). On such logic, democracy, wherein authority is vested in the people (*potestas in populo*), should be the least violent and most powerful form of government. Yet the turbulence of 1968 that preceded Arendt's treatise was itself a sign that Western democracy – the United States especially – was fraying: "our power has become impotent," she lamented. Such power cannot be restored quickly by resorting to violence but, rather, takes painstaking work to address the deeply held grievances that undermine power.

Some fifty years after Arendt's treatise, Americans stared out onto a national landscape blighted by a deadly pandemic responsible for snuffing out over 500,000 American lives over the course of a year. The urban vistas of dozens of cities glowed with fires set during street protests, while citizens gasped under the smoke of tear gas unleashed by riot police. Americans endured a president whose divisive, despotic, and disordered personality took form in an adolescent embrace of violence that sought to compensate for his weak popular support. One symbol of democracy's impotence occurred when members of a free press – having been denounced "enemy of the people" – were among those arrested and attacked with pepper spray, flashbang grenades, and rubber bullets while covering protesters who peacefully demonstrated against police brutality. Another was the mob insurrection at the Capitol, which forced Congress to evacuate. On the Arendtian view, democracy's power was largely restored when, following the siege, Congress resumed its duties to certify the election results.

A Moral Account of Violence

Arendt's political analysis unpacks vital contexts, cases, and dynamics of violence. She also provides an inchoate moral framework that helps distinguish legitimate actions involving coercion and force from those that are not. Arendt defines violence by its implements and instrumentality; by what it lacks (speech, argumentation and foresight); and by its inverse relationship to power. Violence is not defined in moral terms of its own. It is actually power – activities and concerns of people working in concert together – that receives the preponderance of her consideration. Violence in this account is parasitic on power, much as, for Augustine, evil is parasitic of the good. The ethical dimensions of *On Violence* are not spelled as explicitly or precisely as they could be. Why, for example, does Arendt invoke "violence in self-defense" when *force* is employed in lawful and morally justifiable ways? Surely Arendt appreciated the absurdity of saying that someone violently defended herself or her children against an attacker (provided excessive force was not used).

To recall Elshtain's caution, when we label "any deployment of coercive physical force 'violence,' we put our thumbs on the scale and short-circuit moral reflection before it can even begin" (2012, 275). Without greater clarity about legitimate force, we cannot consider when it becomes excessive and unjustifiable – in other words, violence. Any implement – a stick, gun, hammer, car, fist, or even a microphone – may become a tool of violence, depending upon how it is used. But the empirical dimension of force or violence only provides a partial account; we need a sharper ethical gauge to call something violence. Building on Arendt's view of violence as antipolitical action that lacks power, we can conceive violence on its own moral terms.

We might, then, define violence as a *transgressive act involving physical force, often vehemently or excessively employed, with the intent to inflict injury, harm, or damage*. This account identifies explicitly the empirical, ethical, and emotional dimensions of violence, drawing on an etymological examination of the term (*violentia*) and the meanings of three related cognates. First, at its simplest level, violence generally entails physical energy or force (*vis*), often causing damage or destruction, whether to persons, property, or other environs (possibly including nature and elements of the natural world). Political acts involving physical force – whether called coercion, war, terrorism, protest, revolution, or insurgency – all have violent dimensions in this descriptive sense. A person caught up in a tornado, like someone barraged by bombs, rightly speaks of the violence and destruction of such experiences. *Vis* or force, then, captures the *empirical* and effectual meaning of violence, including observable or subjective experiences of it. This is the realm of facts, not values. Limiting violence to physical force provides what some scholars call a “minimalist” definition of violence. Despite its nomenclature, though, this account permits all sorts of examples under its definitional umbrella.

A second dimension of violence, denoted by the word *violate* or violation (*violo*), reveals the ethically *normative* meaning of violence. Violence not only causes harm or destruction; unlike a storm, it does so through some moral violation against a person or entity. For this reason, argues Elshtain, “*Violence* is and should be a strongly pejorative term.” The capacity for human agency enables us to make critical moral distinctions. One can shake a fist against Mother Nature when a bolt of lightning ignites and burns one’s home to the ground. But there is a clear moral transgression involved when the same effect is produced by an arson’s match. Society and its laws could scarcely exist if we failed to render such moral distinctions. We do not indict the driver whose car loses control on the ice and accidentally hits someone in the same way we would indict a driver who intentionally mows down a person with his car. In both cases, victims experienced violent collisions. While the former experienced harm, the latter is also the victim of a grave moral transgression.

Violence involves injustice – a violation of that to which one has a moral claim or right. The word *injury* (*injuria*) stems from Latin roots *jur* or *ius*, from which ethical terms as *justice* and *right* derive. For our purposes, we might simplify as follows: while all violence (*vis*) may cause damage or destruction, only violence from transgression (*violo*) also entails injury and injustice in this ethical sense. Violence denotes that moral values have been transgressed. Put simply, human beings do not commit violence in ethically neutral ways.

When decoupled from the empirical dimension of violence as *vis*, this normative account of violence offers what some call a “comprehensive” or broad account of violence whereby any claim of injustice or violation (conceivably even trivial grievances) can constitute violence, even when force is not involved. Coupling the empirical and normative meanings provides a sharper and more useful conception of violence in which fact and value converge. Such an approach enables us to clarify the distinction between force and violence: to enforce or use force can be justifiable, legitimate, even morally apposite, in a way that to violate or do violence to another can never be (Wade 1975). On this reading, violence is always immoral and cannot be justified in ways that physical force can be. Such an account distinguishes legitimate self-defense from the violence initiated by an attack or assault. One does not *violently* defend oneself, one’s family, or one’s nation by using force against an attacker – certainly not in the ethical sense of the term. Self-defense does not involve a moral violation but, rather, a justifiable effort to prevent such violation and injury.

Crucially, this ethical provision also provides standards by which force, whether used by individuals, authorities, institutions, or even insurgents and revolutionaries can be evaluated. Ethical reasoning allows us to make judgments about excessive force – violence that violates some status or protection to which even the subject of force has a claim. Examples include police officers who use excessive force or who in other ways violate their trust with fellow citizens whom they are charged to serve and protect. Such moral and legal distinctions also are reflected in laws of armed conflict, according to which members of the military may be prosecuted if they target noncombatants. Moreover, those who betray their duty to protect others – by employing violence against them – are themselves culpable in a special, additional way: not simply for the transgression at issue but also for violating the mandate of their office and authority to use force. It also should be noted that legal adherence to the rules of war does not always prevent excessive damage from occurring, complicating distinctions between force and violence (Gopal 2020).

The ethical component of violence even invites consideration of subtler forms of moral transgression, such as moral claims that pertain to the natural world. Human actions that induce climate change, one might argue, entail moral violation – a form of violence against nature, including the seas, skies, and landscapes as well as the creatures dependent on them.

A final tenet of violence stems from the cognate *violentus*, meaning vehemence, impetuosity, or excess. Excessive force and other acts of violence are often manifestations of violent emotions and disordered personalities. This emotional-dispositional dimension reinforces the ethical dimension that presumes human agency and moral accountability. From a different direction, those who are outraged by violence – whether inflicted by criminals, terrorists, soldiers, police, or oppressive regimes – are justified in their righteous anger. Such emotions are instructive as well as rational, Arendt reminds us. Most victims channel their outrage into constructive rational forms. For example, the majority of protesters against police brutality or racial inequality – like Civil Rights activists in earlier eras – engaged in peaceful marches, protests, boycotts, demonstrations, and forms of nonviolent direct action. Those who partake in rioting, looting, arson, and assault to express their rage undermine the legitimacy of their grievances. Such violence cannot be rationally defended or publicly argued for, while efforts to quell such violence, using properly delimited force, can be. For citizens and officials alike, force belongs to the logic of reason and human action – as the term *ultima ratio*, in its proper sense, suggests. The emotional component of violence allows us to distinguish the passions animating peaceful protest and lawful use of force, on one hand, from riotous looting and vicious police brutality, on the other. Reason and emotion work together to regulate moral congruity between just ends and just means.

In sum, an account of violence that addresses the empirical, ethical, and emotional dimensions of violence provides a sturdy framework for evaluating the kinds of violence that Hannah Arendt engaged in her day as well as new forms that have emerged half a century later. Whether assessing authoritarian repression, police brutality, or rioting mobs and insurrectionists, an ethico-political approach provides not only greater moral clarity and precision about the resort to violence but also a guide to the effective use of power and political action in response.

1 Structures and Conditions

CHAPTER 124

Nations

Jean Bethke Elshtain[†]

Nations and States

When moderns in the West think of peoples as a collective or communal entity, they think of states, or nation-states. Ours is a post-Westphalian world, dominated by state formations. More sovereign states have come into being in the last forty years than in any comparable period in human history. Peoples who have some sort of collective identity but have not yet been recognized as states, meaning they are not sovereign in a juridical sense, view themselves, and are seen by others, as second-class citizens in the international sphere. Sovereignty attached to state is the ticket that gives a people entry into the community of states. The “nation” designation attached to “state” suggests that a particular people, having a particular sense of nationhood or national identity, is mapped more or less precisely onto that territorial entity known as “the state.” In the late modern Western world, this mapping is bound to be imprecise, for few “nations” composed primarily if not exclusively of the historic, linguistic, and, frequently enough, ethnic markers of a single nationality, any longer exist.

Nations are more diffuse than states. They do not entail the hard edges, or borders, that states by definition do, unless or until a political ideology dictates that any “mixing” of the people of one nation with those of another is strictly forbidden. Tests may be devised whereby an ostensibly pure nationhood can be distilled and separated from a tainted, hence inauthentic, national identity. Less defined, nations are more flexible and open ended. They can spread out, as in the case of the diasporic nation of Israel, so much so that the collective identity of a nation may come to be that of “exile” or “in exile.” Also, this spreading out may be less diasporic or exilic than aggressive, as one people overruns another and seeks to dominate it. If this occurs, the identity of a particular nation may become that of the “enslaved,” or “oppressed,” or “colonized.”

As soon as nations become nation-states, borders congeal. But borders are not eternal. Some nations are content with historic borders. They are content to confine their collective identity as a nation within received borders, particularly so if the borders seem to correspond to their understanding of who comprises their nation. Other states aspire to extend their borders outwards, perhaps in order to encompass all the members of their “nation” within one political body or “state.” Here one thinks of the National Socialist regime’s claim that it and it alone was the legitimate container of German identity, a concept that then expanded biologically to incorporate all “Aryans.” Under such circumstances nationhood becomes a fighting word and serves as the occasion for a search for *Lebensraum*.

[†] Deceased.

Remarkably, considering historic exiles, diasporas, and colonizations, the aspiration to meld “nation” and “state” has never disappeared. All one has to do is to consider the genocides of the twentieth century, a phenomenon that shows little sign of abating in the twenty-first century, to be disabused of that illusion.

If the state is an early modern, Western phenomenon, emerging from the 1648 Treaty of Westphalia, itself preceded by the Peace of Augsburg, 1555, what is the derivation of nation? Does the nation have any moral standing? If so, from what sources does the moral valuation of nations arise? These are complex and by no means easily answered questions, in large part because “nation” is an inherently ambiguous term. If a nation is, as the dictionary insists, an aggregate of persons who are closely associated by common descent, language, or history, so much so as to form a distinct race or people, there is no immediate and stirring valuation of ethical import that attaches *a priori* to such an entity or concept. Nations are worldly entities. Can they in any way be said to partake of the sacral, the holy, the divine? In other words, how does “ethics” get attached to “nation” or “nations”? In order to explain this basic question in religious ethics and also the current challenge of “nations,” this chapter explores resources in Jewish and Christian thought. This seems appropriate given the “Western” context of the “nations,” but analogies could be found in other traditions as well. Within the Muslim tradition, however, scholars of Islam tell us, the dividing line occurs less between nations than between the “house of Islam” (dar al-Islam) and the non-Muslim world, the “house of war” (dar al-harb). As such, within this tradition, war that is waged to extend “the house of Islam” is legitimate (Tibi 2002). Whereas, we shall see, Jesus of Nazareth rejected earthly dominion, Muḥammad founded a “religiously conceived polity ... and his successors confronted the realities of the state and, before very long, of a vast and expanding empire. At no time did they create any institution corresponding to, or even remotely resembling, the church in Christendom” (Lewis 2002, 98–99). Exploring the theme of “nations,” the task of this chapter is to examine this idea from a distinctly religious ethical perspective in order to demonstrate the contribution of religious ethics to political philosophy.

Nations in Biblical Narratives

In the Hebraic Bible, the God of the Israelites ordains Abraham as the father of nations. In this way it can be said that God is generative of people and of peoples (see Genesis 12:1–3). By contrast to “country” or “land” as a place that identifies a region of origin, “nation” in the biblical imagination is far less prosaic, connoting promise, potential, hope, something not yet realized and perhaps not fully realizable on earth. “States” are unknown to scripture. Instead, there are lands, there are kingdoms, and there is Caesar or Rome once one arrives at the Christian New Testament. The world of the Hebraic Bible or Christian Old Testament is a world of peoples and nations. Nations need rulers. Rulers are elders and kings, established in the first instance by divine authority.

If the Old Testament can be said to constitute a political tradition, that tradition is one of kingship and patriarchal rule. The role of elders – of judges, prophets, and kings – is normative. Such elders are personifications of the nation’s identity and its fundamental (or first) principles. “Abraham shall become a great and mighty nation,” we are told (Gen. 18:17). In the contemporary world, by contrast, patriarchy is a term of derision and virtually synonymous with “the oppression of women,” as it is routinely put.

Such a judgment in the context of the Hebrew texts is, at best, anachronistic. Patriarchal authority in scripture helps to bring “the nation” into being and sustain it. The authority lodged in the rule of patriarchs over nations, certainly the nation of Israel, is not derived from our own wills – as we think of political legitimacy in modernity – but, rather, from what Oliver O’Donovan (1996) calls a “theology of divine judgments.”

Israel’s sense of nationhood or political identity is inseparable from Yahweh’s divine kingship and the covenant of God with Israel, a covenant that brings collective identity itself into being. The constitutive role of divinely authorized kingship is central to nationhood. The story of the origination of nations is precisely that – a powerful narrative, so much so that “nations” and “nation” have ever since been imbricated with tales of the coming into being of peoples. The “state,” by contrast, is a juridical concept, more abstract, less contextual and storied. It is important to note that nations are *not* voluntaristic entities brought into being by a specific act of human will as in much modern political theory (Hobbes 1998; Locke 1980; Rousseau 1997). Nations are elect and elected: God chooses Abraham. From this moment of election flows the idea that nations embody and carry out the will of God (e.g. John Winthrop’s famous “city on a hill” image of the Puritan covenant to be realized on the shores of the new world) (Winthrop 1996).

The coming into being of nations is not presented in exclusively patriarchal terms. The restoration of Jerusalem after exile, for example, is compared to a woman laboring and giving birth. This restoration or “rebirth” is a miracle. Even as a mother nurtures her infant, so God nurtures Jerusalem. Lands and peoples are born and, like a human pregnancy, this takes time to develop and to be made manifest (see Is. 66:7–11). Thus begins a long tradition of thinking of nations in feminine terms. Nations are “she’s” that give birth to, and nurture, a people. In many European languages, one speaks a “mother tongue.” The potent intermingling of male and female imagery in the iconography, mythology, and political theology of nations helps to account for how and why “the nation” remains so compelling an idea. Nations are sources of uniqueness and particularity. They help to make us distinct. Nation captures our difference, just as familial identity does.

God Governs and Judges the Nations

If, in the biblical “world,” Abraham is the Father of Nations, then Moses continues the covenant of nations.

The Lord said to Moses, “Go down at once! Your people, whom you brought up out of the land of Egypt, have acted perversely; they have been quick to turn aside from the way that I have commanded them ... Now let me alone, so that my wrath may burn hot against them and I may consume them; and of you I will make a great nation. (Ex. 32:7–10)

The story of nations is often troubled, as this powerful passage indicates. The God of nations makes demands. The people of Israel fail to measure up. God subjects them to severe judgment. Moses pleads with God, following God’s articulation of his wrath in the passage cited, and compels God to soften his judgment so as not to bring disaster upon his people. Moses does this, in part, by evoking the Abrahamic founding. An object lesson for the normative evaluation of nations is embodied herein: God judges the

nations. This helps to make sense of Thomas Jefferson's pronouncement that he trembled for his nation when he remembered that God was just: the reference point is slavery. It recalls, in the context of the United States, Abraham Lincoln's extraordinary evocation of the inscrutability of divine judgment in his magnificent Second Inaugural:

The Almighty has His own purposes. "Woe unto the world because of offenses! For it must needs be that offenses come; but woe to that man by whom the offense cometh!" If we shall suppose that American slavery is one of those offenses which, in the providence of God, must needs come, but which, having continued through his appointed time, he now wills to remove, and that he gives to both North and South, this terrible war, as the woe due to those by whom the offense came, shall we discern therein any departure from those divine attributes which the believers in a Living God always ascribe to him? (Lincoln 1990, 333)

Lincoln is securely in the Old Testament tradition as he reflects that God may punish those nations by whom offenses come. This theme has been repeated elsewhere: in the struggle against fascism; the movements against and overthrowing apartheid in South Africa; and the denunciation of oppression in many lands. Through the prophet Amos, we see that nations are subject to judgment, scrutiny, and claims upon their collective conscience. Amos is charged by God with bringing to the Israelites a message they do not want to hear, namely, that they as a nation have abandoned God's ways. Amos links true nationhood with justice and righteousness and calls the nation of Israel back to its founding, even as Martin Luther King, centuries later, called upon Amos' words in simultaneously condemning and lifting-up his nation, charging America to be faithful to her biblically inspired principles (King 1991, 297). The normative thrust of "nation" comes through in such circumstances as an attempt to bring fallen practices into closer harmony with God-sanctioned principles present at the founding, so to speak, when God called the nation into being in the first instance.

This falling away and being recalled is a familiar theme in the narrative of nations. When Amos cries out to the people of Israel; when Dr. King cries out to the would-be "beloved community" of his own nation, it is a call for political righteousness that is unattainable absent divine favor or rectification. Embedded in such prophetic moments in the narrative of nations is the claim that God not only judges between the nations, he also is the governor of nations. It is God who sits on the ultimate throne. Earthly kings can aspire only to the penultimate. "For God is the king of all the earth; sing praises with a psalm. God is king over the nations: God sits on his holy throne" (Ps. 47:8). Only those nations whose God is the Lord are said to be happy.

How does God adjudicate between nations? Israel is the covenanted people and finds favor, and frequently severe judgment, in God's eyes. The story of the rising and falling of Israel's political kingships in God's eyes tells us a great deal about what happens when God's kingship is forgotten or abandoned and earthly kingship becomes idolatrous. Although the promise of being within the Lord's house is lifted up for all nations (Is. 2:2; Mk. 11:17), this condition of universal comity is not attained in biblical history. Indeed, the passage favored by those who seek earthly peace as a possible accomplishment in history (Is. 2:4) is a possibility linked to certain conditions that are never attained. The condition of eschatological peace is one in which the Lord's house has been established everywhere. Human sin, pride, selfishness, and political idolatry stand in the way of such an achievement.

Nations: The Dangers of Political Idolatry, the Requirements of Servitude

The biblical tradition knows little of citizenship in the modern sense. Unlike modern social contract theories, a people is constituted by divine election rather than an act of the will by potential citizens (see Rawls 1999). Loyalty to the nation is thereby more likely thought of as a form of divinely ordained servitude. The patriarch serves God and his people. The people serves God and keeps faith with its tradition. Nations themselves are collective servants, playing a part in God's providential plan. It is God's servant who brings justice to the nations (see Is. 42:1–4) and servants of the nation must seek favor with God through obedience. Human beings cannot help but play a part in a collectivity. They are members of nations by virtue of the fact that they are born. The ethical question is what sort of collectivity is our nation? Does it follow the Lord God in all things? Or has it gone down an idolatrous path? This is the biblical way to think about nation – as that which individuals perpetrate to good or to ill ends. It is a concept with a long history of effects in Western political thought.

If the nation faithfully serves its divinely ordained mandate, if it is governed with justice and righteousness, individual loyalty to nation is enjoined, even required. But a nation that becomes idolatrous is one that should be repudiated, even at risk to the self. The Bible is replete with narratives of dangerous overreach, mostly notably the Tower of Babel that figures so centrally in St. Augustine's *The City of God* (1998). Nations that came together to seek greatness and to reach to God, having succumbed to those temptations of pride that bedevil all nations, are smote by God and the peoples are dispersed and become unintelligible to one another. To become like God is idolatry; to strive to do God's will is the faithful obedience of the good servant, a servant of God, a servant of the nation. Such narratives of the dangers of hubristic striving have been drawn upon by theologians and ethicists historically as they strive to articulate limits to national loyalty and its demands. It has led, for instance, to distinctly Christian conceptions of the “two kingdoms,” one religious and one political, and thereby a separation of powers. This idea has been basic to Christian political thought.

So, if a key political concept emerging from the narrative of the people of Israel is that of “nation” and of an identity called into being through covenant, a key political concept deeded to subsequent generations by Jesus of Nazareth is the need to articulate limits to political identity, loyalty, and definition. There was that fateful moment when Jesus examined a coin and told his followers to render unto Caesar what was Caesar's; unto God, what was God's (Luke 20:24–25). Over time, this evolved into a strong view of the relative autonomy of the governmental order for it, too, is mandated by God and it, too, makes legitimate claims on persons.

Where the line is to be drawn, where “Caesar” illegitimately usurps what is God's varies from one religious tradition and denomination to another. And usurpation might come from the side of religion. Faith may usurp what is properly within the legitimate mandate of government. However, given the power and reach of the modern state, the encroachment by one into the mandate of the other is more likely to flow from structures of governmental power, at least in the West, which has never been hospitable to theocracy. (Close alliances between throne and altar are not the same thing.) The ethical upshot is that, if God is the Father of nations and calls them into being, God, especially through the figure of the second person of the Trinity, separates God and Caesar in such a way that “nations” and “national identity” become inherently ambiguous categories in the ethical sense. The believer as

citizen is obliged at each and every point to evaluate what claims are being made on him or her, in whose name, and to what end.

The eschatological transformation of all politics by the Kingship of Christ is a difficult concept for late moderns mindful of global political realities and the diversity of religions. We can make sense of it only as an “end-time” idea. But if Christ’s kingship is removed too far beyond the here and now, what one is called to render to God becomes more abstract, more pallid, than does the far more intrusive immediacy of what we are called to render to “Caesar.” Christian ethics is dedicated to making sense of the relationship of the Messianic age to life in what St. Augustine called the *saeculum*, the historic *now* in which we are pinioned during our earthly sojourn. Human self-governance after Christ remains a form of servanthood even as it is tinged by an ever-present temptation toward political idolatry. Jesus, after all, *resists* the temptation to become ruler of worldly kingdoms, as Satan displays the kingdoms before him. His kingdom, Jesus tells his followers, is not of this earth. But we are. And we remain peoples whose earthly sojourn is marked by an ethically promising and problematic immersion in nations. A crucial task of religious ethics in our time is to mine the resources of the religious tradition in order to orient political existence within and among the “nations.” But this is just to suggest that one requirement now facing any religious ethics is to provide cultural purchase on political realities rather than simply accepting the terms of debate set by the “nations.”

H. Richard Niebuhr, in his modern theological classic *Christ and Culture*, tackles the complex relationship between religious belief and worldly matters as an “enduring problem” for Christians precisely because Jesus articulated a distinction between what is God’s and what is Caesar’s. For some Christian thinkers, “the injunctions of the Sermon on the Mount concerning anger and resistance to evil, oaths and marriage, anxiety and property, are found incompatible with the duties of life in society,” writes Niebuhr (1959, 9). Can the teachings of Jesus serve as the basis for citizenship duties and responsibilities?

Niebuhr delineates five prototypical responses within the Christian community historically: the Christ against culture; the Christ of culture; the Christ above culture; Christ and culture in paradox; and Christ as transformer of culture. Most of the time, these positions do not exist in pure form as Christians struggle with their life in “the nations,” both past and present. An example Niebuhr offers is that of St. Thomas Aquinas, who was faithful as a monk to his vows “against” the culture – poverty, celibacy, and obedience – “even as he belonged to a church that had achieved or accepted full social responsibility for all great institutions” and that had “become the guardian of culture, the fosterer of learning, the judge of nations, the protector of the family, the governor of social religion.” For Aquinas, Christianity is, among other things, a structure of practical wisdom “planted among the streets and marketplaces, the houses, palaces, and universities that represent human culture” (Niebuhr 1959, 128–130).

In the matter of “the nations” such a stance commits Christians to taking up political vocations like soldiering, judging, and governing. Such vocations highlight, often in stark ways, the demands of religious faith and the demands of political responsibility. For St. Augustine, for Martin Luther, and for the anti-Nazi martyr Dietrich Bonhoeffer, the harsh demands of civic necessity as well as the command of love require that one may have to commit oneself to the use of force under certain limited conditions, and with certain intentions. There are dangers in taking up worldly vocations. Those who commit themselves to the care of cultural institutions must remain fully aware of just how fragile these institutions are. But to become wholly immersed in social institutions courts a form of presentism and an overly strong commitment to that which is mutable by contrast to that which alone is immutable, namely, God and his Kingdom. The Christ and Caesar distinction sets up a critical tension that simply is the life of the believer-citizen in modernity.

Acknowledgments

The author wishes to acknowledge the vital contributions of John D. Carlson in researching and conceptualizing this chapter.

CHAPTER 125

Economics

Max L. Stackhouse[†]

Throughout history, religion has been related to economic life. While every religion has its own constituting framework of moral meaning, religious ideals are modulated by their contextual applications when they encounter other possibilities of thought and worship or find it necessary to address new situations. Although anthropological understandings in the past tended to see each culture as a self-contained system with its own religion, code of conduct, social institutions, and economic strategies, broader studies suggest that cultures change by outside influences, most rapidly when economic and technical exchanges make old ways obsolete and religion legitimates new possibilities. How these change, and whether innovation is tolerated, resisted, or embraced, has to do with the inner character of the religion. Each religion will tend to see some changes as fundamentally immoral, and others as compatible with core values. Such factors indicate whether a society is stable and adaptable, or in decline and ready for collapse or conversion.

The Old Silk Road

Ancient examples of such changes can be found in recent studies of the Old Silk Road. Along its several branches and paths, early interchanges anticipated what we now identify as globalization. Intercultural and interreligious exchanges were facilitated by expansive economic trade that had episodic parallels in Africa and Pre-Columbian America. After the domestication of the camel in Asia, many trade routes developed among previously isolated regions – none more extensive and exemplary for our questions than the routes from the Mediterranean Sea, across Central Asia to China, with lesser extensions by sea to Korea and Japan in the East, to India and Arabia to the South, and into Europe and North Africa in the West. Along these routes, Jewish and Zoroastrian (and, after Alexander, Hellenistic) traders found their way east and Chinese traders found their way west. They met Hindu and Buddhist as well as animist tribal traditions along the routes. Each established enclaves along the way, but they usually represented traditions that were ethnically bound – Hebrew, Persian, Greek, Han, or Indo-Aryan. The exchange of religious and philosophical ideas led to some highly syncretistic spiritualities, but little changed the basic ethos. Still, patterns of “fair dealing” and “not stealing” were sufficiently recognized by all to sustain the exchanges and justly punish violators.

[†] Deceased.

The economic practices of India and of China, legitimated by quite stable religious and ethical systems with differentiated trading and craft classes, are in certain ways similar and in other ways quite different. Both formed agricultural, feudal-peasant societies. The hierarchical structure of India was based on the dominance of the brahminic priests, supported by a vast array of local and regional maharajas and princes who, together with the brahmans, enforced quite strict caste distinctions on the ethnically pluralistic, endogamous population. Each caste and princely state had, in fact, subdivisions, each with its own deities and each with an assigned role in the economy – a pattern applied to outcaste peoples as well. This massive complexity fixed groups in their status and functions and even dramatic religious and political incursions – as when the Moguls or British arrived – were largely absorbed into the system.

The imperial structure of China, by contrast, had an integrated political regime supported by a subordinate Mandarin literati who both administered the regional offices of the emperor and propagated an ethic of virtue, duty, and obedience to patriarchal–imperial authority at every level of the society, from the emperor to the family. This unified structure was often less in harmony with nature and heaven than classic theory imagined, but it entailed the consequence that a change of dynasty could change a frightening amount. Stability demanded social as well as cosmic harmony. Centralized authority also allowed greater control of dissent, of the land (as massive irrigation projects or defense walls reveal), and of technology and trade, the fruits of which were enjoyed by elites. The people worked hard, consumed little, and depended on emperors, literati, and local patriarchs to establish the fabric of duties and live in learned leisure.

When the proselytizing religions arose – first Buddhists, then Christians, and later Muslims – they sent missionaries to non-converted regions along the Silk Road. Buddhists bore Indian ideas to the East and West; Christians took the Gospel and Greco-Roman ideas to the East. A rather ample tolerance seems to have been the rule, and each had success in tribal areas where religion served as a link to the wider world. But both Buddhists and Christians of that period were monastic. They thought that the exemplary life required the renunciation of wealth, of politics, and indeed of marriage. Thus, they had little effect on economic ethics except in presenting a basic alternative to it.

When Islam spread along the road, it established a new hegemony from Istanbul to central Asia, with links to the Arab world. And it brought quite another model of religion and economic life. For one thing, Muḥammed, the prophet of Islam, was himself a caravan trader. The lore of the tradition and the laws in the Qur'an and the shari'a reflected an ethos congenial to trade. For another, Muḥammed was a warrior, and there was as little doubt about the spreading of the faith, and economic opportunity for believers, by conquest as there was about the morality of trade. A theocratic political economy given to trade was seen as morally and spiritually quite legitimate.

This attitude differed from the Hindu and Confucian traditions, and, for that matter, most Greek, Roman, and medieval Christian traditions. Although all of these had a place for tradesmen and merchants in society, these activities were not held in high esteem. Not only were they always trying to make a profit, which made them at least appear to be greedy, they also did not stay at home in settled moral systems and often acted immorally on the road – or were thought to. They did not produce as did the settled peasants, they did not provide defense from invaders as did rulers, and they did not cultivate the spiritual, moral, or intellectual virtues to keep the sacred traditions as did the priests and literati.

Still, the ancient Silk Road provided a set of complex channels by which the world became more closely bound together. Arts and technologies, pieties and philosophies, myths and worldviews were more widely

disseminated, as goods, money, and produce became increasingly accessible. Many of the crafts and spiritual practices of Asia passed into the West and were adapted to new conditions. Time-keeping devices, gun power, printing techniques, and navigational instruments were adopted by the legacies of Greek philosophy, Roman law, and Hebrew prophecy in reformed Christian theologies, generating a new complex, dynamic civilization on the Occidental end of that road. These, and confrontations with Islam which also was spreading to the West, jarred primitive Europe out of its lethargic feudalism and gradually prompted new religious, ethical, and social changes that we now call Reformation, Renaissance, and the Age of Exploration. The result was a new relationship between economics and religious ethics.

These changes induced a second period of proto-globalization. When the technology of transport changed from caravan to clipper ships, and the new burst of religious zeal invited the faithful to advance world-transforming convictions, entrepreneurs and missionaries took to the seas. There are many causes of these developments, including a rising nationalism in Europe, a development that generated the “Wars of Religion” contained only by the “Peace of Westphalia.” But if nations could not expand the range of their rule at home, they could send merchants and missionaries abroad. To protect their investments from expropriation and their faiths from attack, soldiers were soon to follow.

Modern Developments

Of course, indigenous rulers and elders resisted. Still, resentments could no more contain the hunger for goods carried in both directions by traders than control the religio-cultural insights taken abroad or brought home by missionaries. This second period of proto-globalization served the Industrial Revolution, and it, in turn, altered both the religio-cultural and the techno-economic life in much of the world. This is the period of “modernization” – a process that, in many places, is still very much underway and among some peoples is just getting started.

In modernity, however, much of economic activity and theory seemed to be entirely cut off from religious and ethical norms, at least in traditional terms. Many see modern economic developments as entirely secular. In this context two great modern hypotheses about the relation of economics and religion in modernity were developed. These hypotheses were developed respectively by Karl Marx and Max Weber. The long geo-economic war between statist “socialism” and libertarian “capitalism,” both usually understood in nineteenth-century terms and neither ever fully made actual, has resolved into a democratic capitalism with some welfare provisions for the very poor and moral qualms for the rest about living in a consumerist society.

Both efforts to understand modern economic systems see them as developments that surpassed traditional and feudal economies in ways that disrupted older communities, alienated workers from traditional relationships, and formed new classes in society. But one view opposes these developments. It generated not only several romantic communitarian movements, but also efforts to form a scientific economics that superseded all traces of tradition, religion, or idealistic moralism. Monumental efforts were made to construct an economic system beyond capitalism, using modes of central planning that would bring liberation, equality, and a new solidarity. Today, these efforts seem universally to have collapsed, but their impact on thought and political policy around the world should not be underestimated. Many religious leaders think about the relationship of religious ethics and economic life in precisely these terms.

What has been increasingly argued, however, is a contrary view that capitalism brings more freedom and works better in producing and distributing goods and services. Further, it is increasingly doubted that capitalism creates the polarization of the classes. The best evidence indicates that it in fact tends to create larger and more inclusive middle classes, even if it also involves greater temporary gaps between those at the top of the economic bell-shaped curve and those newly included at the bottom of that curve. Thus, more poor people seek to migrate to capitalist lands and out of socialist ones. Moreover, most theories today hold that economies work best in a constitutional democracy that also regulates business activities so as to constrain fraud, exploitation, and corruption. They recognize the necessity of legally controlled market exchange and the wisdom of encouraging multiple corporations in it. Indeed, the number of corporations per 100,000 people is a key indicator of economic well-being – an argument for wide access to incorporation procedures and against monopolies by state or industrial collusion.

To be sure, cultures where people are not encouraged to form or sustain viable corporations are left behind economically and become most vulnerable. Some scholars argue that the habits of mind, traditions of trust and trustworthiness, and skills in forming and managing viable institutions for cooperative ventures in modern complex societies depend historically on religious orientations that encourage participation in organizations distinct from state and patriarchal domination. Thus, marginal groups find not only spiritual consolation and moral guidance, but also networks of contacts and the resources of social capital by active participation in church, mosque, or temple. If these are vibrant, the social order becomes more favorable to both religious and corporate development, and to economic well-being.

Two Great Hypotheses

Still, the persistence of the two great hypotheses forces us to inquire further into the nature and character of ethics and religion in relation to economic life. The first hypothesis, associated with Marx, was actually explored long ago by materialist philosophers both in the West and the East. It is, ironically, held in new forms today by some procapitalist economists who link their theory to evolutionary psychology in a fresh version of social Darwinism. This view holds that human motivations are obviously and decisively material interests, that the control of the means of production determines the basic contours of economic life, and that the fittest will and should survive. Religion, in this view, is a survival strategy of earlier stages of evolution that today is propagated by interested parties and blindly inhaled by the branches of the population who remain backward – a kind of opiate for the intellectually incompetent. This view finds forceful contemporary expression, ironically, in the socialist-rooted “world systems theories” of Immanuel M. Wallerstein and the polemics of David C. Korten, as well as capitalist-oriented Nobel Prize winners Gary Becker and, in part, Amartya Sen. In none of these does religion play a role in shaping economic life.

The second hypothesis is associated with the legacy of Max Weber. He claims that the religious convictions of people are among the primary factors that not only influence personal character and behavior, but also the destiny and prosperity of peoples and nations. This view acknowledges, of course, that humans have strong economic interests; but it also holds that humans have ideal interests, ever sensing that there is more to life than material motivations and the struggle to gain control of the means to satisfy them. Indeed, that “more” shapes and selects between various possible interests as well as the kinds of means that are developed to meet these two kinds of interests. This “more” is given historical expression

in religion which shapes the moral life and forms civil society in ways that are determinative for human flourishing. Because work is seen as a calling from God, some religious orientations predispose people to develop disciplined personal habits to form corporations to create wealth for the commonwealth, to seek more efficient means of production through technology, and to develop universalistic principles of morality that can regulate open societies.

In this second perspective, religion and religious ethics are not seen essentially as the byproducts of exploitative myth-making, but can best be seen as primary factors in the social dynamics of history. The question, then, is what kind and quality of religion best meets the tests of social justice and civilizational effectiveness. In some ways it appears that some religions encourage, and some inhibit, economic productivity accordingly as they promote the cultivation of trust, the rationalization of the economy, the formation of pluralistic social organizations, the honoring of human rights, and the rewarding of risk and technological innovation. Moreover, advocates of this view argue that modern capitalist societies are not, as some say, more acquisitive than traditional ones, but argue instead that they are in fact rooted in the constraint of immediate desires and interests, the postponement of gratification, and a cultivation of long-term, even trans-historical spiritual and moral concerns that are taken as guides to business life. Versions of this view today are held by such social scientists as David Landes, Peter Berger, Lawrence Harrison, and Roland Robertson.

Ironically, the chief theorists of these two hypotheses shared one major assumption for most of the past century. They believed that the rational study of these phenomena would, over time, bring increased secularization in all areas of society. More recently, many have reversed that expectation as, in fact, the world's cultures have not secularized. If anything, the religions have adopted and adapted aspects of contemporary technology and social organization, altered the ways in which particular groups control the means of production, and modulated parts of their own traditions to appropriate selectively aspects of socialism and increasingly of capitalism. In the meantime, they continue to generate habits of personal discipline and economic rationalization, complex modes of social organization outside the family and the state, and more universalistic views of moral and positive law. The most interesting fact in this regard, however, is that the criteria by which peoples are making this selection are based on the convergence of practical results and the resurgent, often conservative religious consciousness. Not only is Christianity experiencing what some call a new "great awakening" in the Americas, and in parts of Africa and Asia; but renewal is also seen in the other great, historic religions – Islam, Hinduism, parts of Buddhism and, in some ways, Confucianism. They are all expanding rapidly, reforming their traditions, and generating fresh religiously driven ethical approaches to contemporary issues – and in the process modifying their economic ethic in a procapitalist way. So, most remarkably, is Maoism, the last great representative of a thoroughly secular religion!

Current Challenges?

When one looks at matters historically and cross-culturally, we can say that the second hypothesis has basically displaced the first one – or better, has incorporated aspects of the first one into the second's more holistic view. Indeed, one can find a rather massive resurgence of efforts to make the connection between religion and economics. Not only have Catholic encyclicals and Protestant statements been issued by official church bodies in the last two decades, business practitioners are also seeking to connect

their faith to practical business life, often without the aid of clergy whom they sometimes see as mired in obsolete socialist prejudices.

However, economic life is presently based in increasingly common standards of accounting, management, finance, marketing, communication technology, and the treatment of workers – standards not universally observed. More complex economic systems leave spaces for new criminal activities internal to high profile corporations, and new normative guides as well as regulative means are being developed to inhibit the new forms of corruption. These factors invite the various religious and cultural traditions of ethics to press in a common direction, even if other motifs from these traditions seek to preserve distinctive contours for their host societies.

Yet the infrastructure of something approximating a global civilization is on the virtual horizon, and a critical question is what patterns of ethics will guide it. Although some are still left out of the new levels of productivity and wealth, and perils to ecological sustainability are obvious, quick solutions are not available. Issues of property rights, particularly of intellectual property, become decisive, for those without access to the resources that developed new technologies and modes of production cannot possibly develop alternatives on their own, and thus they fall further behind. Moreover, the great growth of international corporations and financial institutions displaces traditional political means of economic constraint while international law and legal institutions, even if developing rapidly, are too weak to solve fundamental issues.

We can summarize our situation briefly this way:

- 1 Every civilization requires a common morality to flourish – a basic definition of right and wrong and a fundamental sense of the good to be sought, tied to personal virtues and real contexts, and no such basic morality has ever become pervasive in a civilization without a religious basis.
- 2 The basic morality that has produced modern, Western culture and has been the mother of globalizing technology, communication, economic productivity, democratic politics, and corporate organization, is rooted in the Christian theological tradition – particularly as it has drawn on and tried to integrate Hebraic, Greco-Roman, and later Enlightenment resources.
- 3 It is not certain whether this heritage can today develop a generous religious ethic able to engage the world religions and philosophies and, with them, provide the key guidelines of justice and responsibility for a global era without turning to imperial, hierocratic, theocratic, or neocolonial patterns of authoritarianism.

To offer faithful, creative, and simultaneously philosophically, scientifically, and theologically coherent proposals on such issues is a key task of religious ethics today if it is to face the realities of contemporary economic life. It will have to offer a more comprehensive vision of civilizational ethics than even the best historic moments of tolerance and trade, the best studies of business ethics, and the best discussions of capitalism, socialism, and social policy have yet generated.

CHAPTER 126

Human Rights

Simeon O. Ilesanmi

The contemporary international doctrine of human rights is principally an outgrowth of World War II, arising on the one hand from the statement of allied war aims in the Atlantic Charter (1941) and on the other from persistent pressure brought by individuals and groups outside of governments for a declaration of political principles or an “international bill of rights” for the postwar world. Since then, there has been a progressive evolution and codification of the idea of human rights, with the United Nations serving as the main vehicle through which human rights dreams have been expressed and their projects implemented. Beginning with its Charter of 1946, which affirms in its Preamble “faith in fundamental human rights,” the United Nations successively adopted three key documents – the Universal Declaration of Human Rights (1948) and two international covenants, one on Civil and Political Rights and the other on Economic, Social, and Cultural Rights (both 1966) – that today constitute an authoritative catalogue of internationally recognized human rights. Other human rights documents, both regionally inspired, such as the African Charter on Human and People’s Rights (1986), and issues-directed, such as the United Nations Declaration on the Elimination of All Forms of Intolerance and Discrimination Based on Religion or Belief (1981), are supplements to the earlier UN instruments.

The inspiration for the understanding of rights, however, antedated the birth of the United Nations. Among other notable sources of human rights ideas are religious traditions, philosophical ideas, legal theories, and revolutionary political and socialist movements, which have articulated moral and humanistic principles that either correspond to or have influenced modern conceptions of human rights. Buddhism and Islam, no less than Christianity, Judaism, and several indigenous religions, portray a vision of universal moral community, in which human beings exist under one transcendent Source, whose will they are to serve for the benefits of all. We find a similar cosmopolitan vision of human interdependence in Cicero’s *De Legibus* (52 BCE), where he appeals to human rights laws that transcend customary and civil laws, and endorses the idea of “a citizen of the whole universe, as it were of a single city.” Cicero rejected the view that distinctions of race, religion, and opinion are insurmountable barriers to forming an inclusive civic and moral community (see Griffin and Atkins 1991). Enlightenment thinkers bolstered this moral orientation to the world, requiring only that the emerging nation-state be seen as the natural forum for securing civil and political rights against religious establishments. As women entered the public sphere, militants and thinkers like Olympe de Gouge and Mary Wollstonecraft called for the equal natural rights of women.

While few would dispute the importance of tracing the intellectual history of human rights, the controversy surrounding the use of the term today focuses on what it means to have rights, how they may be justified, and what rights we should have or recognize. For reasons that will become clear, issues of justification and scope of rights have been more contentious than the analytic task of defining human rights. This chapter explores all three.

The Meaning of Human Rights

Discussions of human rights come up in a variety of contexts, academic and otherwise, which indicate the prominence of the idea in contemporary international society. Accordingly, some scholars suggest that human rights have become a hegemonic political discourse or settled norms within the society of states. While there is much to celebrate in this trend, it can be argued that the global vernacularization of human rights has also contributed to the confusion about their meaning. Conceptually, the word “right” may designate *rectitude* by means of which we talk of something (for example, an action) as being right. This meaning is only tangentially related to what we usually have in mind when talking about human rights, a term that is broadly used to designate *entitlement*. In legal, political, and moral contexts, human rights refer to justifiable claims that individuals and groups can make upon others or upon society, including their governments. The claims may be negative, when they impose constraints upon the actions of others. They may also be positive, requiring active efforts on the part of those against whom they are made to meet the needs embodied in the claims. But are all claims entitled to recognition? What distinguishes “rights” claims from petty claims, and why should we be inclined to take the former seriously while having no qualms about laughing off the latter?

I will identify three different, albeit overlapping, ways of answering these questions. Each answer roughly corresponds to a separate meaning of human rights. First, human rights are taken seriously, or ought to be so taken, because they are expressions of moral identity. They provide normative clues to what a society and its citizens care about. When enacted into law by a democratically elected government, rights often become a means by which important moral values – dignity, respect, and justice – are legally protected. In short, human rights language calls our attention to what it means to be human. It testifies to the goodness of the human who understands himself or herself, and is regarded by others, as a valuable member of the community, and who not only has to be respected but upon whom others can also make similar claims.

Second, human rights function as a meaningful rhetoric for discussing society’s response to basic human needs. “A basic need” is anything “in whose absence a person would be harmed in some crucial and fundamental way” (Feinberg 1973, 111). Needs are things required to survive with dignity; they are warrants for protection against potential harm. When someone has a need, that person is not merely entitled to compensation in the event that he or she happens to be deprived of the needed good; one also has a right to the satisfaction of that need even before harm befalls him or her. Rights, then, refer to important human interests, those interests that operate as “trumps” in the sense that they cannot be compromised by reference to collective policies or goals. They denote ultimate and weighty moral concerns that usually override other normative considerations and which persons have a moral duty to respect.

Thus, when we articulate human choices in rights language, we are attributing to those choices a certain preemptory force that is neither derived from, nor can be overridden by, the rules of any municipal

legal system. Human rights have a tangible existence and moral force in the world of actions, not because the law or a given received tradition says so (in fact, rights are often the casualties of law and tradition), but because they are the means by which we assess the worth of any tradition or legal system. The capacity of any legal or political order to create moral obligations depends on its conformity with human rights. Unfortunately, this has not always been the case. There has been, in virtually every society, an immense abyss between normative theory and social practice, between constitutional doctrine and constitutive conduct. Slavery, colonialism, sexism, and religious intolerance are among the many indelible deviations from human rights. Thankfully, there have also been progressive efforts toward bridging the gap between our normative aspirations and actual conduct. These efforts are at the core of the rights revolution, in consequence of which many dictators have been tossed out of office and excluded groups enfranchised as bona fide members of their societies. From Africa to Asia, Latin America to Eastern Europe, and in some countries of the Middle East, the language and conceptuality of rights are being incorporated into national constitutions. At the international level, human rights norms and values are also becoming a fashionable subject of bilateral and multilateral diplomacy, largely because of the lexical priority accorded to human rights over actual cultural beliefs and particular social arrangements. Third, these worldwide developments provide a basis for a conceptualization of the idea of human rights, as “an expression of a deep human ability to recognize the other as like oneself; to experience empathy for the other’s needs and sufferings; to consent to, support, and rejoice in the fulfillment of the other’s human capacities and well-being” (Cahill 1999–2000, 45).

It is conceivable to concede this moral power to rights language but nonetheless argue that its desired goals can be achieved by means of other normative languages. Some have argued that other ideas are more effective than human rights in serving as ethical templates for social and political ordering. A key substitute for human rights is the language of duty, defended by communitarians in the West and by those who ascribe uniqueness to Asian and African cultures. This is the position taken in the African Charter on Human and People’s Rights, which Makau Wa Mutua, a Kenya-born scholar, defends as being consistent with precolonial African emphasis on “communal ties and social cohesiveness,” values purportedly undermined by the so-called Western notion of the “individual who is ‘utterly free and utterly irresponsible and opposed to society’” (Mutua 1995, 368). Similarly, others decry what is caustically referred to as “American rights talk” that “tend[s] to be presented as absolute, individual, and independent of any necessary relation to responsibilities.” The near-worship of the individual in the name of rights impoverishes political culture, “promotes unrealistic expectations, heightens social conflict, and inhibits dialogue that might lead towards consensus, accommodation, or at least the discovery of common ground” (Glendon 1991, 12, 14).

American society may be more fragmented than it should ideally be, but it is doubtful that the acceptance and domestication of human rights are the sole culprits. What is more, societies that profess allegiance to the “responsibility language” are no less fragile in their social and political composition than America or other countries of the West. Rather than erecting a false dichotomy between “rights” and “duty,” what seems more reasonable is to affirm their correlativeness and mutual entailment. The presumed opposition between the two often arises from confusions and misconceptions, ignoring the fact that some rights have the characteristics claimed for them, and other rights have the features associated with duties or responsibilities. We need the language of duty to enable us to appreciate our sociality and interdependence, and we need rights language to ensure that individual uniqueness is not needlessly sacrificed at the altar of societal convenience.

For example, the right to freedom of speech may be owned by individuals, but it is a precondition for the highly social process of democratic deliberation. That right keeps open the channels of communication; it is emphatically communal in character. Everyone who owns a speech right does so partly so as to contribute to the collectivity; it is this fact that explains the government's inability to "buy" speech rights even when a speaker would like to sell it. So, too, the right to associational freedom is hardly individualistic. In addition to its instrumental value of furthering the rights of the individual – by enabling individual expression and participation in the political process – the right to association is also meant to protect collective action and sociality. Additionally, some rights, even of the most traditional sort, including property, may be necessary conditions for enabling a sense of collective responsibility, even though some understand these rights to be important primarily because they are central to economic growth and material well-being. Yet people without rights to their property may be so dependent on official will that they cannot exercise their responsibilities as citizens (Sunstein 1995; Tuck 1979).

The danger (and a serious one at that) of dropping the language of rights for other more seemingly attractive, perhaps less fractious and less centrifugal ones is that it would strip people of their *locus standi* for effective and meaningful participation in the deliberative life of their society. The instrumentality of rights is a basis on which the powerless and the marginalized may have some hope of commanding a share of the social and material benefits of their societies. Rights offer us a shield from being coerced or bullied into silence; they draw attention to our voices and our lives – formal attention, informal attention, and the attention of various communities, including attention to oneself (Baier 1993, 159; Feinberg 1973, 58). While no human right is absolute in the sense of being indefeasible, every legitimate claim requires that infringements be justified by morally acceptable reasons.

But should these rights be universally recognized or are they constrained by the dictates of cultures?

Justifying Human Rights

Central to the contemporary doctrine of international human rights is the principle of non-discrimination. "Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth or other status" (UN 1948, Art. 2). The non-discrimination principle has become an article of faith for those regarded as universalists in the human rights community, that is, those who argue that a commitment to human rights necessarily implies a rejection of all systems of inequality based upon extrinsic human traits such as age, race, gender, religion, and places of origin. Some proponents of moral universalism appeal to the structure of human action to justify the inclusiveness of the human rights vision (Gewirth 1982). Other proponents ground human rights in the notion of an *a priori* human nature, preexisting any form of social and political organization (Wiredu 1990, 243). "The whole point of human rights is that they are taken to be binding and available, regardless of any particular identity or conviction" (Little 1999, 157). On this view, rights are the inescapable entailment of the moral status of human beings. The status itself could be predicated on either the value of biological life (Singer 1993, 55–217) or on universal rational agency, the uniquely human capacity for self-consciousness (Korsgaard 1996, 104).

The important question to raise at this juncture is whether religious sensitivities contribute to or undermine the aspirations for a universal recognition of human rights. One stream of scholars believes that it is religion that needs human rights for its preservation, not the other way round. They contend

that the morality of historical religious traditions is totalizing and exclusivist (Okin 1999, 9–24). Others argue “human rights are, in substantial part, the modern political fruits of ancient religious beliefs and practices” (Witte 1998, 258). By evoking “a basic sense of fellow humanity, respect for human dignity, and mutual responsibility,” religious symbols and beliefs provide a motivational rationale for universalizing and domesticating human rights (Cahill 1999–2000, 47–48). More fundamentally, “the idea of human rights is ... ineliminably religious” (Perry 1998, 13). The idea of human rights, on this view, requires affirming that each person is “sacred” in relation to a holistic view of the world and its meaning, so that there are certain things that should not be done to and that should be done for any person.

Despite the disagreement between secular (rationalist) universalists and their religious counterparts, both camps agree on the normative understanding of humanity and the defense of human dignity as the primary object of human rights. Neither camp is also completely free of the potential evils that it identifies in the other. Historical religious traditions have perpetrated gruesome atrocities in the name of defending “absolute and universal” truths. Secular philosophical theories are no less sullied by their attribution of “rationality” to some segments of humanity while denying it to others.

The potential for discrimination on both religious and secular grounds has prompted two kinds of skeptical responses. First, cultural relativists see all assertions of universalism as smokescreens for an imperialist moral agenda and contend that morality is a product of historically bound cultures and specific epistemological contexts. They adjudge every society or culture to be a self-contained system that defines its own standard of rationality. Any pretension to the possibility of a transhistorical or universal moral code, applicable to all societies, without regard to time and place, is nothing short of moral dogmatism or idolatry, either of which is both irrational and reactionary. The other response comes from the proponents of “intercultural dialogue,” premised on the conviction that the world’s religious and philosophical traditions share much in common to enable them overcome their inherited superiority–inferiority complexes. Rather than engaging in a futile pursuit of the “ideal” human, the moral codes found in various societies might produce “a set of standards to which all societies can be held – negative injunctions, most likely, rules against murder, deceit, torture, oppression, and tyranny.” These standards would constitute “the moral minimum,” not a complete moral code, but rather “reiterated features of particular thick or maximal moralities” (Walzer 1994, 9–10).

Notable contributions to human rights debates in religious ethics seem to share an affirmation of pluralism as the context within which to seek legitimacy and justification for human rights. One historical misjudgment that many people continue to make is the view that contemporary international human rights instruments were produced by a single, principally Western, philosophical ideology. To the contrary, it was in the context of pragmatic, intercultural dialogue that international human rights secure their legitimacy. The concerns to which human rights were addressed are the conditions necessary for personal and communal flourishing (Twiss 1998, 272). Against this historical backdrop, it is moot to be asking whether religion can or ought to be part of the conversations about human rights. These conversations are necessarily *public*. As such, religious and secular voices must engage one another as components of a comprehensive cultural milieu.

Scope of Human Rights

The continuing multiplication of human rights instruments at the international and various regional levels shows the ideological fissures to which the human rights community is perennially prone. The

dispute about whether the international community should recognize any priorities, either moral or pragmatic, among categories of rights began with adoption of the Universal Declaration of Human Rights. It resulted in the ratification of two different international covenants, one on Civil and Political Rights and the other on Economic, Social, and Cultural Rights representing, respectively, the now moribund ideological blinkers of East and West. Two sub-issues define this debate: how to classify human rights and whether (or how) to rank them. On classification, it was John Warwick Montgomery who first categorized rights in terms of “generations,” by which he meant the chronological appearance and development of rights theory.

For some time, Montgomery’s “three generations of rights” provided a structure for discussions of international human rights. Broadly understood, the first generation refers to civil and political rights, the second to social and economic rights, and the third generation designates the right to development insisted upon by the formerly colonized countries of Africa and Asia (Montgomery 1986, 69–70). This classification now has a limited utility. It does not take account of the contemporary concern for “group rights”. It is thus useful to think of internationally recognized human rights as falling roughly into five categories:

- 1 Rights of the person (e.g. life, liberty, and security of the person; privacy and freedom of movement; ownership of property; freedom of thought, conscience, and religion, including freedom of religious teaching and practice “in public and private”; prohibition of slavery, torture, and cruel or degrading punishment).
- 2 Rights associated with the rule of law (equal recognition before the law and equal protection of the law; right to an effective legal remedy for violation of legal rights; impartial hearing and trial; presumption of innocence; prohibition of arbitrary arrest).
- 3 Political rights (freedom of expression, assembly, and association; rights “to take part in the government of the country” and to “periodic and genuine elections ... by universal and equal suffrage ... by secret vote”).
- 4 Economic and social rights (social security, adequate standard of living, free choice of employment, protection against unemployment, “just and favorable remuneration,” right to join trade unions, “periodic holidays with pay,” free elementary education, and “the right of everyone to the enjoyment of the highest attainable standard of physical and mental health”).
- 5 Rights of communities (self-determination; protection against genocide, slavery and forced labor, racial discrimination, apartheid; protection of minority cultures; and the rights of children).

There is no universal format by which to classify human rights. It is, admittedly, possible to develop a different scheme than the one suggested here.

A far more controversial question is whether we should give priority to some rights over others. The question is raised because rights do conflict, not only because of competing human interests but also because of finite human and societal resources to adequately satisfy all human rights. Up till the early 1990s the dominant orientation was toward prioritization of rights, guided by such considerations as strategy (Hollenbach 1979, 187–202), moral weight (Shue 1980, 155–174), and judicial enforceability (Feinberg 1973). For example, some commonly argued that social, economic, and development rights were unjusticiable, with justiciability defined as the state’s obligation to respect, protect, and fulfill a person’s right. This characterization rests on the distinction between positive rights and negative rights that I alluded to earlier in the chapter. The former are said to require governmental action; to be resource

intensive and therefore expensive to protect; progressive and therefore requiring time to realize; vague in terms of the obligations they mandate; and involve complex, polycentric, and diffuse interests in collective goods (Scott and Macklem 1992, 24). On the other hand, civil and political rights are justifiable because they are, paradigmatically, negative rights and therefore cost-free, immediately satisfiable, precise in the obligations they generate, and comprehensible because they involve discrete clashes of identifiable individual interests (Nozick 1974, 26–53). All that is required to satisfy negative rights is an obligation not beyond the power of both individuals and governments to meet. This of course assumes the existence of propitious social conditions, especially “a set of institutional arrangements for securing legally binding guarantees beneficial to the individual” and “a secure and procedurally regularized legal system” (Claude 1977, 8–10).

The Vienna Declaration and Program of Action adopted on June 25, 1993 by the UN-sponsored World Conference on Human Rights challenges us to move beyond the prioritization paradigm by holding that “all human rights are universal, indivisible, and interdependent and interrelated.” This is hardly a novel claim from the standpoint of many religious traditions, with their affirmation of the “fullness of life” as the organizing framework of moral discourse, as well as the belief in the all-encompassing Divine Reality who is related to all realms of life. There is little to celebrate about a society that promotes only one category of rights (e.g. civil/political rights) – that society merely projects an image of truncated humanity. Affirming the *interdependence* of rights is one normative and strategic way to avoid such a distortion of human life. Central to the principle of interdependence is the idea that “values seen as directly related to the full development of personhood cannot be protected and nurtured in isolation” (Scott 1989, 786). It advocates a full conception of human freedom and a full and integrated conception of the self. It thus rejects a related series of fundamental oppositions or dichotomies that can serve to privilege certain conceptions of the self, and to reinforce marginalization.

By affirming the normative unity of all rights, the principle of interdependence dissolves the false dichotomy between the so-called negative rights and positive rights, thereby refuting the attendant claim that only the former are justiciable. This distinction rests on a flawed assumption that for every human right there is only one correlative obligation, rather than seeing all human rights as entailing a complex, multilayered structure of obligations (Raz 1984, 194–200). Using the right to food as an example, Shue (2000) explains that there are four duties corresponding to it: (1) the obligation to respect; (2) the obligation to protect; (3) the obligation to ensure; and (4) the obligation to promote. The first is a classic negative obligation of non-interference, while the other three require varying degrees of positive action or state policy. This moral overlap underscores the need to promote in tandem both categories of rights.

Finally, the principle of interdependence takes into account the social realities of the people: its primary focus is the promotion of being human or of the capacity to be human. Full human flourishing requires material and political empowerment, enjoyed at individual and collective levels, and it is only within a vision of interrelated and interdependent rights that this inclusive ethical good can be secured. By shifting the argument from the *content* of rights per se and locating it at the center of the quest for an understanding of what it means to be human, the principle of interdependence brings a dynamic and sense of urgency to contemporary human rights debates. Amid the mounting global vicissitudes of civil wars, cultural oppression, political autocracy, economic stagnation, natural disasters, population explosion, and refugee crises, to name a few, we need a moral strategy that combines both the aspirations for political liberation with the imperatives of economic sustenance and empowerment. Anything short of this would make life more brutish and alienating.

CHAPTER 127

Images and Things

Kenneth M. George

Companionable Objects, Companionable Conscience

How do images and things matter to our ethical sensibilities? How do they shape ethical life? As Hannah Arendt reminds us in *The Human Condition* (1958, 52), our world is a world suffused with things; its materiality is basic to our living together. From the moment we are thrown into the world, our being, our becoming is inseparable from – and thus vulnerable to – the materials that surround and embody us. Without things, and without our human capacity to objectify, we could not become subjects, persons, or societies. “Through making, using, exchanging, consuming, and living with things,” writes Christopher Tilley, “people make themselves in the process” (Tilley 2006). Every social, cultural, or ideological order, every human encounter, every expression or exemplification of value, every gesture of language, and indeed the very nature of experience itself springs from and finds intelligibility in the vast but intimate presence of things. Images, of course, are but a certain kind of thing. Yet in this contemporary moment, when print and digital technologies have intensified the production, reproduction, and circulation of images, powerful visual economies have not only refigured our lifeworlds, but have expanded, too, the horizons and ethico-political stakes of seeing and being seen (Mitchell 2005; Pinney 2006).

What, then, should we make of conscience? Some describe conscience as an “inner voice” that we “hear” only within ourselves, and that “summons” us to this or that course of action. It is like a “command” that “tells” us what to do, or a “rebuke” about what we should have done. Understood in this way, conscience is an individuated and internalized scene of address and dialogue. It resembles, in fragment only, the intersubjective speech acts and discursive practices that make up much of ordinary, everyday ethical life (Keane 2015; Lambek 2010; Lambek et al. 2015). We would be wrong to dismiss or take aim against the intersubjectivity and the ethical summons of language. All the same, depicting conscience as one’s “inner voice” may be thought of as a metaphorical and ideological gesture shaped not just by Abrahamic religious traditions with their emphasis on the sincerity, intent, and individuality of the “believing subject,” but possibly, too, so by a Protestant suspicion of materiality. Missing from this picture of conscience are the sensuous images and things that make up our world.

There are two ways in which we might bring visual and material things back into the picture. On the one hand, things and images may serve as affordances for the sorts of ethical reflexivity and action we associate with conscience (Keane 2015). Here, things act as vessel or scaffolding for moral comprehension, for making ethical judgments, and for imagining and committing to certain paths of action. Gazing

at a votive painting of St. Martin of Tours, for example, might remind one of charity or generosity toward others, or spur one to object to war. On the other hand, images and things are social beings that act and are acted upon by us. As we dwell together with objects, we become responsive to them, and they to us, as we can see when Hindu devotees and images of their gods come into possession of each other through *darshan*. Conscience is not indifferent to this encounter with materiality and visibility, to this experience of touching and being touched. There can be no ethics, no conscience, without images and things (George 2016). The conscience, after all, is a means for staying attached to the world and sustaining an ethical commitment to life and life's many forms. Ethics, in this sense, is not so much about right and wrong, or principles and norms, but about the sensibilities that guide our dwelling in a material world, in understanding our attachment and dwelling with things. How and whether we *align* with objects, how or whether we *respond* to their summons, or whether we acceptingly *yield* to their agency and alterity become paramount questions. Finding companionable objects in the world around us becomes a way of living with a companionable conscience.

Our relationships with things and images go far beyond our reflexive projects of self-discovery and self-making. They mark, too, the public reach and communal distribution of our ethico-political (and ethico-religious) sensibilities. As the work of Susan Gal (2002) and Jacques Rancière (2004) respectively and persuasively suggest, communal formations, social hierarchies, and public/private distinctions all may rest on the distribution of such sensibilities. In this light, communities are what Miguel Tamen (2001) calls “friends of interpretable objects” – groups of people who have recognizable ways for living with things and for determining which things will be recognized, made companionable, and put to cultural or political use, and which will be ignored, scorned, or destroyed in iconoclastic purge. We assemble around things. So much so, that Bruno Latour and Peter Weibel (2005) have tried to conjure political and ethical possibilities for object-oriented public spheres. In contrast to Tamen's communal formations, grounded in shared (or normative, or even habitual) dispositions toward things, Latour and Weibel's broad, pluralistic commonwealth is marked by disagreement and “iconoclasm” – moments when one does not know whether the purge or obliteration of an object is constructive or destructive (Latour and Weibel 2002, 14).

We seek, then, companionable alignments between our conscience and our material world (cf. Ahmed 2010), sometimes in broad accord with others, and sometimes in the heat of conflict and iconoclasm. Material and visual forms are, of course, always undergoing cultural, historical, and ideological change, and are always subject to the weathering effects of nature and time. Then, too, images and things are always mobile and migrant, incessantly cast into motion and re-signification, and demanding fresh ethical engagement and judgment (Roberts 2010). It is the mobility of things and images – often on a global scale – that has led to some of the sharpest ethico-political crises and debates in recent times, even as it has opened up new possibilities of wonder, attachment, and companionable alignment (cf. Spyer and Steedly 2013). This is particularly true within spheres of life that have come to be called “religion” and “art.”

Things and Images in Motion: Witnessing Miracles

A splendid example of how the circulation of images has led to wonder and anxiety may be found in the so-called “Hindu milk miracle” of September 21st, 1995, something I witnessed in televised accounts while traveling through Singapore that day. Around daybreak of the 21st, a worshipper at a New Delhi

temple offered a spoonful of milk to the trunk of a Ganesh *murti*, and watched in amazed awe as the stone idol drank it up. Word spread quickly across India. Within hours, countless images of Ganesh and other Hindu gods were seen drinking offerings of milk. Hindu temple societies and nationalist organizations declared it a miracle, and crowds of devotees poured into temples and depleted stores of their milk supplies. Television media, and telephones spread news of the marvel throughout the worldwide networks of the South Asian diaspora – to Singapore, Europe, the Middle East, North America, and the Caribbean – where the wondrous happening was repeated over and over. Offered sips of milk, the gods showed proof that they were touched and pleased at their devotees' solicitude. There were, of course, skeptics who felt ethically compelled and even eager to debunk the miracle (and religious conduct more generally). For them, this was not a transaction between devotees and their gods, but the capillary action that ensued from the surface tension of the milk when it came into contact with the stone or wood surfaces of the murtis – a miracle of everyday physics, but not of divine presence and blessing. The circulation of images and reports in the media, we see, led to the mimetic reproduction of a local "miracle" across globally dispersed communities of devotees who we might call "friends of murtis." As reproduction of the miracle intensified and spread, more and more devotees gathered to honor their companion-gods and to experience the astonishment, blessing, and gratification of having their gods answer back. Skeptics called it "mass hysteria," but others would have every reason to call it a "mass miracle."

A different miracle-in-motion involves wonder and anxiety over an oil-weeping portrait of the Virgin Mary in the sanctuary at the Coptic Church of St. Bishoi in Port Said, Egypt (Heo 2013). Sightings of the Virgin Mary in nature and on objects made for other purposes have routinely caught the interest of devout and searching Christians. She has been found beneath the Kennedy Expressway underpass in Chicago; in the windows of an office building in Clearwater, Florida; in clouds, tortillas, and rocks, and even in pretzels. Some earn the veneration of millions; many succumb to iconoclastic assault. The miracle of the Port Said icon begins in 1990 with the dream of a Coptic woman named Samia. In her dream, the Virgin appeared, touched Samia's right hand, and cured Samia of breast cancer. A few weeks later, Samia's right hand began to secrete fragrant holy oil. State security officers grew apprehensive as the Egyptian public – both Copts and Muslims – flocked to see the visible truth of the Marian miracle embodied by Samia and the oil seeping from her hand. Samia was placed under monastery arrest for five years to keep her out of sight and thus to preserve public order and maintain state regulation of religious truth. It was during her long arrest in the convent that Samia's hand stopped secreting oil. Inside her prayer cell, however, a print poster of the Virgin began to exude scented oil. It is the poster that has become the miracle icon of the Church of St. Bishoi in Port Said. The Marian apparition and miracle crossed from dream, to body, to print icon, but also threatened to move across religious communities and precincts. The response from the state and religious authorities was not to debunk the miracle but to contain and direct Marian companionability and power within the Coptic community.

Things and Images in Motion: Refiguring Traditions

The global circulation of things and images also has refigured local and regional religious traditions. The devotional worship of Mami Wata (literally the "Mother of Water") in West Africa and the West African diaspora provides a fascinating story of how chromolithographic images from Germany and India found new life in Africa as venerated icons of a beautiful, fearsome, and powerful water spirit associated with

wealth, prosperity, and healing. Traditional water-spirits in West Africa took the form of rainbows, fish, and snakes, but also of hybrids – half-human serpents and mermaids. Through decades of detective work, art historian Henry Drewal (2008) has uncovered the global history of today's Mami Wata, whom he regards as a seductive “capitalist deity par excellence.”

The trail of chromolithographic prints begins with a poster of a late nineteenth-century German circus performer, Maladamatjaute. Former Hamburg fish merchant Carl C. G. Hagenbeck had begun running extravagant caravan shows of exotic animals and people from the far reaches of the European colonial expansion into Asia, Africa, and the Pacific. One of the roaming naturalists and hunters in Hagenbeck's hire brought back a wife from Southeast Asia or the Pacific. She took the stage name, Maladamatjaute, and performed as a “Hindoo” snake charmer in Hagenbeck's caravan. Hagenbeck arranged for lithographer Adolph Friedlander to make a poster of her in full costume and handling snakes in the late 1880s. As Maladamatjaute's fame grew, photographs and circus flyers of her spread around Europe and the United States, and Friedlander's chromolithograph print found its way to India and Africa in the hands of merchants, sailors, and others. For Africans, Maladamatjaute's skin color and hair, her garments, and her snakes made her a splendid icon of Mami Wata, and the print (and variations of it fashioned in other media) soared in popularity. In 1955, twelve thousand copies of the Friedlander print (or a later reproduction) were sent from Bombay to Ghana, testifying to the demand for images of Maladamatjaute-as-Mami Wata. By 2005, the image could be found in twenty countries in sub-Saharan Africa and usually linked to the pursuit of wealth, health, and economic advantage. By the 1930s and 1940s, images of Lakshmi (the Hindu goddess of wealth), Vishnu, Krishna, Dattatreya, Hanuman, Ganesh, and others were being brought to Africa by Indian traders and migrants; the flood of material and visual culture from South Asia began to have an impact on Mami Wata worship and icons. Many of the Hindu gods were incorporated as Papi Wata – male deities in association with Mami Wata – or in the case of Lakshmi, as Mami Wata herself or as a companion water spirit, Mami Titi.

Drewal writes that devotees used these prints as guides “for making icons in wood, clay, and other media; performing rituals; and preparing altars,” and “expanded the pantheon of water spirits, fostering an ever growing complexity in Mami Wata worship, which includes elements of Christianity, Hinduism, astrology, European spiritualist and occult beliefs and practices, and so forth” (2008, 59). Citing the work of Dana Rush (1999, 62), Drewal argues that the prints were both outwardly mobile – “easily transported, copied, and reproduced” across space – and inwardly mobile as their “inherent forms and meanings [did] not remain stationary.” That mobility hinges, nonetheless, on ethico-aesthetic and ethico-religious choices made by devotees in engaging their water spirits over the course of a century and a half. Picking up and reproducing new images meant abandoning, neglecting, or even destroying old ones, and being sure that the new images were efficacious. That this transformation in religious visual culture began during the late colonial period and then continued during the subsequent upheavals wrought by postcolonial state politics and globalized market forces suggests that the allure and meaning of the prints might be found in the practical efforts of devotees who aimed to test the efficacy of prints in securing wealth, health, and blessings in a time of acute uncertainty.

Another revealing story of change in religious material culture comes from the mountainous and once remote Toraja region of Sulawesi, Indonesia. Elites in Toraja society traditionally placed carved, wooden funerary effigies of the deceased beside ancestral burial chambers high up on the face of cliffs. Called *tau-tau*, these rather abstract effigies were considered spirit-doubles of those who had died. During funerary rites, the tau-tau were “awoken from sleep,” clothed, and made to listen to chanted biographies

of their human double before being carried with the deceased to a grave site. In the months and years following, relatives of the deceased would bring ritual gifts to the tau-tau, seeking in return ancestral beneficence and favor for the living. Periodically the figures were ritually cleansed, repaired, and given new garments. Christian missionaries arrived in the region in the early twentieth century and actively discouraged ancestral practices; converts came to regard ritualized exchange with the tau-tau as idolatry. As the region went through a boom in conversion and opened up to tourism in the 1970s, relic tau-tau became broadly advertised emblems of Toraja culture and prized examples of “primitive art” (Adams 2006). The next twenty years saw the massive theft of tau-tau, most of which wound up in the hands of private collectors and museums in the West. Collectors and curators typically justified their possession of the tau-tau by claiming that because ancestral Toraja culture had “died” and left the effigies to decay, it was their ethical role to care for the figures.

Several things ensued. First, Toraja began to hide or lock up family tau-tau to protect them from theft or desecration. The empty graveside galleries shook the tourist industry, and so a cottage industry in knock-off and unconsecrated “replica” tau-tau gained traction as ancestral spirit-doubles were put into hiding in homes and caves. Some Christian Toraja, meanwhile, began to argue that the tau-tau were like photographs of the deceased and need not be shunned. This spurred a renascence in carved or concrete tau-tau for Christian elites who wanted to hold elaborate funerals as markers of wealth and social status. A striking feature of the renascence was the emphasis on realism – the new tau-tau were fashioned after actual photographs of the dead. We see at work, then, competing ideologies of the carved figures. What in traditional reckoning were companionable and ritually consecrated spirit-doubles were in the primitive art market orphaned art objects in need of care and preservation as emblems of human creativity and the world’s art heritage. An ethics of ritual exchange that once sustained the communicative bonds between the living and the dead was supplanted by a memorializing and photographic realism on the part of Christian Toraja. The energies and capital of the tourist sector refigured a ritual object as an emblem of Torajan culture as a whole. “Religion” had become “art” and “culture.”

Things and Images in Motion: Negotiating “Religion” and “Art”

The contemporary spheres of “religion” and “art” that had such an impact on Toraja society emerged from historical discourses related to the ones that gave rise to notions of culture and secularity (cf. Asad 2003). The terms “religion” and “art” serve as a modern means of cross-cultural translation and categorization – ways of sorting out practices and objects and for making ethico-political judgments with respect to global networks and institutions, on the one hand, and to fashioning and governing citizen-selves, on the other. Most devotees of Mami Wati were likely indifferent (and perhaps continue to be indifferent) to what counts as “art” and what counts as “religion.” Elsewhere, however, the boundaries of these fields are debated and policed; authorities, experts, and believers are on the alert for transgressions and entanglements (George 2009, 2012). James Elkins (2004) remarks on the apparent estrangement of art and religion; and Jeffrey Kosky (2013) speaks of an impasse between them. The fields seem to presume different ethical stances regarding attachment, irony, critique, and the expressive purposes to which the material and the visual may be put.

The first generation of modern artists in postcolonial Asia sought ways to display their immersive and ethical attachment to their new nations. A cohort of Indian artists, for example, were very committed to

Nehruvian secularism and religious pluralism, and to these ends reworked images of Hindu gods and goddesses as “secular icons” (Zitzewitz 2014). But nearly all of them suffered attacks from the religious right, as with the late M. F. Husain, internationally celebrated as the “Picasso of India,” but also so harassed for his paintings of a nude Hindu goddess, Saraswati, and a naked “Bharat Mata (“Mother India”) that he renounced his Indian citizenship in his nineties and took up residence in London, Qatar, and Dubai.

Debates about Islam and art in Indonesia since the 1970s have revealed profound anxieties about the artistic use of Arabic calligraphy. The Indonesian painter A. D. Pirous is famous for canvases featuring his signature blend of qur’anic verse, abstraction, and bright color (George 2010). His painterly aim is to afford viewers “aesthetic and ethical pleasure,” a sort of visual spirituality or piety intended to bring viewers closer to God; and through such purposeful work he strives to adhere to a Muslim ethic of *ihsan*, “showing goodness and responsibility to others.” Good intentions, and dazzling paintings, however, did not shield him from a variety of accusations: exploiting or selling the Qur’an; proselytizing (*da’wah*), a practice better and properly left to clerics and teachers; and introducing errors into painted qur’anic verse. The feminist Indonesian artist Arahmaiani ran into different but related problems. Some of her early installation work involved placing bound and published Qur’ans beside highly sexualized objects (such as condoms and pantyhose). For her performance of “Breaking Words” she wrote “Allah” on white ceramic plates in Arabic, invited audience members to write on them as well, and then smashed the plates against a wall (Langenbach 2007). In both cases she was subject to death threats and arrest for blasphemy. Both Pirous and Arahmaiani are artists of conscience, and their different use of qur’anic verse reminds us of a point made by Sara Ahmed that “different people are made happy by different things [and so] object choices are not equivalent” (2010, 44). Pirous might point to the happy effects of the Qur’an, and Arahmaiani to unhappy ones. Yet both ran up against religious authorities who saw these works as challenges to their custodianship of the Qur’an. As a former Indonesian minister of religious affairs once bellowed, “The Qur’an should not be sacrificed for art!”

Things and Images in Motion: Forming Transnational Public Spheres

The global movement of images and things (especially ones with religious significance) has also played a part in shaping transnational public spheres. “Friends of interpretable objects” gather not only as local communities or as nationwide publics and counter-publics, but in transnational networks, too, as we saw in the instance of the “Hindu milk miracle.” In many cases, these object-oriented transnational publics come into view when there are sharp conflicts over offending images or instances of iconoclastic violence (cf. Mitchell 2005, 128). News reports in mass media and through digital social media extend popular concern and alarm, especially when conveying the ostensive truth of the news through video clips and photos. The Taliban’s 2001 destruction of the towering sixth-century statues of the Buddha at Bamiyan, Afghanistan, summoned international outcry in defense of “world heritage,” as did the 2015 looting and destruction of archaeological treasures at Palmyra, Syria, at the hands of Islamic State (Daesh). The controversies and reprisals surrounding the publication of cartoons depicting the Prophet Muhammad in the Danish newspaper *Jyllands-Posten* (2005), and in the French satirical weekly, *Charlie Hebdo* (2006, 2011, 2015) are prominent examples in which offending images find framing with transnational discussion about blasphemy and freedom of expression. Saba Mahmood in her discussion

of the Danish cartoon scandal (2009) helpfully points out that these terms and principles – blasphemy, freedom of expression – circumscribe such controversies in a way that obscures not just the problem of moral injury, but what she calls “attachment and cohabitation” between religious subjects and material objects of exemplarity and veneration. Things matter, not just principles.

Crossings of objects and images from the domain of “art” to the field of “religion” (and vice versa) also figure in the ethico-political and ethico-aesthetic debates that animate these transnational spheres. The “Lagerfeld Bustier” scandal of 1994 offers an example (George 2009). In January of that year, Karl Lagerfeld unveiled his spring couture collection for the Paris fashion house Chanel. The show featured supermodel Claudia Schiffer in a cleavage-enhancing black bustier decorated with a panel of *thuluth*-style Arabic script in pearl embroidery. The script turned out to be a phrase from the 36th sura of the Qur’an (Ya Sin:21), a sura traditionally recited in *tahlil* rites for the dead or dying. Shown photographs, Muslim clerics in Indonesia were the first to notice that the bustier displayed part of a verse from the Qur’an, and called for a global protest and boycott against Lagerfeld and Chanel for their offensive handling of divine revelation. Outraged Muslim clerics and organizations in France, Egypt, Australia, and other parts of the world joined in the outcry. Lagerfeld claimed not to know that the Arabic was from the Qur’an; he had lifted it from a book showing calligraphic ornamentation on the south arch of the Taj Mahal. (The arch is inscribed with Qur’an Sura 36.) A spokesperson for Chanel explained that “the designer had no idea what the original meaning was. He was just interested in the design *from an aesthetic point of view*” (emphasis added). Chanel apologized to the world Islamic community, burned the bustier, and asked that all photographs and videos of the bustier be destroyed (though no Muslim called for the destruction of the bustier or the photos and videos.) What the controversy especially highlights is the way members of a global religious community – here Muslims – do not restrict their interests to the works and projects of Muslim artists alone, but take it upon themselves to weigh in on the visual arts whenever they impinge on religious or ethical concerns. Further, the particular role of Indonesian clerics in the controversy shows that individual Muslims belonging to different nations may not only view themselves as part of a global Islamic community, but also seek a platform to speak for its interests or to act on behalf of the common good of Muslims everywhere.

To sum up, pictorial-material space and substance are no less fundamental to the field of ethics than ideas, principles, or interior states of belief, sincerity, and aspiration. Brigit Myer and Dick Houtman have written that a “materialized study of religion begins with the assumption that things, their use, their valuation, and their appeal are not something added to religion, but rather inextricable from it” (2012, 7). Their remarks apply to the study of ethics as well. We find ourselves in the ever-present company of images and things. The horizons of our sociality and our dwelling in the world include them. As friends of images and things, we owe them our receptivity and earnest care.

CHAPTER 128

Corporations

Rebecca Todd Peters

A corporation is a specific type of business firm possessing a legal status independent of its owners or shareholders. As an independent legal entity, corporations have the authority to engage in functions traditionally reserved for individuals, like the ability to buy and sell property, enter into contracts, and sue or be sued. Incorporation also offers the ability for businesses to exist in perpetuity and limits the liability of investors/stakeholders to the amount of their investment in a particular corporation. In 2015, sixty-nine out of the top one hundred largest economic entities were corporations and the other thirty-one were nation-states (Global Justice Now, n.d.). In 2018, the five hundred largest corporations in the world generated \$32.7 trillion in revenues (Fortune n.d.), representing over one-third of the global GDP of \$85 trillion (World Bank 2019). These five hundred corporations represented thirty-four countries and employed over sixty-nine million (Fortune n.d.) of the almost 3.5 billion people who participate in the global paid labor force (World Bank 2019). Given their economic power, corporations are powerful political as well as economic players on the global stage.

Moral questions related to corporations are often approached from two related but distinct directions – applied ethics and normative ethics. The field of applied ethics or business ethics is primarily focused on the behavior of individual stakeholders – CEOs, managers, workers, investors, and so forth. Normative ethical approaches to economics and corporations are primarily focused on developing moral arguments about the role and function of corporations in society. This entry will largely focus on normative ethical questions related to the social role of corporations. As human institutions, corporations are tools for achieving social ends. However, as a social instrument, the corporation as tool can be (and has been) used in a variety of ways and for a variety of ends. This entry will trace the historical development of corporations with an eye toward how corporations have been used historically as tools for particular social ends and will identify particular contemporary moral questions associated with corporations.

Historical Development of Corporations

Modern corporations trace their origins to the sixteenth century and the era of European exploration and trade. At the time, debt was inheritable and the risks of weather and piracy involved in exploring and establishing new trade routes threatened the economic potential of the burgeoning sea trade. Monarchs and governing bodies began to grant charters to joint-stock companies that limited the economic liability of investors to the amount of their personal investment in the company.

These proto-corporations became the primary tool for exploration and trade in the seventeenth century. The Dutch quickly established themselves as the leading power in this new arena, largely due to the Amsterdam stock market or bourse that funded Dutch exploration and trade ventures. Italian sociologist, Giovanni Arrighi notes that the Dutch emphasis on mercantilist accumulation over territorial accumulation cemented their political and economic hegemony in Europe in the seventeenth and early eighteenth centuries. Dutch wealth filled the Amsterdam bourse with ready capital to fund further joint-stock company ventures. As trade routes expanded to the Atlantic, the Dutch no longer possessed the territorial or demographic base to compete with other European powers. Recognizing their inability to continue to compete successfully through trade, the Dutch concentrated instead on expanding their power in high finance in order to continue to benefit from the spread of mercantilism.

As the Dutch shifted from trade to finance, the political and economic power of the British empire grew. By the eighteenth century, England's economic, military, and political power surpassed, not only Holland, but all the European states, making it the most powerful force in Europe. Britain's ascendancy heralded a new age for the chartered joint-stock company or the emerging corporation. England became symbolic of the new age of expansion that joined territorialism and capitalism into a new form of political control known as colonialism.

Joint-stock companies, like the English East India Company, were not simply merchants and traders but also functioned as the imperial governing bodies in many colonial states. With the authority to build forts, maintain military forces, engage in battle, levy taxes, make and enforce laws, the joint-stock companies combined business and governmental functions as they both monopolized trade in and with the colonies and governed them as administrators of the British crown. In the eighteenth and nineteenth centuries these corporations invested mainly in extractive industries which drew wealth out of Africa, India, and other colonial outposts to the economic benefit of the colonial capital owners and the colonial states. Often, these raw materials were turned into manufactured goods in the imperial country and returned as expensive imports to their countries of origin. The strategy of these corporations to promote high profit margins enabled corporations and imperial governments of the period to amass great wealth.

The introduction of steam and machinery into the world of production in the nineteenth century transformed the role of the corporation within the political economy of nation-states. Rather than promoting exploration and trade as corporations did in the seventeenth and early eighteenth centuries, or pursuing the colonizing functions of the late eighteenth and early nineteenth centuries, the corporations that emerged in the late nineteenth and early twentieth century were strictly business ventures that served the primary purpose of concentrating and organizing the new forms of industrialization that steam and machinery made possible. In the mid-nineteenth century the emergence of Fordism and factory production as well as the nature of the industrial revolution transformed the face of business in the United States. Railroad companies, steel, copper, and oil producers, and the mass production of consumer goods were all industries that were more profitably served by large business corporations rather than the traditional small business enterprises of early America.

The post-Civil War years in the United States saw an increase in the consolidation of these industries as wealthy individuals and corporations aggressively sought to buyout their smaller competitors and monopolize various industrial sectors. This was known as the first great merger wave. The remarkable growth of corporate strength and power in the United States during this time was also due to extensive lobbying on the part of business to encourage states to increase their willingness to grant charters for corporations as well as the friendliness of the courts in expanding the legal rights of corporations.

The enormous growth potential represented by the North American continent and the openness of a largely immigrant population to innovation and change represented a unique set of historical conditions within which the development of the modern corporation proceeded. It did not take long for successful US corporations to begin to move beyond their own markets to actively pursue trade abroad and by 1902 Europeans were already speaking of an “American invasion.”

By the end of the World War II and a half century of war and occupation, many European countries had fallen far behind the industrial and technological advances that had propelled US business forward. Furthermore, the infrastructure and productive capabilities of Germany, France, Britain, and Italy had been severely compromised by the bombing campaigns. In the postwar period, world leaders developed significant financial plans to guide the process of European and Japanese recovery. A postwar conference at Bretton-Woods in New Hampshire created a new set of International Financial Institutions (IFIs) with the intention to aid in postwar reconstruction. However, when the US Marshall Plan infused nearly \$12 billion in grants and low-interest loans into war-torn Western European countries, the World Bank and International Monetary Fund (IMF) had to find a new purpose. As the war-torn countries rebuilt their economies and their infrastructures, the attention of Western world leaders who effectively ran the World Bank and IMF turned their attention toward the poverty of formerly colonized countries, many of which had only recently achieved their formal independence in the 1940s and 1950s. The poverty in these countries was determined to be a result of “underdevelopment” and a new era of “third-world development” began.

Focused largely on building an infrastructure for industrialization, the IFIs provided funding and legitimation for projects in the Global South that transformed many postcolonial nation-states into industrial economies. However, much of this infrastructure development was driven by foreign direct investment (FDI) from Western corporations, many of which were part of the military-industrial complex that provided the technology, equipment, and knowledge to build the highways, dams, and power plants that were meant to “modernize” the developing world. The money from the IFIs to fund these infrastructure projects went largely to the first world corporations that had the technological capacity to execute the infrastructure development.

By the 1970s, increased competition from European and Asian business and industry began to challenge American economic hegemony and rates of profit. European countries became stronger after their initial postwar recovery and reconstruction phase and newly industrializing countries of southeast Asia introduced lower priced goods into markets where US companies had traditionally had a stronghold. The oil crisis of the 1970s almost tripled oil prices and generated an enormous amount of “petrodollars,” leaving unprecedented capital reserves in banks the world over. As commercial banks sought investment opportunities for their rapidly increasing bank deposits from the oil crisis, interest rates fell and credit ratings for countries in the Global South improved. These factors coincided with a new mandate at the World Bank to increase their funding ten-fold, making the World Bank a driving force of international finance as billions of dollars were lent to countries in Africa, Asia, and Latin America to assist them in becoming more like Western economies. The postwar infrastructure development of these countries literally paved the way for the development of industries in the Global South. Corporations based in the first world began to take advantage of drastically reduced wages and the excess of petrodollars that were flowing through the Global South. These newly developing countries provided the additional benefit of untapped market potential to replace decreased consumer spending practices in the “first” world. According to Arrighi, the accumulated value of US direct foreign investment more than doubled between 1970 and 1978 and that of

non-US foreign direct investment more than tripled. While European and American companies had cooperated over shared interests throughout the early and mid-century, the second half of the twentieth century marked the beginning of the “multinationalization” of many large corporations, a move that presaged a radical shift in the role that corporations played within the political economy.

Moral Issues Associated with Corporations

Corporations are a human institution created to perform certain tasks and functions in society. Corporations can thus be understood as tools that people use to accomplish social goals. Tools, in and of themselves are amoral, but tools do not exist independently of the humans who create them and use them, and human actions, ideas, and beliefs reflect a variety of moral perspectives. These various moral perspectives often offer different visions and understandings of how society should be ordered and how we understand the moral principle of justice. Corporations have always been used in different ways by different people in different eras to achieve a variety of purposes. In their earliest days, the trading companies were tools to limit the liability of investors and thus encourage increased intercontinental trade. Later, these companies became the tools of colonization in an early form of public–private partnership that was part military, part administrative, and part commerce. In the twentieth century, corporations functioned as tools to make war, tools to industrialize and produce goods, and tools to feed the world. By the early twenty-first century, transnational corporations are primarily regarded as tools for wealth creation. With sixty-nine of the largest world economies belonging to transnational corporations, their economic and political power present a host of moral questions and concerns that mark contemporary ethical debates about corporations. In order to think critically about these moral questions, it is necessary to examine the changing way that corporations have been used in recent decades.

Prior to the multinationalization of corporations in the twentieth century, businesses functioned in many ways as informal and formal agents of the government. The charters offered by governments were originally intended to enable the private sector to perform necessary economic and productive tasks that were impractical for the government to pursue – building railroads, smelting iron ore, processing food. Additionally, corporations provided jobs for a large number of workers and supplied the population with necessary goods and services. For centuries, there was a mutually reinforcing interdependence between governments and the economic institutions that they chartered. While these corporations were not social welfare organizations and the private sector interests in these enterprises were always motivated by profit, the move toward multinationalization marked a transformation of the corporation from the status of a partner of the state to an independent entity that was positioned as transcending the boundaries of traditional nation-states. This shift in status from corporations as agents or partners of the state to transcending the boundaries of nation-states is an early step in shifting public perceptions about the purpose and function of the corporation.

This attempt to shift our social understanding of the purpose and function of the corporation is an example of how corporations are used as tools to achieve human social goals. As national corporations began to establish enterprises in other countries, they initially identified themselves as “multinational” reflecting a changing identity in which corporate leaders positioned themselves as institutions embedded within host countries with civic responsibilities like paying taxes and following the laws of the countries in which they are located. Over the past thirty-five years, the multinational corporate

identity has been transformed into a transnational corporate identity in which transnational corporations are positioned as independent entities that transcend the nation-state. In the culture of transnational corporations, the principle of instrumental rationality focused on cost-saving and profit maximization replaced any recognition of the moral responsibility of corporations as entities embedded in local communities or nation-states that help contribute to a public or common good. This shift in focusing exclusively on maximizing efficiency and increasing profit margins reflects the economic ideas of Milton Friedman and the ideology of neoliberalism (also known as supply-side economics, “free market” theory, and the Washington Consensus) promoted by Ronald Reagan and Margaret Thatcher in the 1980s. The neoliberal emphasis on deregulation, increased trade, and privatization is the ideological backdrop for the phenomenon of the leveraged buyouts of the 1980s that played a significant role in shifting the role of corporations in society.

In the 1980s publicly traded corporations that had low debt, fully funded pension plans, generous employee benefits, and decent profit margins were primary targets for “corporate raiders.” Essentially, efficiently run and well managed corporations were viewed by these venture capitalists as gold mines. By leveraging substantial loans against the potential earnings made on the takeover or through junk-bonds or both, the purchasers were able to buy out a controlling interest of the stock at prices above its currently traded value. The corporate raiders would then transfer the debt that financed the buyout to the corporation itself, thus saving millions in taxes as operating profits were turned into deductible interest payments. These corporate raiders were also referred to as “vultures” because they were regarded as scavengers who did no productive work themselves but exploited the hard work and solid business strategies of brick and mortar corporations that produced goods and services. The vultures focused on strategies that would increase immediate profits while eschewing concern for the long-term health or stability of the corporation. Strategies with high profit returns included selling off parts of a corporation, liquidating pension funds, or laying off employees, with no focus on growing corporate value over the long-term or the role that corporations play in the larger health of economies. This strategy of extracting maximum value from corporations while disregarding the long-term economic consequences and the moral responsibility of corporations has been repackaged in recent years and labeled as “activist investors” in an attempt to shed the negative association of terms like “raiders” and “vultures.”

By the end of the 1980s many of the most socially responsible corporations – the ones that had looked out for their workers interests or had environmentally sound business practices or had been the most fiscally responsible – had been taken over by venture capitalists and either sold off piecemeal for a profit or transformed through debt, layoffs, and a new business ideology based solely on the maximization of profit. The CEOs and managers who factored environmental or humanitarian concerns into their business decisions were replaced by people who were viewed as more “capable” of turning a profit, that is, those businesspeople who had adopted and internalized the new corporate ideology of profit-maximization. The moral indifference to the workers whose retirement funds were stolen, or the forests that were clear cut because they were considered more valuable to a company’s profit if they were liquidated now, rather than over a period of twenty years – all of the decisions that were made on the basis of profits and without consideration of their social or humanitarian value – represented the emerging *amoral* self-perception of transnational corporations. From a corporate standpoint that views profit maximization as the primary/sole purpose of business, economic decisions made to maximize profit are neither moral nor immoral.

There was a second group of corporations who were also awash in capital assets but avoided takeover by venture capitalists. These corporations were led by CEOs and senior managers who recognized the shifts that were beginning to transform the corporate self-understanding and developed aggressive plans to invest surplus capital and increase corporate debt load in order to deter the interest of venture capitalists. This diversification contributed to the increasing growth and economic power of transnational corporations. But these CEOs were the prescient ones in the business community. They knew that buying up smaller corporations around the world would not only forestall their own leveraged buyout, but that this would increase the parent corporation's access to other markets, an essential prerequisite for any viable transnational corporation in an era of economic globalization. Either way, whether through leveraged buyouts or diversification, the corporate culture at the end of the 1980s had shifted radically from that of twenty years earlier. While business has always been about turning a profit, the ideological shift that occurred during this period created a corporate self-understanding that business was *only* about turning a profit and then maximizing that profit.

By the time the 1990s rolled around, corporate management was looking for new and innovative ways to continue to increase profits. Now that the leveraged buyouts had run their course, management developed a new strategy that took hold in the 1990s – downsizing and the externalization of costs. While neither of these strategies was new to the business world, what was new was a concentration on developing what economist Bennett Harrison has termed the “lean and mean” corporation. In this new paradigm, the concentration of power and authority is still vested in the transnational corporation itself, but the transnational corporations are moving toward organizational decentralization through downsizing and outsourcing. Downsizing refers to the process of dividing permanent or “core” jobs from contingent or “peripheral” jobs. Corporations focus on securing the jobs that represent their primary source of economic power; jobs like finance, marketing, and proprietary technology are consolidated as the center of corporate power and peripheral work is subcontracted out to the lowest bidder, often in low-wage countries in the Global South in a process known as outsourcing. Harrison makes note of this “dark side of flexible production” which produces a two-tiered labor system and provides stable employment and handsome salary and benefits for the few while adding to the problem of “working poverty” for a large number of former corporate employees. This combination of downsizing and outsourcing not only further increased the profitability of transnational corporations, it is the most recent step in the transformation of how corporations can be used in society.

Corporate Economic and Political Power

As transnational corporations increase in size and economic resources, their political power increases accordingly. This increase in political power, however, is not simply related to the economic power but also to how corporations are able to use their economic power for political gain. The final factor in assessing the morality of corporations requires attention to the evolution of the legal standing of corporations.

As early as 1816, US Supreme Court Chief Justice John Marshall noted that corporations possessed the characteristics of immortality and individuality, thus endowing the corporation with the same legal standing as a “natural person.” He also described the corporation as “an artificial being, invisible, intangible, and existing only in contemplation of the law” (Bowman 1996, 44). While the 14th Amendment

was passed in 1868 to protect the civil rights of American Blacks, for decades most court decisions based on the 14th Amendment involved corporations. Building on Justice Marshall's rulings in the 1810s and the testimony of Representative Roscoe Conkling that the original framers had intentionally used the term "person" rather than "citizen" in order to include corporations within the 14th Amendment, corporations acquired the status of "personhood" under the law. Due process has since been used to invalidate state regulatory legislation that attempted to curb the excesses of corporations.

In the late 1970s two US Supreme Court decisions greatly expanded the "rights" of corporations to include the protection of corporate free speech under the First Amendment. The first decision expanded the First Amendment's freedom of speech protections to include *financial* contributions to candidates or parties and in the second decision the court extended these protections to cover corporate political speech. In addition to protecting the corporation's right to exercise its influence in the political arena through *political speech* the Supreme Court also moved to protect *commercial speech* in the late 1970s by extending First Amendment protection to a variety of forms of commercial speech including advertising. In 2000, the US Supreme Court ruling in *Citizens United v. Federal Election Commission* (558 US 310, 2010) eliminated controls on corporate political speech, making it legal for corporations to advocate for or against the election of individual candidates, further increasing the political power of corporations in US elections.

In considering moral issues associated with corporations, it is necessary to think carefully about the moral implications and consequences of how corporations are being used as tools in society. As transnational corporations transcended allegiance to individual nation-states, they not only circumvented their responsibilities as corporate citizens, they also sought to transform any understanding of corporations as either subservient to the state or partner of the state into an understanding of corporations as independent of the state and oriented primarily toward self-interest and profit maximization. This positioning of transnational corporations as self-interested individuals has coincided not only with their divestment of any social responsibility to the well-being of the state but also from any social responsibility or accountability to the majority of the workers whose productive labor creates their profits and the communities within which they have built their productive enterprises. The elevation of profit-maximization as the sole purpose of the corporation has reduced their ability to recognize any stakeholder beyond the investor/shareholder – to the larger detriment of the health and well-being of the planet and the human community.

As social institutions, corporations can also be shaped in different ways that reflect a different moral understanding of the role of business/corporations in society. Religious communities and religious leaders have long been at the forefront of calling for more just visions for the role of businesses and corporations in society and the movement to ground corporate accountability in the triple-bottom line (people, planet, profit). The UN Global Compact also represents a major coordinated global effort toward justice and social responsibility for transnational corporations.

Considering the moral questions related to corporations is an ever evolving task that changes as quickly as humans can create new ways to use corporations as tools to achieve their goals. That said, there are often particular ideological trends or positions in different eras that shape new social roles for corporations, for example, limited liability, colonization, industrialization, militarization/war, neoliberalism. Careful moral assessment of these social roles for corporations must pay careful attention to the ideological arguments that support such roles and must attend to the moral question of how these corporate roles contribute to the common good of the human community and the natural world.

CHAPTER 129

Education

Joshua Daniel

In this entry, I articulate a trajectory of progressive education theory as a heuristic tool for examining the relationship between religious ethics and education. The point is not to defend this particular theory against its critics, which would take us far afield of religious ethics, but rather to use it as a theoretical lens that discloses characteristics of education relevant to religious ethics. There are two reasons why progressive education theory is particularly fitting in the context of religious ethics. First, progressive education theory is *fundamental and reflexive*: fundamental, because it interrogates the nature of education with reference to basic claims about human nature; and reflexive, because it involves a critical view on education practices in order to assess the extent to which they fulfill what education's own nature demands. In these respects, progressive education theory helpfully prevents us from perceiving education as one human activity or profession among others with straightforwardly distinguishable characteristics. All religions undertake the explicit education of current and potential members, but focusing on this may leave unexamined how religions understand why they bother educating at all. Second, progressive education theory is *ethical*. Insofar as it entails basic claims about human nature which serve as a critical perspective on actual education practices, this theory is an ethical endeavor in making the educational process responsible to the realities of human life. Religions themselves can be understood as ethical realities insofar as they make claims about human nature that provide critical leverage on surrounding, if not competing, human activities. In this respect, religions in their more prophetic modes and progressive education theory often occupy the same place in their social worlds.

This last comment reveals a limit to my approach. Progressive education theory may align with religions in their more prophetic, or socially critical, modes – but religions also have socially established modes, modes implicated in the maintenance of their religions' surrounding social worlds, and even religions at their most prophetic may not brook criticism within their own walls. Indeed, progressive education theory often opposes itself to forms of religious education, particularly any didactic form of instruction. Yet, this theory illumines pedagogical realities that prevailing, accepted education practices may not reflexively recognize, and so remains useful for examining how religions, as ethical realities, educate. The trajectory of progressive education theory I will articulate has three moments, aligned to three pedagogical thinkers: Jean-Jacques Rousseau, John Dewey, and Paulo Freire. The conceit is that the theory as a whole discloses education to be a three-fold responsive endeavor. For Rousseau education is *student-responsive*, in that it presumes or intends persons with particular attributes and dispositions as

its students. For Dewey education is *world-responsive*, in that it presumes or intends a particular picture of the world which students inhabit during (and after) their education, and to which their education does or does not intend to fit them. Finally, for Freire education is *power-responsive*, in that it occupies a particular place within the world's power relations even as it presumes or intends its own power dynamics. Now, aligning each thinker with a particular form of responsiveness is not meant to suggest that such alignments are mutually exclusive. Rousseau's pedagogy is also world- and power-responsive, and so on. Still, these alignments imply what I understand each thinker's particular contribution to progressive education theory to be.

What follows is merely an introduction to these thinkers' pedagogical theories, focused on their particular contributions, but the endgame is to suggest how these provide conceptual tools for organizing inquiry into the relationship between religious ethics and education. The claim here is not that education within and around the religions needs to become student-, world- and power-responsive, but rather that it already is, and that progressive education theory may help clarify this. At each step, brief connections will be drawn to the Christian traditions because that is the author's particular training.

*

In a claim essential to the notion of student-responsiveness, Rousseau insists, "Childhood has its ways of seeing, thinking, and feeling which are proper to it." That is, there is such a reality as a child sufficiently different from an adult to warrant a form of education that focuses on what children *are* rather than on what adults want them to become. Pre-adult humans and the distinct developmental stages that compose pre-adulthood, have an integrity which demands recognition and respect if education is going to succeed. Rather than inculcate ways of seeing, thinking, and feeling proper to adulthood, thereby treating children as little adults, Rousseau would have the tutor monitor and follow the students' own ways of engaging the world so as to cultivate their natural development. Hence, Rousseau's pedagogical magnum opus, *Émile, or On Education*, is structured in five books each paired with a stage of human development – infancy, childhood, prepubescence, puberty, and sexual maturity – where each stage is dependent on the pedagogical gains of the prior stage. To take one significant example salient for religious ethics: Rousseau argues that humans are first and foremost self-regarding physical beings, motivated by the satisfaction of natural needs. In this respect, he understands infants and children to be entirely non-moral, because our specifically moral capacities develop after other capacities. The result is that education focuses on the strengthening of our physical capacities to satisfy our own needs – e.g. strategic exposure to risk in infancy, exercise of the senses in childhood, learning a manual trade in prepubescence – while at first eschewing, and then gradually and indirectly introducing, moral ideas. By the time of sexual maturity, students have the requisite capacities to be moral, and they need them in order to master rather than be mastered by their sexual desires. At this stage, students' physical strength transmutes into the moral strength (Rousseau's understanding of virtue) that enables students to master themselves. The point I want to highlight here is that moral development follows and *depends on* physical development. The aim of education may be the cultivation of virtuous adults, but it demands recognizing and respecting the non-moral physicality of children.

This may sound straightforward, but it's complicated by Rousseau's basic philosophical claim, as expressed in *Émile's* first sentence: "Everything is good as it leaves the hands of the Author of things; everything degenerates in the hands of man" (Rousseau 1979, 37). Apparently a secularized version of

Christian accounts of original sin, the claim is that humans are naturally good – *not* naturally *virtuous*, just naturally *nonwicked* – but corrupted into wickedness by the institutions of human civilization. Insofar as it remains a human institution among others, education will corrupt students. Hence, Rousseau's student-responsive education requires a dialectical mode whereby it opposes corrupting pedagogies and the institutions they inevitably serve. Such a mode requires the provision of a protective and nourishing space where the student can develop their natural capacities unhindered by social conventions. Practically, this demands the pairing of students with their own personal tutor, who's responsible for their natural development from infancy to marriage, and a relocation to the country where life is less corrupted. By restricting education to a single isolated dialogical relationship, Rousseau hopes to preserve and cultivate students' natural goodness, as well as to set up the ideal conditions for the discernment of their natural development. The problem with human institutions is that they replace our natural needs with social desires, the satisfaction of which constitutively require others and so incites us to dominate them. Moreover, the kind of moral education Rousseau eschews, the sheer positing of particular virtues and obligations as though students are already moral, plays into and abets the economy of social domination: since moral demands are meaningless to children, they are simply perceived as the demands of socially powerful others contravening children's own desires, motivating them to desire becoming socially dominant in turn. Rousseau's approach keeps students out of this dynamic. Of course, the point is not "to make a savage and to relegate him to the depths of the woods," but rather to ensure that, "enclosed in a social whirlpool, [the student] not let himself get carried away by the passions or the opinions of men" (Rousseau 1979, 255). Eventually, students will enter the social world and get married, so the cultivation of their natural goodness must serve social living. It does so by transforming into the moral strength of virtue, which enables students to remain self-possessed within the whirlpool.

Insofar as religions educate their members, they imply claims about human capacities, particular our moral capacities, and then respond to their members as so capacitated. One fault line within the Christian traditions involves the extent to which original sin is understood to distort our moral capacities. If, as in standard natural law positions, basic moral capacities remain intact, such that divine grace completes or elevates our moral achievements, then it makes sense to teach morality in a positive sense, cultivating particular virtues and inculcating particular obligations. If our moral capacities are corrupted all the way down to their roots, such that grace is basically responsible for any moral achievement, then it might make sense to forego positive moral education and focus on cultivating the recognition of our moral incapacitation, relegating morality to the restraint of our inevitable wickedness. A related fault line in Christian traditions regards the relationship between Christian communities and the wider social world. If basic moral capacities remain intact and are thereby shared outside our religious community, then education within the community doesn't need to be dialectically opposed to education without; possibilities are open for inter-educational exchange, whether Aristotelian thought for Thomas Aquinas or classical rhetoric for Augustine. If we're morally incapacitated, an incapacity shared outside our religious community, then education within the community will tend to be more anxious about surrounding forms of education insofar as they fail to recognize and emphasize our incapacities, while remaining tolerant of social forms that confine themselves to external constraint – hence Luther's resistance to scholastic philosophy, coupled with an endorsement of general social relations like marriage and principates. The point is, regardless of the extent to which they understand humans to be morally capacitated, religions necessarily respond to their members as so capacitated by way of educating them. Scholars need to

attend both to what religions *claim* about moral capacities and to how, socially-materially speaking, they *treat* their members in educational practices.

*

While Dewey endorses Rousseau's emphasis on the natural development of students' actual capacities, he rejects the latter's characterization of the social as necessarily corrupting. For Dewey, education fails not when it integrates students into some social environment, but when it integrates students into a social environment that fails to exercise their capacities meaningfully; and social environments fail to do this when their character is inappropriate to the broader world that students inhabit. Hence, successful education demands that schools be meaningfully world-responsive. In other words, education must prepare students for social life by exercising their capacities to be answerable to the realities of that life. For Dewey in twentieth-century America, this meant preparing students for democratic life, which he understands to be a life of "(r)esponsibility for the conduct of society and government" exercised by all citizens (Dewey 2008b, 398–399). Educational forms that emphasize the impartation of knowledge to passive students fail in this regard, as do forms that segregate training in useful labor from the liberal arts. In both cases, social class divisions persist pedagogically, whether hierarchically between teacher and students, or culturally between two tracks of students. Democracy demands a public-school system emphasizing active learning that is simultaneously socially useful and humanistic. In light of this, Dewey contends that school work should concentrate around *occupations*, cooperative activities that combine elements of both play and work. Properly done, occupations, rather than imparting knowledge, pose an engaging problem the difficulty of which students can experience, and thereby be motivated actively to solve. Occupations accomplish this insofar as they are organically related to social life, drawing their problems from the interaction between fundamental human concerns (food, shelter, etc.) and local industries and businesses. Ultimately, occupations effect the combination of social control and freedom requisite for democratic living. On the one hand, social control is intrinsic to occupations because their cooperative-active character entails norms of behavior for participants. At the same time, this social control evokes individual freedom, understood as the exercise of intelligence for the purpose of making one's distinct contribution to a shared endeavor – stated otherwise, freedom means taking responsibility for one's social participation. In this way, schools should be microcosms of their democratic communities, socializing students into occupations that will exercise the capacities requisite for democratic responsibility.

Obviously, Dewey's pedagogy is more institution-based than Rousseau's. This is partly a function of their positions in their respective sociohistorical contexts, but also essential is the influence of Darwinian evolutionary theory on Dewey. Because he understands dualisms in thought to derive from undemocratic social divisions, Dewey needs a non-dualistic form of thinking. Darwin's account of organismal change as occurring through the interaction between organism and environment provides this, leading Dewey to articulate a notion of *experience* central to his educational thought: experience is the temporal interaction between individual students and whatever constitutes their environment at particular times. In turn, education is the "intelligently directed development of the possibilities inherent in ordinary experience," which is, "the actual life-experience of some individual" (Dewey 2008a, 61). The environment that students interact with outside of school and will interact with after schooling is an institutional environment; this is why truly educational occupations engage students presently while preparing

them for future social responsibilities. The teacher's role is to aid the intelligent development of students' experiential capacities, ensuring that the "trial-and-error" character of ordinary experience becomes reflectively sophisticated into rational thought, the exercise of which, as noted above, renders students free. This demands that the teacher's role be that of participant-guide: she leads the occupations because of her own wider experience, but internally so by arranging the school environment – that is, by planning the occupations – to be conducive for the development of student experience. This is complex, because the teacher is responsible not merely for the class's experience, but for the experience of each individual student; in order for occupations to evoke the *distinct* contribution of each student, the teacher must know each student's particular experience and then find a social form that engages them all, together. Dewey's pedagogical ideal here is the experimental cooperation that characterizes scientific inquiry: "Science is experience becoming rational" (Dewey 2008c, 233). The idea is not that the sciences become the preeminent bodies of knowledge, but rather that the process of utilizing past experience to solve novel problems be deployed in all disciplines. Hence, the school serves as a microcosm of the democratic community, rendering students responsible citizens, through participation in the process of scientific inquiry.

For Dewey, education is world-responsive by fitting students into the social world that is the broader environment containing their school environment. Insofar as religions educate their members within a broader social environment, they must make decisions about how to fit within that environment. Within the Christian traditions, this concern connects to the fault line mentioned above, that between Christian communities and the surrounding world. Early apologists like Justin Martyr claimed the same intellectual and ethical heritage as his non-Christian Roman interlocutors as part of a larger argument that Christians make exemplary imperial citizens. More recently, Rudolf Bultmann proposes a method of biblical interpretation – demythologization – that makes the biblical text amenable to a scientific world-view, by shearing it of its primitive improbabilities (e.g. virgin birth, Jesus's miracle-working) so that it's a better medium for the reader's existential encounter with God. While these are two examples of more positive connections between religious communities and their broader social environments, and to that extent rather Deweyan, world-responsiveness as a category is neutral between world-rejection than world-acceptance. The history of Christian traditions is replete with communities that sought somehow to withdraw or clearly differentiate themselves from the broader social environment; at the same time, insofar as broader social environments are complex phenomena, such communities often remain connected in hidden ways. While monastic communities separated themselves from ancient urban life, their spiritual life betrays sympathies with Stoic and Epicurean schools of thought that also took issue with such life. And while Stanley Hauerwas has formed a generation of Christian ethicists to focus on the distinctive narratives and social lives of particular Christian communities rather than make the sort of concession Bultmann does, Hauerwas' theoretical articulation of this stance betrays sympathies with certain postmodern and social constructionist forms of thought which are part of the common sense of our times. Ultimately, world-responsiveness is a complex affair for religious communities, and the ethical education undertaken by them is likely to bear multiple forms of world-responsiveness, based on the perspective scholars' take on them.

*

Parallel to what Rousseau claims about children, Freire argues that cultural groups have their own ways of engaging the world, which education must respect. Freire's context is adult education in Brazil,

particularly literacy programs in which members of a socially and economically privileged class taught students from much poorer communities. This class disparity is exacerbated by a form of education that Freire calls *banking education*: students are understood as passive, empty containers that teachers fill with deposits of knowledge. Banking education is fundamentally oppressive as a form of sociocultural imposition: because it denies that students have a worthwhile way of engaging the world, inevitably the teacher will “deposit knowledge” according to his own way of engaging the world, and thereby “deposit” that way too. Once we recognize that students *do* have their own way of engaging the world, even if they can’t read and write, and appreciate that the point of education is to help students articulate *their* way, then pedagogy changes in essence. The teacher’s first task should be to join the students in a “quest for the curriculum” (Freire 2005, 139); instead of focusing on the teacher’s deposits, together they articulate a critical representation of what’s significant to the students, which Freire calls their *meaningful the-matics*, the structure of themes through which they engage the world. This is quite involved, including a dialogical form of anthropological fieldwork, whose results are tested in student study groups, and then analyzed once again: “The thematics which have come from the people return to them – not as contents to be deposited, but as problems to be solved” (Freire 2000, 123). We could say that now the plan for education is set, but notice that the focus is on the students’ way of engaging the world, understood as something inherently problematic. The idea is that the quest for the curriculum has provided the students a more critical perspective on their way of engaging the world, which enables them to see that that way is transformable. In this sense, planning education around the students’ way of engaging the world isn’t a matter of cultural celebration, but rather cultural discovery and investigation. Such education is about empowering students, by helping them recognize and exercise the power inherent in engaging the world in a particular way, in taking a critical stance on that way, and in transforming it. Freire calls this empowerment *conscientization* (Freire 1985a, b), the becoming-critical of students’ consciousness.

Buoying Freire’s pedagogy of empowerment is an anthropology focused on praxis and dialogue. According to this, all humans have an ontological-historical vocation to humanize themselves and their worlds. Unlike animals, who are submerged within the natural world and thereby unable to know it, humans emerge from the world, which enables us to discern it objectively as a totality and then intervene with consequence. We humanize the world insofar as we transform the natural world into so many cultural ways of engaging it. Language is key: when humans name, or linguistically express, the world, we present it as a problematic reality that requires transformation. What this reveals is that humans are creatures of *praxis*, by which Freire means that our reflective knowledge and transformative action are interactively entangled: to know something is the beginning of the process of changing it.

Just as fundamentally, we’re creatures of *dialogue*. Because our ontological-historical vocation is to humanize the world, we each have the “primordial” right to exercise praxis. Hence, humanization demands that dialogue – “the encounter between men [*sic*], meditated by the world, in order to name [and therefore, *change*] the world” – be the paradigmatically human relation (Freire 2000, 88). Notice that the function of the world is to mediate dialogue, to be the shared reality upon which humans are exercising praxis together. This means that the world is less an object of settled knowledge than of constant transformation: once we transform the natural world into so many cultural ways of engaging it, those ways become the world we inhabit and thus the shared reality that incites transformation. In this respect, humanization means the dialogical sharing of the human power of praxis for the purpose of ceaseless cultural transformation. In light of this anthropology, the fundamental problem with banking

education is that it dehumanizes both students and teachers, by denying both the dialogical exercise of praxis; which is to say, it disempowers us by denying us our properly human power. Abetting this dynamic is an approach to the world – to our various cultural ways of engaging reality – as static, fixed entities, immune to changes wrought by human power. Thus, in the face of the sociocultural oppression that attends banking education, an education of empowerment means the recovery of our vocation of humanization.

At its starkest level, as expressed in Freire, power-responsiveness means either recognizing and cultivating others' power, or denying it; though these are extremes between which may occur various forms of power-distribution. Insofar as religious communities have their own internal power dynamics – between clergy and laity, as well as among the clergy and among the laity – and occupy power dynamics within the wider social world in which they participate, they find themselves as both the agents and patients of power dynamics, wittingly and not. Freire's own work is connected to the rise of liberation theology in base religious communities throughout South America. Liberation theology arises from the religious perspective of poor communities marginalized in both society and official religious institutions, insisting on the authority of this perspective and thereby critiquing those power dynamics that silence this perspective. This entails not only a pedagogy of empowerment within poor communities, but also social-analytic attention to the church's complicity in wider sociohistorical oppressive power dynamics, which often leads to alliances with non-religious forms of thought and social movements that also combat oppression (e.g. Marxism, for early liberation theology). Once again, we see the importance of the fault line between Christian communities and the surrounding world. The Protestant Reformation, perhaps the best known historical fracture within the history of Christian traditions, centered on disputes about internal power dynamics – in particular, the kinds and extent of power that clergy exercised over laity – but was also implicated in the wider power dynamics of the emerging nation states insofar as particular reformers were supported by princes. Meanwhile, resonant with Freire's literacy work, the reformers depended on the printing press and vernacular translations of the Bible as a way of supporting the educational empowerment of the laity as they disputed what they understood to be overreaching by church authority. Both of these movements within the history of Christian traditions appealed to scripture and early Christian history as providing authentically Christian models of empowerment and power-distribution, meant to work as critical leverage against contemporary power dynamics. Scholars ought to attend to how the internal and external power dynamics of religious communities are entangled, both from a social analysis perspective and from the various perspectives of those within the religious communities caught up with their power struggles.

*

Hopefully, the above has whetted an appetite for progressive education theory among scholars interested in the intersection of education and religious ethics. To reiterate, while this theory is admittedly normative and so likely entails certain ethical criticisms of religious forms of education, its fundamental and reflexive character means that it illumines pedagogical realities that all forms of education respond to: students with their capacities and dispositions; the surrounding social world that impinges on educational practices; and the power dynamics both within and without such practices. The task for scholars of religious ethics is to map their particular traditions and topics amidst these realities.

CHAPTER 130

Law

M. Christian Green

Law exists in intricate connection with systems of religious ethics in many ways. Both fields are normative and axiological, seeking prescriptively and proscriptively to channel divine norms and human values into actions and practices. Both fields embrace complex hermeneutics, using literary, historical, social scientific, and other methods to determine and shape notions of the good life in both philosophical, theological, and political terms. But perhaps even more than in texts and traditions, symbols and rituals, ethics is where religion becomes most powerful – and most controversial – especially where it intersects with law and morality around issues such as life, death, sex, war, money, religious freedom, human rights, and other moral issues. The fundamental concern, in both law and religion, to justify, witness, and attest to the grounding of human values and to certain truths about the human condition, especially in relation to the divine, also makes law an important terrain for comparative religious ethics inquiries in our time of many truths and “many worlds” (Schweiker 2004).

The Thomistic Synthesis, Natural Law, and Virtue Ethics

Concerns for law have an ancient pedigree in Western philosophical, theological, and political ethics, extending at least as far back as Plato’s reflections on justice in the *Republic* and its more authoritarian transmutation in the *Laws*, two of his best-known dialogues on these themes (Plato, trans. Bloom 2016; Plato, trans. Saunders 2005). Plato’s reflections on the lessons of his teacher Socrates in the dialogues would be transformed again by his own student Aristotle, who provided a more sociological and political set of reflections on legal and ethical themes (Aristotle, trans. Ross 1954; Aristotle, trans. Jowett 2000). Perhaps the earliest systematic exposition of the role of law in the Christian tradition of theological ethics is that offered by St. Thomas Aquinas in the *Summa Theologica* (Aquinas, trans. Fathers of the English Dominican Province 1948). In fact, Aquinas was the leading translator of Aristotle into the Western philosophical tradition coming out of Europe’s “Dark Ages,” a time when Aristotle was being read primarily by Muslim and Jewish scholars (Menocal 2003), who were the main keepers and preservers of Western philosophy at the time.

In the *Summa Theologica*, having described human actions passions, habits, vices, and sins earlier in his argument, Aquinas makes important connections between the law and the possibilities for both human law and divine grace. In so doing, Aquinas highlights a number of distinctions that continue to serve as

evaluative and adjudicative criteria in law and ethics today. Is a human action voluntary or involuntary? What effects do intention, choice, consent, and will have in determining our actions? Are there degrees of vice or sin – concupiscible and irascible, venal and mortal, active and passive – that should guide our evaluations of human actions and moral frailties? All of these considerations are reflected in notions of law and ethics in Christianity and numerous other religious and legal systems around the world.

While distinctively Christian definition in nature and purpose, the Thomistic account of law shares many features with other religious systems, most obviously Judaism and Islam. Aquinas tells us that law is not merely a matter of divine command, but also an exercise in practical reason – since the law cannot command us without our reasonable comprehension through conscience and assent. With Aristotle, Aquinas maintained that law related human acts teleologically toward a last end of happiness, described as a “perfect community” of “universal happiness” in which “every law is ordained to the common good” (*Summa Theologica* I–II, Q 90, a 2). These observations would be especially evocative for the later Christian theological ethicist Martin Luther King, Jr., who drew upon Aquinas in drafting his famous “Letter from a Birmingham Jail” (King 1994) in which King called for civil rights under law and the creation of a “beloved community” in which the universality of the law’s ordination toward happiness would, in fact, include all. Indeed, Aquinas’s formulation of the law in this perfectible and common good-oriented way would be immensely important not only for theological ethics, but also for political ethics and social justice in the Christian tradition.

Another aspect of Aquinas’s concept of law would leave an equally deep footprint in Christian theological ethics – namely, his division of law into four kinds: eternal, natural, human, and divine. Aquinas describes eternal law as the law that has always existed in God’s rule of the world through divine providence and divine reason. The eternal law operates as a theological and metaphysical condition for the possibility of law itself. Natural law, in turn is a sort of human “partaking” or participation in the eternal law, reflecting the way in which the eternal law is “imprinted” in our natural inclinations in ways should that ideally and ultimately lead to justice. These natural inclinations are not all that different from the laws governing animal behavior – a connection that has at times drawn attention of sociobiologists and evolutionary psychologists seeking the roots of human behavior, though often more reductively and deterministically than Christian doctrines of grace and free will might admit (Browning 2009, chs. 3 and 6). Even so, this biological dimension of the natural law can be the basis for constructive engagement of religious ethics with questions such as animal rights, environmental ethics, and justice toward the non-human world, all of which have become important concerns in law and ethics today as humanity confronts the effects and the limits of the Anthropocene era (Deane-Drummond, Bergman, and Vogt 2017).

Natural law has also been conceived in Western philosophy and Christian theology as an imprint or spark of the divine within the human person, an idea that dates back to the Greek and Roman Stoics, including the naturalistic Aristotelian philosophy to which Aquinas was drawn. For a concise discussion of natural law, the New Natural Law movement exemplified by Finnis and Grisez, and more recent developments (see Lloyd 2016b). This conception of natural law and its implications for human character and action is also the heart of the virtue ethics, an area that has been a particular focus of Catholic moral theology (Duke and George 2017; Finnis 1980; George 1998), but which is increasingly drawing the attention of Protestant ethicists, and ethics from other perspectives and religious traditions (Biggar and Black 2000; Boyd 2007; Emon, Levering, and Novak 2015; Lloyd 2016a, 2016b; Van Drunen 2014).

In light of Aquinas's overall project of reconciling law and virtue, it would appear that natural law and virtue ethics are importantly related, but they have also been distinguished from each other in various ways. Given the sometimes amoral or even immoral impulses of human nature, it rests with virtue to countermand these implications and their effects. Virtue ethics focuses on the cultivation of habits and virtues and their role in the formation of character as a means toward the moral life. There are, in turn, important connections to be made between virtue ethics and the "uses of law" that would later be articulated in robust form by Protestant Reformation theologians Martin Luther and John Calvin, particularly the third or pedagogical use of law (see also pt. I in Kaveny 2016a). In the early days of the Reformation, Protestant theologians were highly skeptical of the idea of natural law, finding human nature to be prone to deception, perhaps entirely depraved. But the three uses of law that would become a focus of Protestant theology – namely, (1) a *theological*, or spiritual, use for the forensic identification of sin, (2) a *civil* use for the reining in of sin through human laws, and particularly (3) a *pedagogical* use of guiding individuals and society to virtue (Witte and Arthur 1994) – suggest the potential for law and ethics to be harnessed in ways that might allow humans to overcome some of their more pernicious tendencies, though perhaps not the entirety of their depravity.

These important later Protestant extrapolations aside, when it comes to what the natural law entails or requires, Aquinas later specifies its primary precepts as being ordained toward: (1) *preservation* of life from forces that would take it prematurely or unjustly, (2) *perpetuation* of life, primarily through reproduction and the education of offspring, and (3) an inclination to "know the *truth* about God, and to live in *society*." The first two precepts have given rise to robust ethics of life and death in the Christian ethical tradition, involving such matters as abortion, euthanasia, sexuality, and procreation. These issues are often controversial, as they go to the heart of intimate choices and relations that individuals make in their embodied lives – and people tend to be quite concerned when people make decisions that affect the life, liberty, and treatment of their bodies. But the third precept is particularly significant for what it says about the larger body politic, particularly as it seems to embody an ethic of religious pluralism, or at least a sense that we must come up with some way in diverse and sometimes conflicted societies to reconcile the truth claims we make about religion with the importance of the common good. Catholic moral theologian and law and religion scholar Cathleen Kaveny has written eloquently of this problem in a series of articles, and now books, on the challenges posed by America's frequent "culture wars" (Kaveny 2012, 2016b, 2016c, 2017).

Human Law, the *Euthyphro* Dilemma, and the Problem of Legal Positivism

Human laws, or the laws that human leaders make to govern society, are a key means by which people are to be trained and their natural inclinations directed toward individual and common goods. But the human factor also carries the risk of straying too far from its eternal and natural law roots, because of the human tendency toward pride, self-deception, and other sins. The problem of relating human and divine law, Aquinas's third and fourth formulations, is reflected the *Euthyphro* dilemma set forth in the Platonic dialogues, as well as the more recent skepticism of the normative value of law reflected in Michel Foucault regarding the power of the law to discipline and normalize.

In the *Euthyphro* (Plato, trans. Grube and Cooper 2002), Socrates and Euthyphro address the nature of piety and the question: Is the pious loved by the gods because it is pious, or whether it is pious because it is loved by the gods? In theistic ethics, this can be seen as presenting a moral and legal question: Is what is good commanded by God because it is good, or is it good because God commands it? In more recent times, the Euthyphro dilemma also seems to be suggested in a key series of legal and jurisprudential debates over theories of natural law and legal positivism, as well as the later movement of legal realism, which hinged crucially on the relationship of law to morality and religion. The debates emerged in reaction to the nineteenth-century British legal theorist John Austin's theory of legal positivism, which opposed natural law approaches. Consistent with the tenor of the time to defend law as a scientific discipline and drawing heavily on the utilitarian philosophy of Jeremy Bentham, Austin argued against any connection between law and morality and argued for the empirical and value-free study of law. Law, in his view, consisted of commands of the sovereign over individuals, backed up with threats of punishment for noncompliance to the end of the greatest happiness of society (Austin 1998). In such a system, the will of the sovereign essentially substitutes for, or supplants, the will of the divine. At its worst, this version of human law risked becoming the rather dystopian and Benthamesque panopticon version of law to which Foucault would draw attention in the late twentieth century (Foucault 1977).

But before that, Austinian legal positivism would be perhaps most definitively critiqued by the notable twentieth-century legal theorist H. L. A. Hart. Hart was a legal positivist, but he challenged Austin's idea of law as the pure will of the sovereign. On the positivist side, the law was, in Hart's view, a historically contingent social construction of particular societies embodied and actualized in systematic forms of social control administered by institutions (Hart 2012). While not accepting the principles of Thomist natural law, Hart was more solicitous of the idea of some connections between law and morality. On the one hand, he argued that, "it cannot seriously be disputed that the development of law, at all times and places, has in fact been profoundly influenced by the conventional morality and the ideals of particular social groups, and also by forms of enlightened moral criticism urged by individuals, whose moral horizon has transcended the morality currently accepted" (Hart 2012, 185). On the other hand he also maintained that "it is possible to take this truth illicitly, as a warrant for a different proposition: namely that a legal system *must* exhibit some specific conformity with morality or justice, or *must* rest on a widely diffused convention that there is a moral obligation to obey it" (italics in original, 185). Legal positivism, as Hart defined it, meant the "simple contention that it is in no sense a necessary truth that law reproduce or satisfy certain demands of morality, though in fact they have often done so" (185–186).

Hart rejected the natural law conviction "that there are certain principles of human conduct, awaiting discovery by human reason, with which man-made law must conform if it is to be valid," but he was more solicitous of the idea that legal theory should take into account "the ways in which legal validity is connected with moral value" (186). Hart's rejection of the specific link between law and morality, especially as contemplated in the natural law framework, was evident in his famous debate with British jurist, Lord Devlin, over the Wolfenden Report recommending the decriminalization of homosexuality in Britain. In that debate, Lord Devlin challenged the report on grounds of the need to defend public morality under utilitarian philosopher John Stuart Mill's harm principle; while Hart defended the recommendations and argued against the use of the law to enforce morality. In another widely noted debate with legal philosopher Lon Fuller, Hart again defended the positivist separation of law and morality against Fuller's argument for morality as the source of the law's binding power (Fuller 1969). Again, in the Hart–Fuller debate there were shades of the Euthyphro dilemma in the question whether

law could compel action through sheer force of the perceived rightness, goodness, and justice, or whether the law needed the imprimatur or compulsory power of social convention or an even higher and more divine source (Cane 2010).

As an outgrowth of the nineteenth-century movement to redefine law as an objective and value-free science, the early twentieth century also brought the rise, particularly on the American jurisprudential scene, of legal realism, a theoretical movement that justified and validated the law and its systems (Fisher, Horwitz, and Reed 1993; Kalman 2011; Zaremby 2015). The value-free approach distinguished legal realism from natural law theory. Legal realism's movement away from linguistic interpretations of the law in the direction of a more sociological and anthropological approach, admitting a range of social, political, economic, and other non-legal factors to its analysis, set it apart from legal positivism. Although legal realism did consider the relation of law to religion and religious institutions, along with many other social, political, economic, and other factors, as part of the sociology of law field to which it gave rise, it still insisted, with legal positivism, on the autonomy of law from these other fields at the normative and axiological level. Indeed, among other main themes, legal realism is noted for its insistence on the instrumental use of the law to achieve social rather than moral ends and a sense that the legal and moral dimensions of law should be kept separate. Overall, the legal realist approach was a reaction against the formalist approach to law that dominated American jurisprudence in the nineteenth century, when judges were thought not to make law, but to deduce principles of law from formal principles that were clear, certain, and unchanging – in other words, nearly divine. Instead, legal realism advocated a wide-ranging inductive approach to law, such that the law could end up turning, as leading legal realist Judge Jerome Frank quipped, on “whatever the judge had for breakfast.” With legal realism, in the terms of Plato's *Euthyphro*, the law became a lot more human and much less divine.

Legal and Religious Pluralism Today

Toward the end of the twentieth century, and particularly into the twenty-first century, when rapid global travel and even more rapid global communications have revealed the “many worlds” that inhabit our one world and made these worlds known to each other, there has also been a resurgence of religion around the world that has made itself felt in the fields of law and religious ethics. With greater attention to the relationship between law and religion in Islam, as well as in Hindu and Buddhist traditions in South and Southeast Asia and the Confucian and Daoist cultures of East Asia (e.g. Bell and Chaibong 2003; Katz 2009; Lubin, Davis, and Krishnan 2010; Redwood French and Nathan 2014), study of the relationship between law and religion has become globalized. New attention has also been given to the phenomenon of “legal pluralism,” that is, the coexistence of religious and secular systems of law around the world (e.g. Emon 2014; Helfand 2015; Sandberg 2015). Some of these contexts of legal pluralism reflect the legacy of colonial practices that left the areas of marriage, family, inheritance, and other areas falling into the category of “personal law” in the hands of indigenous religious communities. Some of it has to do with diaspora and migratory populations to Europe and North America from Muslim, Hindu, Buddhist, and other parts of the world bringing their legal and religious traditions with them. These systems of religious law sometimes pose a challenge to the secularism that prevails in much of the West, in which some systems have been able to accommodate religious legal norms and institutions more readily than others.

The challenge for law and religious ethics is to inquire into how systems of religious and secular law can coexist and what effect this has on the systems themselves. In parts of Africa, for example, where independence constitutions of the mid-twentieth century have recently given way to new constitutional formulations in many nations, principles of religious freedom have been enshrined in law. But given the way in which the power to *name* is the power to *norm*, issues and conflicts previously cast as ethnic, socioeconomic, or grounded in access to resources are in some cases being redefined as religious in nature, prompting calls for secularism of various sorts to quell the violence. Moreover, in Africa and other parts of the world, indigenous religions, with increased protection under international law, are demanding recognition and rights. So, despite the calls for separation of law from religion and morality in many legal theories of the twentieth century, the twenty-first century now sees law and religion increasingly intertwined in many parts of the world. The relationship between law and morality that was the theoretical focus of the twentieth century seems to be morphing into a global question of how to balance secularism and religion with both realism and globalism manifest in the new legal realism movement (Stewart Macaulay and Mitchell 2016; Klug and Engle Merry 2016).

The Significance of Law for Religious Ethics

In departing from Thomas Aquinas's four-part division of the law into eternal, natural, human, and divine law, this entry has focused significant attention on natural and human law, despite the metaphysical significance of the eternal law and the ritual significance of observance of divine law and its commands. From the perspective of a religious ethics that is not only philosophical and theological, but also grounded in the political and social dimensions, ethics is where the tenets and teachings of religious traditions are lived out through interpretation, application, and practice. This can be taken as indication of the centrality of ethics in religion and religious studies – but it can also be a source of controversy.

The Power of Normative Structures

This entry is situated in this volume under the category of structures and systems. Indeed, both law and religion play fundamental roles defining norms and values within their own fields and in the wider society. In our current context of postmodernity, there are real questions about whether amid the proliferation of truth claims there can be any common values that exert normative force. This kind of skepticism regarding the relationship between has also dominated legal realist movements in a way that has sometimes bolstered hard forms of legal positivism in which the law really does seem to be a matter of “whatever the judge had for lunch.” And yet, the life-and-death questions of sex, death, war, and others that fall into the category of ethics demand adjudication through normative structures. The ongoing ethical challenge is to see that those structures do justice and are directed at the common good.

Hermeneutics and Horizons

Law and religion both require and provide norms in order to fulfill their axiological functions, but these are not “cookie cutter” commands that demand assent and obedience. Both law and religion

have developed sophisticated fields of interpretation, or hermeneutics, devoted to testing extant norms against the circumstances of today – reaffirming those values where possible, but also at times importantly modifying these norms in the face of current events and what justice demands in response. Hermeneutical interpretation is also a key feature that keeps both law and religion in touch with literary, historical, social science, and other tools and methodologies – the great insight of the legal realism movement – for understanding society’s ever-evolving norms and values, bringing classic traditions into dialogue with current realities and ones still emerging on the horizon (for two influential theories of hermeneutics and its value for moral and ethical inquiry, see Gadamer [1991] and Ricoeur [1981]).

Law is Neither Autonomous Nor Omnipotent

Finally, though law has great power in advanced, regulatory societies, it is not autonomous from other social sectors and forces – nor is it omnipotent. In other words, it is not divine. Religious groups and religious ethics have played important roles at home and abroad in shaping the law on marriage and family, crime and punishment, civil and human rights, and many other areas. Moreover, while law is often retrospective and retroactive in its response to social phenomena, religion and religious traditions often have greater latitude to be prospective and prophetic in their engagement with law and society. In contexts where the law is perceived as a living and almost organic system, as opposed to an originalist textual construction operating as the “dead hand of the past,” this mutual engagement of law and religion around issues of ethics insures ongoing development along the arc of justice.

CHAPTER 131

Religious Non-Governmental Organizations

Jeffrey Haynes

Today, there are numerous religious non-governmental organizations (RNGOs). Many RNGOs have social, socioeconomic, and/or political concerns, and this means that they often engage with ethical and moral issues. Numbers of RNGOs have grown in recent years and many focus their activities at the United Nations (UN). The result is increased intra- and interreligious dialogue on many justice and human rights issues with ethical and moral dimensions, including: women's sexual and reproductive health rights, improving development outcomes for the poorest people in the Global South, and fighting religious defamation (Haynes 2014). At the same time, however, expanded involvement of faith in international relations can also serve to encourage interreligious competition or friction between "liberal" and "conservative" RNGOs (Bob 2013).

To explain the increasing involvement of RNGOs in international relations, this entry examines RNGOs at the UN. The UN is the world's foremost intergovernmental organization (IGO), with 193 member states. It is also the place where around 4,000 non-governmental organizations (NGOs) have registered their involvement with the UN's Economic and Social Council (ECOSOC), and among them are circa 400 RNGOs, some 10 percent of the total. The context of RNGO involvement at the UN is the post-Cold War international environment, a novel, postsecular milieu, characterized by globalization and the significant "return" of religion to international relations. Globalization is the context for current debates and discussions at the UN, many with ethical and moral dimensions. The UN is the world's foremost forum where thousands of secular NGOs and hundreds of RNGOs have a place to be heard and an opportunity to try to influence global governance.

It is important to understand why growing numbers of RNGOs today have a significant presence at the UN. On the one hand, today there is now "more" religion in international relations compared to, for example, the Cold War decades. On the other hand, we can also see expansion of RNGO significance in the context of increasing presence and influence at the UN more generally for transnational non-state actors. Compared to secular NGOs, however, a significant RNGO presence at the UN is a recent occurrence, only developing since the 1990s. Secular NGOs, on the other hand, have built their presence at the UN since its founding in 1945. Their significance can be measured by the fact that today many "have access to intergovernmental meetings, present written statements, make speeches, and lobby for specific texts to be adopted" (Willets 2006, 305). Initially, however, growth in NGO numbers was slow: over the initial two-and-a-half decades, "fewer than 400 NGOs were registered with the UN, and at any particular meeting only a few of these were active, mainly behind the scenes" (Willets 2006, 305). It was not until

the 1970s, in the context of a series of major UN conferences – on trade and development, human rights, women, and the natural environment – that there was major growth in numbers of NGOs active at the UN. This not only led to more secular NGOs active at the UN, but also helped expand “the range of issues addressed, the types of activities undertaken, the amount of media coverage, and the extent of influence achieved” (Willets 2006, 305). In addition, Martens argues, institutionally the UN began to realize the benefits of working with NGOs and consequently sought to strengthen relations with them, opening up “for more interaction with NGOs and creat[ing] diverse ways to bring them into its system” (Martens 2006, 691–692). Yet, while NGOs are strongly linked to international UN-organized conferences and agencies, such as ECOSOC, like RNGOs they have no formal status within the General Assembly or the Security Council.

The 1990s and 2000s saw significant growth in numbers of RNGOs at the UN. Expansion in their numbers was consequential to increased awareness of global social, economic, and political issues, including: (1) changing international conditions linked to the end of the Cold War and the dissolution of the Soviet Union, (2) globalization, (3) emergence of postsecular international relations, and (4) demands for improved global governance, where pressing demands for improved human rights and justice could be addressed. Because such issues were also ethical and moral problems, RNGOs often became involved in connected debates at the UN.

Transnational networks are very often formed, in part, of RNGOs. What, if anything, is unique or puzzling about them compared to cross-border networks of secular NGOs? Of course, there is nothing new to the claim that transnational networks will try to use whatever influence they can to achieve their ends. Research into secular transnational networks consistently notes the importance of ideas, norms, and values in encouraging people to act in one way rather than another, which Nye (2004) conceptualizes as “soft power.” Soft power is a crucial component of transnational non-state actors’ attempts to influence international relations, including RNGOs. However, such influence wielding is not restricted to secular cross-border entities. Transnational RNGOs also attempt to use any soft power they may have to help them achieve their objectives. It is not hard to see why this should be the case: such actors typically lack hard (economic and/or military) power and so must rely on other means of wielding influence. In doing so, RNGOs are behaving precisely as the general literature on secular, transnational, non-state actors suggests.

Growth in RNGO numbers was connected to the holding of several high-profile UN conferences during the 1990s that collectively focused on justice and human rights concerns. This served to stimulate increasing numbers of RNGOs to engage regularly with each other and with an array of secular actors at the UN and elsewhere. Yet, although the publicity and sense of engagement channeled by these UN conferences were very important, they were not on their own sufficient to explain growing RNGO focus on the UN. We also need to take in account three further other factors. First, as already mentioned, expanded RNGO involvement at the UN was linked to post-Cold War globalization, which generally encouraged cross-border campaigns on various justice and human rights concerns (Haynes 2005). Second, there was growing concern in the UN with including “civil society” representatives in the UN’s deliberations. Many governments and several UN agencies, including the World Bank and the International Monetary Fund, were anxious to dispel the notion that the UN was essentially a top-down, government- and elite-dominated entity, which exhibited scant concern with or had time for bottom-up initiatives and concerns. Third, the UN introduced and developed a growing number of procedures and arrangements with the aim of “officially integrat[ing] NGOs and their activities into the operations of the UN,” including in the case of RNGOs’ formal registration with ECOSOC (Martens 2006, 692). The overall result of these developments was that not only secular transnational actors and networks, but also

RNGOs registered with ECOSOC, found it possible to embed themselves in the structures of the UN, to become parts of debates and disputes and, overall, and, as a result, start to play important roles in global policy formation and dissemination, often as components of ideologically congruent coalitions, featuring both state and non-state entities with shared goals.

Secular NGOs have been part of some national delegations at the UN on globally important issues, such as the climate emergency. While RNGOs have not managed to achieve this level of involvement with states, some RNGOs, for example World Vision, have significant involvement in UN efforts to achieve the sustainable development goals by 2030. This suggests that some RNGOs, including World Vision, have recently become influential at the UN, albeit without the right to be involved in deliberations of the UN “big hitters:” the Security Council and the General Assembly. Beittinger-Lee (2017, 137) identifies three modes of interaction – “immersed,” “integrated,” and “initiating” – practiced by RNGOs at the UN in New York. What characterizes each is “the degree of distance or closeness” which an RNGO has with the official UN procedures and processes. First, “immersed” involvement occurs when the UN definitively sets the parameters of RNGO engagement and the latter has no effective ability to change the arrangement in their favor. As a result, when a RNGO becomes involved in the UN via formal sessions and meetings, they are totally “immersed” in that environment and, if they want to be part of the institutional arrangement, they must completely comply with extant rules and restrictions. Second, RNGOs may engage in an “integrated” context where they function as partners alongside other stakeholders such as UN agencies or member states and as a result have a certain amount of ability to mold the agenda. Third, “initiating” involvement comes about when RNGOs target what they do directly to the public, other non-state or state actors, such as UN member states, the UN secretariat, or other institutional entities or employees of UN agencies.

Overall, what we observe is a growing RNGO presence at the UN and in some cases increased willingness on the part of the UN to engage with issues of relevance to RNGOs, including ethical and moral issues connected to human rights and justice concerns. Yet, it is not clear overall how the UN regards RNGOs. On the one hand, the UN seeks to be neutral in relation to religion-based voices, arguments, and campaigns. What this implies is that the UN aims to provide a level playing field for religious actors, compared to secular ones, but does not favor them nor necessarily endorse their (religion-based) arguments and objectives. In his account of the recent clashes between the Christian right and liberal and left-leaning groups at the UN, Bob (2013, 194) maintains that “transnational processes in themselves are neutral” toward different ideologies and religions.

Another view disputes the claim of UN neutrality to faith-based voices. That is, while it is agreed that RNGOs have undeniably increased their presence within the UN system, this does not mean a level playing field; instead, faith-based agendas at the UN do not necessarily find increased success, not least because many governments are wary of or hostile to RNGOs and are unwilling to treat them as legitimate players at the UN. Banchoff (2008, 290) argues that RNGOs’ failure to achieve their objectives in relation to a mooted anticloning ban at the UN “illustrate[s] both the importance of religious actors in world politics and the limits of their influence.” Attributing this failure to state-centrism at the UN, Banchoff contends that “[t]he norm of national sovereignty, institutionalized within the United Nations itself, framed the terms of the debate and contributed to the outcome: a toothless and ambiguous declaration with no practical implications for the future worldwide trajectory of stem cell and cloning research” (Banchoff 2008, 290). What this means is that faith-based claims based on faith-based arguments are fundamentally at odds with the long-term adhesion of the UN to the superiority

of states and their associated sovereignty. However, as Kayaoglu (2014, 62) notes, while this theory is not inherently implausible, it is clear that “the norm of national sovereignty has not prevented the United Nations from pushing for other types of prohibition regimes or human rights norms.” As result, “national sovereignty alone does not suffice to explain the ineffectiveness of religious voices within the UN system.”

Types of RNGOs at the UN: The Roman Catholic Church, the Organization of Islamic Cooperation, and the World Council of Churches

RNGOs are active in transnational civil society and involve themselves in various policy fields at the UN. However, at the UN RNGOs are not only focused on what might be called “religious concerns.” In addition, many become *de facto* social and/or political actors, working with “pragmatic” policies which they believe are more likely to succeed than when only religion-based arguments are employed. In other words, in order to increase chances of success, an RNGO’s faith-based principles may be pragmatically amended to include secular concerns and issues. As a result, the issue is *not* RNGOs versus the rest at the UN. Instead, it is to what extent and with what results do RNGOs find it expedient to work with non-faith actors, which share the former’s ideological proclivities, including both states and secular NGOs?

While a numerically large RNGO presence at the UN is less than three decades old, the UN has been active in global policy formation and dissemination since its founding over seven decades ago. Some RNGOs, including the Roman Catholic Church, the Organization of Islamic Cooperation (OIC), and the World Council of Churches (WCC), have been actively involved with the UN for decades. Since the UN’s founding, however, its constituent structures and processes have been dominated by states, which are almost invariably secular actors, seeking to make and implement decisions based on individual and collective *material* preferences and values, rather than faith-based ones. In this secular and material context, how might RNGOs expect to influence global policy? The UN engages with selected RNGOs out of a determination to appear more open and approachable to a variety of actors from civil society, both religion-based and secular. It does not necessarily imply that the UN is becoming more attuned to religious concerns *per se*. Instead, the issue is about working – and being seen to engage regularly – with civil society organizations, including RNGOs, in the context of what is sometimes described as the UN’s “democratic deficit” (Lehmann 2016).

At the UN, some RNGOs – including, the Roman Catholic Church, the OIC, and the WCC – claim to be the representatives of millions of people. The Holy See is the apostolic episcopal see of the bishop of Rome, known as the Pope. The Holy See is unique. It is both a RNGO and “the smallest sovereign state in the world; the see of the Pope (as the Bishop of Rome); home of the Pope and the central administration of the Roman Catholic Church; achieved independence from Italy in 1929” (Princeton University 2010). While the Holy See is not a RNGO *per se*, the Pope is the head of the Roman Catholic Church which claims 1.3 billion adherents. The Holy See has had permanent observer status at the UN since 1964, with the attendant right to attend all sessions of the General Assembly, the Security Council, and ECOSOC. In other words, the Holy See is not a “typical” RNGO but is instead a state overtly directed by religious principles. The Roman Catholic Church, on the other hand, is the

inspiration of many NGOs at the UN, which uniformly claim to be inspired by the teachings of the church. The OIC brings together 57 mainly Muslim-majority countries, with a combined population of hundreds of millions of people, and claims to be Muslims' global voice. The OIC was founded in 1969 and its relations with the UN began soon after. Like the Holy See, the OIC has permanent observer status at the UN. Finally, the WCC, the umbrella organization for around 350 non-Catholic churches with tens of millions of members, was founded in 1948. The WCC established relations with the UN soon after, principally through the Commission of the Churches on International Affairs. The WCC has maintained a constant and active presence at the UN for over fifty years, with UN headquarters liaison offices in New York and Geneva. In addition, consultative relations have further been established with virtually the whole family of UN-related agencies (including the UN Environment Program [UNEP], UN Development Program [UNDP], UN Conference on Trade and Development [UNCTAD], World Bank, and the World Health Organization [WHO]), although not with the state-dominated General Assembly or Security Council.

However, most RNGOs at the UN are not like the Roman Catholic Church, the OIC, or WCC in terms of their size, influence, and membership. Many of the approximately four hundred RNGOs registered with ECOSOC are relatively small and comparatively insignificant, without much individual diplomatic, financial, or ideological leverage. Some, such as World Vision, have impressive annual incomes, numbered in the billions of US dollars, while many others have incomes which are significantly smaller. A small RNGO with a trifling income may find it quite possible to become registered at the UN and thus have the right to engage in lobbying and other activities but in this case small is not beautiful. Typically, small means insignificant. As a result, many small and middling RNGOs are faced with a stark choice: engage in coalition-building, organize and work with partners, whether religion-based or secular, non-state or state, in order potentially to increase the likelihood of influence in debates and discussions on issues of importance to them at the UN in the context of global policy.

Put another way, most RNGOs which organize and work at the UN are *necessarily* strategic, goal-orientated actors, similar to other kinds of comparable organizational structures, including many of the thousands of secular NGOs registered at the UN. This is because, as Hopgood and Vinjamuri (2012, 38) explain, like secular NGOs, RNGOs typically adopt two main strategies at the UN: *alliance formation* and *specialization*. They adopt these tactics as part of a strategy to try and achieve their objectives, as they must compete in an oligopolistic NGO "market." The point is that although RNGOs are strongly motivated by their religious beliefs, they still face the same challenges of earthly existence which confront secular NGOs: securing often limited resources and maintaining donor loyalty. It is crucial for RNGOs to achieve consultative status with the UN's ECOSOC. This is because this confers a key validity, a virtual currency necessary both to build alliances and "seek financial support from other organizations within the field" (Bush 2005, 16). Religion-based organizations denied such legitimacy will find it very hard, even impossible, either to obtain support from or enter into formal arrangements with other actors, including human rights NGOs, foundations, and states. "This explains why even groups like 'Watchtower,' whose theological doctrines declare the United Nations to be an instrument of Satan, or the World Sikh Organization, many of whose members opposes affiliation with the UN for political reasons, have nonetheless held or aggressively sought consultative status with the UN" (Bush 2005, 16).

In addition to serving as a forum for debate over various social, socioeconomic, and political issues, typically related to human rights and justice concerns, the UN is an arena where religious identities

are legitimated, challenged, or otherwise negotiated. This contention can be illustrated by focusing on the array of RNGOs which can be counted under the banner of the Roman Catholic Church. On the one hand, there are “liberal” Catholic RNGOs, such as “Catholics for Choice” (CFC, founded in 1973 as “Catholics for a Free Choice”), which seeks both to defend women’s reproductive rights and to downgrade the Holy See’s position at the UN from permanent observer to NGO. Catholics for Choice describes its mission as “to shape and advance sexual and reproductive ethics that are based on justice, reflect a commitment to women’s well-being and respect and affirm the capacity of women and men to make moral decisions about their lives” (Catholics for Choice 2017, “About us”). Furthermore, an active voice is maintained by CFC both within the “United States and internationally to ensure that all people have access to safe and affordable reproductive health-care services and to infuse our core values into public policy, community life and Catholic social teaching and thinking,” writing that they “are part of the great majority who believes that Catholic teachings on conscience mean that every individual must follow his or her own conscience – and respect others’ right to do the same” (Catholics for Choice 2017, “About us”). Denounced by several Catholic bishops, CFC illustrates both a fundamental conflict and question over what it means to be Catholic, who gets to speak for Catholics, and how to define Catholic perspectives on human rights and justice issues. Some Catholic actors, for example the socially conservative Center for Family and Human Rights, have very different – albeit, “Catholic-inspired” – worldviews compared to CFC. Muslim RNGOs can also evince a conservative/liberal split. In this context, we can note the socially conservative Muslim World League, with close ties to the OIC, and the liberal and autonomous Cairo Institute for Human Rights Studies. These differing RNGOs highlight a more general truth among RNGOs: within most if not all extant faiths there are divisions between “liberal” and “conservative” viewpoints which are often captured in differing faith-based perspectives focused in competing RNGOs’ concerns. As a result, it is difficult or impossible to identify key generic characteristics of a “typical” Christian (Catholic, Protestant, or Orthodox), Islamic, or Jewish NGO. Similarly, it is very difficult to establish which – if any – RNGO is a definitive Christian, Islamic, or Jewish voice at the UN in relation to, *inter alia*, human rights and justice issues. In relation to the Roman Catholic Church, for example, Catholic identity is continually negotiated through competing claims from, on the one hand, the Holy See and, on the other, the various views articulated by Catholic NGOs, which are often focused at the UN. Negotiations over identity, beliefs, and goals are very important as they have the potential to influence relationships of power within as well as among religious groups. RNGOs with formal ties with the UN via accreditation with ECOSOC can have significant input into these types of negotiations. Those that lack ECOSOC-agreed access do not.

This emphasizes a wider point of great importance to the analysis presented in this entry. The issue is that there may well be more ideological variation among RNGOs which emanate from the same faith tradition than there is between faith-based and secular entities. RNGOs, even those from the same faith tradition, frequently compete with each other, at the UN and elsewhere, and individual RNGOs may push for policies from either liberal or conservative viewpoints. In other words, even when several RNGOs share a faith orientation it does not necessarily mean that they see the world as similar ideologically. The implications of this are profound, as differing ideological worldviews on, for example, justice and human rights issues, can mean that RNGOs from the same faith tradition actually perceive each other as ideological foes.

In order to pursue religious goals successfully at the UN, it makes sense for RNGOs to build alliances with a variety of actors, including other RNGOs, secular NGOs, and states. The main criterion for such liaisons is that of ideological compatibility: whether potential “coalition” partners share similar “liberal” or “conservative” worldviews in relation to issues focused upon at the UN, especially those linked to justice and human rights issues, with which RNGOs are typically concerned. Examining RNGOs at the UN highlights in many cases ideological polarization which supports the contention that “religion” is not a fixed category or value with consistent meanings and understandings attached to the term. For example, many “conservative” RNGOs would probably agree that the nature of the UN system – which to them may appear both “too” liberal and “too” secular – is to encourage values commensurate with a “secular global order” that conflicts or competes directly with what they see as “appropriate” “Christian” or “Muslim” (or other religious) values. RNGOs from various faith traditions with “liberal” views, on the other hand, will likely regard the UN as a very important environment where ideologically opposing forces, including other RNGOs, can be counteracted. This is necessary in order not only to advance what they see as for them *the* most appropriate faith view but also what is right in terms of an ideologically-generated approach to understanding and influencing outcomes at the UN and by extension global governance. In short, because there are often major ideological differences between “liberal” and “conservative” RNGOs, even from the same faith tradition, it is not helpful analytically to work from the premise of a clear cut, generalized, “secular” *versus* “religious” split at the UN between RNGOs and secular actors. The ethical and moral issues which RNGOs generally are concerned with at the UN, turn out to be controversial areas which are not easily divisible into generic “secular” and “religious” categories.

CHAPTER 132

Religious Institutions

Gerard Mannion

Exploring Institutional Morality: What is It? Why Do It?

While the term institution can also be used to refer to a particular custom, practice, behavior, and so forth, in this entry we are concerned with examining the sense of a collective that brings together individuals in an organized fashion toward achieving specific shared aims, functions, purposes, and ends. Institutions can be founded toward achieving widely differing purposes and ends and many institutions are aimed toward *social* ends. An institution will share an organizational structure, with conventions, regulatory protocols and procedures, and common practices helping to shape its daily life and serving the fulfillment of its ends and purposes. In many institutions, what will emerge will be patterns of collective understanding, action, and being that help shape these other aspects of daily life. We may call these traditions and, with regard to religious institutions, traditions play especially significant roles in the life and activities of the institutions and the people who together constitute the institutional community.

The study of institutional morality is an undertaking premised upon the fact that moral principles and ethics are not simply of relevance for individuals or even for communities and societies. They are also of great importance to the daily life of institutions, including the collective institutions that religious and faith communities gather their religious lives around or which serve those communities.

While there have been multiple studies that have touched upon the morality of institutions across many disciplines stretching back long into history, including innumerable studies concerning corporate, public, and organizational ethics (the realms of “corporate social responsibility” and “business ethics” being two broad examples), institutional ethics *per se*, in terms of being a specific area of enquiry, particularly with close regard to how an institution is run and its daily life *ad intra*, that is, its internal day-to-day functioning (which naturally, in turn, will also affect its external relations and impact), is a relatively new addition to the field of ethics.

Can Institutions Possess a Moral Character?

One area of specific contention concerns exactly *how* we may be able to speak of an institution possessing a moral character. Some theorists believe that the only way in which we can make sense of institutional morality is by examining the ethics of those particular individuals that make up the body of the

institution: in other words, their individual moral character, their values, virtues, and principles are somehow conceived to become combined or pooled in various ways (e.g. Seamus Miller).

However, the present author believes that this proves problematic in multiple ways and that, in fact, it can be seen that institutions can acquire or develop a moral character of their own *regardless* of the ethical character of its own members and, indeed, can sometimes display a moral character that can come into conflict with or even prove contrary to the ethics that particular individuals hold to – whether at leadership level or that of “rank and file” members. It is in relation to such areas of enquiry wherein some of the most significant and interesting questions concerning the morality of institutions lie.

The day-to-day life and activities carried out by and within institutions have moral implications, both internal and external to the institution. The foundational purposes and collective ends pursued by institutions have moral implications and the organizational structures, practices, protocols, and regulatory systems of an institution are also all aspects of institutional life that merit ethical discernment.

In a general sense, therefore, given that there are moral outcomes – both good and bad, positive and negative – that will follow from the collective acts, ends, and purposes that institutions give rise to, we can therefore apply analogous ethical thinking to collectives in a similar fashion to how ethics explore the moral character and actions of individuals. Therefore, it can, indeed, be said that institutions have a moral character and can be analyzed in ethical terms in a multitude of ways.

Discerning the Moral Nature and Scope of Religious Institutions

In addition to the definition of an institution offered above, a *religious* institution will be characterized by further specific common features. Such will be linked to, shaped, and guided by the beliefs and practices of a given faith community. And, in turn, the institutions within a particular religion will have influence on the formation, refinement, interpretation, and implementation of those beliefs and practices. The sacred texts, traditions, and practices specific to that religion will usually therefore prove normative in multiple ways for the life of such institutions – in theory, if not always in practice. When there is a conflict between the two, distinctive moral problems result.

More specifically, the foundational *moral* traditions and guiding principles and practices of the faith community in question will also warrant scrutiny with regard to how the religion's moral framework(s) both shape and impact and, in turn, can be affected by the given institution's own activities and organization.

Religious institutions perform a wide variety of functions, with the social and political sciences largely (and correctly) indicating that a majority of such functions are social in nature. Insofar as an institution is religious oriented or linked in nature, then, one can also see much overlap with the wider social functionality (or otherwise) of the requisite faith in general. But, of course, functionalism is very far from being the only or even most widely accepted theory for explaining what religions are about and what they essentially do. And what can be said for a religion in general, can obviously be applied to the discernment of the morality (or otherwise) of institutions within that religion.

Among the key functions of religions, of course, is the facilitation of the major rites of passage in life. And, of course, religion nurtures and helps people and communities to develop in terms of moral character and ethical discernment themselves.

But, in taking together the most important functions of religion, collectively and perhaps above all, religions seek (or aspire) to offer adherents and converts a *way*, a path of life. And, naturally, religious

institutions are also part of the vital means and mechanisms by which such a way, such a path is communicated, facilitated, and maintained. However, religious institutions and norms can also work to stunt moral development or even to shape individuals and communities in a direction that runs counter to morality. Religious institutions can and do work contrary to morality and to the common good, as well as vice versa.

Religious institutions can be understood at the macro level – even, indeed, conceiving of the religion itself as one large-scale social institution when considered in its organizational and structural sense (e.g. the Roman Catholic Church, or the Church of England can both be spoken of as institutions, or, in a looser sense, one might also conceive of Shia or Sunnī Islam, or Theravada and Mahayana Buddhism in broad macro-institutional terms in terms of shared characteristics and patterns of belief and behavior within those traditions).

Then, within specific religious groups there are multiple forms of additional religious-linked institutions. These can range from leadership, moral, legal, and disciplinary oriented institutions, to institutions fulfilling other social ends – for example, educational, charitable, welfare, and healthcare purposes. Various religious ministries can be understood as institutions in and of their own right or ministers can be seen as serving the specific institutional ends of the religion at either the macro or micro level, or both. The same can be said for particular religious offices and functions – although sometimes there can be confusion between function office and/or ministries and those individuals charged with carrying them out, which can lead to multiple moral dilemmas in and of themselves, for example, confusing a function with the functionaries who perform it, thereby escalating the power and authority of the latter in a manner which can contradict the actual (morally) right performance of the function itself.

So, when it comes to religious institutions, the boundary lines between the religious *community* (whether at local or wider level) and a religious institution *per se* can become blurred and have considerable overlap. For example, the people that may gather, live, and minister in and in connection with a local Buddhist, Shinto, Daoist, or Hindu temple, a Sikh Gurdwara, Jewish synagogue, Christian parish, Muslim mosque, or a shrine in many religions collectively can constitute a community *and* a place of worship, veneration, and/or meditation, yet also a religious institution. Depending on their geographical location, there will also likely be differing laws and regulations they must comply with in relation to state norms. That is to say, the state will also perceive this local community as an institution in multiple ways and treat it accordingly.

And there may be several further sub-institutions in connection with the local religious community, such as those aforementioned educational, charitable, healthcare, and welfare sub-institutions (or indeed separate institutions in their own right) in connection with that community. The network and web of relationships in such faith communities, then, can be developed to differing degrees and can frequently become complex both in organizational and indeed moral terms. Whether or not these local religious institutions and their offshoots are also part of a wider constellation of institutions in connection with their faith beyond the local level (e.g. wider area institutional collectives – e.g. think of a church diocese or a specific faith's regional or national religious bodies) varies depending upon the religious group. In many instances, there may also be overlap with institutions and organizations connected with specific ethnic and cultural identities within religious communities at various differing levels of locality. Such ethnic aspects of institutional being can, in particular contexts, lead to tensions with co-religionists and those from beyond their faith community's confines alike. Some religions will have broader federal-like structures and organizational features to serve the institutions at more localized levels.

There are also pan-religious and interfaith institutions (e.g. the Parliament of the World's Religions), as well as intrafaith institutions (e.g. ecumenical institutions seeking to foster better understanding, relations, and cooperation between different Christian denominations such as the World Council of Churches or between Jewish communities via the World Zionist Organization). These can also exist at the local level, national, regional, and international levels alike. Such can be institutions that, in themselves are comprised of membership by other institutions.

Particular offices of leadership, governance, and ministry will likewise exist at both the local and wider levels. The degree of hierarchy in terms of organization and structure will also vary depending upon the religious tradition, branch, and location. Some will incorporate democratic and discursive bodies and practices to determine key decisions and matters of teaching, interpretation, organization, and discipline. Some will have a mixture of monarchical-style leadership and governance alongside democratic and other collective forms of discernment and decision-making at various levels of the religion from the universal to the local.

Sacred texts, teachings, and traditions will likewise play a significant role in such decision-making, leadership, and governance to differing degrees, depending upon the community. Educational institutions and the work of scholars in and experts on the particular religion can also have a significant bearing for many faith communities in such levels of institutional life.

Then, of course, in some religions there will be specific religious communities consisting of, for example, orders of monks, nuns, and other types of devotees (as well as analogous types) who commit themselves to a specific way of community life shaped by their faith. These, too, can take on the characteristics of both a community and institution. For example, an ashram, shrine, monastery, friary, nunnery, or convent. Some of these will be governed according to particular normative rules and traditions, some may be gathered around particular gurus, mystics, or charismatic leaders. They will vary in type with regard to whether they organize themselves along radically egalitarian lines to strictly hierarchical lines with many variations between both poles.

Other religious communities may embrace members of more than one faith or previously (or continuously) divided and differing branches of the one faith (e.g. Hindu-Christian interfaith ashrams, again, or Christian ecumenical communities). Forms, then, of “multiple religious belonging” would help shape and give purpose to such institutions.

All such institutions have ethical relevance in multiple ways. Some institutional activities may be committed to particular moral and social ends – toward increasing the common good, toward fostering the wider practice of social justice and virtues in their societies and the world. Others may be fostering exclusivistic and unjust ideologies and practices. Some institutions may paradoxically work toward both outcomes.

Some religious communities and institutions may blend religious with social and political aims, objectives, and traditions. Sometimes the politicization of the religious institutions may have serious negative consequences that run counter to the actual moral traditions of the religion in question. Not a few religious-linked institutions, both historically and in contemporary times, have blended and blurred their religious beliefs with extremist and violent aims and ideologies (most of the major world religions have experienced various forms of such institutions).

Many states, of course, have adopted specific religions as the state religion (either officially, even constitutionally or *de facto*) and this has had multiple subsequent impacts upon both the religious institutions thereafter and the state institutions as well. Indeed, the influence and impact of religious institutions upon the moral character and ethical resources of wider society, in general, is a further area of enquiry

where attention to the morality of institutions can prove fruitful. For any country dominated socially and politically by one faith, this has many ethical implications, particularly if the prevailing interpretation of that faith, moral or otherwise, impacts the freedoms of the citizens, especially of those living in the country who do not belong to that faith. Further ethical considerations that many studies have considered are the ethical implications for a society of the growth in secularization in specific communities.

Many religious communities will have spiritual leaders or guides, gurus, charismatic figures, prophets, and other figures around whom various institutional trappings and organizational features and practices may emerge. Again, these may vary from the most rigidly hierarchical to the most radically egalitarian. Some such figures and their followers or the traditions they give rise to can have a dramatic effect upon the religion, its teachings, the interpretation of these (and of sacred texts), and its institutional organization and life. This can also be so due to the traditions, interpretations, and practices such followers leave behind after their deaths – inspiring, exemplary, and holy persons, saints, and martyrs are further persons around whom institutional practices can develop.

With regard to these figures and indeed any religious leadership figures and decision-making and authoritative bodies, power and influence can be abused in ethically alarming ways to varying degrees (e.g. from financial corruption in a religious institution to the manipulative and fatally catastrophic leadership of the Branch Davidians at Waco, Texas). So, also, can power and authority be exercised in morally exemplary ways toward the promotion of the common good.

Studying Religious Institutions: Methods, Tools, and Resources

A profitable approach to the exploration of religion vis-à-vis the morality of institutions and organizations could engage in a comparative and interdisciplinary approach to the dimensions of religion and institutional morality in three distinct ways. First, the notion of institutional morality *per se*. Second, engaging in ethical analysis of religious institutions and related institutional issues pertaining to religion, religious belief, and religious communities. Third, considering examples of resources from religion, religious studies, and (where applicable) theology for better discerning and enhancing institutional morality.

There are many interdisciplinary research tools and findings that can help us explore how institutional morality is actually shaped and what factors might assist this, as well which factors prevent a positive institutional morality from flourishing.

Of especial relevance for exploring institutional morality in general, including pertaining to religious institutions, are the numerous developed theories, traditions, and additional resources in *social* ethics that are shaped *within* particular religious traditions. And, obviously a comparative religious studies, theological, and comparative ethical approach can help in such explorations.

But obviously resources from beyond religious traditions and those which are common to both religious and secular studies alike can and should be utilized. When exploring institutional morality, questions of metaethics (the nature and scope of morality and of ethics itself), as well as considerations pertaining to ethical method in particular are of specific value.

Most religions in shaping their ethical traditions and forms of moral discernment and regulation embrace a *mixture* of ethical approaches – with the most common such combination for many religious institutions being a mixture of deontological and virtue ethics (with the latter being one ethical approach that can furnish several especially helpful ways of analyzing institutional morality). Many will fluctuate

between emphasis upon one or the other approach at differing times, under differing leadership, and depending upon the particular moral questions and dilemmas under consideration.

General as well as specific theories from moral and social anthropology, social ethics, and organizational ethics, theories from philosophy, theology, and religious studies, among other disciplinary approaches all have much to offer the study of institutional morality. This also includes the various resources from forms of applied ethics and organizational ethics as they relate to institutions. Further fruitful levels of enquiry are forthcoming when we combine resources across different disciplines.

Notable approaches from the past that can be revisited to help inform studies of morality with regard to religious institutions include studies where the overlap between exploring religious communities and specific religious institutions will be especially prominent. Classical studies and typologies from the likes of Ernst Troeltsch and Max Weber have influenced subsequent typologies and characterization of religious communities and institutions. Indeed, several of Max Weber's famous theories can and have been applied to a wide variety of religious institutions, particularly, for example, those concerning the routinization of charisma. So, also have Karl Marx's critical theories about the function and structures of religion, in a wide variety of forms, been applied to and thereby indicated ways in which religion may have both negative, as well as positive, moral effects. As indicated, differing functionalist perspectives on the nature and purpose of religion obviously have had much to say about the social functions of religion – and therefore there are moral implications to those functions too (e.g. Émile Durkheim's studies particularly with regard to the social cohesion that religion can offer societies). Classic theories of religious pluralism (e.g. John Hick, Ninian Smart) and postcolonialist and feminist critiques of religion (e.g. Edward Said, Timothy Fitzgerald, Talal Asad, Elisabeth Schüssler Fiorenza, Rosemary Radford Ruether), have respectively offered morally positive and negative assessments of religion and therefore of its institutional manifestations and operations alike. *De facto*, these critiques have ethical implications on multiple fronts.

In particular, one of the most fruitful avenues for exploring religious institutions from an ethical standpoint may be via an engagement with *theories of social being and social interaction*. Such can provide multiple resources to explain collective existence and collective action, for example, how we account for and understand shared aims, goals and ends, and social phenomena such as cooperation, social conflict, opposition, and antagonism. Moving toward more specifically ethical considerations, we might then begin to consider how to account for common norms/values/virtues/vices. Theories of social being can help us explain specific shared characteristics such as collective altruism, as well as institutional morality in general.

To take here but one example, if we take the notion of social constructionism from the social sciences and apply this in a comparative sense to religious institutions, we can better understand what shapes the moral life and practices of the institution in question, as well as of religious institutions in general. The social construction of reality essentially envelopes a set of theories about the various ways in which we collectively shape and give existence to our shared worlds, our ways and means of relating to one another, the processes and habits, the concepts and forms of knowledge that govern our interactions and how such become habituated through these processes and thereby become institutionalized over time. This in turn shapes the knowledge and beliefs about our social reality itself.

Indeed, applying theories of social constructionism helps demonstrate that institutions can and do possess moral character. Morality is essentially socially constructed *per se*, therefore institutions are one of the key mechanisms for facilitating such socially-constructed moral norms, values, virtues, practices,

ethical resources, and traditions. And religious institutions are preeminent at the forefront of the emergence of such socially-constructed moral frameworks and traditions. Obviously, some religions also hold beliefs about particular teachings and traditions being somehow “given,” ordained, or “revealed” through prophetic, divine, or other superhuman mediums. But this does not challenge the essentially socially-constructed nature of their moral traditions for even traditions believed to have been divinely revealed or given to special charismatic figures within the religion through processes of enlightenment, meditation, or existential challenges require interpretation and hermeneutical practices are also socially-constructed.

Finally, the contributions of critical theorists such as Jürgen Habermas concerning the “system colonizing the life-world” also offer much potential for applying theories of social constructionism to institutions and especially so given the ways in which religious worldviews, and the organizational and institutional life of religious communities, are clearly constructed in multiple social ways.

Authoritative Religious Teachings: Institutional Interpretation and Implementation

As indicated, most religions develop a body of teachings and many (often a majority) of these teachings, in one way or another, are either directly pertaining to morality and ethics or have moral relevance. The major world religions also have recourse to those scriptural tradition(s) which influence the day-to-day life of their institutions and the conduct of their members in a wide variety of ways. So, also, may there be oral traditions that have been passed down which may or may not become written down and part of the textual pedagogical corpus.

But matters can become complicated with regard to the interpretation, development, and application of those teachings. Who determines what texts become part of the canon of sacred texts (and which do not)? Who is responsible, entitled, or qualified to interpret them and what happens when there are differing interpretations of the teachings? What is to be done with ancient or even modern and contemporary teachings (textual or otherwise) and interpretations that either the religious communities themselves or the wider society in which they live, or both, find morally questionable, even repugnant? What forums exist to determine when teachings need to be revisited and revised or, indeed, sometimes reversed and jettisoned altogether? These challenges obviously have multiple ethical implications.

Further issues arise when teachings, in part or in general, are believed to have been “revealed,” “inspired,” or informed by foundational and key figures in the faith or through some form of direct revelation from or via the (or a) deity or ultimate concern central to the religion. Forms of prophecy and witness add further intricacies to any given faith’s body of teaching.

Then there can be clashes over what precisely counts as authoritative in a given faith community. For example, the clashes over the authority of scripture and tradition during and subsequent to the Protestant Reformation and the Catholic Reformation. Or, again, the disputed legacies over the authority and legacy of the teachings of Ali ibn Abi Talib between Shia and Sunnī Muslims and further disagreements over the nature and extent of the Caliphate.

Therefore, with regard to authoritative teaching and its interpretation and development, as well as application, additional religious institutions can emerge specifically to coordinate and regulate such interpretive and developmental processes.

Religions can therefore have recourse to a variety of hermeneutical processes and practices to help in the ongoing interpretation and development of their authoritative teachings and/or their sacred texts (e.g. midrash in Judaism). Some religions therefore have developed sophisticated theories, structures, systems, and processes for teaching that recognize and/or facilitate specific means and forms of teaching in the community as authoritative (e.g. magisterium in Roman Catholicism).

Some faiths even codify the outcome of many of these interpretive processes into the status of “law” that will guide and regulate their communitarian and institutional life (e.g. canon law in some Christian traditions, shari‘a Law in relation to Islam, and Torah in Judaism). All in all, religious hermeneutics, then, is a moral issue in and of itself.

Religious institutions face a series of particular challenges of a moral nature when members of the religious community exercise dissent with regard to the teachings and norms of the faith themselves, or, more commonly, with regard to the interpretation and implementation of those teachings by the leadership at a given time. It is not infrequent that “dissenters” and their viewpoints become reassessed over time so that they are transformed into prophetic and ultimately authoritative voices for the faith communities concerned. Perceived orthodoxy and heresy in religions can be seen to have been routinely “flipped” or reversed over time.

Still wider bodies can be instituted to help the religious communities reach decisions of especial importance, to revise and update teachings and structures, to settle disputes, to implement programs of renewal and reform (e.g. a synod or council).

Questions of Leadership, Authority, and Accountability

Specific moral challenges can arise in relation to how leaders and people in decision-making positions and positions of authority are identified and appointed. So, also, in relation to how they comport themselves in discharging their leadership duties. Whether at the wider macro-institutional level or more regional and local level, religious institutions will vary and differ on the modes of appointment, term of office, and so on. Some positions will be decided upon via democratic processes, some via forms of succession, some by a mixture of the two.

All too often leaders and others in positions of decision-making and responsibility in institutions – whether secular or religious – can find it increasingly difficult to tally the values and norms either of their organization or institution or indeed their personal values and beliefs, with the day-to-day operations and reality of their responsibilities.

Specific problems arise when leaders resort to affirming the applicability of such values *ad extra*, but see no applicability necessary *within* the confines of the organization itself. Likewise, if they seek to portray the organization as holding fast to the very values and principles it flouts on a daily basis. Perhaps most ethically challenging of all, is when leaders and institutional bodies, for various reasons, seem to believe the enormity of the responsibilities of their leadership positions (or its attractiveness or both) requires them to place on hold ethical values and principles – be this suspension temporary or for the duration of their service and office. Furthermore, they may believe they are doing so in the better interests of the institution itself and/or for some “higher” ends that necessitate that ethical concerns are pushed into the background.

It is therefore vital that religious institutions encourage and facilitate the exploration of issues and questions of leadership, authority, power, governance, responsibility, and accountability on a periodic basis.

Concluding Remarks

Many instinctively presume – or at least expect – that the moral standards of religious institutions will be somewhat higher and more consistently ethical than those in secular institutions. However, historical and contemporary evidence makes clear that religious-linked institutions are seldom exempt from the same failings and moral corrosion and corruption as any other institutions. True, they usually have higher moral aspirations and, indeed, in many cases will strive to live up to those aspirations. Religious faith communities also utilize their moral and doctrinal traditions and resources to scrutinize, critique, and indeed reform secular institutions when they are deemed to be morally failing in the light of those moral and doctrinal traditions. At times, religious institutions can fall prey to consistent failings in living up to the moral principles, frameworks, and traditions that their faith claims to be shaped by.

All in all, it is, therefore, also vitally important to explore how and when institutional aims, goals, and ends, along with the practices that issue forth within and out of the institution might clash with morality and ethics. So there need to be means and resources for assessing the extent to which moral corrosion and corruption might develop within particular religious institutions and for how to go about rectifying and reversing such developments. Here, religious institutions can draw upon a vast array of ethical resources within their own traditions.

To close we list but a limited number of examples that can be found, in one form or another in many religions (admittedly described under various names and guises), that stand alongside numerous other empowering moral concepts, theories, virtues, values, and aspirations: the notion of community; the virtue of solidarity; love/charity; and, perhaps most relevant of all for ethical discernment of institutions, the concept of social or structural/institutionalized sin. These resources can prove enlightening for the study of the morality of institutions both within and beyond religious forms of such. Therefore, they are also proof that religious institutions can be part of the solution to institutional corruption and corrosion, as well as being part and examples of the extent of the prevalence of the same.

2 Challenges

CHAPTER 133

Science

Roger A. Willer

Introduction

Modern science as a body of knowledge and set of practices, as a mindset and social system is arguably the most significant “invention” of the Enlightenment. In its approach to knowledge of the natural world, it has demonstrated astounding success in identifying causal relations, predicting outcomes, and unleashing “miraculous” technology. That same knowledge poses for the human species unprecedented challenges and knotty problems, and it often leaves in its wake social anxiety and harm. Whatever one’s estimate of the cost versus benefit, it is incontestable that the social system called science has emerged as a, if not *the*, primary source of global culture creation.

While forms and structures of religion, morality, government, economic exchange, etc. also are major players in culture creation, their continuities with human heritage stretch back thousands of years. Contemporary science as an approach to nature, a practice and a body of knowledge, however, represents a historical discontinuity from past mindsets and practices. Beginning around 1650 with the emergence of European modernity, it has become – in a historically short time – a global enterprise more far-reaching than any form of religion, morality, economy, or government. It is striking that a scientist from virtually anywhere can settle quickly into common work with local scientists because of universal commitments such as testability and verification. The scientific body of knowledge is historical in character and is expected to change through the contention of conflicting paradigms of research, theories and findings. At the same time, the singular goal of all who practice science is to contribute to a *single* body of causal explanation about nature that is expressed in statements of empirical regularities (law) and theories and that also can make highly accurate predictions.

Given science’s dominant intellectual and social power and the knotty problems it raises, the minimally charted intersection of religious ethics and the sciences is startling. There is evidence of important new work entering this intersection, but it remains accurate to say the literature of the developing field of religious ethics has engaged only minimally with science *qua* science or with the individual sciences themselves as matters of moral and religious reflection.

The claim that religious ethics has not engaged science significantly may strike the reader as bogus given the extensive attention to ethical issues dominant in many fields, such as genetics. This claim, however, depends on a critical distinction between science as a passion for theoretical knowledge and technology as the application of that knowledge. Yes, ethicists devote significant attention to the

technological application of scientific knowledge, but they have infrequently explored the moral aspects of science itself as a mindset, practice, and social system. The moral-laden character of *techne* has been long recognized, while the developing field of religious ethics is just beginning to identify the parameters by which it may bring resources into play for constructive critique and mutual contribution. Among the initial challenges are adequate descriptions of the domains involved and the question of the legitimacy of interaction between them.

The Domains and the Question of Mutual Dialogue

The Domain of Science in Search of Causal Explanation

What exactly is unique about the domain of science as a search for human knowledge? How does one mark what is a science versus what is not? Most people have a clear sense that there is something distinctive in the modern facility and practice called science as it seeks explanation of causal relationships in the natural world. At the same time, the contentions around what counts as science and what does not is evident to any reader in the philosophy of science. From the time of Western antiquity until approximately 1650, the ancient concept of *scientia* (knowledge) indicated the broad domain of theoretical knowledge over against *sapientia* (wisdom) and *techne* (the know-how of craft or application). It is a testimony to the power of the knowledge developed through modern practice of replicable observation stated into laws and theory that this domain of practice has claimed for itself alone the term science, the term that had designated any theoretical knowledge.

Even with such caveats, the question of what constitutes science remains. Is astrology science? Is medicine? Common parlance distinguishes the scientific from pseudoscience or from medical application by pointing to the inductive empirical method, to the practice of experiment and observation. Likewise, the common belief about science is that it collects a steady, cumulative acquisition of knowledge by that means. Dictionary definitions refer to these core elements. Both common parlance and dictionary definitions clearly fail, however, because such definition excludes the formal sciences of logic and mathematics as well as theoretical science! Moreover, most thinkers now accept some version of the argument that science proceeds by models and paradigms and exemplars (Kuhn 1996). Rather than linear advances in explanation dependent on rule-governed assessment of the data, it is now accepted by many that sudden small advances build pressure (new data and information dissonant with accepted theory) until the avalanche of a paradigm change occurs in theoretical ideas.

Significant debates about these matters continue within the philosophy of science, but the following description can be widely affirmed as a methodological description delineating the mindset and social practice of the sciences as they seek a congruent body of knowledge about the natural world (Klemke 1998). Science organizes:

- Statements that record and classify observations relevant for the solution of a problem in as accurate and definite a way as possible.
- General statements – laws or hypotheses – that assert regularities among certain classes of observed or measurable phenomena.
- Theoretical statements that connect and account for the largest possible number of laws.

- Other general or specific statements that are deducible from the initial descriptions and from laws and theories and which are confirmed by further observation and testing.
- Predictive statements drawn from the above indicating with reliability what outcomes can be expected given initial conditions and subsequent factors.

These five taken together describe what is unique to scientific practice while, and this is critical, leaving open the questions of the methods of obtaining data and the means to develop laws and theories. The methods may be deduction, induction, intuition, educated guess, or others. It distinguishes science, however, from pseudoscience and from technology and permits establishing useful categories in terms of precision: formal sciences (logic and mathematics), physical sciences (physics, chemistry), life sciences (biology and psychology) and social and behavioral sciences (sociology and economics). These may, then be usefully distinguished from the way knowledge and truth is sought in the disciplines of the humanities (philosophy, the study of religion, history, etc.) or the arts.

The Domain of Religious Ethics as the Search for Transcendent and Moral Meaning

How then should one describe the particular field of religious ethics in relation to science? What is different about its search for human understanding? In the broadest brush strokes, it is commonly held that science is about the facts of nature while religion is about transcendent meaning and ethics is about moral values and praxis. But as already seen in the investigation of the character of science above, such brush strokes provide, at their best, simply a useful start.

What exactly counts as “religious,” the first term of “*religious* ethics?” It is more notoriously problematic to define what is religion than it is to define what is science. Whatever else may be said about the character of religion, however, it certainly indicates beliefs, practices, a community and institutional activity oriented to the transcendent dimension of being human and the search for meaning. The domain of religious understanding insists, over against a purely scientific domain, that the universe includes something real and identifiable that is a transcendent dimension with ultimate meaning. In short, there is something about the whole that is greater than nothing but the sum of the empirical parts. It is worth noting that many practitioners of science assert their belief that science points beyond itself, even so far as to believing that transcendence is a real horizon that cannot be measured, empirically observed, or comprehensively theorized. Religion is, then, usefully described in relation to science as the domain of human understanding attentive to the transcendent dimension and its meaning for human life.

The second term in “religious *ethics*” also must be delineated. It is commonly assumed that the discipline of ethics, whether religious or non-religious, is the reflective, systematic study of morality, consisting of two dimensions: (1) values or norms; and (2) practical reasoning or decision-making. Religious ethics demonstrates, however, that ethical reflection necessarily includes several additional dimensions; its practice depends upon more than just comparative values and comparative practical reasoning.

While debates continue about the nature of these dimensions, the idea is sustained that ethics entails – whether religious or non-religious – five broad dimensions: Foundational, Hermeneutic, Normative, Practical, and Meta-Ethical (Schweiker 1995). All five are needed in any ethical reflection that wishes to

be comprehensive, including at the intersection with the sciences. The foundational dimension explores claims about the fundamental character of reality and, specifically, the character and meaning of human agency. The hermeneutical dimension assesses how an ethic interprets the moral situation in all its complexity. The normative dimension asks, “What is good, right, or fitting?” The practical dimension investigates reasoning about moral action, how decisions and actions occur. The meta-ethical dimension explores theoretical or second-order questions, such as those of domain, description, and the legitimacy of some exchange between disciplines.

Is Dialogue Between Religious Ethics and Science Legitimate?

With these descriptions in place, it becomes possible to broach the primary reason that the intersection of moral questions about science qua science largely has been uncharted. The received philosophy of science stretching back through Immanuel Kant, René Descartes, and many others has contended that science is, when practiced correctly, value free and purely objective. In theory they placed a protective border around the sciences as a unique domain of human enterprise, a value-neutral pursuit of objective knowledge that therefore could not and should not be subject to moral investigation. These beliefs were widely shared by both philosophers of science and by the practitioners of science and can be considered the standard account until the late twentieth century. This line of thinking, generally designated as logical empiricism, remains in play today among some theoreticians as well as many practitioners.

Among others, both in the literature and in practice, a related if less imperialistic view has emerged that the sciences and the humanities are both salutary but belong in independent domains. These domains are happily (or antagonistically) isolated from each other behind encircling ramparts of distinction that make dialogue inappropriate. The prevalent code word for this view is descriptive: non-overlapping magisteria (NOMA) (Gould 1999). In both of the two views just described, dialogue is impossible practically or illegitimate theoretically.

Many contemporary thinkers – in philosophy of science and other fields including religious ethics – now hold, on the contrary, that it is both possible and legitimate to stipulate parameters honoring both the integrity of the sciences and that of the humanities in a way that enables exchange at multiple intersections. Many point out, further, that the human enterprise of culture creation is so powerful today that it now bears the moral burden for the very shape of nature’s future and the existence of subsequent generations. They point to science as the engine enabling what could be called an anthropocentric eon. It seems compelling, then, that important questions from the distinct domains should be engaged mutually by sciences and religious ethics. Such two-way attention is necessary for the sake of wise and robust contributions to the intellectual, systematic, academic pursuit of human understanding and culture creation.

This approach avoids any “war” between science and religion in a dialogical exchange that recognizes (1) the unique commitments and search for causal explanation that science represents, without (2) accepting imperialistic claims that scientific commitments and causal explanations are the only true domain of *real* human knowledge. Founded on those commitments it is salutary to explore examples of mutual exchange through the various dimensions of ethics.

Dimensions of Intersection Between Religious Ethics and Science

Practical Reasoning: What Are the Necessary Occupational Values in the Practice of a Scientist?

While the logical empiricist view of science holds that science qua science is value free, even its most adamant proponents acknowledge that occupational values such as honesty, openness, diligence and integrity are essential in the pursuit of truth. In science it is expected that every reasonable precaution will be taken to avoid experimental error and that information – even that which contradicts one’s own – will be handled fairly, and so on. The practice of science is inherently a communal work and simply cannot succeed without these moral commitments. Because these values are so widely assumed, however, little attention has been given to them and to the significance of the standards they actually entail.

It is a common assumption that moral failure on these matters is rare and does not threaten the integrity of the research enterprise generally. However, between 2000 and 2010 the number of published papers grew by 40 percent while the number of articles retracted due to research misconduct – the ultimate in academic take-backs – grew by 1000 percent (Oransky 2016). More troubling, there are well documented cases of “mercenary scientists” paid to manufacture uncertainty by questioning studies, muddying the evidence, and dissecting every conclusion (Oreskes and Conway 2010).

Besides the ensuing havoc for research, failures to foster these values contribute significantly to the loss of science’s credibility among the public. While most of the intellectual reflection about such occupational values has occurred within the Western tradition, reflection from non-Western traditions could help open new insights. For instance, the virtue of “right livelihood” in Buddhist thinking applies. It holds that one’s occupation must serve rather than harm humankind and that each person has an obligation to every other to perform one’s job well.

The Normative: Are There Values at the Core of Science?

The claim that values operate normatively in scientific method and practice remains to many a sacrilege in the sanctuary of belief regarding the neutrality and objectivity of science. In such contested territory the short length of an entry on science cannot begin to do justice. However, this much can be supported: while the received tradition held that genuine science is utterly objective (valueless) and rule-governed, it has now been widely agreed that empirical data is *always* undetermined and must be appraised in relation to theory and to other commitments. Even if a data set contradicts a long-standing accepted theory, it must be appraised, ultimately, via an alternative theory or within a new paradigm. Such decisions are not solely rule-governed. This means there *necessarily* are values operative in the assessment of data, the choice of theory, and the establishment of paradigm and exemplars.

But what does it mean that scientific assessments are, in some respects, closer in structure to value judgment than to a valueless rule-governed inference that the classic tradition in philosophy of science claimed? In what sense should “value judgment” be understood? Does it imply that emotive-based, social, philosophical, or cultural-based values *should* be inserted? A few thinkers argue that it does or that it should. The more dominant view recognizes that the values operative in science qua science are epistemic ones; that is, the values for judgment are those that improve epistemic status, the conformity between theory and world.

There is a careful distinction at work here. Epistemic values may not be solely rule-governed nor somehow neutral in themselves. Yet, and this is the critical point, they are ancillary in scientific work and therefore do not mean that scientific method or knowledge is a sheer social construction, as some thinkers have argued. It is in this sense that the epistemic character of doing science and the moral values involved present intersections at which the field of religious ethics becomes relevant. For instance, since such values are needed to close the gap between theory and underdetermined evidence, there is a constant danger that philosophical, political, social, and religious values *will* be employed, wrongly. Likewise, it is possible for moral values to slip in, other than those that support epistemic clarity, honesty, fruitfulness, etc. Identifying clearly the epistemic from the non-epistemic (inappropriate) values is essential.

In mutual exchange with the sciences, religious ethicists can provide tools to spot and respond to these dangers. Two illustrations are readily at hand. (1) The claim of some Muslims that the Quranic account of creation must govern scientific research and the claim by some Christians that creation science should be given the same consideration as standard science should be identified as the insertion of elements from a religious world-view into data interpretation and theory choice. (2) Ethicists can help to identify when the choice and presentation of data seems to be influenced by financial gain, a growing danger because of the dramatic shift from public to profit-driven sources of funding research.

The Hermeneutical Dimension: In What Sense Is All Human Knowledge Necessarily Interpretive?

As an invention of the Enlightenment, science was conceived as an objective and presupposition-less enterprise through and through. As pointed out above, many still believe this is the case. By contrast, it is axiomatic in religious ethics that *all* human understanding and *all* human enterprises are hermeneutical, that is, require interpretation. To be human is to be an interpretive creature. Science is done by human beings using human tools, including language as the interpretive mediator of all observation and data. This fact belies the exceptionalist claim that science can, even in theory, operate without presupposition or prejudgments – except in a proscribed manner. For instance, it is necessary for scientific research to postulate the existence of mathematically perfect systems and models. While necessary, such prescriptions do not allow science to claim it is an enterprise entirely free of prejudgments or an exception to moral questions.

One of the more compelling examples is that the so-called objectivist assumption of logical empiricism has been shown, in fact, to weaken the practice of science. This is a feminist critique made in relation to certain practices of science and it has been sustained over time. The critique is not the claim there are feminine “ways of knowing,” but that the cognitive rigidity of pretended objectivity and the exclusion of the gendered structure of theoretical labor has slowed the improvement of knowledge. The claim is that research attentive to feminist commitments “makes new explanatory models available, reframes old questions, exposes facts that undermine the plausibility of previously dominant theories, improves data-gathering techniques, and shifts the relations of cognitive authority among fields and theories” (Balashovzy 2002). This illustration from feminist work makes clear why many argue that religious ethics needs to engage science as science asking it questions of power analysis: What economic or power interests are being served by the practices of the sciences? This analysis applies to all of its practices from research grant writing to selection of theories to presentation of data.

The recognition of the hermeneutical character of science does not imply that science is just another social construction; a point linked to the epistemic value judgments noted above in the discussion of the normative dimension. While not without interpretive prejudgments, the successes of the sciences demonstrate they do remain the most sustained means of searching for the facts of nature. Science proffers an irreplaceable horizon of causal explanation that enriches human understanding for culture creation.

The strong claim here, though contested by some thinkers, is that the sciences are more effective at what they do when the hermeneutical aspects are acknowledged, and intersection occurs with horizons from other domains. In this view, dialogue becomes valuable to science itself in showing how research practices and projects with moral and political sensitivity to gender, race, and ethnicity, etc. can produce better knowledge if the highest epistemic standards of empirical adequacy and fruitfulness are maintained.

The Fundamental Dimension: What do Religious Ethicists Need to Rethink?

As in the previous dimensions, the fundamental dimension presents opportunities for two-way exchange, but the challenges come more heavily from the side of science. While each religion needs to host its own particular dialogue with science, the claim common to most religions is that the sciences should admit the possibility of domains of understanding beyond scientific facts and science's inherent limitations. Religious ethicists would, in addition, question claims that the practice of seeking knowledge bears *zero* moral responsibility, as has sometimes been claimed by scientists.

In a mutual exchange, the sciences insist that religious ethics must take into account the best-established scientific bodies of knowledge relevant to its work. The extensive and progressive research programs in sciences such as in the cognitive sciences, primatology, or complexity science challenge long established religious claims on ethical topics such as human agency, the human self, decision-making, character, conscience, reasoning, value commitments, and more. These pillars within the fundamental dimension of ethics now require critical rethinking in light of the findings of such fields as neuroethics and others that seek accurate explanations of the measurable universe.

The Fruitfulness of Dialogue?

Is it legitimate or possible for science and religious ethics to engage in mutual exchange? Dialogue, after all, implies a mutual give and take that inevitably introduces challenges and possible modification into each other's domain. One's answer depends on careful considerations of both the character of science and of what is at stake in each of the five dimensions of ethics. The question of legitimacy will continue to be debated, yet the question of possibility is being answered by new examples that demonstrate how scientific information intersects with the work of religious ethics to create improved knowledge for the benefit of humanity (Eisen and Konchok 2017; The Enhancing Life Project, 2017).

Should absolute boundaries be maintained? Could there be beneficial intersections? Should ethics guide science to explore certain areas based on likelihood of developing technology that improves social justice rather than exacerbating disparities? Should the sciences proscribe some areas of research, such as germline genetic engineering? Such questions and a multitude of others like those discussed above cannot be answered well without mutual exchange and shared attention. Since culture creation as a

human enterprise now bears the moral burden for the very shape of nature's future and the existence of subsequent generations, these questions cry out for attention from multiple domains. At stake is the success of the human enterprise of culture creation.

CHAPTER 134

Ecology

William French

The first hint of gray appears over the river as birds begin to call from the far shore. Water buffalos stir in an alley by the temple, but the dogs sleep on. Doors open, and devout Hindus make their way to Varanasi's riverside *ghats*, down the steps and into the Ganges' waters to bathe and pray. Far to the north the sun's rays strike the peaks of the Himalayas, then the snowfields and glaciers below. Warming begins the day's melt that feeds the headwaters of the Ganges and the Yamuna, the other great sacred river of northern India. These rivers, in turn, sustain India's northern agricultural plains.

Dawn's sweep across the planet begins a grand ecological drama each day as plants, grasses, and plankton – the primary producers of the Earth's ecosystems – harness sunlight through photosynthesis to produce the foundations of the planetary food chains. The ecological sciences remind us that the global ecosystem is a vast superpower upon whose outpouring of energy all human communities, national economies, and living species depend. In the last century, however, surging growth in human numbers and powers of production along with globally rising expectations for higher consumption have come to pose significant threats to many long-stable natural ecosystems and the species that these ecosystems sustain.

No previous generation has faced the array of critical ecological concerns that now command attention and international response: climate change, habitat destruction, aquifer overuse, deforestation and erosion, species endangerment and extinction, air and water pollution, acid precipitation, and nuclear reactor vulnerability. Most biologists now warn that the widening expansion of farms, ranches and metropolitan sprawl pushes extensive destruction of natural habitats and that this coupled with the rising impacts of global climate change is ushering in the sixth extinction spasm of Earth's long history, the first for which humanity bears responsibility (see Kolbert 2014). The concerns the scientific community had about climate change began to be communicated to the broader public by Bill McKibben in 1989 and Al Gore in 1992 (McKibben 1989; Gore 1992). In the last twenty years extreme weather events – powerful hurricanes, droughts, extreme rains, and rising storm surges – have drawn much broader attention to the harsh fact that climate change is real and it is here now and that it threatens to get worse (Klien 2014). Twenty sixteen stands as the hottest year since accurate measurements have been taken. Twenty fifteen stands next, with 2017 and 2018 next in line. Among the 10 hottest years on record 9 have occurred since the year 2000 (NOAA, 2019).

In response across the last three decades religious communities have begun to seek resources in their traditions that might help highlight the significance of ecological concerns and help mobilize responsible

action. The religions of the world sustain value commitments that often stand in stark contrast to the pro-growth and consumption-centered ethos that drives dominant governmental and economic agendas around the world. For this reason growing numbers of environmentalists view the world's religious communities as potentially important partners for energizing a global effort to mitigate global climate change and to protect the Earth's ecosystems (see Wilson 2006). But for the world's religious communities to live up to their ecological potential, they must overcome parts of their heritages that undercut ecological care and concern. This chapter examines Christian and Hindu resources for developing an ecological ethic as well as elements in these traditions that hinder this effort.

Christianity

Christianity shares with Judaism and Islam a common set of core beliefs stressing the transcendence and sovereignty of God, the goodness of God's creation, and the primacy of the human over the rest of creation. All three traditions hold that God has granted humanity "dominion" over the rest of nature. Creation is understood as fundamentally good, but generally not, in itself, sacred. Humanity enjoys rights to use animals, plants, and the rest of nature, but in return humans owe nature certain duties of care.

The ethical core of all three traditions came to emphasize an intense concern for human life and value. This ethical concentration on human value and interests made sense during the many centuries before the industrial revolution and the rise of modern medicine when human life was so threatened and shortened by disease and the nonhuman natural world by contrast seemed so vast and undamageable as to be viewed as a solid "given," a stable stage upon which the brief drama of human life was played out. Earth seemed really big then and solid. It was human vulnerability that focused moral concern. But historically these religious traditions – Judaism, Christianity and Islam-- balanced their stress on human primacy with an emphasis on how humanity is a participant in the broader community of God's creation.

The rise of modern science in Europe – advanced by Francis Bacon, Isaac Newton, and many others, however, enshrined a new mechanistic picture of nature that sharpened a sense of humanity's separation from, and superiority to, the rest of nature (see Merchant 1980). Christian theologians in the modern period came to understand history, culture, and language as the best frames for understanding the distinctiveness of human life and experience. The ancient and medieval pictures of humanity as part of the community of God's creation took a back seat to the new stress on human historical agency and freedom. As the stress on creation waned, the traditional ethic of dominion with its notion of stewardship duties tended to give way to an ethic justifying an unrestrained domination of nature. A domination agenda seemed unproblematic given the continued belief in the sheer vastness and fundamental givenness of Earth's ecosystems, seas, and species. With public concern rising in the last half century about ecological degradation and potential climate disruption, Protestant, Catholic, and Orthodox Christians have sought to reemphasize the doctrine of creation and to reflect on God's and humanity's relatedness to the natural world. Stung by Lynn White's famous critique in 1967 of Christianity as the most anthropocentric and ecologically-unfriendly of all religions, many Christians today are trying to recover a sense of nature's holiness so as to help inspire a greater commitment of care for the Earth. Protestants gain inspiration in reexamining the stress on the ordering of creation found in the writings of such giants as John Calvin

and Jonathan Edwards, while Orthodox thinkers turn to Maximus the Confessor, Gregory of Nyssa, and other Patristic Fathers for insight. Like the Orthodox, many Catholics are recovering a sacramental understanding of the natural world and turning to the legacy of creation-oriented thinkers like Francis of Assisi and Hildegard of Bingen for inspiration. Likewise Catholics find Thomas Aquinas's emphasis on the priority of the "common good" of the "community of the universe" as a helpful guide for reflecting on our new ecological responsibilities (see Schaefer 2011).

In the last two decades many Catholic bishops' conferences in a number of countries have promulgated pastoral letters on a range of ecological concerns even as Pope Francis in 2015 promulgated a powerful encyclical *Laudato si'* (On Care for Our Common Home) stressing both the urgency of our responsibilities to mitigate climate change and ecological degradation and our obligation to respond to the needs of the world's poor (Pope Francis 2015). Francis's encyclical is the first ever to engage ecological and climate change concerns as a central priority of Catholic ethics. Happily Francis's encyclical sought to lend moral support to the United Nations Climate Summit process that was attempting at Paris to overcome twenty years of international stalemate. The Paris Summit was successful in forging a historic agreement in which all nations have pledged to impose caps on fossil fuel consumption and timetables for compliance. But this international effort is only beginning and it will demand much effort to overcome the political power of oil and coal interests that wish to protect their profits and business agendas. Many Christians accept the need to recover the stewardship ethic stressing our responsibilities of care owed to the rest of the non-human natural world. There are two distinct schools of stewardship thinking. Some espouse a creation-centered stewardship ethic that condemns anthropocentrism for its exclusive moral concentration on the value of the human and its reductionistic assessment of the rest of nature as a field of objects or resources for human use. In the creation-centered view, animals, plants, and ecosystems must be recognized as "ends-in themselves" possessing dignity and intrinsic value independent of their usefulness to humans. Others hold that the problem lies not so much in our human-centered traditional ethical scale of value but rather in our failure to incorporate an ecological understanding about humanity's dependency on nature into our accounting of human well-being and self-interest. If sufficiently informed by ecological data, traditional anthropocentrism, can quite directly ground robust moral arguments for environmental protection (see Brown 2009).

Some thinkers worry that the stewardship tradition, even in its creation-centered variant, places too much emphasis on human superiority and agency. They affirm an ecocentric ethic that embraces a more egalitarian view of humanity and the rest of nature as members of a common Earth community. However, the stewardship approach has important strengths and can be articulated so as to stand guard against arrogance. Today humanity, for better or worse, is, in fact, the dominant force shaping the destiny of the climate system and all ecosystems and wild species around the world. The creation-centered stewardship approach rightly emphasizes the powers of human agency that differentiate us from the rest of nature. It also acknowledges the responsibility that humanity now bears for restraining human practices that promote ecological degradation and climate disruption.

A number of Christian thinkers and activists find the notions of "animal rights" and "biotic rights" drawn from current debates in environmental ethics helpful for emphasizing the intrinsic value of non-human living species and our obligations of care owed to them. Increasing numbers of Christians are considering vegetarianism out of a desire to reduce the suffering of animals caused by the factory farming system and to mitigate the often heavy ecological toll that expanding cattle herds and pig farms entail

(Linzey 1994, 3–27, 125–137). Many believe that the intrinsic value and “rights” of all living things must be recognized even as we must acknowledge gradations of value existing across the range of living species due to markedly differing levels of capacities for experience, consciousness, and agency. Many reject anthropocentric ethics as deeply flawed, but accept that in forced-choice cases the life of a human or a primate may appropriately be given moral priority over that of “lower” animals (see Nash 1991, 181–183).

Many thinkers now are trying to ecologize the traditional Christian emphases on love and justice. The ethical stress on “love of the neighbor” has long been understood to push for direct concern and care beyond the narrow confines of self-concern or concern for one’s family or group to all human beings, especially those in need. Today increasing numbers of Christians believe that neighbor love requires an ecologically-broadened sense of community with a widely expanded recognition of those “neighbors” who deserve our concern and care. Our neighbors, in this view, are not just humans of this generation, but animals, whole ecosystems and future human and nonhuman generations.

Many Christians with a commitment to social justice worried that the emerging environmental movement might pull attention away from the needs of the poor and oppressed. However, most social activists have come to see that ecological damage tends to hit the poor and oppressed hardest even as environmentalists have come to articulate more clearly a concern for human communities as well as for the natural world. In the 1970s and 1980s, the National Council of Churches and the World Council of Churches began to call for “eco-justice” to underscore the strong link between environmental sustainability and social justice (Hessel 1992). Eco-justice expands the range of the application of justice by considering obligations to future human and nonhuman generations. Pope Francis’s encyclical *Laudato si’* (On Care for Our Common Home) similarly stresses that it is urgent that Christians mobilize to protect the natural world and mitigate climate change and protect biodiversity even as all must step up efforts to help ease the suffering of humanity’s poor and oppressed. The two concerns are intertwined in what he calls “integral ecology” (Pope Francis 2015).

Christian feminists and liberation thinkers have made important contributions by stressing linkages between social injustice and ecological degradation. Many feminists argue that sexism and anthropocentrism draw mutual support from an historically entrenched set of hierarchical value rankings that justify the domination of women and of the natural world itself. Many Christian feminists call for an “ecofeminism” that affirms both the full humanity of women and the intrinsic value of all of creation (see Ruether 1983). Likewise, liberation theologians in Latin America, Africa, India, and the Philippines are now incorporating a concern for ecological well-being into their social and political analysis.

At the grassroots level an impressive number of Christian organizations around the world are now committed to promoting ecological sustainability. The National Religious Partnership for the Environment, the North American Coalition for Christianity and Ecology, the Catholic Climate Covenant and the Evangelical Environmental Network are among a host of religious organizations in North America dedicated to promoting ecological responsibility. In Australia Catholic Earthcare works for ecological protection while in the Philippines Colombian priests and nuns have been active in promoting sustainable development and resisting deforestation. In Africa, the Association of African Earthkeeping Churches is made up of 150 churches who have joined to fight forest clearing and habitat destruction. A rich array of similar ecologically-oriented Christian organizations exists throughout Europe, Latin America, and in parts of Asia.

Hinduism

Bounded by the Indian Ocean, the Rajasthan Desert regions to the west, and the majestic Himalayan mountains to the north, the land of India has witnessed the development of a remarkable civilization and set of religious traditions. Sadly Hindu communities across India today face firsthand profound ecological challenges. Delhi's air pollution is among the very worst of all global cities. Rising population and intensive agriculture are drawing aquifers down rapidly across Northern India cutting the ability to irrigate fields and to sustain families. Himalayan glaciers are melting back and that threatens the irrigation capacities downstream in the decades ahead. The habitats of tigers and elephants have been severely reduced. And climate change threatens to destabilize the monsoon rains that have played such a huge role in sustaining the villages and cities across India down through the millennium.

Western scholars once tended to depict Hinduism as essentially otherworldly in orientation. More recent scholarship – both Indian and Western – has depicted Hinduism as essentially eco-friendly due to its affirmation of the divine presence in the world and the preponderance of devotional (*bhakti*) rituals and practices involving plants, natural elements – water, earth, fire – and animals. Both depictions oversimplify. Clearly the traditional Hindu emphasis on *dharma* and the tradition's numerous devotional practices offer elements that *can* support the development of a Hindu ecological ethic. However, Hinduism's stress on *moksha*, spiritual liberation, continues to pull attention away from the embodied world and its material problems. Furthermore, although rituals may employ natural elements or honor holy trees, plants, or locales, and certain passages in sacred scriptures may refer to the sacredness of embodied reality, we should not assume that such practices and texts necessarily relate to ecological concerns or promote a sense of ecological responsibility (Narayanan 2001, 202, 188).

Clearly some values present in Hinduism are quite compatible with an ecological ethical agenda. An emphasis on *ahimsa* or non-violence, for example, has ancient roots in South Asia and has influenced the development of Hindu sensibilities. Even though vegetarianism is strictly prescribed only for Brahmins, ascetics, pilgrims, or residents of sacred cities or regions, Hinduism sustains a general respect for vegetarianism that is lacking in most cultures around the world.

Hindu belief in reincarnation grounds an understanding of the self that is different from the stress on the individual that is so prominent in contemporary Western cultures. Reincarnation understands the self as existing in a fluid medium of life across countless modes and forms of being and existence, including animals. Hindus generally consider human life to be superior to animal life, but the greater suffering of animals can inspire compassion instead of arrogance or callousness. While Hinduism embraces diverse understandings of *karma*, most share the view that actions that purposefully cause harm to others brings negative consequences for oneself when one is reborn. This religious sensitivity to the chain of cause and effect can be directly ecologized to promote an ethical concern to anticipate the chain of effects from current actions and to seek to restrain practices that threaten future environmental degradation (Dwivedi 2000, 14–16; Coward 1998, 41–45).

Other traditional Hindu ideals and values offer potential support for ecological concern. The *Upanishads*, one of the oldest layers of Hindu scripture, emphasize the existence of an ultimate reality, Brahman, which underlies and infuses all that exists. Spiritual disciplines described in these texts promote the discovery that at one's core lies a spiritual essence or soul, Atman, and that Atman and Brahman are one. "Self-realization" means becoming aware that the true "self" is co-extensive with the entire

universe of being. This monistic vision places a “potential curb on the desire to oppress, manipulate or dominate other beings” (Kinsley 1995, 63). Others note parallels between the Hindu emphasis on *dharmic* order and environmentalists’ stress on the need to promote ecological sustainability. Some point in particular to Hindu scriptures that condemn the needless cutting of flowers, plants and twigs, the harming or destroying of animals, or the polluting of rivers as evidence of a traditional linkage between notions of *dharma* and care for the natural world.

Vishnu is especially associated with maintaining *dharmic* order, and the Vaishnava tradition affirms a story rich with ecological implications. Vishnu is said to have saved the world when it was dragged beneath the ocean by a demon. Vishnu assumed the form of a great boar, battled the demon, and killed it. He then dove to the bottom of the ocean, raised the Earth up in his tusks, and laid it out as it is today. Some hold that Vishnu’s devotees today must act as Vishnu did to save the Earth (Mumme 1998, 154). Indeed, all across India, the Earth is revered as a mother goddess, known variously as Bhu Devi, Bhumi, Prithivi, Vasudha, Vasundhara, and Avni.

Hindus believe that India constitutes a “sacred geography,” with a profusion of sacred sites that are said to manifest the presence of the divine in the embodied world. Across India reverence is given to numerous sites, including cities, forests, and mountains. Certain natural places and cities, like Benares, are said to be *tirthas*, sacred fords or “crossings,” where the Divine “crosses over” into the world. Some sites are revered as *dhams*, special divine abodes rendered sacred long ago by the actions of deities or by the contemplative energy of ascetic sages. Major *dhams* lie in India’s north, south, east, and west marking the entire land as sacred (Eck 2012, 1–42).

Many rivers, like the Ganges, the Yamuna, and the Narmada, are revered as goddesses, but that does not stop cities, towns, and factories from daily dumping raw sewage and industrial waste into these sacred waters. A number of religiously based organizations have taken real leadership roles to address the problems of water pollution and the lack of sewage treatment. In 1982 in Benares, for example, Veer Bhadra Mishra, a *mahant* (a religious and administrative head) of one of Benares’s major temples, the Sankat Mocan Temple, joined with others to launch the Clean Ganges Campaign. This effort helped inspire Rajiv Gandhi, India’s prime minister, in 1986 to develop the Ganga Action Plan to initiate sewage treatment and pollution prevention along the length of the great river.

Hinduism likewise has historically affirmed the need for forest and tree protection. The laws of Manu condemned the cutting of trees and a number of sources emphasize that one of the important duties of kings is to protect the forests. Today a number of efforts draw inspiration from this heritage of tree protection. In Rajasthan, for example, one can visit villages of the Bishnois people and see how they continue to protect wildlife and trees in keeping with the religious tenets that their founder set down five centuries ago (Dwivedi 2000, 16–17). Likewise in South India, the administration of the Venkateswara (“Lord of Venkata Hills”) Temple at Tirumala-Tirupati has embarked on a sustained effort to help educate people about the ecological benefits of planting and protecting trees. This temple is the most visited and richest temple in India and its educational efforts are widely noticed.

But India’s most famous forest protection effort surely is the Chipko Movement, begun in Uttarakhand, a Himalayan district. Community groups in 1973 began to fight for their traditional rights of forest usage and to resist large scale lumbering projects. Inspired by a Gandhian activist, they adopted a stance of nonviolent resistance and employed the tactic of hugging trees to protect them from lumbermen’s axes and saws. Chipko means to “hug” or “embrace.” Success spread their message and the movement spread

across the region. Chipko efforts eventually forced the government to enact a moratorium on large-scale lumbering even as the movement came to promote appropriate development across the region (see Guha 1991).

Sunderlal Bahuguna, one of Chipko's leaders, connects the dangers of deforestation to an ancient story. In it the goddess Ganges tells that her fall from heaven will bring a pounding flood and massive destruction. But Shiva agrees to prevent this by breaking the falling rush of water by catching it in the matted locks of his hair. Shiva's action turns destructive floods into calm life-giving currents. Bahuguna and others believe the forests of Himalaya are Shiva's locks, slowing monsoon rain and snowmelt runoff, and thereby preventing flooding and securing valleys and villages. Deforestation, Bahuguna warns, cuts Shiva's hair and insures the destructive floods about which the ancient story gave warning (James 2000, 519–520).

While Hinduism's rich array of devotional practices and its emphasis on *dharma* clearly offer resources for inspiring care for the natural world, certain Hindu beliefs and practices tend to block a widespread emphasis on ecological responsibility. Three such obstacles are readily apparent. First, the stress on *moksha* in various streams of Hindu philosophy sustains an otherworldly orientation that holds the affairs of this world, such as ecological degradation, as ultimately unimportant. Second, while the reverence for the Earth Goddess, Bhu-Devi/Prithvi, is inspiring, she is outranked in the Hindu pantheon by Sri/Lakshmi, the first wife of Vishnu and the Goddess of "wealth and good fortune." In Hinduism, as Vasudha Narayanan puts it: "[T]he Earth Goddess faces some very stiff competition" (Narayanan 2001, 198). Like Christianity, Hinduism has many popular beliefs that encourage the pursuit of wealth and acquisition, not simple living, frugality, and conservation. Third, many assume that Hinduism's affirmation that parts of nature are sacred predisposes Hindus toward an ecological ethic. But it is far from clear that a sacralized understanding of nature by itself necessarily leads to such an ethical stance. The popular emphasis on the very greatness of the Earth Goddess, Bhu-Devi, or India's various river goddesses actually often appears to undercut a sense of responsibility for pollution control or environmental protection. As ecologists insist the rivers are vulnerable, polluted, and in need of human help, many Hindus respond that the rivers are divinely powerful, able to absorb and destroy all pollution, and that it is we humans who need the help of the sacred rivers (see Nagarajan 1998, 285–286). While environmental groups along the Ganges and Yamuna Rivers try to promote concern for the physical cleanliness of the waters as an act of religious respect, many Hindus continue to see little relationship between religious and environmentalist concerns (see Alley 2000, 357–359, 379–381).

Conclusion

Powerful forces of human production and consumption have been unleashed in the last century which are having alarming impacts on all ecosystems, all human communities and climate stability. We now have entered the sixth great extinction event and now face the potential threat of catastrophic climate change.

While many Christians try to recover a sense of the sacredness of nature, Hindu practice reminds us that an affirmation of nature's sacredness does not necessarily promote a sense of ecological responsibility. Hinduism's best potential for developing a vital ecological ethics appears to lie in linking ecologists' analyses about ecosystem degradation to the tradition's nature-oriented devotional practices and its

emphasis on sustaining the *dharmic* order. Christianity's main resource for ecological ethics appears to be the expansion of the requirements of love and justice expressed in an ethics of stewardship. While the critique of anthropocentrism is well founded, it is important to acknowledge that human-centered ethical appeal, when informed by ecological data, has in fact been a main force in the passage of environmentally oriented legislation and environmental protection policies. While anthropocentric and ecocentric ethical appeals are usually viewed as antagonists, they often function as allies in environmental policy debates. When one wants to save the planet, one should welcome any allies one can find. There is a festival every year in Puri on the east coast of India in which thousands of worshipers pull through the streets a giant wooden cart bearing an icon of the God Jagannath, the "Lord of the Universe." When the British colonized India they were appalled to see devotees throw themselves under the cart attempting to die in sight of their God. This festival gave birth to the English term "juggernaut," meaning the irresistible force of an immense body in motion with vast destructive power. Today rising human population coupled with the expanding power of the global economy and rising consumer expectations constitutes a true juggernaut that threatens many of Earth's species and ecosystems. The stakes involved in our emerging ecological drama are of such magnitude that the securing of Earth's ecosystems and climatic order must be recognized as one of our generation's top religious and moral priorities. As Thomas Berry rightly notes, each age is called to its "great work" (Berry 1999). Care for the Earth and its array of species – both human and nonhuman – is surely ours.

CHAPTER 135

Global Dynamics

Sallie B. King

Globalization

Globalization is metaphorically explained as the “shrinking of the world.” As a descriptive term, globalization refers to the ongoing development of ever more extensive and profound interdependence among the countries, economies, cultures, physical localities, and peoples of the world. Though humankind has seen other times of heightened interdependence (during exploratory, imperial, and colonial eras), the current period of globalization, in the late twentieth and twenty-first centuries, is unique in three respects: (1) it is primarily propelled not by political and military power, but by economic and technological/communication forces; (2) the extent of its reach is virtually planet-wide, as opposed to regional; and (3) it undermines the power of the nation-state – even the most powerful states must accommodate themselves to the imperatives of international trade or suffer the consequences.

One of the problems posed by globalization has to do with concern over the potential “homogenization” of global culture. With the English language, blue jeans, McDonald’s, and American movies almost everywhere, globalization seems to be a threat to cultural diversity. Non-dominant cultures seem similar to endangered species, and they have a consciousness of being so. Like an endangered species, the loss of an endangered culture, while worst for itself, would be a loss for humanity. From an instrumental perspective, a culture is a resource for humankind, with potentially valuable resources of wisdom, insight, perspective, lifeways, etc. From a global perspective, it is part of our human heritage. Clearly, some elements of the many cultures will not be of future value and some are reprehensible. However, in the case of cultures whose mores do not violate emerging global norms, contemporary ethical thought cannot justify their demise. Those who admire human cultural creativity and value its flourishing can only mourn the potential widespread and sudden demise of its creations, especially since this potential demise bears no relation to a given culture’s inherent worth. What might be done to retard the loss of cultural diversity is an urgent but most difficult question.

Identifying Common Values

Despite the threat to diversity posed by globalization – and conscious of that threat – many people have come to believe that it is important to make a concerted effort to identify points of unity among the peoples of the world, in particular, points of unity on values. Inasmuch as globalization refers to the increasing interdependence among the countries and peoples of the world, it is clear that people share problems and opportunities with each other to a greater degree than was previously the case. Threats of nuclear holocaust, transnational terrorism, global climate change, and the AIDS epidemic, as well as opportunities with problematic implications such as international trade, cannot be resolved by countries working independently. Nor can we recognize and agree upon what *kind* of resolutions would be good without an explicit set of shared ethical values.

Are there absolute norms that transcend the views of particular cultures and religions? How would such a view be justified in an age in which we seem ever more pushed towards relativistic views? In the past, many a particular civilization has claimed its own values to be absolute and by virtue of its power imposed them on others. On the other hand, how is it that even those who generally deplore “cultural imperialism” celebrate the end of *sati* in India (prohibited by what was clearly an imperialistic act) and of apartheid in South Africa (to which globalization helped to bring an end)? Perhaps there are some culture-transcending, if not “absolute,” norms. But even if that were the case, how could such culture-transcending norms be globally embraced without threatening the diversity of particular cultures?

Important advances have been made on these issues in the past two decades. In *Common Values* Sissela Bok argues for a “minimalist” set of values based upon the observation that certain behaviors are necessary in order for any society of people to survive. Specifically, all societies, in order to survive, have had to (a) require of its members some positive duties of mutual support: duties to care for children and the sick, the duty to honor and obey parents, and a general attitude of reciprocity within the group, expressed in a negative or positive form of the Golden Rule (“do unto others as you would have others do unto you”); (b) prohibit certain actions which, if allowed, would destroy society, especially violence, deceit, and theft within the community; and (c) establish fair procedures for resolving conflicts (Bok 1995). For Bok, these together establish a minimal set of common values found in virtually all cultures, by virtue of their necessity.

Other thinkers nuance the idea of shared values by distinguishing between the core area of ethical agreement, where cross-cultural unity is strongest, and the marginal area, where disagreement is common (see Adams 1993). Thus while the general principle that lying is wrong is found in virtually all cultures and virtually all cultures insist upon its importance in such core contexts as legal disputes, in the marginal area of the “white lie” there is neither agreement among cultures nor strong insistence within a culture on conforming behavior. Similarly, affirmation of the general principle that killing within the group is wrong is near universal, but on matters such as capital punishment and euthanasia there are disputes. We should bear in mind this clarification when considering lists of cross-culturally affirmed common values.

International Human Rights

The international community has been debating questions of common values, values shared by all humankind, quite intensively since the end of World War II. In these discussions, the United Nations, first, and the Parliament of World Religions, more recently, have played key roles.

The United Nations was created in an effort to help strengthen international understanding and cooperation. One of its early acts (1948) was to proclaim the Universal Declaration of Human Rights (UDHR). It has become the gold standard for internationally recognized and accepted (if not always acted upon) global norms of behavior. These are expressed in a set of specific “human rights and fundamental freedoms” that are to be respected by all peoples and all nations. The UDHR does not claim that its norms are metaphysically absolute. It states that respect of its norms is necessary for humankind to live together in something approaching a peaceful way. In its preamble, the UDHR declares these rights and freedoms for pragmatic purposes: to promote the development of friendly relations between nations; to avoid the violence to which people will sooner or later turn if their basic rights and freedoms are ignored; and, significantly, because to “enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people.” Here an empirical claim is made that the people of the world want these protections.

The UDHR has been challenged as a form of cultural imperialism. The idea of a “right” is undeniably a product of Western culture; such an idea does not exist in traditional Asian thought, for example. It has been recognized that representatives of Western countries played the dominant roles in drawing up the UDHR. However, these have not proven to be fatal objections. Subsequent international documents drawn up under the auspices of the United Nations have emphasized social and economic rights and the group rights of entire peoples. The meetings that produced these subsequent documents emphasized the full participation of the greatest possible diversity of peoples and countries. The documents themselves reflect not only the interests of poorer countries, but also the worldviews of cultures with less stress on individualism.

Early in the 1990s Lee Kuan Yew of Singapore and Mahathir Mohamad of Malaysia ignited debate with their claim that the idea of international human rights is a Western idea that emphasizes individualism and promotes adversarial relationships. Asian societies, they held, place greater emphasis on social harmony and communitarian values. As a response to this challenge, a number of Asian political and social activists denounced the claim that so-called “Asian values” are incompatible with international human rights.

Activists like Aung San Suu Kyi and many others dismiss claims that “Asian values” are incompatible with international human rights as no more than efforts by authoritarian rulers to reject challenges from the international community to their power. Most scholars agree. It remains true that the concept of a “right” is a culturally embedded concept that is alien to many cultures. However, different cultures can and do find ways in their own language and concepts to justify embracing the protections represented by international human rights, protections that those lacking them very much want. Thus, a popular song from the streets of Burma contains the lyric: “I am not among the rice-eating robots ... Everyone but everyone should be entitled to human rights” (Suu Kyi 1991, 174).

International human rights are quite narrow in scope. They prohibit certain egregious kinds of harm and urge certain specific acts of beneficence; beyond this, international human rights make no claims upon governments, cultures, or people. Thus a country that engaged in *sati* or apartheid would in those respects be in violation of international human rights and subject to possible sanctions from other countries. Simple variations in belief or practice that are non-violent and non-oppressive have nothing to fear from international human rights instruments. The latter represent no threat to cultural diversity, other than forms of diversity associated with violence and oppression.

Global Ethic

The Parliament of World Religions, like the United Nations, is both a product and an agent of globalization. Older than the United Nations, the Parliament of World Religions first met in Chicago in 1893, a milestone globalizing event in which, for the first time, representatives of each of the world religions spoke for themselves on an equally shared platform. In 1993 a centenary celebration and second gathering of the world's religions was held, again in Chicago, and at that time the Parliament was put on a regular footing, with meetings to be held once every five years, in different places around the globe.

In preparation for the 1993 Parliament meeting, Hans Küng was asked to oversee the preparation of a draft of a Global Ethic that could be endorsed by representatives of all the world's religions. The draft was based upon input from a great diversity of religious representatives and adjusted after extensive consultation with a separate set of diverse religious representatives. This draft was approved at the 1993 Parliament as a Declaration "toward" a Global Ethic.

There is significant overlap in content between the Global Ethic and ideas about common values. In the declaration of the Global Ethic, the Parliament affirmed general beneficence, referring to the ubiquity of the Golden Rule. The Global Ethic renders this as its "fundamental demand": "Every human being must be treated humanely." There follow four "irrevocable directives": from the many religions' ethical codes' prohibitions of killing comes "commitment to a culture of non-violence and respect for life"; from prohibitions of stealing comes "commitment to a ... just economic order"; from prohibitions of lying comes "commitment to a life of truthfulness"; and from prohibitions of sexual immorality, "commitment to a culture of equal rights and partnership between men and women" (Küng 1996, 15–25). These principles should be understood as affirmations of core values, bearing in mind the distinction between core and marginal values mentioned above.

From the beginning, the Global Ethic was conceived not as an external ethical standard to be imposed upon the various religions, but simply as the identification and articulation of the area of moral agreement that already exists among them. It is recognized that it will need to be supplemented by the ethical codes of the religions, rich in narratives, symbols, and ideals. Even so, the Global Ethic is empirical evidence indicating a core area of norms in which the many religions agree with each other. This agreement is put forward by the promoters of the Global Ethic as evidence counting against ethical relativism. Of course, the fact that many religions seem to agree on certain norms of behavior is in fact no evidence that those norms are right in an absolute sense. However, such agreement does provide welcome counter-evidence to the widely held *popular* view (which, while poor philosophy, is nonetheless very influential) that holds that since religions (and cultures) espouse different ethical views, there are no ethical norms that transcend religion and culture and therefore all ethical norms are merely relative to one's religion and culture. Moreover, it demonstrates in a concrete way to members of one religion that members of other religions hold views in common with them, thereby undercutting absolutist tendencies to think of one's religion as entirely right and in sole possession of Truth, others as entirely wrong (King 1998).

The Global Ethic has had its critics. Some have questioned whether the process of its composition was sufficiently inclusive of diversity. Fundamentalists and exclusivists, though invited, did not participate in the deliberations. Among its four directives, the "commitment to a culture of equal rights and partnership between men and women" has been most controversial. Such concerns as these are by no means fatal, but simply indicate that the Global Ethic needs to be subject to further discussion, as was the

UDHR. The result of further discussion in that case was the refinement of the original tenets and greater cross-cultural legitimacy. There is no reason to expect a different outcome for the Global Ethic.

These efforts at constructing common values or global ethics by the United Nations and the Parliament of World Religions take an empirical and pluralistic approach. Their approaches begin from diversity and seek to discover points of overlap or agreement. In retrospect, this move seems inevitable. How, after all, would it be possible to take a non-empirical approach to the effort to construct a global ethic? Any such approach would necessarily entail some metaphysical assumptions which would inevitably privilege one or some worldview(s), religion(s), and culture(s) over others. Any such approach would be guilty of a pernicious and hegemonic absolutism.

The Challenge to Universal Benevolence

In addition to the precepts and prohibitions that we have been discussing, religions also hold up ethical *ideals* to which they urge their followers to aspire. These are often understood to be at a level of perfection which one may never expect fully to realize, but to which, nevertheless, one aspires to become ever more faithful, or to embody ever more fully. Such ideals in many religions prominently include the ideal of benevolence.

Benevolence is not what it used to be, though. Try to hold to universal benevolence in the context of the contemporary, globalized world, in which, thanks to modern electronic communications and media, we now know current events virtually everywhere in the world. Try to hold to universal benevolence in a world in which, according to current World Bank figures, approximately 24 percent of the world's population (46 percent in sub-Saharan Africa), or 1.2 *billion* people, live in absolute poverty – a figure rejected as too conservative by many observers (World Bank 2002). Hold to universal benevolence in a world in which one's life expectancy varies by decades depending upon the country in which one is born. Think universal benevolence with respect to the urban slums of the Ivory Coast of West Africa, where the population is growing annually by 3.6 percent, meaning that the population will rise from 13.5 million people to 39 million by 2025, much of it living in new urban slums (Kaplan [1994] 2000, 38).

What does universal benevolence tell us to do in this world? What guidance do the ethical teachings of our religions give us? If we try to think seriously about the massive problems facing humanity, an ethic of universal benevolence seems to point in a direction that cannot possibly be fulfilled. Must we resort to triage like those development planners who see some countries as so vastly impoverished, so deeply in debt, so ruined ecologically, so lacking in resources and prospects that they write off the entire country as literally hopeless? If we write them off, what becomes of our humanity? On the other hand, what else can we do but put our resources where they can be of best use? Can our religious ethics help us to think through these dilemmas?

Some religious ethics emphasize justice; others, notably the Buddhist, emphasize compassion. Do these two approaches point us in different directions in the globalizing world? Let us consider. Perhaps we think it straightforward to draw distinctions between ideals and duties; specifically, between caring (or compassion) and responsibility. Traditionally, many religions and moral traditions saw responsibility stopping at the borders of "one's own" community. We may *care* about the whole world and cherish the ideal of serving all humankind, but we only have a *duty*, it seems, to take care of those closest to us.

In this view, as one moves concentrically farther and farther from one's immediate circle one seems to move from a duty of beneficence – a responsibility to act for the good of others – to a vague ideal of benevolence, good will to all. There are strong pragmatic and socio-biological reasons for this view. But even in this version there is no clear line between duty and ideal; each seems to fade into the other as one biologically *is* and emotionally *feels* less and less close.

The reality of globalization is precisely this: our idea of who is within “our community” is changing. Today the questions “Who is my brother? Who is my neighbor?” become more and more urgent, the answers less and less clear. If I have traveled, I may care as much about people in another country where I have spent time as I do about people on the other side of my own country. Do I have greater responsibility for people at a distance if I care about them more? If globalization is making us see as artificial such things as national borders, shall we ultimately agree with the Dalai Lama, who argues that globalization is making it easier for us to realize that the lines we human beings have taken as dividing us have always been imaginary, that we always have had a duty to all humankind, and that we should embrace the “universal responsibility” to contribute to the happiness of all humankind (Dalai Lama 1999)?

To the question, “Am I my brother's keeper?” (Genesis 4:9) shall we respond: Can you bear not to be? Since World War II and the Nazi Holocaust, we feel a great urge – a moral duty even – to intervene for humanitarian purposes to prevent the slaughter of innocents in civil war, to stop “ethnic cleansing” and genocide. *Is this our duty, or just an ideal, which we might or might not embrace in a given case?* Perhaps we do see intervention to prevent genocide as a moral duty. Does similar thinking extend to intervention in economic crises which may likewise kill, gravely injure, and uproot vast numbers of people? What about non-crisis situations? John Cobb (2002) argues that the global economic system does daily, systematic violence to the poor, to human community, and to the natural world. If he is right and the global economic system itself is violent, does our moral duty extend to changing it?

Virtually everyone reading these words is a “global winner,” one who by virtue of birth in a prosperous country faces continuing prosperity as globalization proceeds. The “global losers,” those born in one of the many impoverished, indebted countries, face miserable prospects. Do we “global winners” have a *responsibility* to help the “global losers,” since our “winning” has nothing to do with our inherent worth or hard work? Or is such help just an optional good act? Many wealthy countries have programs to help those of its own citizens who, by virtue of birth in a poor family or a race that has been historically oppressed, face a sharply disadvantaged start in the competitions of life; in the United States there are Head Start, welfare, Affirmative Action, federal small business loans, and much more. Many believe that justice requires this of the state. As the world becomes ever more closely interdependent and national boundaries less and less meaningful, will the “global winners” come to feel that justice requires intervention in much more significant ways than heretofore in the plight of the “global losers”? Should they? The question is where to draw the line between “us” and “them” – if, indeed, we can justify drawing it anywhere.

Some institutions, in fact, do not draw the us/them line anywhere. Certain non-government organizations, such as Oxfam and Doctors Without Borders, focus on a single issue and regard it with a globalized perspective that recognizes no real lines dividing humankind. They seem to answer the Dalai Lama's call for “universal responsibility.” Motivated by and initially defined in terms of compassion, experience led them to recognize and act on the need to extend compassion into the realm of justice – Oxfam now works to change world trade rules that favor the rich; Doctors Without Borders challenges the economic, political, and military rules that prevent equal access to healthcare. Here, justice ethics – minimally, the

ethic of distributive justice – blends with the ethics of compassion. Moreover, at least in these cases, while the task of compassion alone (feeding or healing the world) is infinite, if the rules could be changed to become more just, the task might become possible, though vast. Thus, in the globalized world, skillful compassion may require justice – while sufficient will to change the rules and produce justice will surely require tremendous compassion. Justice and compassion, it seems, are both necessary parts of the picture.

When asked for his advice on what to do about global suffering, Buddhist teacher Thich Nhat Hanh emphasizes that we should not turn our eyes and ears away from suffering, but stay with others' suffering, be present to it, and then some response will come to us; we will feel an imperative to act. Perhaps it is here that compassion ethics and justice ethics meet. Perhaps it is when we feel that we cannot bear to see others suffering that we have a responsibility to take action to help them – a responsibility to our own humanity as well as a responsibility to others. If that is the case, then the Dalai Lama is right: any lines we try to draw to limit our compassion, our responsibility, are artificial. If that is right and our compassion points to a universal responsibility, then our compassion seems to necessitate, minimally, striving for distributive justice. Thus compassion comes to embrace justice without losing its character as compassion, while justice finds its roots in compassion.

CHAPTER 136

Technology

Gerald P. McKenny

What is Technology?

What challenges does technology pose to religious ethics? The very question points to our contemporary historical and cultural situation. Technology poses the challenge to religious ethics, not vice versa; religious ethics must answer for itself – prove its legitimacy or its efficacy – in the face of technology. But what is technology? And how has it come to place religious ethics in the position of the addressee of a challenge?

In its precise sense “technology” refers not to every human-made device or process, or to the history or theory of such devices and processes, but rather to a complex phenomenon created by the union of scientific knowledge with what were once called the “useful arts,” the “mechanic arts,” or simply “art.” Historians of technology often trace this union to the nineteenth century, when the systematic deployment of scientific knowledge in the service of technical invention and innovation began (see Marx 1997; White 1967). By contrast, many philosophers of technology argue that early modern science is already implicitly technological by virtue of the way it orders nature (see Arendt 1958; Gehlen 1980; Heidegger 1977; Jonas 1974). But regardless of when it began, technology is the product of this union of science and “art.”

Technology, then, belongs to the modern world with its profound effects on traditional patterns of thought and conduct, authority and community, meaning and identity. Hans Jonas summed up the problem of technology for ethics in two observations. First, whole regions of existence that for pre-modern moral evaluation simply formed the unalterable background of the moral life, are now susceptible to deliberate human action and thus subject to ethical evaluation. Second, traditional moral evaluation presupposed the constancy or repetition of conditions subject to ethical judgment and choice. Modern technology, by contrast, overwhelms our established moral categories with problems and situations that are wholly unprecedented (Jonas 1984). In these respects technology seems not only to confirm but also to be paradigmatic of the self-understanding of modernity as a radical break from tradition. So understood, technology poses a considerable challenge to religious ethics, for it requires an altogether new kind of ethics, one that is discontinuous with traditional, including religious, forms of ethics.

Technologies and Technology

We can distinguish between the challenge posed to religious ethics by particular technologies and the challenge posed by technology as such. In an obvious sense, technology consists of the devices and processes that arise from the union of science and art: the new software program, the new prosthetic device, the new method of inserting genes into plants, the new spy plane, the new satellite communications system, and so forth. Here, ethical reflection on technology attempts to inscribe new technologies, or technological progress in a certain field, into an existing framework of natural or religious law or a set of religious beliefs.

Two things can be said of the voluminous literature on religious investigations into particular technologies like these. First, this literature refutes the claim that technology renders traditional forms of religious ethics obsolete. It is impossible to give an account of Jewish and Christian ethics in the past century without treating their extensive engagements with technologies, especially in the domains of medicine, sexuality, and war. It is true that these technologies often required significant extensions and reformulation of existing norms in these traditions. A good example is the impact of aerial bombing and mechanical respiration on the principle of double effect in Roman Catholic natural law thinking. But as that example indicates, technological novelties, unprecedented though they were, did not prevent traditions of religious ethics from dealing with them from out of their own resources. The mere existence of new technologies does not appear to render moral traditions or even the norms that comprise them obsolete.

Second, this literature is overwhelmingly Jewish and Christian. One reason for this is the nature of ethical reflection in these two traditions. In both traditions ethical norms are formulated in a context of textual learning, and a principal (though by no means the only) means of transmission of these norms is by public instruction and proclamation by recognized authorities. The casuistic and prophetic genres of ethics that have emerged in such contexts fit well into (and help to form) the discursive spaces in which technologies are typically debated and evaluated. Scholars of other religious traditions are now attempting to invent similar forms of argument on particular technologies (see Keown 1995; Nakasone 2000). However, it is not yet clear whether the insights of these traditions are best expressed in these dominant Western genres or whether instead such attempts deprive us of the challenge of a different way of addressing these technologies.

One could object that traditions of religious ethics accomplish the inscription of new technologies into their traditions only by ignoring technology as such or by treating the latter in a comparatively trivial sense. The case of Jewish and Christian analyses of human gene therapy is instructive (see McKenny 2000, 2002). These analyses show how gene therapy is analogous to conventional medical interventions and thus justifiable in principle, subject to the same conditions that govern other biomedical interventions. These conditions include informed consent, an acceptable risk–benefit ratio, justice in access to and allocation of treatment and research and in prioritizing gene therapy relative to other biomedical interventions, and so forth. Many Christian analyses rule out or express reservations over gene therapy research that involves non-therapeutic risks to embryos, while official Roman Catholic analyses also reject methods of gene therapy that would involve illicit forms of reproduction. Finally, there is often an effort to identify a limit to gene therapy – a characteristic or set of characteristics that should be off limits to genetic intervention.

It is striking how little reflection on technology as such occurs in these analyses. There is some reflection on technology as a form of human participation in the divine work of creation or as an anticipation of redemption in Christian analyses, or as a way of participating in the task of *tikkun olam*, healing or

restoring a broken world, in Jewish analyses. Less positively, in some (mostly Protestant) analyses technology is said to objectify human beings or reduce them to their constituent parts and to involve a potentially problematic control over nature – a central theme in treatments of biotechnology from a Buddhist perspective (see Barnhart 2000; Loy 2000). However, the nature of technology is left unexamined or is only superficially examined in these analyses. As a result, it is unclear whether and how technology can play the role, be it positive or negative, assigned to it. While these analyses prove that religious traditions can meet challenges posed by particular technologies, they do not prove that these traditions can meet the challenge posed by technology as such.

When we move beyond the devices and processes, the particular technologies, to consider technology as such we are faced anew with the claim that technology requires a new kind of ethics, one that is discontinuous with the ethics of religious and other traditions. But what does it mean to consider technology as such? Let us begin with Martin Heidegger's understanding of technology as the culmination of Western metaphysics, with its emphases on efficient causality and on the calculability of natural forces (see Heidegger 1977). Here "technology as such" refers to the disclosure of nature as "standing reserve" in which natural energies are unlocked, stored up, and distributed, and to the human subject as orderer of the standing reserve who stands in peril of being taken (and taking himself) as standing reserve, unreceptive to other ways in which nature might disclose itself. Two facets of this interpretation are especially significant: the notion of nature as standing reserve, and the recognition that technology is recursive – that it folds back on the subject such that the orderer of the standing reserve is also ordered as standing reserve. However, Heidegger's formulations belong to the machine age of technology, in which, as Arendt observes, nature is still used as it is given, however radically technology transforms it. This is the case with Heidegger's paradigmatic technology, the hydroelectric plant, and with his claim that technology discloses human beings as human resources. By contrast the kind of technology that occupied acute observers in the second half of the twentieth century (Arendt 1958; Gehlen 1980; Jonas 1984) does not work on nature as given but, as Arendt again observes, radically remakes nature (Arendt 1958, 147–151). The technological remaking of the external world in turn involves a much more radical recursivity. In Jonas' terms, "*Homo faber* is turning upon himself and gets ready to make over the maker of all the rest" (Jonas 1984, 18).

Theses About Technology

It is technology as the radical remaking of nature (including the human) that has posed the challenge to religious ethics since the mid-twentieth century. Ethical evaluation of technology since then has typically rested on three theses about technology, all of which are relevant to the question of whether we are in need of a radically different kind of ethics. These three theses, however, are all questionable in light of recent developments in biotechnology and information technology. To question these theses is to suggest that the need for a new ethics is exaggerated.

The Uniqueness Thesis

Modern technology is often thought to involve a kind of rationality (e.g. instrumental rationality) that is distinct from other kinds of rationality, or a kind of action (e.g. making) that is distinct from other kinds of action (e.g. doing). One result is that ethical rationality and action are often thought to be

entirely distinct from technological rationality and action. For example, Karl-Otto Apel and Jürgen Habermas sharply distinguish ethical or communicative rationality from instrumental rationality (Apel 1979, 1984; Habermas 1970, 1984). Following Max Weber, they describe a modern context in which value-free instrumental (i.e. technological and strategic) rationality is complemented by pre-rational convention (i.e. the contract) or decision. They worry that if rationality is value-free and value is pre-rational, there can be no rational validation of disputed ethical norms. Their respective solutions involve formulating a non-instrumental ethical rationality based on the conditions for the possibility of the discursive validation of disputed norms. What concerns us here is the assumption that technological rationality, which selects means to defined goals, is thoroughly distinct from ethical or communicative rationality. Similarly, Arendt and Jonas, focusing on action rather than rationality, sharply distinguish ethics and technology by appropriating Aristotle's distinction between doing (*praxis*) and making (*poiesis*). All of these theorists write in the shadow of what they see as a progressive displacement of other kinds of rationality and action by technological rationality and action. The ethical itself is threatened by technology.

The sharp distinction between technology and ethics can now be challenged from both sides. On the one hand, some technologies are not merely more effective means to a given end, and thus purely instrumental, but also play a significant role in forming ends. For example, selective serotonin reuptake inhibitors (SSRIs) were developed and marketed for treatment of clinical depression but soon became a popular way to alter personality (Kramer 1993). The point is not simply that an unintended goal emerged, but rather that SSRIs opened up a whole new kind of self-forming practice. Biomedical technologies help determine which aspects of ourselves – our personalities, bodies, capacities, and performances – we attend to in our self-forming practices; stimulate and direct desires for self-alteration; form our desires into deliberate projects; and bring certain features of ourselves and our activities to our attention while suppressing others. Technology in such instances is not merely a means to an end but also projects new ends, reshapes existing ends, orients us to both new and existing ends, and reorders priorities among ends. Similarly, networked computing is not merely a more effective way for people to communicate with each other but is also a self- (and other-) forming practice in which users create anonymous and pseudonymous personae and evolve new forms of linked community. Of course, technological and ethical *rationality* remain distinct in these cases. However, these cases indicate that technological means are related to ends in ways other than the efficacy aimed at in technological rationality. Where such relations occur, ethical rationality must take account of technology as a kind of pre-rational ethical self-formation.

On the other hand, we can also understand ethics as a kind of technology, at least by analogy. Pierre Hadot and Michel Foucault have drawn attention to ethical activity as a technique or set of techniques of self-formation (see Hadot 1995, 81–144; Foucault 1985, 25–32; 1997, 223–251). The end of ethical activity (*praxis*) is not simply to act well; it is also to make something distinct from the activity itself (*poiesis*). As with technology, the self and its relations to others are a work, the product of deliberate fashioning through cognitive and disciplinary practices.

These comparisons do not suggest that technology and ethics are the same. Technology is concerned with means, however complex their relation to ends. Only ethics critically evaluates proposed ends and deliberates over what rightly pertains to an end. However, despite these differences technology sometimes operates as a kind of ethical self-formation and some kinds of ethical action are analogous to technology. This is sufficient to call into question the uniqueness claim.

The Inevitability Thesis

Technological progress is often thought to be inevitable. According to one theory, technological inevitability occurs through the force of biological need. Marx and Engels describe a process by which the activity and instruments used to satisfy the initial human need to meet the conditions of material life themselves become needs demanding satisfaction (presumably by additional activities and instruments) (Marx and Engels 1970, 48ff.). For Gehlen, technology expresses an instinctual human need to render the environment stable (1980, 16–19). According to another theory, technological inevitability is a kind of metaphysical force. Jonas, for example, describes the irreversibility, cumulativeness, irresistibility, and self-perpetuating character of technological practice and decries the “automatic utopianism” which it forces on us even apart from our desires (1984, 7, 21, 127ff., 140ff., 203). Where these inevitabilist terms prevail, ethical discourse on technology oscillates between a wistful near-resignation in the face of a totalizing force and a determination to gain control over the latter (resignation and control being perhaps the two principal ethical modalities of the West). Criticism of the notion of the inevitability of technology is now prevalent among historians of technology (see Winner 1997). However, it was Heidegger who, in rejection of the inevitability thesis, pointed out what may be its most significant problem, namely that the desire or effort to gain control over technology, the will to mastery over it, is itself technological (1977, 5, 32).

Together, the uniqueness and inevitability theses amount to a kind of autonomy theory which represents technology as a force that ethics must address from outside. The task of ethical reflection is to articulate a distinct form of rationality and action and to deploy the latter in an effort to limit or control technology, which by its nature expands into all domains of life, crowding out other forms of rationality and action. If this autonomy theory is true, technology does not merely pose new problems for ethics, it threatens the domain of ethical discourse and practice itself. To question the autonomy theory is in part to suggest the possibility of an ethical discourse that treats technology, in at least some of its forms, as integrally involved, for good or for ill, in the identification and pursuit of real or apparent human goods. This possibility is explored in the concluding section of this entry.

The Replacement Thesis

Twentieth-century ethical evaluation of technology often holds that, left to itself, technology steadily encroaches on and eventually replaces human activities and capacities or even human nature itself. While the uniqueness and inevitability theses can be applied equally to the machine age, the replacement thesis captures what is most distinctive of the post-machine era of technology. In its simplest form the thesis was stated by Hermann Schmidt, for whom technology progresses from the tool, in which physical and intellectual energy must still be supplied by the human subject, to the machine, in which physical energy is objectified but intellectual energy continues to be supplied by the human subject, to the automaton, in which both physical and intellectual energy are objectified (Schmidt 1953; quoted in Gehlen 1980, 19ff.).

Schmidt's formulation is an oversimplification but this narrative of progressive replacement of the natural by the artificial which then, in the form of the automaton, becomes a quasi-nature of its own characterizes reflection on post-machine era technology. For Gehlen (1980), technology is the progressive replacement of the organic by the artificial, beginning with the tool as a substitute for the organ and culminating in cybernetics, in which the basic principle of human action is transferred into the

automaton. Arendt traces a progression from a tool-machine stage in which natural materials and forces are channeled into the artifice to a machine-automaton stage in which humans create nature-like processes, as in automated production. Arendt also shows how the understanding of nature in terms of cosmic rather than terrestrial processes in seventeenth-century physics culminated in the technological transformation of terrestrial reality by cosmic forces in twentieth-century physics. Technology, she argues, progressively alienates human beings from the earth (i.e. from the terrestrial processes that bind humans to other organisms), an alienation that culminates in biotechnology, which makes human life itself artificial (Arendt 1958, 2, 4ff., 147–151, 268ff.). Jonas, too, describes technology as the progressive replacement of the natural by the artificial and the artificial as itself a kind of nature with its own necessity – an automaton. Two decades later, he finds us on the threshold of the future foreseen by Arendt, in which the effort to remake external nature is already extending to the human. Not surprisingly, behavior control and genetic engineering, both of which portend the automaton, are two of the technologies Jonas singles out for attention (1984, 10, 17–21).

It is not only philosophers of technology but also its more reflective practitioners who hold the replacement thesis. Marvin Minsky, a central figure in artificial intelligence (AI), articulating what appears to be a widely shared desideratum in the AI community (or at least in the MIT Media Lab), promises a future of “virtual” minds capable of thinking and feeling as humans do, followed by a transformation of our “real” human minds into artifices that operate in the same way and possess the same (superior) capabilities as the “virtual” minds (Minsky 1997, 1125–1126). Minsky’s utopia is well in the future, but implantable computer chips that replace or create memory, sensory, or reasoning functions are already on the horizon; some prosthetic versions already exist (Maguire and McGee 1999). Similarly, molecular biologists envision a future of artificial chromosomes, though it is unclear whether these will replace or only supplement natural chromosomes, while embryologists anticipate a future of artificial wombs.

If technology is replacing human characteristics then despite the urgency it imposes – at stake is nothing less than the future of human nature and activity – it makes the ethical task remarkably clear. The task is (1) to determine which characteristics cannot be replaced without destroying human nature itself; and (2) to establish why human nature, so understood, should not be destroyed. It is, in short, to come up with a normative conception of the human.

Three things may be said of attempts at this task. First, such attempts are common in treatments of biotechnology in Jewish and Christian ethics, especially efforts to specify human characteristics that should never be subject to genetic engineering. Second, even some secular writers concede that religiously grounded normative conceptions of the human offer a direct path to ruling out biotechnological developments that risk replacing the human. Yet these secular writers also assert the irrelevance of religious conceptions to public debates. However, their arguments for the irrelevance of these attempts are open to criticism. For example, Jonas insists that the category of the sacred has been thoroughly effaced by modern science and technology (1984, 23). This claim is questionable in itself, but Jonas concedes that his own biologically informed philosophical conception of the human is also ruled out of court under the rules of modern thought. If he is willing to challenge these rules on behalf of his philosophical conception, why is he so quick to urge these same rules against religious conceptions? Francis Fukuyama argues that religious conceptions are persuasive only to those who accept their premises. Yet his conception of the human relies on a biological–philosophical theory of emergent properties which, of course, will be persuasive only to those who accept its controversial premises

(Fukuyama 2002, 88–91, 160–171). It is not clear, then, that religious conceptions of the human are at any disadvantage relative to secular conceptions.

Third, nearly all normative conceptions of the human identify the normatively human with characteristics (e.g. rationality, purposive action, emotional capacities) that will be threatened with replacement only if technology takes extreme forms. In their focus on the limit (i.e. on what cannot be lost without losing our humanity), these conceptions leave everything this side of the limit to preference satisfaction. The problem is that if technology moves in directions that do not involve the replacement of human characteristics but rather complex interactions between nature and artifice, then the replacement thesis is false, and these conceptions of the normatively human will fail to guide us in the use of technology this side of the limit.

How sound, then, is the replacement thesis? First, the effectiveness of many technological interventions depends on cooperation with human activity. Since most human traits are not solely determined by genetic factors this will certainly be the case for the vast majority of genetic interventions, especially in the case of complex traits. A genetic intervention capable of enhancing cognitive capacities such as memory or intelligence will almost certainly not replace human activity. One will still have to study a foreign language despite the comparative ease in memorizing vocabulary and declensions, and one will still have to read the differential equations textbook. It is therefore inaccurate to speak of such interventions as replacing human activity. Second, many technological interventions do not replace or eliminate traits but suppress or enhance them for a certain temporal duration and/or allow for a certain degree of control over their expression. This is the case, for example, with most pharmacological interventions. A hypothetical drug operating directly on biochemical processes to suppress a feeling of fear clearly bypasses the kinds of human activity by which a Stoic adept engages in cognitive therapy to convince himself that fear is irrational, or by which a Thai Buddhist forest monk cultivates through meditation a habit of suppressing fear in the face of animal predators and malevolent spirits. But the fear has not gone away; given the proper stimulus it will reappear once the drug has worn off. Even if one keeps taking the drug the capacity for fear is still present – perhaps even more so than in the cases of the Stoic or the forest monk, who may no longer have to take direct action to suppress it. Once again, these technological interventions do not replace or destroy a human characteristic.

Third, consider a likely forthcoming technology such as implantable brain chips, which may impart cognitive and perceptual information and capacities more or less wholesale and more or less permanently. Here the replacement thesis seems clearly to apply. Or does it? There is no way of knowing yet how such technologies, if developed and implemented, would be used. But it is not obvious that they would be used in a way that would constitute a clear case of replacement. It is possible that they will complement and supplement rather than replace existing cognitive and perceptual capacities and functions. Nor is this merely a theoretical possibility. In her study of users of networked computing technologies, Sherry Turkle (1995) found that “virtual” online identities did not replace “real” identities. Rather, complex interactions occurred in which, for example, virtual identities were used to work through conflicts in real identities.

Should contemporary technology develop along the lines suggested in these examples rather than along the lines of the replacement thesis, it would mark a significant break with the kind of technology described by many philosophers. While still exhibiting the fundamental characteristics of post-machine technology (remaking and reflexivity), technology would result not in the replacement of nature with the artifice, but in a complex hybridization of nature and artifice, of the organic and the digital. The paradigmatic

technology would be not the automaton but the cyborg. Cyborg technologies would challenge religious ethics not at the limits, where something characteristically human must be preserved against the steady replacement of the natural with the artificial, but at every point, where not the human as such but the nature and meaning of human activities, performances, and practices is at stake.

The Ethical Task

What challenges does technology pose for religious ethics? Contrary to the most significant theorists of this post-machine era, technology does not confront religious ethics as an autonomous “other” against which religious ethics must deploy radically alternative forms of rationality and action while building fire walls around certain human characteristics. Nor is there any reason to conclude that post-machine era technology demands a radically new kind of ethics. The challenge is of a different order. Like religious traditions themselves, the technology of the post-machine era is deeply involved in the remaking of human beings. This means that technology now confronts religious ethics as a potential rival or partner in ethical self-formation, as that which may distort or may assist the cognitive and disciplinary practices by which religious traditions form us. Rather than protecting against the onslaught of a force that threatens to engulf the ethical and the human as such, the challenge for religious ethics may increasingly be to determine what place, if any, technological alteration of human capacities, performances, and character might have in the ethical self-formation practiced in a religious tradition. This would involve two kinds of religious ethical inquiry: critical inquiry to determine how technological means orient us to ends and shape the meanings of activities, and deliberative inquiry to determine whether and how these technological means promote or detract from the orientations and meanings that are normative in a religious tradition. Should these critical and deliberative inquiries flourish in religious ethics, the challenge technology poses to religious ethics will be met by a challenge posed by religious ethics to technology.

CHAPTER 137

Animals

Charles Camosy

A Profound Shift in the Conventional Wisdom

Virtually anyone who has studied the issue in any depth knows that some religions have profound concern for non-human animals. Buddhism and Hinduism, in particular, have been singled out in this regard – not least because of how prominent a role non-human animals play in soul migration and reincarnation. But the conventional wisdom has been that the traditions which have dominated the explicitly religious practices of the West – Christianity and Judaism – have been particularly bad when it comes to ethical concern for non-human animals.

Deeply influenced by the widely-read views of thinkers like Lynn White, Jr. (“The Historical Roots of Our Ecological Crisis”) and Peter Singer (*Animal Liberation* 1975), the conventional wisdom has generally accepted that the particular focus these religious traditions have on human animals being uniquely made in the image and likeness of God – along with the Divine command in Genesis 1 to dominate and subdue the non-human parts of creation – has led these them to exclude non-human animals from their sphere of ethical concern. White argued that with the dominance of these traditions the West lost something important about the spiritual value of nature that was present in the pagan traditions that were replaced, and this was reflected in the ways later technologies have been harmfully and dramatically used against non-human creation. Singer argued that these traditions espoused a deeply problematic speciesist view that only the lives of *Homo sapiens* mattered morally, and wrote with particular contempt for Thomas Aquinas and the contemporary pro-life movement in this regard.

Those who share the critiques of White and Singer who stand outside these religious traditions have generally had their views confirmed by the overwhelming majority of believers within the traditions. There is, however, a profound shift underway with regard to this conventional wisdom, and it is coming from within Judaism and Christianity. Inspired by its past president, Aaron Gross, the Society of Jewish Ethics has taken the lead in having a particular focus on animal ethics and insisting that all of their meetings are free of animal products. The Society of Christian Ethics (SCE) followed by developing an “animal ethics” interest group in 2015, both promoting and facilitating scholarship in this area. A 2014 edition of the *Journal of Moral Theology* – featuring contributions from eminent Catholic theologians like Jean Porter and Julie Hanlon-Rubio – marked the first time an issue of a respected academic journal of this kind was devoted entirely to the topic of animal ethics. And, of course, much of the discussion on non-human creation was shifted upon publication of Pope Francis’s (2015) eco-encyclical, *Laudato Si’*.

In part because academic research on animal ethics has so many natural bridges to religious practice and political activism, it should not be surprising that many of the very same leaders in shifting the conventional wisdom on these questions in academic arenas are also doing so via activism outside the academy.

Jewish Scholarship and Activism

As already mentioned, Professor Aaron Gross of the University of San Diego is probably the most important and influential academic voice in the field of Jewish ethics, as well as one of the tradition's most important activists. In addition to his leadership with the Society of Jewish Ethics, he is also active in the leadership of the "Animals and Religion" group with the American Academy of Religion. In his 2014 book with Columbia University Press, *The Question of the Animal and Religion: Theoretical Stakes, Practical Implications*, Gross used the horrific case of maltreatment of animals at a kosher slaughterhouse as a jumping off point for elevating questions surrounding animals and religion more generally. Gross has also done important work on Jewish theological concepts as they impact issues of animal ethics. His contribution to *The Oxford Handbook of Jewish Ethics and Morality* (Gross 2012), for instance, has a detailed discussion of the complex history and laws that comprise *tza'ar ba'alei chayim* – the Jewish legal/moral imperative that prohibits causing unnecessary suffering to non-human animals. He also marshals impressive resources from Jewish scripture and tradition in arguing for the propositions that: (1) non-human animals have inherent value, (2) there is an ideal for a "good death" of a non-human animal, and (3) meat-eating is an ethical problem.

There is other important Jewish scholarship related to animal ethics. Writing in *Jewish Biblical Quarterly* (1996), for instance, Shimon Bakon titles his piece "Not to Inflict Hurt on Animals" and draws our attention to the many times the Hebrew Bible appears to have this ethical concern. Such scriptures, Bakon points out, are deeply skeptical of sport hunting, caution against separating a non-human animal mother from her young, and even imply that non-human animals have rights under Jewish law to certain kinds of treatment.

With this base of biblical and theological support being brought to the fore by scholars of religion and religious ethics, it is hardly surprising that we are seeing an explosion of Jewish activism surrounding the ethical treatment of non-human animals. Aaron Gross's career helpfully blurs the line between academics and activism, particularly with his "Farm Forward" initiative. One is greeted on their website (www.farmforward.com) with the "Until No Animals Suffer on Factory Farms" headline, leaving no doubt about Farm Forward's goals. They describe themselves as a team of strategists, campaigners, and thought leaders – and are sponsors of the Jewish Initiative for Animals, which has worked with more than sixty-five Jewish organizations to live out their biblical and theological commitments with regard to non-human animals.

Another dynamic activist organization, Jewish Veg, is even more explicitly connected to Jewish religious culture and leadership. Boasting an impressive council of seventeen Rabbis, they are explicitly working toward putting "Jewish values in action" when it comes to relationship with non-human animals. A significant Jewish animal activist organization, for instance, *Shamayim v'Aretz* Jewish Animal Advocacy, educates leaders, trains advocates, and leads campaigns for the ethical treatment of animals. They argue that non-human animals are the most abused part of God's creation and that, in protecting such animals, holiness is brought from heaven down to earth.

Much more could be said about the proliferation of Jewish activism closely related to animal ethics, but space does not permit. In closing, however, it is worth noting that as recently as 2011, both the *Shamayim v'Aretz* Jewish Animal Advocacy group and Jewish Initiative for Animals did not exist, and Jewish Veg was a tiny organization simply trying to find its legs. If current trends continue, by the time the next edition of the encyclopedia is published this kind of activism will have become a very significant voice in public discourse about non-human animals in general, and about ethical eating practices in particular.

Christian Scholarship and Activism

Andrew Linzey, an Anglican priest and Oxford professor, was for twenty-five years a lone voice crying in the Christian wilderness when it came to theology and animal ethics. His *Animal Rights: A Christian Assessment of Man's Treatment of Animals* was published in 1976, and he went on to write nine more books on related topics over the next three decades. Though he works with a fairly standard account of secular animal rights, he was pretty much the only theologian doing animal ethics work during the 1970s and 1980s. And given that the subject itself was often not taken seriously at the time, he was often marginalized by his fellow academics for doing so.

In 1992, a Roman Catholic graduate student at Duke named John Berkman wrote an essay with his mentor Stanley Hauerwas titled "The Chief End of All Flesh." The essay was deeply theological, arguing that the proper stance of Christians toward animals: (1) came out of a general command of Christ to be nonviolent, and (2) comes from the realization that animals exist, not for us, but for God's good pleasure. Later in the decade, as a young associate professor at the Catholic University of America, Berkman (1999) would publish another essay on the topic: "Prophetically Pro-Life: John Paul II's Gospel of Life and Evangelical Concern for Animals." Predictably, his department chair attempted to marginalize this work on animal ethics and in fact ordered him to stop writing on the topic. When Berkman refused to comply and published a 2004 essay titled "The Consumption of Animals in the Catholic Tradition," he was denied tenure by the senior theology faculty. Needless to say, the topic was still being marginalized by theologians well into the twenty-first century.

But, again, a major shift has taken place in just the last few years. Major academic theological societies have now taken formal steps to promote animal ethics as a serious academic discipline. Dissertation topics on issues related to animal ethics are welcomed and even encouraged in most departments of theology. This shift with regard to animal ethics is perhaps best exemplified in the meteoric rise of the career of British theologian David Clough. Trained at Yale, he traded his early work on war and pacifism for thinking theologically and ethically about non-human animals, and almost all of his publication in recent years – including a major two volume work titled *On Animals* (2012, forthcoming) – have focused on these topics. During this time, he has become chair of the theology department at the University of Chester, former president of the Society for the Study of Christian Ethics, and his *On Animals: Systematic Theology* was featured in a panel discussion at the annual convention of the American Academy of Religion. Although his recent work on animal ethics hurt his career he is now one of the most influential Christian ethicists in the world.

Clough's research and arguments are responsive to the concerns of White and Singer. Clough emphasizes that human animals have never needed an ideological basis as motivation for cruelly exploiting non-human animals. Indeed, well before any kind of formal religious practice entered the

anthropological scene, humans were well on their way to such exploitation simply because they found they could survive and thrive via such practices. Christianity's rise to power in the West brought with it no significant change for the worse. Indeed, Christianity – though obviously not perfect – was a moderating influence on animal cruelty. From condemnation of the barbarity of animal fighting and killing in the Roman games of antiquity, to centuries of resistance to hunting non-human animals for sport, the general trajectory of Christian theology was toward using and killing animals only when necessary, and to replace cruel practices with kind ones. Though underplayed in most circles, including Catholic circles, this fairly robust reading remains authoritative in the *Catechism of the Catholic Church* (Catholic Church 2012).

If we need to note a historical shift in how the West treated animals, a better marker is the convergence of the industrial revolution and free market capitalism. It is these movements, which come out of the secular Enlightenment, which led the West to think of non-human animals as mere products with no value other than what a market gave them. Tellingly, owners of contemporary factory farms often refuse to speak about the reality of the animals themselves, instead referring to their business goals of maximizing protein units per square foot. Clough and others who are part of the current animal ethics theological revolution argue that returning to a more traditional view of animals, and in what their moral value consists, can be an important source of resistance against the cruel practice of using animals as tools for profit.

But what of Singer's argument that a Christian notion of the sanctity of human life, particularly as espoused by the deeply influential thirteenth century theologian Thomas Aquinas, was a profound defeat for the value of non-human life? One important response notes that the recent theological research by John Berkman and other Thomists has complexified Aquinas's views on non-human animals. For example, Singer and others highlight his views, including the view that non-human animals do not suffer, noting that Thomas Aquinas's mentor was Albert the Great, the most prominent zoologist of the Middle Ages. It is likely that Albert's mentorship played a significant role in Aquinas concluding that each living creature manifests the goodness of God by living and flourishing according to its own nature. For Aquinas, the greatest good after God is not the good of human beings, but rather than good of the ordering of the whole universe – of which animals are an important part. Indeed, Aquinas believed that non-human animals had souls or spiritual realities and deeply complex emotional lives.

Charles Camosy, a Catholic professor of theological and social ethics at Fordham University, has also responded to Singer's critiques, pointing out that the concept of moral value and personhood in traditional Christian theology is not speciesist in the way Singer suggests (Camosy 2012). Plenty of non-human beings (angels, demons, and even aliens) are considered persons – that is, “substances of a rational nature” – and there is nothing in theory prohibiting a non-human animal from also being considered this kind of substance. And even if one of our fellow creatures is not a substance of a rational nature, traditional Christian theology would never jump to the conclusion that such a creature is a mere thing to be used by human beings as a mere product. The traditional view, already discussed, is that animals belong not to us, but to God, who created them “good” with inherent dignity distinct from that of human beings. In his eco-encyclical *Laudato Si'*, Pope Francis reinforces the traditional view that non-human animals have “inherent value” and “value in themselves.” The dominion God gives humans over animals is not to be characterized by domination, but rather by the kind of kindness and mercy God shows us.

These theological views, if taken seriously, obviously have direct import for how individual Christians and their communities live their lives. It is not surprising, then, that Christian theologians, like their Jewish counterparts, are leading the way when it comes to the growing edge of activism in this area. In

2015, for instance, Clough launched his CreatureKind (www.becreaturekind.org) project which uses the insights from his research in engaging Christian churches in North America and the United Kingdom – particularly when it comes to protection of farmed animals. Camosy has also used his research into similar kinds of activism, including partnering with Jewish Veg on a series of public lectures and a systematic attempt to reach out to US bishops on matters of animal ethics.

An activist group called Catholic Concern for Animals, in addition to producing a widely-read and high quality newsletter for non-specialists, has also done good work reaching out to Catholic bishops in the United Kingdom and Europe. Picking up on the fact that Christ's entering the world was described by the Gospel of John – not as becoming human – but as becoming “flesh,” the Christian activist group Sarx has devoted itself to promoting the principle that all animals should be able to live with dignity, freedom, and peace. Remarkably, the faith outreach office of the HSUS has sought out and received the support of many prominent Evangelical Christians – including Karen Swallow Prior, a renowned Liberty University professor, and Russell Moore, head of ethics and policy for the Southern Baptist Convention.

Much like the Jewish activism mentioned above, if Christian activism with regard to animal ethics continues on its current path it will be a major force in the not-too-distant future.

Religious Ethics and Intersectionality

Particularly in the context of Christian ethics, women scholars like Celia Deane-Drummond, Jean Porter, and Grace Kao are leading the growing edge of animal ethics into its bright future. The work of Kao, in particular, is contributing to an essential part of that future's methodology: intersectionality. Scholars of theological and religious ethics, because they already do their work at the intersection of multiple disciplines and discourses, are uniquely positioned to see how various identities (gender, race, class, disability, age, sexual orientation, religion, etc.) are connected with each other in systems which oppress vulnerable populations.

Kao's research on (eco)feminism, animals, and religion, for instance, works within intellectual soil tilled by Carol J. Adams in her *Sexual Politics of Meat: A Feminist Vegetarian Critical Theory* (1990). Feminist thinkers like Kao and Adams have done the important work of highlighting how gender identity and animal identity intersect in ways which produce profound injustice for both women and non-human animals. They call out the deep cultural connections between masculinity, meat-eating, and misogyny – and how this logic is connected to the use of violence and militarism in Western culture more generally.

Professor Matthew Halteman's “Animals and the Kingdom of God” lecture series at Calvin College is widely seen in religious animal protection communities as a bellwether for the growing edge of the discourse. Tellingly, his series featured two 2017 lectures on “Intersectional Veganisms.” The first, titled “Liberation for Every Body,” was by Nekeisha Alayna Alexis (Anabaptist Mennonite Biblical Seminary) and argued that liberating human beings from systematic oppression and moving toward a peaceable kingdom of necessity involves liberating “other animal selves” from systematic oppression. The second, titled “Womanist Principles of Wholeness and Interlocking Oppressions in Animal Theology,” was by Candace Laughinghouse (Chicago Theological Seminary) and argued that privileging womanist principles involves an empowering of all the vulnerable who are systematically oppressed, human and non-human.

An intersectional methodology is most often associated with the cultural “left” of the culture wars, but the political assumptions behind such wars increasingly fail to capture the political commitments of those

claimed by an ancient religious tradition. This is most certainly the case when it comes to theologians who are both pro-animal and anti-abortion. Berkman's work on animal ethics, as well as Camosy's, is intersectional in seeing the connections between violence directed at non-human animals and violence directed at prenatal children. Both are voiceless, vulnerable populations whose dignity is radically inconvenient for those who have power over them. The physical and moral reality of both populations is hidden away, often by powerful interests who work very hard to limit the capacity of activists to make a disconnected culture face the physical and moral reality of populations who cannot stand up for themselves.

Interestingly, even quite politically conservative figures in the pro-life movement are now making the case that their commitments on abortion have direct import for animal protection. Writing in the conservative journal *First Things*, Mary Eberstadt (then of the Hoover Institute) wrote a piece titled "Pro-Animal, Pro-Life" (2009) in which she argued that anti-abortion and animal protection activists are political strangers by way of historical accident rather than principled disagreement. Writing in the conservative magazine *The National Review*, Matthew Scully (a former speech-writer for George W. Bush and Sarah Palin) wrote a piece titled "Pro-Life, Pro-Animal" (2013) in which he argued that both kinds of activists would have their work strengthened by "defending the innocent and powerless wherever they are, bringing to all creatures who have none to help them the love of their Creator, and by that example showing what it means to be pro-life all the way" (para. 27).

This approach has particular purchase with pro-life feminist activists who refuse to choose between standing against the oppression of prenatal children and against the oppression of women. Increasingly, as an explicitly intersectional vision has taken hold in several pro-life feminist communities, they have a particular focus how the cultural forces they are resisting are interconnected with oppression of the disabled, people of color, sexual minorities, and other vulnerable minority groups. One such community, the activist organization Rehumanize International, has been a leader in this regard – and has featured discussions at their major conferences which discuss animal ethics and how it intersects with their primary value: consistent resistance of aggressive violence.

Many important future trajectories with regard to animal ethics will almost certainly find themselves moving along these intersectional lines. Especially as the connections between how human beings treat animals and issues like climate change, worker justice, migration, race, social class, religious tolerance, and respect for indigenous populations become more clear, discourse about animal ethics will only grow in its intersectional focus.

In 2013, the *New York Times* did a feature article on the growing interest of Christian scholars and activists in animal ethics (Oppenheimer 2013). The piece focused on the academic work of Linzey, Clough, and Camosy, while also noting the more popular and activist work of Eberstadt and the faith outreach office of the HSUS. The author of the article also interviewed Peter Singer, and pressed him on his view expressed many years ago in *Animal Liberation* that Christianity and the sanctity of life ethic were the enemy. While it is true he used strong and critical language in the past, the article revealed that – after learning that Christians and other religious scholars and activists are engaging animal ethics in serious ways – Singer now thinks that his original language went too far. Indeed, at a recent co-presentation he did with Camosy at HSUS headquarters in Baltimore, Peter Singer revealed that he now considers Christianity to be an ally in the struggle for animal liberation.

This is the current trajectory of concern for animals within theological and religious ethics. The conventional wisdom of the culture wars of two generations ago no longer applies. At the time of writing this entry, animal ethics is poised to take its place as a primary concern of religious ethics right across the theo-political spectrum.

CHAPTER 138

Justice

Michael Kessler

“The arc of the moral universe is long, but it bends toward justice”

(Martin Luther King Jr.)

The word justice is inscribed upon government buildings as a lodestar for legal and political institutions, setting their goals as harmony between citizens and fairness in dealings. Justice is demanded by victims wanting to be made whole and punishing those who transgress from the laws. Justice is enshrined in scriptures as the attribute of deities and commands good people to fix inequities and relieve oppression suffered by others. Justice is a comprehensive concept across religious ethics, linking moral norms and personal duties to institutional functions and goals, especially our political institutions and our personal dealings in contracts, promises, and economic activity.

Justice is a word easily spoken, yet the demands of justice, as formulated by traditions of religious ethics, are difficult to conceptualize in the modern world. The modern embrace of the dissolution of theo-ontological unity and the resultant pluralism of worldviews means there is no substantive agreement about the origins and meaning of justice. While there are common conceptions of justice still resonant, the social and political will to achieve some of the demands of justice is frustratingly absent within our technological, global, capitalist orders. Self-interest and strategic calculation displace political goal setting that might be based on substantive principles of justice. In a world plagued by the legacies of slavery and colonialism, economic and political inequality, war, ethno-racial-nationalism, oppression, and unchecked evil, it is hard to envision justice as anything more than an unrequited dream. Can we sustain the optimism of Dr. Martin Luther King that justice will arise?

Theological ethicists can help catalyze the achievement of justice through clarifying its nature and demands in an increasingly unjust world. A review of some key ideas of justice provides the foundation for developing a theological account of justice as a form by which mediating institutions create conditions of fair, equal treatment and ensure each person can achieve dignified conditions of life. Across the taxonomy of types of justice (distributive, restorative, retributive, transnational, social) this account of justice generates critical, prophetic awareness of how social and political institutions build up or tear down human dignity and implores resistance to those which fail to achieve the good ends of institutions.

Some Key Elements of Justice

In the West, justice connects human actions to their impact on other persons. In classical Latin, *iūstitia* meant fairness and equity, and giving to one what is their due, while those who administered law and order were called justices, the embodiment of equity and order. Adapted into French and Anglo-Norman language, justice meant the power to administer the law and to exercise authority. In Justinian's *Institutes*, the codification of Roman Law defined justice as “the constant and perpetual will to render to each one his due” (Justinian, Digest. i, 1; De Just. et Jure 10). Throughout the Western tradition, justice was the virtue that described how to strike harmony among many persons, ensuring the state's institutions and one's fellows treated citizens equally and fairly.

Justice applies to many different aspects of life and different types of justice have been categorized to highlight nuances of the term in various social and political sectors. *Commutative* justice denotes the aspect of justice that demands basic fairness in individual and group agreements and exchanges, such as economic transactions. *Distributive* justice denotes that access to and distribution of resources like income, power, and capacities are fairly available to each member of society. *Political* justice imposes the *form* by which power is shaped and expressed between persons so that their dignity is not harmed and requires this justice to be a defining characteristic of mediating institutions like legislatures and courts. Sometimes justice is divided between *procedural* and *substantive*, where the former indicates that a society must achieve justice through fair and equal treatment under institutional processes (while material inequalities of rank, wealth, etc. may still be tolerable) while the latter indicates that justice may demand recalibration of those material inequalities. *Social* justice typically denotes the demands for persons and institutions to organize social, political, and economic institutions in a way that is fair and protective of the dignity of each person, including resistance to oppressive social and political situations. *Criminal* or *Retributive* justice refers to the political institutions capacity and authority to coordinate interpersonal and intergroup relations according to rules and enforce corrective punishment against offenders. *Restorative* justice refers to post-conflict processes (such as truth and reconciliation commissions) to heal from the legacy of conflict or systemic injustices and may be combined with criminal prosecutions.

Certain other elements highlight the enduring complexity of the idea of justice. A central theme in the ancient world was that justice is a cosmic principle of order and a central attribute of the deity. For instance, in Hesiod's *Works and Days*, justice represents a cosmic economy of order, the balance of the world that emerged through the interplay of violence and peace. In the Hebraic tradition, Yahweh bears justice as a core feature of the divine essence: “Ascribe greatness to our God! The Rock, his work is perfect; for all his ways are justice. A God of faithfulness and without iniquity, just and right is he” (Deuteronomy 32:3–4).

While cosmic ideas of justice fill poems and scriptures with ethereal images, just adjudication of disputes required human-enacted procedures. A compelling example is depicted on the shield Hephaistos creates for Achilles in the *Iliad*, where Homer depicts the people assembling in the market to dispute over the blood price for a man who had been killed. “One man promised full restitution in a public statement, but the other refused and would accept nothing. Both then made for an arbitrator, to have a decision; and people were speaking up on either side, to help both men. But the heralds kept the people in hand” and the judges rendered an opinion to settle the dispute (*Iliad* 18, 490–509). Similarly, in Hebraic texts, rulers and local elder councils judged particular cases, usually depicted as occurring at the city

gates. While God is the ultimate guarantor of human justice (Isaiah 3:13–4), the actual decisions are guided by the wise elders in a communal setting, rendering a decision that the disputants could abide as a just outcome.

The classic Greek account of moral and political justice was given by Aristotle, where justice is the ideal character of the political society and the human moral self (albeit the aristocratic class). Book 5 of his *Nicomachean Ethics* gives a moral account of justice as a judgment through which reason determines the mean between excess and deficient tendencies of an action. Political justice concerns how people develop the moral constitution to regulate their mutual relationship in a *polis* through law so they can share a common life. A crucial element of interpersonal relations for Aristotle is distributive justice, defined as the equitable distribution of goods, wealth, services, and honor among members of a polis; conversely, injustice is when two equal agents receive unequal effects.

Rulers were often valorized when they capably administer justice and ruling justly was a requirement given by the divine. The Hebraic scriptures enjoin both personal and communal observance of justice, figured as fair-dealing and truth-telling: “You shall appoint judges and officers in all your towns which the LORD your God gives you, according to your tribes; and they shall judge the people with righteous judgment. You shall not pervert justice; you shall not show partiality. ...Justice. ...you shall follow, that you may live” (Deuteronomy 16:18–20). Social duties are closely linked to personal piety; one could not be a faithful servant of God while being unjust toward neighbors or strangers. The Hebraic prophets implore the followers of God to become righteous and act with justice: “He has showed you, O man, what is good; and what does the LORD require of you but to do justice, and to love kindness, and to walk humbly with your God?” (Micah 6:8). Those who oppress while enriching themselves are condemned: “Therefore because you trample upon the poor and take from him exactions of wheat, you have built houses of hewn stone, but you shall not dwell in them. . .For I know how many are your transgressions, and how great are your sins, you who afflict the righteous, who take a bribe, and turn aside the needy in the gate. . .Seek good, and not evil, that you may live” (Amos 5:11–15).

Yet pursuing justice can sometimes collide with political and legal requirements. Sophocles explored this conflict between cosmic and conventional justice in *Antigone*, where the title character had buried her dishonored brother, Polynices, against the explicit order of the ruler Creon. Antigone knew that Creon’s law was supreme for the city yet held that transgressions against Creon’s authority are ultimately pale in comparison to the higher duty by which she is bound to give both of her brothers a proper burial: “It was not Zeus that made the proclamation; nor did Justice. . .I did not believe your proclamation had such power to enable one who will someday die to override God’s ordinances, unwritten and secure. They are not of today and yesterday; they live forever” (Antigone 494–501:178). Justice is first a religious duty; acting in accordance with ultimate justice might make one a political criminal.

Plato developed a fully transcendent idea of justice. He dismissed inferior conceptions of justice like Thrasymachus’ view that justice is that the strong, by nature, have the right to rule. Socrates argues that justice is a virtue that brings harmony and order to its object and removes the injustice of “faction and difference” (348–353). True justice refers to an objective, formal reality of divine order to be applied in both the city and the soul. In the soul, reason apprehends true ideas, which control the appetites and the spirited parts of the self. The virtue of justice, when operative along with the other virtues (wisdom, courage, temperance), balances each element, promoting moderation, harmony and accord creating a unified and harmonious self. The *polis* should be similarly harmonized so as to lead people to be law-abiding and orderly.

Cicero envisioned that the conventional body of laws (*lex*) that emanate from the legislator ought to bear this ideal form of justice or right. Humans band together for a specific purpose in the *civitas*, agreeing to associate in a partnership for the common good (Pub I:39:65). The law is not simply a product of human convention or thought; the law is “something eternal which rules the whole universe by its uniform command and prohibition” (Laws II:8). Justice is achieved when the law is properly formed: “the origin of Justice is to be found in Law, for Law is a natural force; it is the mind and reason of the intelligent man, the standard by which Justice and Injustice are measured.”

The relation of the city’s justice with the transcendent was problematized in the teachings of Jesus of Nazareth. Jesus taught unconditional love for God and neighbor. The Gospel leads to a robust Christian account of a personal imperative to pursue social justice. Yet, in the midst of massive oppression, Jesus rejected the role of a political revolutionary. Cosmic Justice comes through redemption in relation to the Divine creator, establishing the “Kingdom of God,” not first through institutional transformation. There is no direct theory of institutional justice that emerges from the Gospel accounts; much of their focus points to separation between divine and political: “Render therefore to Caesar the things that are Caesar’s, and to God the things that are God’s” (Matthew 22:15–22).

The Pauline interpretation of justice is derived from this temporal-divine split. The Christ is seen as the long-expected deliverer of Israel, who brings new life through cosmic salvation. God in Christ *justifies* the person and is the only way to salvation (Galatians 2:16). Paul urged simple obedience to the Roman authority as the basis of an earthly justice: “Let every person be subject to the governing authorities. For there is no authority except from God, and those that exist have been instituted by God. . . But if you do wrong, be afraid, for he does not bear the sword in vain; he is the servant of God to execute his wrath on the wrongdoer” (Romans 13:1–7). Obedience to the ruling authority institutes temporal security, even while it is only partial, not ultimate, justice.

While earthly justice may secure to each what is their due, Christians were often called to turn away from a rightful claim to property in confronting the need of their neighbor. St. Basil wrote extensively about the charitable moral duty to demonstrate love by effectively distributing one’s wealth to those in need. “Money, when it is cast off to good purpose, is not lost to those who have flung it away and cast it from them. As if deposited in other, safer ships the stomachs of the poor it is preserved and, reaching the harbor in advance, is kept for those who have rid themselves of it, not to their peril but unto glory. . . These needy ones will joyfully bear it away and will lay up our wealth in the bosom of the Lord as in a safe treasury. . . Let us permit our wealth, which is meant for this purpose, to be poured out upon the needy” (Basil, 497). Basil, along with other early theologians like John Chrysostom, Clement, and Augustine, did not call for redistribution by law, but rather through charitable work. Justice could not be achieved if one held on tightly to the lawful property the laws might allow one to store up.

Augustine developed Paul’s division of earthly and heavenly justice, shaped by his existentially pessimistic anthropology. The “evil” that humans succumb to is a volitional disorder in which the proper object of the will – love (*caritas*) for the Divine – is pushed aside by the love (*cupiditas*) of the self and immediate, consuming pleasures of the self and the material world. Natural human reason is incapable of restoring proper order over the desires. Nothing the human accomplishes can bring salvation; God instead is the operator of salvation, graciously inclining the will in spite of ourselves. The purpose of formal laws and government structure is tragic; without security and order, life is subject to constant threat. Augustine thereby situated Christians as simultaneously citizens of two cities – that of God and that of Man (Augustine XIV:1:261). The city of God is the community of those who have been saved and

their mode of desire toward objects and other beings is *caritas*, which preserves in love that which is desired. The city of man is the community formed by those whose love is *cupiditas*, a mode of consuming that which one craves. The Christian pilgrim is in between these worlds and must negotiate these multiple obligations, being simultaneously sinner and saint. Temporal justice may involve cessation of violence, but it was not true justice. True justice can only be found in the City of God, the order of the “unchangeable Good” (Augustine XII:1:7). The pilgrim uses earthly things, including the political orders, simply as supports for their sojourn toward God.

Thomas Aquinas molded a view of justice that combined many strands together. Justice resulted from the promulgation of a law that reflected the objective moral order of the created universe. Human law (one of four types of law) is a collection of particular legislations to institute justice in earthly affairs (ST I–II:95:1013ff.). The human lawgiver, who has the common care and good of the community as their goal, formulates rules of social existence that apply general rules to specific political and social realities, in order to achieve a just state of affairs. Human law is circumscribed by the Divine creation (eternal law) and order of the world (natural law) and, to be valid, human positive law must be consistent with the eternal and natural law (ST I–II:95:2:1014–5). “The force of a law depends on the extent of its justice. Now in human affairs a thing is said to be just, from being right, according to the rule of reason. . . every human law has just so much of the nature of law, as it is derived from the law of nature” (ST I–II 95:2:1014–5). Positive law that deflects away from the dictates of natural law ceases to be law (ST I–II:95:2).

Modern Justice: Liberal Democracy

In the modern West, the predominant understanding of justice is enscribed within the liberal social contract model of political society. On this account, humans are self-determining and self-preserving agents bearing a range of natural rights who use their rational and instinctual capacities to perceive the shortcomings of life waged amidst a hostile natural environment and secure their autonomy in political society. John Locke theorized the basis of political society as a contract between these rational agents who bond together in the polity under a common, stable, and just rule by a sovereign empowered by each individual’s alienation of executive, legislative, and judicial capacities over to the sovereign, who rules for the limited purpose of preserving each citizen’s life, liberty, and property. This modern idea of technical rationality no longer emphasized transcendental goods that human agents discovered and modeled. For the materialist Hobbes, justice is nominalistic since it is the result of our desires and the “good” is only defined by our own preferences, without reference to a transcendental or natural law. Justice only becomes objective and concrete when the sovereign legislates an absolute and fixed normative order. For the realist Locke, on the other hand, a natural law horizon provides the universal and objective moral basis for just actions in the state of nature. Humans can defend their interests not merely as a material matter, but as a lawful matter – property acquisition and holding, interpersonal actions, and economic exchange are all regulated by the natural law disclosed by reason, based upon an understanding of other humans as free and equal, requiring duties of responsibility toward them and their interests. Political society is required because of deficiencies in legislating, judging, and executing the laws of nature, not because of their non-existence. The sovereign does not create the demands of justice – they exist by nature – but enforces these demands more effectively than individuals left to their own devices. Justice is achieved in political society through laws that prevent harm so citizens can coexist peacefully.

Kant perfected this definition of justice in his *Rechtslehre* (Doctrine of Right or Justice). For Kant, the civil condition between moral agents requires a positive system of law as an external structure of forms for agent actions and an executor with coercive power to enforce the laws. The *Rechtstaat* is the properly-formed state which, as an institution, creates the condition of right, or justice, between rational citizens. Civil law achieves justice by instituting “the sum of the conditions under which the choice of one can be united with the choice of another in accordance with a universal law of freedom” (MM 230:56). Duties of *Recht* impose rational constraints on an agent’s external actions in order to secure the coexistence of the external freedom of other rational agents; in the *Rechtstaat*, the state actualizes and enforces these duties.

John Rawls’ *Theory of Justice* is the standard contemporary account of justice. Rawls focuses on the basic structure of society “as a fair system of social cooperation over time,” a “well-ordered society” of “citizens as free and equal persons” cooperatively living together in a society regulated by a public conception of justice (Rawls 1971, 5). For Rawls, we do not achieve this justice through agreement about a substantive metaphysical view of the good life; our fellow citizens hold intractably different metaphysical views. These diverse citizens, though, can come to some agreement on “fair terms of cooperation” and *political* conceptions of justice and each participate in the democratic polity on the basis of equal basic rights and liberties (Rawls 1971, 7–21). Political conceptions of justice focus on the fairness of the basic structure of society and how the political and social institutions work as a system of social cooperation and “the way they assign basic rights and duties and regulate the division of advantages that arises from social cooperation over time” (Rawls 1971, 10).

To accomplish this political justice, Rawls develops a mechanism for setting the rules of society in a fair way. The “original position” is a way for citizens to imagine themselves forming the social order. They must ask themselves what rules and political principles would ensure a fair structure of society? The “veil of ignorance” specifies a position for each citizen that brackets their contingent circumstances (e.g. race, economic status, gender) so they can rationally apprehend the basic fairness of social structures and rules. Without knowing particular bargaining advantages or disadvantages, what social structure would optimize one’s freedom and equality and fair treatment regardless of the particularities of one’s life? On this basis, Rawls argues that any reasonable account of justice entails two major principles:

- 1) Each person has the same indefeasible claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all;
- 2) Social and economic inequalities are to satisfy two conditions:
 - a) They are to be attached to offices and positions open to all under conditions of fair equality of opportunity;
 - b) They are to be to the greatest benefit of the least-advantaged members of society (the difference principle). (Rawls 2001, 42–43).

Justice thus involves the fair distribution of resources (what Rawls called primary goods and includes opportunities, liberties, wealth among others) while, at the same time, the fairness of the political structure focuses on the procedural mode of political decision-making rather than some substantive outcomes: “The basic structure is arranged so that when everyone follows the publicly recognized rules of cooperation, and honors the claims the rules specify, the particular distribution of goods that result are acceptable as just, whatever these distributions turn out to be” (Rawls 2003, 50).

Rawls, and modern liberal accounts of justice, are subject to multiple critiques. One critique, waged by thinkers like Amartya Sen and Martha Nussbaum, focuses on local, person-level capabilities, not aggregated resources, as benchmarks for justice. The capabilities assess the extent to which persons are able to actualize certain primary goods in their specific situations (like being able to live a normal lifespan, to have attachments, to form a conception of the good). Another mode of critique is that liberal accounts of justice suppress the religious and moral depth of one's life where transcendent goods are now seen as preferences determined solely on the basis of one's desires. Another critique of Rawlsian-style ideas of justice revolves around their statist focus – justice is something that citizens achieve only in states. Thinkers like Thomas Nagel argue that the State is a necessary structure and, without a state, all the hopes and aspirations for “justice” lose their foundation. Many cosmopolitan thinkers argue, instead, for a system of global justice in which individual and group rights are protected through mechanisms not dependent upon domestic legal institutions.

Theology of Justice: Forming Human Power toward the Good

Justice as a theological category pushes in a number of directions. The first, horizontal dimension of justice mandates a view that even while social relations and political institutions are transitory and not final, *better* modes of those relations (and the institutions that manage them like law and politics) can be created and sustained. As such, a theological account of justice needs to render intelligible the relationship between persons and must recognize that those relationships take place within many social and political institutions that mediate between persons. Christian theologians like Karl Barth, Paul Tillich, and Reinhold Niebuhr, working in the context of the world wars, sought to understand how the Gospel demands for a righteous life could relate to and take place under the reigning political institutions. Barth was highly suspicious of modern political institutions and the earthly justice they yielded (although even he recognized the primacy of the liberal democratic order as the best of the earthly models). Niebuhr argued that the Christian moral life was primarily directed to individual ethical formation; group and national identity could be ethically shaped but in limited fashion. He recognized the basic, enduring reality of human power, and the need to realistically confront power that destroys life. This Christian realism saw human modes of justice enacted by legal and political institutions, as necessary, but limited in their effect and always subject to coercion and irrationality.

Tillich's position is most instructive for a theological ethic of justice that seeks to *improve* the political institutions of a society. Tillich argued that the liberal democratic state is an ideal form of human political society, because it could, when well-formed, properly balance the interpersonal dynamics of free persons, through an organization of power and coercion in legal structures. For Tillich, power is inherent to the nature of human beings struggling in the finite conditions of life; politics is the struggle over the distribution of power and resources. To achieve the good, power must be formed so that it yields a good end for the expression of power. Justice is the form given to power, a form that channels and directs power to seek the good of all life and gain security for each existence. State law can provide this form to channel power to the appropriate ends. The liberal democratic state is necessitated by the very ontological structure of human existence – free rational individuals need a structured rational community to orchestrate their coexistence. Compulsion itself is not unjust, power is not unjust, but rather “compulsion which destroys the object of compulsion instead of working towards its fulfillment”

is unjust (Tillich 1954, 67). Rejecting the pacifist position, Tillich argued that power is a necessary component of achieving any just order; love is not enough. To destroy what opposes the integration of being and value, love must be united with compulsory power and provide the form by which power seeks to create, not destroy, being.

This movement of justice, while partial, does express a theologically significant value. Any power that works for the good of being, on Tillich's account, is a manifestation of the creative power of the divine, even if that manifestation is hidden from view. This sacramental, or theonomous, understanding of justice means that the finite form of the state's justice can bear the ultimate reality: "Every victory of the Kingdom of God in history is a victory over the disintegrating consequences of the ambiguity of power. . . and conquers, even if only fragmentarily, that compulsion which usually goes with power and transforms the objects of centered control into mere objects. Insofar as democratization of political attitudes and institutions serves to resist the destructive implications of power, it is a manifestation of the Kingdom of God in history" (Tillich 1963, 385). Tillich's conception of political criticism envisioned the idea of justice shaping and forming the finite social reality and serving as a regulative ideal to critique how existing institutions can better serve and ensure the basic goods of human life.

Another dimension of justice for the theological ethicist is the prophetic-critical role of the divine reality. Justice is a powerful tool of critical clarity about social and political institutions and identity narratives (such as gender, racial, and religious) and how received narratives and cultural structures help or hinder the achievement of justice for peoples locally and globally. Johann Baptist Metz, for example, prophetically turns to memory and suffering as categories to understand human experience and responsibility. Metz resists the absorption of suffering into a deistic logic that annihilates the meaning of suffering and leads to an "eternalization of suffering" where we come to expect that oppression and suffering are always part of human existence and nothing can be done to alleviate them (Metz 1995, 619). Christian memory resists this dismissal of the oppressed and calls forth a way to justice. Political "consciousness *ex memoria passionis*" breaks the false consciousness of our received narratives, disrupting "with a harsh and steady light the questionable nature of things we have apparently come to terms with" (Metz 1995, 8). For Metz, what we might call the critique of justice begins with memory of the oppressed: "Every rebellion against suffering is fed by the subversive power of remembered suffering" (*ibid.*). Christian memory of suffering is futurally-oriented: "the midpoint of this faith is a specific *memoria passionis*, on which is grounded the promise of the future freedom for all. We remember the future of our freedom in the memory of his suffering." This Christian memory of suffering refuses to "indifferently surrender the political life. . . to the play of social interests and forces. . . [but] brings a new moral imagination into political life, a new vision of others' suffering that should mature into a generous, uncalculating partisanship on behalf of the weak and unrepresented" (Metz 1995, 15). Here, justice is the inbreaking of God's redemptive reality into the midst of social and political structures that deny the validity of being, turning over every social structure and their justificatory narrative that impinges human dignity.

These prophetic modes of justice return one to consider the underlying drive of justice to harmonious interpersonal relations – whether one-on-one or via institutions – that are creative and fulfilling rather than destructive. In spite of this rich provenance, obstacles to the enactment of justice are everywhere. Within our own legal and political institutions, the deep stain of chattel slavery and its destructive legacy are embedded in open and hidden ways. When nightmares like the extermination programs of modern

nations and genocide and endless human oppression (on the basis of economic inequality, race, gender, religion, sexual identity, etc.) abound, justice for all seems to be a global fantasy. Where King spoke of a moral universe's arc bending toward justice, we need to follow King's example of acting deliberately out of love so as to directly seek a just order. As the Pontifical Council for Justice and Peace articulated, theological ethicists must insist that we "move beyond a contractualistic vision of justice, which is a reductionist vision, and to open up also for justice the new horizon of solidarity and love. By itself, justice is not enough" (2004, 203). That may mean, as with Portia's injunction in the *Merchant of Venice*, that mercy and love may need to "season" justice to remind persons of higher ends than mere earthly justice. That does not entail naïve passivity in the face of this world's injustice: one can and must act with love and fulfill ultimate goods in the very movement of political and legal justice, whenever life is creatively preserved and destruction resisted. The Kingdom of God is at hand does not mean abstract piety but "to render justice to the poor, releasing the oppressed, consoling the afflicted, actively seeking a new social order in which adequate solutions to material poverty are offered and in which the forces thwarting the attempts of the weakest to free themselves from conditions of misery and slavery are more effectively controlled" (2004, 325).

CHAPTER 139

Production and Consumption

Joe Blosser

Economics, no matter what the textbooks say, has never been a value-free science. From the first act of bartering to today's financial sector, no act of economic production, exchange, distribution, or consumption occurs in a vacuum. The economic forces involved in the production and consumption of goods and services are embedded in a multidimensional matrix of environmental factors and human needs, values, and motivations. It is the task of religious ethics to bring to light the ways in which religious rituals, practices, communities, and beliefs shape, question, and are driven by the contemporary forms of market-based economics that dominate much of the world. As religious ethicists seek descriptive and normative clarity in the concepts of production and consumption, they engage in a hermeneutical task of breaking open and finding links between the often-insular languages and practices of economics, ethics, and religious communities.

As the world is drawn more closely together through communications technology and the global marketplace, the plurality of religious, moral, political, and economic values, languages, and practices become increasingly evident. An exploration of production and consumption must be situated within competing spheres of influence that conceive of these terms in different ways.

Religion and Economics Historically Understood

In the Christian West, the relationship between religion and economics as separate fields of inquiry only became divisive in the last century. Some scholars trace the inception of religion and economics as separate fields to the Reformation (Roll 1954). But Ernst Troeltsch (1912) argues that Reformation theologians practiced an “Old Protestantism” that continued to view the economy under the power of theology. He argues that it is not until the Enlightenment and the rise of the sciences that one begins to see a separation in the disciplines (Nelson 1991).

In the seventeenth and eighteenth centuries, when most scholars acknowledge the beginnings of the science of political economy, its practitioners sought to discover the universal laws – God's laws – that explained how the economy functioned. Adam Smith described the connections between God's providential order and the way the economy worked. And the parson Thomas Malthus believed, in Paul Heyne's (2008, 223) words, that “the laws of the market were not the mere will of particular social classes or arbitrary governments; they were the very decrees of Providence.”

In the nineteenth century, most economists continued to be quite comfortable with the relationship between theology and economics. The most popular pre-Civil War textbook on economics in the United States was *Elements of Political Economy*, which was written by Rev. Francis Wayland (1837). Pope Leo XIII issued the encyclical *Rerum Novarum* in 1891 to counter the rise of socialist movements and the plight of laborers in free markets. He inaugurated a tradition of Catholic social thought concerning the economy that continues to today. The tradition has stridently protected private property rights, resisted socialism, insisted on the role of government to protect basic rights, upheld the special status of the poor, and insisted that those with power have a responsibility to those without it. Even the American Economic Association has its roots in Christian efforts to transform the economy to be in line with the laws of God. Up to the twentieth century in the Christian West, the concepts of production and consumption fell under the religious and moral teachings of the church – they were understood as a function of God’s providence.

In the twentieth century, academic specialization, secularization, and the professionalization of the fields have led to a hardening of the lines between economic and religious analysis of the human condition. It is in this reified space that religious ethicists work across disciplines to answer the value-laden questions of how we all come to live and work together in a way that promotes mutual flourishing.

The Landscape of Theology and Economics

Because of the complex history of religion and economics, the terms production and consumption are not just “economic” words. The terms must be understood within the economic and religious communities that employ them. A wide spectrum of such usage exists across religions. By looking at the range of ways in which economists and Christian theologians have employed the terms, religious ethicists can identify ideal types for how religious ethicists across traditions use these terms. Such an investigation into Christian ethics is further warranted because the roots of the dominant Western economic models run deep into the Christian tradition, at least back to Calvin, but likely further.

Three ideal types capture the ways in which religious ethicists and economists understand the two fields: imperialist, isolationist, and integrationist. As ideal types they are not intended to or capable of fully encompassing any particular position or scholar. The types sketch a landscape of religion and economics that should help religious ethicists understand how production and consumption are being used in particular circumstances.

Theological and Economic Imperialism

The imperialist type describes scholars of religion and economics who seek to colonize other disciplinary approaches. Though they come from different fields, the basic logic of imperialism pervades the work of Radical Orthodox and some evangelical scholars, just as it does Chicago School economists.

Radical Orthodox theologians offer some of the clearest examples of the imperialist type (Milbank 1991). They seek to remake the economy along Christian lines because they see economic analysis as a violent form of secular reason. Many fundamentalist and evangelical Christians also call for an overhaul of the economy on Christian terms (Land 2005). They emphasize that Jesus puts a Christian view of the economy in opposition to any other view.

Such Christian imperialist approaches often understand “production” and “consumption” not in the dominant economic language of scarcity, but in terms of abundance and gift. As they see it, God created a world of abundance, and if we are proper stewards of this world, we do not have to live in the economic world of scarcity, self-interest, and efficiency. In fact, the secular economic order assumes (and requires) human sinfulness to thrive. Such Christian approaches relegate the markets to serving the Christian ends of justice and charity.

The Christian imperialist claim to have the dominant interpretive lens is mirrored by Chicago School economists. At the heart of the Chicago School approach, George Stigler (1982) preaches a belief in humans as primarily utility maximizing creatures. He traces this core belief back to Adam Smith. What Stigler finds to be Smith’s Newtonian discovery is that individuals are self-interested creatures in competitive markets. Milton Friedman (1980) argues that for the individual to be successful he or she must be unshackled from the forms of coercion that prevent the kinds of voluntary exchanges on which competitive environments depend. Gary Becker (1976) takes Stigler and Friedman’s fundamental presumption of people as self-interested utility maximizers and uses it to colonize other disciplines. Though other disciplines can lend insight into human motivations and non-market activities, Becker believes economics can explain most human action.

In Chicago School economics, production and consumption are purely economic terms used in marginal analysis. Consumers will consume goods until the marginal benefits of consuming one more unit no longer exceed the marginal costs. And producers will produce goods until the marginal benefits (meaning profits) of producing one more unit no longer exceed the marginal costs. These are not seen as “moral” judgments, but scientific statements about how people act in a competitive marketplace.

Theological and Economic Isolationism

Some theologians, and perhaps the majority of economists, do their work in isolation from other fields. One could look to Christian traditions of isolation, like the Mennonites or Amish. One can also see the isolation type in the work of theologians like Stanley Hauerwas and William Willimon (1989). They use the phrase “resident alien” to suggest how the church is a kind of colony, a site of a different kind of living inaugurated by Christ. Such theologians do not call for the church to withdraw from the world, but to live into a narrative that is different from the world’s.

Like imperialists, isolationists use explicitly Christian language and symbols to develop their approach to economic issues like production and consumption. So, again, production has to do with symbols like creation, value, purpose, or calling, and consumption is cast in terms of responsibility, justice, sustainability, desire, and questions about deserving. Unlike imperialists, however, isolationists are not trying to replace economic analysis. They are rather working up a Christian narrative separate from secular discourse.

On the economic side, the neoclassical tradition grows out of a belief in the difference between positive and normative economics. Following in the isolationist tradition, Lionel Robbins and Frank Knight advocated that economists steer clear of moral and public policy statements. Most practicing economists – as evidenced by the majority of the sessions at the national and regional American Economic Association meetings and the kinds of articles published in the top tier economic journals – continue to see themselves engaged in a positive science that is set apart from moral concerns.

Paul Heyne, a University of Chicago trained religious ethicist, turned economics professor, develops the isolationist tradition with greater nuance. Heyne (2008) draws on Hauerwas as his primary theological resource, and because Heyne believes Christian positions must proceed from scripture, he sees that they have little to say to contemporary scientific economics. Heyne disagrees with the positive–normative distinction and instead roots the separateness of economics in the kinds of stories it tells. The problem with most Christian accounts of the economy is that they believe the economy can be constructed on universal moral principles. And most of the time when theologians speak about the economy, they actually reject the economy as economists understand it. What economists do is construct persuasive stories about how the world works using “the economic way of thinking,” which Heyne summarizes as, “All social phenomena emerge from the choices of individuals in response to expected benefits and costs to themselves” (294). Unless theologians are willing to talk about expected costs and benefits, they will not be talking about economics, but something else.

Theological and Economic Integration

Hermeneutical and multidimensional approaches to religious ethics find themselves in the integration type, seeking links and connections between religious and economic ways of knowing. A wide spectrum also exists within approaches to integration. Some religion scholars reject textbook neoclassical economic approaches in favor of Marxist or other heterodox economic positions. Latin American liberation theology, for example, has used Marxist analysis to help craft cultural critiques as part of a larger theological message that advocates for a preferential option for the poor. Other religion scholars embrace textbook economics, finding congruence between the kinds of freedom advocated by both religious believers and economists. For instance, Michael Novak (1993) argues for the symbiotic relationship between Catholic theology and free market economics. He suggests that both theologians and economists can counter poverty by pursuing a course of action that expands human freedom in the economic realm so that people can work and be creative. One can find theologians and economists similar to Novak in the Acton Institute and published in the *Journal of Markets & Morality* or *Faith & Economics*.

In the midst of the range of integration approaches lie a number of scholars who draw on both religious and economic ways of knowing. One can think here of Christian scholars like Sallie McFague, John Cobb, Doug Meeks, Rebecca Todd Peters, Max Stackhouse, Doug Hicks, William Schweiker, and others. Some economists also fall in this space, like Deirdre McCloskey, Herman Daly, Robert Nelson, and many of the economists in the History of Economics Society and the Association of Christian Economists.

Dimensions of Production and Consumption

Across religions scholars can be found working in each of these ideal types, and whatever their approach, the terms production and consumption are used to do work across three dimensions: the analytic, the anthropological, and the axiological. While often one or more of these dimensions is unacknowledged in a given approach, production and consumption always have some sort of explanatory power. They say something about who we are as people, and they make value claims. To better understand the integration type where so many religious ethicists do their work, one can look at how integration works in each of these three dimensions.

Analytic

Because integrationists take the field of economics seriously, the analytic force of the terms production and consumption must draw (to some extent) on the ways economists actually use these terms. While variously used in heterodox approaches, neoclassical economists use consumption and production as part of a larger narrative about social cooperation, spontaneous order, or what Paul Samuelson (1948) in his groundbreaking *Economics* textbook took Adam Smith to intend by his use of the term “invisible hand” (it’s a matter of great debate whether this is *actually* what Smith intended the term to mean).

Economics has been defined in a whole host of ways. A “textbook” definition of the field might say something like: economics is the study of how individuals cooperate with each other to make voluntary exchanges in a competitive marketplace that best satisfy their needs in the face of scarce resources. Built into such a definition are important assumptions: people are rational utility maximizers, there are limited resources, the marketplace is competitive and offers full information to its participants, and exchanges are voluntary and not coerced by power-dynamics or outside forces. Religious ethicists often raise questions about any number of these assumptions, but setting these aside for a moment, the story these economists want to tell is one about how when individuals seek their own self-interest in free and competitive markets, they become participants in a complex, spontaneous order that ultimately benefits the whole.

The concept of consumption, seen through the lens of price theory, details how individuals in this order make their choices. Consumption is part of demand. It concerns the choices individuals make to satisfy their tastes in a marketplace. Such economists can predict consumer behavior if they know a person’s: (1) tastes, and (2) budget. In the most basic textbook terms, economists create indifference curves to represent the baskets of goods which consumers would consider equally desirable. Such curves are downward sloping, convex, and do not cross each other. With an individual consumer’s tastes mapped onto indifference curves, economists then construct a person’s budget line, which is the set of baskets of consumer goods someone can afford with the money they have. When graphed, the place where the budget line is tangent to an indifference curve suggests the optimum choice – it will be the most preferred basket of consumer goods a person can afford on their budget. Another way economists figure consumer choices is through the creation of utility functions, which are a way to translate baskets of goods into a unit of utility, which is a measure of satisfaction or happiness. When economists talk about “utility maximization,” they are talking about behavior or choices that maximize happiness. From this basic analysis, economists can determine how price or income changes affect optimum choice, which goods are inferior or normal, and so on. Consumption focuses on how individuals choose given the reality of scarcity and their own desire to maximize their pleasure. Professional economists go well beyond such a bare-bones textbook understanding of consumption to problematize the construction of tastes, how utility is calculated, and urge an understanding of “enlightened self-interest” beyond mere selfishness.

When it comes to the term production, textbook economics sees it as a function of how firms – which seek above all to maximize profits – supply goods and services. So where consumption contributes to an understanding of demand, production deals with supply. Where consumption assumes the self-interested utility maximization of individuals, production assumes that firms are always seeking to maximize profits. It is the task of a firm to take the factors of production (i.e. land, labor, and capital) and turn them into consumer goods. To maximize profits firms will produce a consumer good up to that point where the marginal cost of making it equals the marginal revenue from selling it. The price

at which the good is sold depends on the demand curve and other factors determining supply, like technological advances, creativity, long vs. short run choices, availability of kinds of inputs, competition, externalities (e.g. pollution), and so on.

For both consumption and production, economists assume the person making the decision uses marginal analysis to make the best choice, given constrained options. A person will continue to consume or produce a good, service, or activity until that point when the marginal benefits no longer exceed the marginal costs. Consumers are thinking of marginal benefits in terms of utility or happiness, and producers are thinking of it in terms of profits.

Religious ethicists can take at least two things from the neoclassical economic analysis of production and consumption. First, the fact that such models are even somewhat predictive suggests that there may be something of analytic value in them. Religious ethicists often balk at assumptions about humans as self-interested utility maximizers, the sanitized economic models that are removed from the complexities of life, the focus on individuals and not communities, the lack of moral evaluation of choice, and so on. These assumptions, however, do seem to say something about how we live. Religious ethicists may not want people to act this way, but it appears people cohere to these assumptions enough that the models hold some predictive value. Second, even if one rejects the descriptive abilities of economic analysis, the models tell a persuasive story that policy makers, politicians, and much of the public find convincing. Religious ethicists must understand why people believe and act according to this story if they hope to tell their own stories of how production and consumption work. If used in their own work, religious ethicists must ask what kind of analytical work production and consumption are doing.

Anthropological

When neoclassical economists assume humans are self-interested utility maximizers, they construct a view of people as *Homo economicus*. Religious ethicists from across religious traditions often find this an unworkable view of humans. Christian theologians may recognize in these economic assumptions a view of “sinful” or “fallen” human reality. They may acknowledge that people act self-interestedly most of the time, but reject that such actions should be *encouraged* or that society should be predicated upon the continued sinful actions of people.

From an Islamic integrationist perspective, people are not fallen or sinful, but contain something of God. Humans have incredible potential to reflect God, but Islamic ethics is keenly aware of the power of human attachments to worldly things. Thus, an Islamic economic system builds itself around both human potential and curtailing temptation. Islamic economics sees humans as Allah’s trustees on earth, so all economic activity must be in accord with the teachings of Allah as revealed by the Prophet Muhammad. Allah is understood to “own” everything, and as trustees, by extension, humans are afforded private property as long as the holding of that property remains in the spirit of the trust, not violating others rights, paying appropriate fees for the property, enjoying it properly, and so on.

An integrationist Islamic view of humans as God’s trustees has significant economic implications. On the production side, profit must be obtained within a strict set of ethical guidelines. One cannot produce goods that violate the law (e.g. gambling, alcohol, etc.), nor can one produce goods in such a way that they harm people (through sweatshops, child labor, etc.). The productive resources that one owns must also be put to use. One cannot, under the guise of private property, sit on resources for personal gain. This includes one’s own labor. Work itself can be a form of worship, so Muslims often are encouraged to work as God’s trustees.

On the consumption side, many Muslims are taught to not become addicted to worldly goods, so there are restrictions on consumer goods, like cigarettes or pork. Traditionally, Muslim investors must also be wary not to invest in companies that damage health, the environment, or produce goods that coerce and tempt humans to worldly pleasures. Consumer behavior is also limited by prohibitions against *riba*, or interest. This prohibition intends to protect the poor from predatory behavior and prevent people from going into unnecessary debt. These guidelines, along with others that govern Islamic finance, helped the Islamic banking sector thrive through the 2008 recession and beyond because Islamic banks were buffered from the abuses driving the banking crisis. An integrationist approach to Islamic ethics reveals how production and consumption are rooted in a view of the human as God's trustee, which structures how such ethicists engage the economic discourses of costs and benefits.

Axiological

A major point of contention between religious ethics and economics concerns the claim by some economists that they participate in a value-free science. All economic analysis, however, produces a slate of values, and the value-free approach to economics tends to reduce all values to money alone. The impact of this unacknowledged axiological claim extends beyond economic analysis and undercuts the moral value of all the ways humans create, labor, consume, and build relationships through economic activity. Most especially, the production and consumption of goods, services, and activities cannot be separated from issues of commutative and distributive justice.

Many religious ethicists are moral realists, and as such, moral claims are seen to be more than the products of economic or social analysis. The Abrahamic traditions, for example, make claims about the inherent worth of humanity that resist the reduction of all value (including human labor, creativity, etc.) to monetary terms because they appeal to a value beyond earthly values. The most important contribution religious ethics can make to conversations of production and consumption is to insist on a set of values outside those of money, beyond complete commodification. Through the various tables of value employed by religious traditions, religious ethicists can work alongside economists (probably primarily heterodox economists and historians of economics) to reinvigorate the place of political economy within the ecosystem of moral philosophy and religious ethics.

CHAPTER 140

Sustainability and Climate Change

Michael S. Hogue

The Passing of the Future?

Sustainability and climate ethics are concerned with the challenges provoked by the mutually amplifying systemic trajectories of modern life: the exponential growth of the human population, the magnitude of our technological and industrial impacts on natural systems, the global expansion of a fossil-fueled economic system that generates inequality and concentrates economic and political power, the increasingly radical forms of energy extraction needed to maintain this economic system and the growing population, and the fact that marginalized and disempowered individuals and communities tend to suffer the most immediate and negative consequences of this juggernaut of dynamics.

In response to these dynamics, sustainability and climate ethics revolve around a multitude of complex moral questions. What moral values and responsibilities should orient our powers to intervene within the natural world? What principles should we prescribe to ensure that future human generations have the environments and resources they need to survive and even to flourish? What moral duties, if any, do we have toward the future of life? Do we have duties toward the future of animal and vegetal life as well as human life? Does non-human life have intrinsic value, or merely instrumental, utility value for humans? Do we have moral obligations to ecological systems, to landscapes, to species, or even to the whole of the planetary system? How should we adjudicate conflicting ecological, social, and economic goods, the moral status of the future and the present, the claims of individuals and systems? Which economic and social policies, and what level of policy framework – local, national, and/or international – are best suited to the application and enforcement of ecologically sustainable and socially equitable economic practices?

In the field of religious ethics, these complex moral questions are addressed through the ethical, philosophical, and theological resources of the religious traditions. What role can, or should, religious traditions play as we engage the diverse challenges of the ecological crisis? Are certain religious traditions, symbols, beliefs, rituals, and values more ecologically attuned than others? If the major religions of the world originated millennia ago, and developed their primary texts, doctrines, and ethical systems long before the emergence of global economic systems and the planetary ecological crisis, can any of them be expected to provide the practical wisdom we need now?

In response to these questions, some religious leaders, thinkers, and practitioners have discovered wisdom in their traditions they had previously overlooked. Others have sought to imagine and theorize

new moral and religious concepts, values, traditions, and practices. Responses include formal statements made by official bodies of all major religions of the world; scholarly works written and debated by theologians and religious ethicists; and educational, legislative, and grassroots initiatives across the traditions at local, regional, national, and international levels. Many anthologies survey these various responses and the conceptual and methodological issues they raise as well as the normative proposals they advance. There is also a multitude of outstanding individual works, adopting a variety of reformist, reconstructive, and comparative approaches. For example, religious thinkers from diverse traditions have utilized an ecological hermeneutic to reinterpret and reform select philosophical, symbolic, textual, and ritual aspects of their respective traditions. Others have developed more critical approaches that deconstruct and reconstruct the central doctrines, symbols, and practices of traditions. Yet others have advanced comparative projects by interpreting the ecological resources and histories of multiple traditions, or by examining how sustainability functions as a comparative category and a religious discourse that creates new occasions for multifaith engagement. Each of these types and levels of response, from formal ecclesial and institutional statements, to grassroots work, to the innovative reformist and reconstructive efforts of individual thinkers, are vitally important aspects of a robust religious ethical response to the ecological, sustainability, and climate crises.

Rather than offering an interpretive survey of the normative and methodological options, or a comparative analysis of the ecological resources of diverse traditions, this entry explores the urgency of the present moment by questioning a common assumption that orients many religious ethical approaches to the sustainability and climate crises: the assumption that there will be a human moral future that is continuous with the human moral past. This is a common assumption because moral thought, and particularly sustainability and climate ethics, is oriented around a problem structure and is motivated by a concern for the future consequences and effects of human action. The sense that there is something wrong, that there is a problem that should be engaged now for the sake of the future, is why prophetic statements are made, acts of witness are enacted, and scholarly articles and books are written. Although religious and moral actors do these things for diversely articulated reasons – for instance, out of a sense of obedience to a divine will, in response to a call of faith, or as an act of compassion – these reasons are often aligned with the aim to positively influence the future.

But what if the claim that the assumption that there will be a human moral future is itself a problem because it fails to recognize the tragic paradox of the crisis we face and therefore obstructs the kind of cultural analyses, systemic transformations, and existential conversions that religious and moral response to the urgency of the crisis demand? The fact is that our human interventions into, and alterations of, the planetary system, and especially our impact on the climate, imperil the human future, not to mention the future of other forms life. And this endangering of the future is due not only, or even primarily, to malicious intent, willful ignorance, or pathetic indifference to nature. If this were the case, as is often supposed, then the solutions to the problems (if not executing those solutions) would be straightforward – transform evil, increase knowledge, expand the scope of value and extend the reach of responsibility. However, these remedies are insufficient if the tragedy of the ecological, sustainability, and climate crises is the paradoxical effect of the systems, practices, and values that have shaped human civilization over the past several hundred years. To identify these crises as a tragedy is to claim that they are the unintended and unforeseeable, but seemingly inevitable, result of the employment of capacities and powers intrinsic to a form of being human.

If taking the ecological crisis seriously and fearlessly facing facts ruptures the very concept of a human moral future, and the concept of a human moral future continuous with the past is intrinsic to the form of human life that has brought about the crisis, then a religious ethical approach to the crisis compels a reimagining of what it means to be human. Likewise, a reimagining of what it means to be human in the context of the ecological crisis entails a reimagining of the future as one hypothesis among others, rather than an assumption. If the climate crisis is an utterly new moral event in the history of life on earth, incommensurable in scale and urgency with any other kind of moral challenge the religious traditions have ever engaged, but nonetheless one that we as a species have precipitated, then responding adequately to it may require that we think beyond the resources of existing moral and religious traditions, perhaps even against their grain. What form of religious ethic, and what form of human life must we reimagine or rediscover if we are currently living, as Bruce A. Collings has evocatively argued, in the “ruins of the future,” a present in which not only history, but also the future, has passed?

The religious ethical significance of the loss of the human moral future, in a form continuous with the human past, orients the rest of this entry. The section that immediately follows engages this loss through a brief analysis of the reconfiguring of the phenomenology of moral space and time in the context of the Anthropocene, the name geologists are using to describe the present, human-dominated epoch in the history of earth. The concluding section will introduce the vital elements of a religious ethic of ecological attunement as a constructive approach to the sustainability and climate crises.

Moral Time and Space in the Anthropocene

Human life, like any other form of life, is spatially and temporally conditioned and consequential. As organic, metabolic beings, we are affected by, and cannot help but to effect, the spaces and times of our lives. But as moral creatures, as beings who recognize, affirm, and assign value to other things, states, and beings in the world, our relation to time and space is different from other organisms. We imagine and compare possible futures and diverse consequences as we discern how we should act in the present. We examine our personal moral histories, and the histories of our religious and moral traditions, for moral insight and wisdom. We know that just as the conditions of our lives have been influenced by the lives of our ancestors, the consequences of our decisions and actions will affect the lives and worlds of our descendants.

However, the timing of moral life is neither linear nor uniform. As organisms, we live and die according to the unyieldingly linear flow of biological time. As ecological beings, we observe seasonal time by noticing changes in the weather, the growth cycles of plants, and the migratory patterns of other animals, but in geological time, these patterns and cycles fluctuate. As moral and cultural creatures, we live in multiple registers of time at once and we measure time in different ways for different reasons – we orient ourselves in relation to liturgical and ritual cycles, secular and religious, and we plot the meanings of our lives through the storied time of mythic worlds, the origins and endings of worlds coming and going.

Just as we inhabit multiple registers of time, we also live within and move among many different spaces at once. We inhabit physical, social, natural, and cultural environments. As human moral animals our capacities to register and assign moral values, to deliberate, imagine, decide, and to act are physically embodied. To have a body is to take up space and to be dependent upon a natural environment that provides clean air to breathe, clean water to drink, and nutritious food to eat. As social animals, we inhabit

associational and institutional spaces, family spaces and spaces for work and play. We develop our physical, mental, and emotional instincts in relationships with others, for good and ill. We dwell within and migrate across sacred and profane spaces, spaces of solitude and community, wild and cultivated places.

All this is to say that we are polychronic and polytopic creatures: we live and move and have our being in the spaces and times of many worlds (Schweiker 2004, xii). Our species habitat is pluriform and multi-dimensional – historical, spatial, biological, ecological, social, and cultural. Although this has always been the case, the ecological, sustainability, and climate crises illuminate this reality in new ways. While we may be the only creatures who have evolved the capacities to affirm, assign, and argue over the moral value and purposes of life, we also have more power over the present and future conditions of life than any other species. Our capacities to intervene within natural systems have made it possible for us to grow our own food, domesticate animals, construct shelters to protect us from the weather, build towns and cities, cultivate landscapes, channel waterways, harvest minerals, mine coal, drill for oil, and manufacture a human world so vast and interconnected that there is now no place on earth untouched by our influence.

But the very same powers that have brought about many qualitative improvements to human life have also precipitated the sustainability and climate crises that threaten the planetary conditions necessary to sustaining habitable worlds. We have brought about these crises through our participation in a global economic system that illogically demands unlimited growth and yet is predominantly fueled by non-renewable and ecologically hazardous forms of energy; through industrial agricultural practices such as monocropping and the intensive use of chemical pesticides and herbicides, which have depleted the soils we need to continue to grow healthy food; through mass consumption of meat that has led to overgrazing, the clearing of forests, and increasing levels of methane, a potent greenhouse gas; through the destruction of watersheds by land erosion, forest depletion, chemical leaching, and agricultural runoff; through habitat destruction and fragmentation; through industrial pollution of water, land, and air; through a fossil-fueled form of life that has thrown the natural carbon cycle out of balance and is warming the planet at an unprecedented rate.

Since the beginning of the Industrial Revolution in the mid-eighteenth century, human population and economic production have grown exponentially, the amount of land under intensive human use has nearly tripled, and atmospheric CO₂ concentrations have increased from 277 ppm (parts per million) to over 400 ppm. And yet, while the population grew from one billion to approximately three billion between 1750 and 1950, it has taken only fifty years for the population to double since then. Alongside the accelerated population growth during this period, the massive buildup of manufacturing capacity during World War II, combined with the efforts of the World Bank and International Monetary Fund to generate, manage, and administer postwar recovery, led to the global expansion and intensification of industrial impacts. Postwar population growth, increased production, and economic globalization required more fossil fuels to sustain, thus massively magnifying the impacts set into motion by the Industrial Revolution. As a result, the cumulative CO₂ emissions generated over the past two centuries have overwhelmed the “natural” sinks in the carbon cycle and spawned the reinforcing feedback loops that constitute the climate crisis: warming air and oceans reinforce one another, causing changes in ocean currents and increased ocean condensation, which increases the volume of moisture in the air, which, in combination with altered ocean currents, leads to more frequent extreme weather events, such as longer droughts in some areas and more intense rainfall and flooding in others. These changes have generated tertiary socioecological impacts such as diminishing water supplies, crop failure, rising numbers of ecological refugees, new migratory patterns, and changing distributions and rates of vector-borne diseases.

While every species alters its environment to some degree, no other species has the power to alter the whole of the planetary system in this way. Thus, we have become a moral event in the history of the earth, a geohistorical as well as a biocultural force. The history of the human species has become the dominant story in the history of the earth, and the planetary dominance of our species story has led geologists to propose the “Anthropocene” as the name for the earth’s current geological epoch. As a geological term, “Anthropocene” signifies two ideas. First, it signals that the earth is no longer in the geological epoch called the Holocene, which literally means “present age.” This is alarming since the relatively stable climate of the Holocene made human civilization possible – it made agriculture possible, which made settlement, cities, and complex forms of human social life possible. If everything that humans know and experience as civilization was made possible by the climate stability of the Holocene, then to move out of this epoch into a new one, the Anthropocene, is to move into a time without human historical analogue. Strange as it may seem, humans have never lived through a human age for the earth. The second idea signaled by the term Anthropocene is at least as unsettling as this. It is the claim that we have not only exited the Holocene, the geological niche that has been uniquely hospitable to human civilization, but we have shown ourselves the door – we have escorted ourselves into a time of uncertainty on earth with no human historical precedent.

Because of the planetary scale of our deepening human ecological impacts, the earth has become like a hall of mirrors. Wherever we peer into planetary systems, whether geological, hydrological, or atmospheric, we see a peculiar image reflected. What we see is the end of the idea of the human as set apart from nature. This hall of mirrors is the Anthropocene, a human age in the history of the earth in which the human and the non-human, the political and the planetary, the economic and ecological, and the human present and the future of life have become viscerally and inextricably entangled.

But the paradox of this self-caused retreat from the Holocene is that by making the earth *Homo imago*, by terraforming our species’ self-image into the earth, we have an opportunity to reimagine ourselves as *terra bēstiae* (Hogue 2018). As creators of a geological age we have crossed over from a biocultural to a geophysical form of agency, a profound phenomenological, moral, and religious threshold. It is this crossing that marks the ending of the idea of human separatism from the rest of nature. Since human/nature separatism, or the idea that the human and natural are ontologically distinct, has been a founding opposition in the history of modern Western civilization, it has also formatted other organizational binaries such as nature/culture, mind/body, animal/human, outside/inside, environment/organism, economy/environment. And since this founding opposition and suite of binaries have aided and abetted the ecologically negligent systems and practices that drive the ecological, sustainability, and climate crises, then the ending of human/nature separatism is also, potentially, the beginning of a new ecological form of being human. In particular, the Anthropocene paradox opens an imaginal space in which to potentiate new ways of doing religious ethics in an ecological key.

Ecological Attunement and the “Outcry of Mute Things”

Two vital ideas animate a religious ethic of ecological attunement. First, a religious ethic of ecological attunement inverts the traditional conceptual logic of religious ethics by hypothesizing the ecological crisis itself as a religious event, instead of treating it as a problem that can be solved by existing religious traditions. Second, a religious ethic of ecological attunement does not assume the human moral future, but interprets it as one possibility among others, including the possibility that there may not be one.

To explain the first idea, the conceptual inversion, it is important to comment briefly on what is meant by a “religious event.” Religious events are dramatically transformative in some way, whether by illuminating what has been obscured or by integrating what has been alienated. Religious events cause a reseeing, or reimagining of the meanings and values that ultimately orient us; they move us to reconnect, rediscover, or integrate our lives with what we take to be most fundamentally important, with the sacred, or with some profoundly creative reality or power, such as God, or nature. Thus, religious events are encounters, insights, relationships, experiential undergoings and overcomings that throw life into question; they rend the veil of the ordinary; they interrupt, disrupt, and can sometimes transform life.

What would it mean to imagine and experience the ecological, sustainability, and climate crises as a religious event, rather than as a set of problems to be engaged by the religions? Consider for a moment that we humans, like every other thing that exists, are the unplanned creatures of an exquisite lattice-work of natural processes which originated in mystery about 13.7 billion years ago. If this is so, then the answer to the question of why the Universe exists or why there is something rather than nothing is likely to remain infinitely out of reach of human comprehension. But we know that if the rate of acceleration of the elements out of the Big Bang varied even in the slightest, the Universe would not have unfurled the way that it has. We know that even a slight adjustment of the earth’s coordinates in relation to the sun would have made life impossible. We know that life first emerged on our planet about 3.5 billion years ago. We know that since then life has been in a process of relentless transformation. We know that, even though the origin of modern humans was recently dated further back to approximately 200,000 years ago, we are latecomers to life on earth. We know that we are creatures with purposes and values. And, what is more, it can be argued that all other living creatures, insofar as they metabolize, also have purposes and values of their own, whether they are consciously held “in view” or not.

The synthesis of human consciousness, moral empathy, and our capacities to alter the world, yields moral responsibility. This responsibility emerges out of our awareness that human life is entangled with the rest of life, that life as such seems to be rare in the Universe, and that we as a species possess the power to alter the planetary conditions upon which the future of life depends. Thus, precisely insofar as we have become a massive planetary force that imperils the future of life, we have also become earth’s (if not the Universe’s) custodians of life and therefore also conservators of value. More fully realizing this responsibility is what a more ecological form of being human entails; and more fully integrating this ecological mode of responsibility entails reconnecting to the nature we share with other forms of life as *terra bēstiae*.

The question, then, is whether the ecological, sustainability, and climate crises constitute an event, experience, or undergoing that can lead us to reconnecting to this nature and thus more fully to realize our responsibility. The Jewish philosopher Hans Jonas answers this question with unmatched pathos:

It was once religion which told us that we are all sinners, because of original sin. It is now the ecology of our planet which pronounces us all to be sinners because of the excessive exploits of human inventiveness. It was once religion which threatened us with a last judgment at the end of days. It is now our tortured planet which predicts the arrival of such a day without any heavenly intervention. The latest revelation – from no Mount Sinai, from no Mount of the Sermon, from no Bo (tree of Buddha) – is the outcry of mute things themselves that we must heed by curbing our powers over creation, lest we perish together on a wasteland of what was creation.

(Jonas 1996, 201–202)

The hearing of this outcry could become the encounter and upending that rends the veil of the human-centered meanings and ecologically negligent values that have oriented human life for centuries, a religious event that initiates the cultural analyses, systemic transformations, and existential conversions demanded by the tragedy of the ecological crisis and the paradox of the Anthropocene. But one needs to be able to hear this outcry, in its urgent immediacy, which is why abandoning the assumption that there will be a human moral future continuous with the past, the second vital idea in a religious ethic of ecological attunement, is so important.

To live in the “ruins of the future” makes it possible to experience the ecological, sustainability, and climate crises as a religious event. This religious event, if grasped in its burdensome fullness, illuminates the tragedy of human separatism from the rest of nature with such blinding light that it can compel a total conversion in what it means to be human; it is an event so ultimately disorienting that it can provoke a crisis, or turning point, in our species self-image that leads us to hear what the ecological negligence of human separatism obscured, the mournful tune of the “outcry of mute things.” Once we attune ourselves to this outcry, it is impossible to unhear it. If we can cultivate and sustain this attunement to the fulsome ecology of life, it may lead to a recovery of, as John Foster eloquently describes, “our ability to live and act as whole natural beings, undisintegrated and unalienated” (Foster 2014, 12). Thus, abandoning the assumption that there will be a human moral future continuous with the past is not an act of acquiescence. Instead, it is an act of responsibility, a demand to see through the delusion that anything other than radical system change, or anything less than a profound conversion of what it means to be a morally responsible human being, is sufficient to the urgency of the crises we face. Facing the facts of climate change, as well as the fact of our failure as a species, thus far, to catalyze a global transition from a fossil-fueled to a more sustainable form of life, is the first step toward a more ecologically attuned religious ethic.

1 Structures and Conditions

CHAPTER 141

Religious Membership

Robin Gill

One of the important rediscoveries in religious ethics over the last few decades has been the intimate and complex relationship between moral agency and moral communities. This relationship is extremely varied. Sometimes, as in Islam or Judaism, it also involves an intimate connection with a Holy Book. Sometimes, as in Confucianism, it is very closely related to the traditions of a particular society. There is also a wide range of ideas involved, from Buddhist claims about compassion and enlightenment to Christian debates about grace and freedom. Yet, in many religious traditions, a connection is made between moral agency and moral communities that is at odds with much, but not all, modern Western ethical theory. The latter tends to conceive of the moral agent abstracted from communal membership and to focus upon freedom and rational autonomy as the defining feature of moral agency.

This entry explores some of the implications of this debate about accounts of moral agency. At stake, most basically, is how religious ethics is to understand the importance of religious membership in providing an adequate account of moral agency.

Within the secular post-Enlightenment tradition following Kant, moral agency has characteristically been perceived as being independent of religion and based instead upon autonomous rationality alone. The individual makes moral choices and decisions based solely upon rational criteria that are available to all competent, rational agents (whether they are themselves privately religious, as Kant was, or not). Moral philosophers like Alasdair MacIntyre (1984) have challenged this understanding of moral agency. At a negative level, moral philosophy – the discipline concerned with autonomous, rational criteria in moral thinking – has been unable to deliver indisputable rational criteria or universally agreed moral decisions. Incommensurable differences remain on key moral issues such as abortion or justice both within the general public of Western societies and (especially and most significantly) among experts in moral philosophy. At a positive level, MacIntyre has argued that virtues molded by moral and religious communities are essential to an adequate understanding of moral agency. Charles Taylor (1989) has also challenged a purely secular understanding of moral agency. Although committed to a notion of autonomy within moral agency, he nevertheless has argued that moral reasoning cannot be properly understood without acknowledging the long history of moral concepts within specific and typically religious communities.

Using insights from MacIntyre and Taylor, this entry argues that a pluralistic society should recognize not only that religious minorities need to be respected if such a society is to be genuinely inclusive, but also that a number of crucial, but supposedly secular, moral notions have religious roots and may even

make full sense only when these roots are explicitly acknowledged. This entry will begin with the current debate in ethics about agency and membership before moving to specifically religious concerns. Although drawn predominantly from current Western, Christian ethics, there should be implications here for many other forms of religious ethics as well.

The Debate About Agency

A central part of MacIntyre's critique of moral philosophy is that it makes claims for secular reasoning that it is unable to deliver. Modern ethics as a discipline has tended to claim that it alone, unlike theological ethics, can resolve moral dilemmas in the public realm. Moral reasoning without any divine revelation can be a universal means of reaching moral conclusions. Whereas religion divides people, secular moral philosophy can unite them. Through the Enlightenment understanding of morality we have been delivered from the bitter religious warfare that characterized Europe during the sixteenth and seventeenth centuries. Decision making based upon moral philosophy offers the prospect of agreement across cultural and ideological divisions. Reason abstracted from religious membership is morally central.

In *After Virtue* MacIntyre subjects such claims to a detailed critique. There is, so the book argues, a clear gap between such claims and their attainment. Within moral philosophy there are very evident and unresolved differences between, for example, deontologists and utilitarians. These differences become apparent as soon as recent debates are examined about issues such as the rightness of abortion or the nature of justice in society. The book maintains that these differences are actually incommensurable in terms of post-Enlightenment moral philosophy.

So, for example, the differences between pro-life and pro-choice factions in the abortion debate are not, so MacIntyre argues, resolvable in terms of post-Enlightenment moral philosophy. All too often contesting rights of the fetus, on the one hand, or of the woman, on the other, are simply asserted by the different factions without any prospect of rational resolution between them. Vigorous attempts to resolve this contestation have so far failed to convince either faction. Of course, particular power groups within society can ensure that, in the absence of intellectual agreement, one of these factions prevails. In reality this has now happened in much secular bioethics within the West in favor of the pro-choice faction. Although there is still a widespread belief that it is right to have a conscience clause allowing healthcare professionals opposed to abortion not to take a direct part in providing abortions, the same professionals are nevertheless still obliged to refer women requesting an abortion to other professionals who are not opposed. At best this is a conscience clause allowing professionals to opt out of direct action on abortion but not to opt out of abortion provision altogether (akin, perhaps, to ambulance service on the front line in World War I for exemplary pacifists rather than incarceration for thoroughgoing pacifists). A conservative Roman Catholic, Jewish, Muslim, or perhaps Buddhist doctor, opposed on religious grounds to abortion, has no legal alternative but to comply.

Again, a central weakness of much recent moral philosophy is "atomized individualism." It is all too often assumed that moral conclusions are typically reached by individuals through a series of logical steps without reference to others or to tradition until they make a moral decision. The focus here is upon the self as a self-contained island and upon moral decisions reached by an internalized process of logical deduction, as if individuals were not actually part of wider communities embedded in history and

tradition. Taylor (1989, 305ff.) seeks to show at length that this is a very impoverished understanding of the moral self. Yet, ironically, it is still an understanding that is implicit within much discussion of autonomy and decision making in applied secular ethics.

In contrast to atomized individualism, some ethicists advocate a return to the moral tradition of virtue ethics and point to the role of moral communities in shaping virtuous individuals. Within this tradition, individuals are trained in virtues within local communities so that, when faced with ethical dilemmas, they do not approach them *de novo* as isolated individuals but as members of communities and as heirs to longstanding sources of moral wisdom. Such individuals depend less upon secular rationality than upon deeply ingrained virtuous habits to resolve moral dilemmas. On this understanding of bioethics – an understanding which is beginning to receive more serious discussion – the primary task of the discipline is to identify virtues which should guide and shape healthcare professionals and patients alike.

Herein lies a central problem. MacIntyre, for one, is highly skeptical about whether Western society is ever again capable of having a unified moral vision. Having deconstructed the universal claims of moral philosophy, he sees only fragmented and changing moral communities in the Western world. He points to the need for a new moral community, but offers little hope that it is actually still possible for any moral community to gain widespread acceptance. At most, presumably, a series of fragmented communities can bring their virtues to areas such as modern medicine, but without any expectation that everyone can accept them.

All of this suggests a serious moral gap that is particularly relevant to religious ethics. There is an evident gap between philosophical claims about virtue within communities and sociological skepticism about actual communities within the modern Western world. If modernity is premised upon individual rationality, it founders upon incommensurable moral conflicts (the very conflicts that moral philosophy was supposed to resolve). A more postmodern vision is premised instead upon local communities shaping virtuous people, but it founders upon the seeming impossibility of achieving general assent today for returning to premodern communities. Moral fragmentation and social conflict seem to be inevitable.

It is at this point that Taylor identifies a second major moral gap. He believes that moral agents are now in an age in which a publicly accessible “cosmic order of meanings” is an impossibility. All that moral agents can rely upon today is “personal resonance” – and that of course will vary from person to person. He likens us to a crew of car mechanics in a pit-stop, each with four thumbs and with only a very hazy grasp of the wiring used in modern racing cars. We can resort to mundane procedures in an attempt to counter this serious deficiency, but these will not finally obscure the fact that we no longer share a vision of a “cosmic order of meaning” (Taylor 1989, 512). To apply this analysis to bioethics, it is painfully obvious that in ethical discussions about healthcare today we cannot even agree upon a notion of health. For some people, health is concerned narrowly with an absence of disease (itself a term with cultural variants), whereas for others it is concerned with wider well-being (a term with metaethical variants) and for others still with physical, mental, and spiritual health (now with metaphysical variants). Or consider modern warfare: it is often extremely difficult, if not impossible, to get opposing factions to agree about how just-war theory actually applies to them. For example, one side may see a particular recourse to arms as being a legitimate struggle for liberation, whereas the opposing side may see it instead as an act of terrorism.

Within a detailed discussion of Kantian ethics, John Hare (1996) suggests a third major moral gap. He argues that this is the gap that arises from Kant’s high moral demand for individuals combined with his

belief that everyone has a propensity not to follow this demand. Specifically, the high moral demand that all people should always behave morally in ways that are universalizable is in clear tension with their propensity to selfishness. For Kant, Hare argues, this gap was particularly acute precisely because he believed that “ought” implies “can”: if it is not the case that people can live by the moral demand, then it cannot be the case that they ought to do so. Hare is unconvinced by secular strategies designed to reduce this moral gap. The first seeks to reduce the moral demand itself (perhaps moral demands need not be universalizable) and the second exaggerates our natural propensities (perhaps humans really are not selfish after all). Both of these strategies have also been used at times in bioethics. If the moral demands in bioethics are sufficiently low then we should be able to attain them, or if we can assume that all healthcare professionals and patients will act selflessly then we can keep the demands high. They have also been used in applications of just-war theory. For some, war is inevitable, so they regard the function of just-war theory as simply to limit the worst features of warfare; others maintain that rational moral agents really can consistently reject violent action of any kind and live in a peaceful utopia. Rejecting such strategies, Hare (and, he believes, Kant) argues that this gap can only properly be resolved in terms of specifically religious ethics.

The influence of these moral philosophers upon specifically religious ethics in the last two decades has been immense. Many religious ethicists argue that this philosophical shift away from an individualistic understanding of moral agency gives renewed impetus to their discipline, concerned as it is with providing a critical account of differing ways that particular religious communities respond to moral issues. Some argue that Enlightenment secular moral agency is itself just one ideological tradition among others rather than a privileged mode of moral agency replacing traditional, religiously based moral agency (Hauerwas 1992, 2001; Milbank 1990). What does this really mean? It is at this point that the theme of religious membership becomes significant.

Assumptions About Moral Agency

A number of assumptions lie behind this new understanding of moral agency among religious ethicists. The first is that modernity is characterized by global pluralism rather than by secularity. Modern secularism is not a neutral platform for examining the world, but itself a form of ideology. The second is that, within this global pluralism, differing and sometimes competing religious communities abide and continue to contribute to moral agency. And the third is that such religious communities properly understood – and despite their internal differences – do still have a significant role to play in the public forum, even within secular democracies.

A good illustration of this is the extent to which religious ethicists, both in the United States and in the United Kingdom, and more widely within Europe, have been involved in public discussions of the morality of military action following September 11, 2001 and the morality of novel scientific areas such as that of stem cell research. It is still a feature of many national committees established to consider such moral issues that they regularly include a religious ethicist, alongside secular philosophers and lawyers. Politicians within both the United States and the United Kingdom are very wary of basing public policy upon any specific religious teaching (even within the Republic of Ireland such an approach is no longer popular). The same can be said of other, non-Western pluralistic societies, say India. Within many Islamic countries, too, there are similar tensions. In these contexts, secular “law” has increasingly had to navigate

religious diversity. Not the least of the fears is the risk of alienating other religious minorities within their respective countries. Nonetheless, there is still a wide-spread recognition that religious groups may have a distinctive contribution to make to the well-being of society at large.

The appointment of the theologian Rowan Williams as archbishop of Canterbury (2002–2012) is one example of this increasing recognition. Because the Church of England is still an established church, the prime minister of the United Kingdom has a direct role in the selection process of an archbishop. This role remains despite the fact that religious attendances across Christian denominations and across faith groups as a whole in England are lower than those elsewhere in the United Kingdom and about half of those in the United States. The archbishop, in turn, can vote in the House of Lords and thus has a direct role in political decisions and is likely to be especially influential in those involving moral issues. Before his appointment it was already known that Rowan Williams held relatively conservative views on the morality of stem cell research involving human embryos (research which the government supported) and more radical views opposed to the bombing of Afghanistan following September 11, 2001. In addition, to the consternation of evangelicals within the wider Anglican Communion, it was also widely known that he had liberal views on homosexuality and had knowingly ordained as priest someone who was living within a committed same-sex relationship. All of this suggests a very complex pattern of interaction quite at odds with a separation of public morality from religious traditions. A prime minister at the time, himself with known religious commitments, sanctioned the appointment of an archbishop who was likely to exercise a role of public leadership on moral issues, despite evangelical opposition to this appointment from within the Anglican Communion and despite the possibility that once appointed the archbishop might actively oppose government policy in some moral areas (as he did over invading Iraq).

An added twist to this example is that as England increasingly sees itself as a multi-faith society (although in reality the official membership of mosques and synagogues there is relatively small), so the archbishop of Canterbury has sometimes been identified as a spokesperson for religious faith in general. In recent years, a number of key meetings have been sponsored at Lambeth Palace, the London residence of the archbishop, involving a broad spectrum of religious leaders. The objective of these meetings has not been simply to promote interreligious friendship and cooperation, but also to present common cause when needed to influence government policy. For example, when Robert Runcie was archbishop (1980–1991), an unsuccessful attempt was made by one of these meetings to influence government to extend the law against public blasphemy to religious traditions beyond Christianity. Inevitably, such an attempt was contentious even within the religious traditions themselves. Some adherents argued that internal contradictions would inevitably arise (especially given the intellectual difficulties in defining what constitutes a “religious” tradition) and in any case free speech was preferable to anachronistic concepts of blasphemy.

There have been a number of religiously inspired empirical studies of public attitudes and moral behavior. One obvious example is *The Family, Religion and Culture Project* directed by the theologian and ethicist Don Browning (1934–2010). Books published as a result of the project attempted to give an overview of the social and theological debate about the family in modern America. At the heart of this project was a conviction that the family should be defended robustly by people of faith, despite the fact that in the name of the Bible it has often been distorted in the past. In the foundation book for the series, the authors argued that the fundamental family issue of our time may be how to retain and honor the intact family without turning it into an object of idolatry and without retaining the inequalities of power,

status, and privilege ensconced in its earlier forms (see Browning 1997). Using extensive social statistics they argued that in America one out of two marriages ends in divorce and almost one in three children is born outside marriage. Yet the United States is still a country of relatively high religious attendance and over two-thirds of all marriages take place in churches and synagogues. Second and even third marriages regularly take place in them in the United States and increasingly within the United Kingdom as well. Those writing for the project were well aware of these facts when they sought to defend what they term the “intact” family – by which they meant families in which children are brought up by both of their biological parents. Not wishing in any way to discriminate against other families, they still believed that it is vital for religious communities to encourage intact families, if necessary with help from the law.

Another approach, which I have set out at length elsewhere, is based less upon a moral campaign than upon an attempt to assess in social scientific terms just how significant religious factors are in moral agency (see Gill 1999) and in moral passion (see Gill 2017). Using extensive international data from social attitude questionnaires, I test whether claimed religious behavior or belief has any demonstrable relationship to more general moral attitudes or action. What emerges is that the religiously active are indeed distinctive in their attitudes and behavior. Some of their attitudes do change over time, especially on issues such as sexuality, and there are obvious moral disagreements between different groups of the religiously active in a number of areas. Nonetheless, there are broad patterns of belief, teleology, and altruism that distinguish those who are religiously active from those who are not. For example, Christian churchgoers have, in addition to their distinctive theistic and Christocentric beliefs, a strong sense of moral order and concern for other people. They are more likely than others to be involved in voluntary service: many childcare groups, youth clubs, charity shops, and care-of-the-elderly services depend heavily upon churchgoers. They see overseas charitable giving as important and are more hesitant about euthanasia and capital punishment and more concerned about the family and civic order than other people. None of these differences is absolute. Analogies could be found in other religions. The values, virtues, moral attitudes, and behavior of churchgoers are shared by many other people as well. The distinctiveness of the religiously active is real but relative.

This evidence is consonant with the argument about moral agency and communal membership. Even in pluralistic American society, there are still religious communities – Catholic Irish, Orthodox Greeks, and Orthodox Jews – which are relatively less fragmented. Yet, as MacIntyre notes, “even however in such communities the need to enter into public debate enforces participation in the cultural *mélange* in the search for a common stock of concepts and norms which all may enjoy and to which all may appeal ... in search of what, if my argument is correct, is a chimaera.” This produces a curious mixture of historically and culturally contingent communities misguidedly searching for moral consensus. Further, “moral philosophies, however they may aspire to achieve more than this, always do articulate the morality of some particular social and cultural standpoint.” As a result, modern, pluralistic societies cannot hope to achieve moral consensus. Rather, “it is in its historical encounter that any given point of view establishes or fails to establish its rational superiority relative to its particular rivals in some specific contexts” (MacIntyre 1984, 268–269). While moral agency within particular religious communities may be distinctive, it can still overlap with that of other religious and “secular” communities.

Can a causal relationship be established between religious belonging and the distinctive virtues that religious people hold to a greater degree than other people? The strongest evidence for such a relationship involves comparing the responses of two groups of adult non-churchgoers – the one originally brought up going to church almost every week and the other never going in childhood at all. This

suggests that the effects of involuntary churchgoing as a child can still be traced in the relative strength of the Christian beliefs of adult non-churchgoers. Compared with non-churchgoers who never went to church as children, those adult non-churchgoers who went regularly as children show twice the level of Christian belief. In addition, the latter are more likely to hold moral attitudes on personal honesty and sexuality that are closer to those of regular churchgoers (see Gill 1999).

Belief and Action

If this evidence is accurate it suggests that for many moral agents there is not the clear separation of morality and religion that the secular post-Enlightenment ethics has claimed. The latter may have underestimated the power of religious belonging/belief to motivate individual moral agents and overestimated its own power to resolve public moral disagreements. In contrast, in a world that is more self-consciously pluralistic, religious traditions may once again be allowed a significant role in public debates about moral issues, even though they are unlikely to be granted the sort of monopoly of ethical decision making more characteristic of theocracies than modern democracies.

CHAPTER 142

Future Generations

Svend Andersen

“Future generations” is the name for an ethical problem. People now living can influence the lives of future people in new ways. Industrial civilization has such an effect on the natural world that the life conditions of future generations depend upon it. Modern biotechnology can influence both the very existence of future persons and their properties. Because of the recent emergence of the problem, it is unsurprising that traditional Christian and other religious thinking does not contain obvious resources for dealing with it. One could even argue that there are important elements in traditional religious thinking that run counter to moral responsibility for future generations.

The Facts and the Problems

A closer look at the problem of future generations shows that it is not simply one issue, but several different problems. They can be presented as three questions:

- 1 Should there be future generations at all? This question presented itself dramatically from the point in history when it became possible for humans to extinguish the whole of humankind. That possibility emerged after the construction of nuclear and biochemical weapons, and it was a determining feature of the political climate during the Cold War.
- 2 What living conditions should future generations have? This question has, first, a purely *economic* meaning: how does the handling of contemporary wealth influence the economic conditions of future humans? This problem is not new, but its dimensions are. Second, during the last fifty years the question has acquired an *ecological* meaning. In what kind of natural environment will future generations find themselves? And third, the question has a *demographic* dimension, which is not totally distinct from the previous two aspects. Will the number of people on the planet cause grave problems in terms of life conditions?
- 3 What kind of people should future generations be? Thanks to biotechnology and the so-called reproduction revolution, it might be possible to an increasing degree for parents to influence the properties of their offspring. Prenatal genetic testing makes possible the negative selection of diseases and handicaps. Genetic engineering might be used for “enhancing” the genetic makeup of future children. Reproductive cloning could mean that some future persons will be (almost) genetically identical with existing persons.

These problems raise different ethical questions, some of which are similar to traditional moral problems. In Western societies these problems are also dealt with in a secular context with moral philosophy as its form of reflection. It is therefore appropriate to present some arguments in moral philosophy and religious responses. Before we enter into the ethical field proper, however, it is necessary to mention some conceptual difficulties.

Conceptual Difficulties

The moral problems related to future generations are in many ways shaped by secular, Western culture. Their very formulation presupposes that the moral agent is an individual acting against other individuals. Traditionally, future individuals were thought of as children or grandchildren of now-living persons. The problems of our day, however, are not only “private” or family problems. Rather, the moral agent is the whole of humankind, the living inhabitants of the planet. And the moral subjects with whom they are confronted are future generations as a collective entity. The new issue is whether and to what degree this collective entity belongs to the sphere of responsibility of the now living. As to the concept of the future, in secular terms, its content is not qualitatively different from the present. Future generations are human beings like us, living in the same physical world we inhabit and in the same empirical time.

Many traditional religious beliefs do not fit into these concepts of “generation” and “future.” Religions do not regard the future just as an extension of the present. In the Abrahamic religions (Christianity, Judaism, and Islam) we find ideas about a future which is transcendent to worldly reality. Cosmic time is one single process beginning with creation and aiming at the end of the world and the establishment of transcendent reality. Asian religions, on the other hand, see the cosmos as a continuous repetition of stages, even if there is a final state (nirvāna). So the very picture of temporal development and hence of the future in many religious worldviews is different from the secular picture, and the views in various religions are different from each other. The same is true of the concept of “generation.” According to the “biblical” religions, children are the same kind of individual humans as their parents. There is one uniform chain of generations until the end of time and the establishment of a new transcendent life form. In Asian religions, however, the idea of reincarnation gives a totally different picture. Children are beings who make rebirth possible.

Related to these cosmological and metaphysical differences are differences in the concept of individual persons. The “biblical” idea of a human agent presupposes the concept of the person in the sense of an identifiable conscious entity who remains the same over time. This concept is far from obvious in Asian religions, where, say in Buddhism, the idea of a stable self is rather regarded as an illusion. It is therefore not enough to realize differences in various religions’ moral teachings about future people. One also has to keep in mind that the very idea of future generations takes its meaning from metaphysical frameworks that vary in different religious traditions.

Future Generations in Traditional Religious Ethics

As an example of traditional religious thinking about future generations we can look at biblical religion (i.e. the Hebrew Bible that is common to Judaism and Christianity, and the New Testament). In the religion of the Hebrew Bible, this-worldly human life has a central place. Humans are created by God as

bodily beings. This involves sexual differentiation, sexuality, and procreation: “male and female he created them” (Genesis 1:27). And it is emphasized both as a blessing and a task that humans shall “be fruitful, and multiply, and replenish the earth” (1:28). It is a divine obligation for humans to create future generations.

Even if “future generations” clearly is a central motif in the religion of the Hebrew Bible, one can hardly call it an ethical issue. But the importance of the continuation of the people is reflected in some norms of sexual ethics. Thus, it is emphasized that sexuality should be linked to procreation. Children are regarded as those on whom the future of the parents depends. Hence the obligations of the children are strongly emphasized, as is obvious in the so-called fourth commandment: “Honor thy father and thy mother” (Ex. 20:12).

The “this-worldly” thinking is altered with the appearance of a new understanding of time in apocalyptic thought (i.e. ideas about the end of this time and the beginning of a new era with the establishment of a transcendent, eternal kingdom). Even if this prophetic vision is about a future enacted by God, human responsibility is still emphasized. However, humans are not responsible for the enactment of this “new” future. In the New Testament, apocalyptic thinking plays a dominant role, to such a degree that the end of time will soon occur: “the time is short” and “the fashion of this world passeth away” (1 Cor. 7:29, 31). This of course makes the question of future “worldly” generations quite irrelevant. Marriage and procreation more or less have the character of an interim arrangement: “they that have wives be as though they had none” (1 Cor. 7:29). One could say that according to original Christian belief as we find it in St. Paul, salvation in the transcendent future dominates over the created world. In a way, “future” and “generation” do not really belong together.

Christians soon had to realize that this world would not come to an end immediately. They had to develop an ethics for life in this material world, involving marriage and the raising of children. As an example, consider Martin Luther’s interpretation of the fourth commandment. Remarkably, Luther finds in the commandment not only prescriptions for children to obey their parents, but also a reminder of the responsibility of parents. Their main task is to raise children to become useful people for God and neighbor. This not only means collecting “money and goods” for the children, but also securing their learning and education. The result of good upbringing in this sense would be the flourishing of the worldly and spiritual community of humans. Luther sees the issue of future generations in the framework of his doctrine of social life – both secular and religious – as sustained by God the creator.

Responses in Moral Philosophy

Modern Western ethics has responded to the problem of future generations along the lines of the three questions noted at the beginning of this entry.

Nuclear deterrence after World War II challenged philosophers from very different camps. Bertrand Russell (1872–1970) saw in it the threat of “extinction of the human species.” According to German philosopher Karl Jaspers (1883–1969), the existence of the atomic bomb and the possibility of nuclear war marked a qualitatively new situation: the threat of total annihilation of humankind caused by humans themselves. The risk of nuclear war raised metaphysical or existential questions. Jaspers saw the problem of nuclear war as closely related to the problem of totalitarian government. The West was faced with an alternative: either prepare to defend freedom with the risk of annihilation, or surrender

to communist totalitarianism. For Jaspers, this is an alternative between two sacrifices of not only political-rational, but also religious significance. The sacrifice of the whole of humanity for the sake of freedom only makes sense if human life is seen in relation to transcendence. Also, the new situation requires a conversion of human beings. The decisions of world politics hence reached dimensions similar to the myths of earlier times (e.g. about the Flood) and the challenge was not only to politics but also to the churches.

Hans Jonas (1903–1993) saw a similar threat in the environmental crisis. His answer is a future-ethics of responsibility (Jonas 1984). Prototypical is the responsibility parents carry for their children. Jonas regards as the most fundamental ethical imperative the obligation for there to be future generations – not in the sense of an obligation towards specific humans, but rather as an obligation towards the very idea of humankind.

As to the life conditions of future generations, one question is whether and how the present generation has any responsibility for the economic basis – the wealth – of their descendants. The question can be understood as one of *distributive justice* (i.e. of finding an ethically defensible distribution of the burdens and goods in society). Does it make sense to talk about a just distribution across generations? The concept of distributive justice has a long history within moral philosophy and religious ethics. Two important theories dominate contemporary philosophy: contractarianism and utilitarianism.

American philosopher John Rawls (1921–2002) constructed his theory of justice on the basis of the classical idea about the social contract (Rawls 1973). In order for political principles to express fairness, the contracting persons have to choose them under a “veil of ignorance” (i.e. ignorant as to their position – social and otherwise – within the future political order). According to Rawls, under these conditions, two principles of justice would be adopted: (1) equal rights of freedom for all, and (2) unequal distribution of goods and burdens only if all benefit, particularly the worst off. Among the things hidden under the veil of ignorance is the place of each contracting person in the order of generations. The problem of distribution is this: what is a fair share to leave for the following generation? According to Rawls, transmission of the “gains of culture and civilization,” maintenance of “just institutions,” and the saving of “a suitable amount of real capital accumulation” are required (Rawls 1973, 285). Even if the relation between the present generation and the following is asymmetric and non-reciprocal, just saving mirrors a kind of mutuality. In Rawls, the historical life of a people is seen as cooperation governed by the same principle of justice as that between contemporaries. One generation acting justly for future ones is an essential part of maintaining and improving a just social order.

For utilitarians, the goods to be distributed are amounts of “happiness,” nowadays defined as preference satisfaction or interest fulfillment. The utilitarian concept of just distribution is not primarily based on equality, but rather on maximizing: the right way of acting is the one that leads to maximal interest fulfillment for all parties involved. The principle of utility is applied to *environmental* problems by Peter Singer. What kind of environment should the present generation hand over to future ones: should “wilderness,” for example, be regarded as “world heritage”? According to utilitarianism, we should leave an environment that will create maximum interest fulfillment, perhaps in terms of enjoyment of nature (Singer 1993). But how can we know which kind of environment will bring enjoyment for future generations? They may have different preferences from ours. This is just one of the difficulties with which a utilitarian ethics for future generations is confronted.

The life conditions of future generations will to a large degree be determined by the number of inhabitants on the earth, hence there is also a *demographic* aspect to our problem. Global population

growth will require increased production of food and goods, and will cause further exploitation of natural resources. Hence, it seems to be an obvious requirement to curb the growth of the world's population. Seemingly we have a moral obligation to limit the number of individuals in future generations. However, according to utilitarian ethics, this conclusion is not obvious at all. Utilitarianism has a clear stance on the future of humankind. It regards the extinction of human beings as the gravest crime, because it would entail a vast reduction of the possible sum of happiness. A crucial feature of contemporary ethics, Derek Parfit argues, is that it must take into account that human beings now live in large communities. This means that the negative effects of our acts spread over thousands of millions of people. This is the problem of future generations which, for Parfit, belongs to the most important part of ethics. What is required in this situation is a rational altruism which rejects the self-interest theory of rationality. Rational altruism means radical impartiality. In some cases that requires us to give up our preferential treatment of our own children in favor of acting for the best for all children (Parfit 1985).

Now, if quantity matters, as it essentially does in utilitarianism, a remarkable consequence regarding future generations seems to follow. For any size of the world population, growth would be preferable because that would cause a larger amount of lives worth living. Parfit calls this the “repugnant conclusion” because he admits that the theory he is looking for must avoid it. Even if Parfit has not found the theory required in order to improve non-religious ethics, he has sharpened our awareness of the kind of control we have over future people, and the new kinds of ethical problems that such control brings with it.

Human power over the future also lies in some of the possibilities biotechnology has brought with it. A couple making use of prenatal genetic testing might have the choice of either giving birth to a diseased child or having another child through a new pregnancy. Is this choice about either harming or benefiting a child? In whichever way we answer, the question is an indication of the new kinds of influence people have on future generations. Genetic testing has bearing not only on the parent–child relationship. According to many critics, it can rather be understood as a kind of *eugenics* (i.e. an effort to influence the genetic properties of future generations). Genetic testing and selective abortion would be an instance of negative eugenics. It would improve the genetic quality of the population by selecting away “bad genes.” One important argument against this practice is that it contradicts the basic principle of equal human dignity.

Genetics holds promise not only for diagnosis but also for the treatment of diseases. Techniques of so-called gene therapy could not only be applied to diseases, but also be used for improving capacities such as intelligence, longevity, memory, etc. This future possibility for genetic enhancement gives rise to a moral dilemma. On the one hand, it seems natural for parents to give their children the best possible opportunities, and what could be better than the traits mentioned? On the other hand, the determination of crucial properties would give parents a power over the lives of other human beings that contradicts the basic principle of human freedom. This principle has been advanced by Jürgen Habermas in relation to both genetic enhancement and reproductive cloning. The successful application of these techniques would cause the birth of children, the genetic makeup of whom was intentionally designed by other human beings. According to Habermas (2003), this would be an elimination of the chance that is normally connected with reproduction to such a degree that both individual human freedom and a relationship of equality would be violated. This would deeply alter the moral self-understanding of the human species and in this sense influence future generations.

The philosophical theories mentioned in this section fall into three groups. In the first we find a philosopher (Jaspers) who explicitly represents a philosophical religion. Similarly, Jonas could be called a religiously inspired philosopher. In the second group we have philosophers of a Kantian type (Rawls and Habermas), whose theory could not be called religious. Yet they defend liberal positions that leave room for congenial religious arguments. Third, the utilitarian philosophers explicitly emphasize that they seek a non-religious moral theory.

Responses in Global Politics

The environmental threats to the future of humankind – overpopulation, pollution, and resource scarcity – have been on the agenda of global politics since the United Nations Conference on Human Environment in Stockholm in 1972. In 1983 the UN created the World Commission on Environment and Development (called the Brundtland Commission, after its chairperson). The commission published its report, *Our Common Future*, in 1987. As a follow-up to the report, the UN organized the United Nations Conference on Environment and Development (UNCED) in Rio de Janeiro in 1992, followed by a conference on the same issues in Johannesburg in 2002.

The main ethical idea related to UNCED is “sustainable development.” The statement of this idea explicitly mentions future generations: “a sustainable development is a development that fulfills present needs without putting the possibilities of future generations to fulfill their needs in danger.” The idea expresses a principle of intra- and intergenerational justice. The primary needs to be met are those of the poor of the present world. The development necessary to achieve this should not, however, unjustly limit the fulfillment of the needs of future generations. The realization of sustainable development would require a universal effort directed at the common (future) good. The UN serves as a political–legal framework, however fragile, to achieve it.

Besides the official UN conference, the Rio summit hosted a great number of nongovernmental organizations (NGOs), among which were several religious communities. The World Council of Churches (WCC) held its own conference, *Searching for the New Heaven and the New Earth*. In a letter to the churches, the participants of the WCC conference emphasize the uniqueness of the historical situation: for the first time, the life-sustaining systems on the planet can be destroyed by human activity. “And the children, what shall we say to the children and to the future generations?” Christians are to work for a just, peaceful, and ecologically sustainable development in a life-oriented global community. The religious foundation of this global ethics lies in the Christian belief in the Holy Spirit. The power of the Spirit, the authors claim, permeates the whole of creation. Christians should develop a spirituality of creation. A life according to the Spirit would work for all that supports life, such as justice and peace, and fight against poverty and racism, etc. But because the Spirit is present in the whole of creation, spiritual life also means taking care of nature.

Christianity was of course not the only religion present at the 1992 Earth Summit. Among the non-governmental activities was a multi-religious manifestation celebrating the “sacredness of the earth.” This event can be seen as an expression of the same idea as the one behind the project of a “world ethic” represented by the Christian theologian Hans Küng. According to Küng (1991), the global threats that put the very survival of humankind into question make necessary the establishment of a common global ethics in which all world religions should play a substantial role.

Conclusion: Why Should Religious People Care?

To skeptical eyes the “world ethic” project could be seen as an effort to instrumentalize religious ethics. The reasoning behind the project seems to be this: because of the grave global problems that threaten the very existence of future generations, we must create a common global ethics with elements from the main religions. Such a pragmatic attitude might conceal some of the theoretical problems inherent in religious ethics. In conclusion, I want to point at two examples of such problems.

- 1 The emphasis on the obligation to make possible future generations could be seen as an expression of an *anthropocentric* attitude. However, religions such as Hinduism and Buddhism are often regarded as favoring a *biocentric* view, seeing humans as just one kind of entity within the wholeness of being. And even if the Abrahamic religions can be understood in an anthropocentric way, they too think of the whole universe as God’s creation and hence question the absolute value of human beings. In any case, the main religious traditions place a caveat on the idea of the survival of humankind as an absolute ethical obligation.
- 2 As mentioned in the beginning, religious doctrines essentially contain ideas of non-empirical reality and hence forms of existence that transcend the chain of generations. Non-empirical reality can be seen as a spiritual realm behind the illusion of the empirical world or as a future beyond worldly time. In either case, human bodily life is only given a relative position, and the existence of humankind is hardly seen as an end in itself.

The “relativity” of the existence of future generations that follows from both sets of ideas is, however, not the same as moral indifference. Even if this-worldly existence is not the final form of life, it is not without significance. That would be the consequence of asceticism. It is precluded by those religious doctrines that – like creation in Christianity – emphasize the God-giveness and goodness of human life on planet earth. As far as religious ethics is founded in this dual attitude – human life is significant, but not the final good – it could issue in a realistic ethics for the relationship to future generations. Even if religious believers realize that some day there will be no humans any longer, they take on the responsibility for creating the best conditions for their successors. They love their future neighbors as themselves.

CHAPTER 143

Ecumenism

Timothy F. Sedgwick

Ecumenism marks the search for shared Christian identity in matters of belief and practice in a post-Christendom world. The development of Christian ethics is the story of ecumenism in the movement from moral judgments to shared understandings of the nature and purposes of moral teaching. These include understandings of moral development, formation, discernment, and the exercise of power and authority to determine membership and the relationship of church to culture. This is, moreover, the story of the development of universities and the discipline of religious ethics which informs Christian ecumenism and leads to accounts of religious ethics and interfaith understandings.

From Denominationalism to Ecumenism

The driving force of Christian ecumenism came from missionaries in the early twentieth century. They saw the mission field divided between churches such that Christian faith was identified with the particular claims of the different churches engaged in “overseas” mission, largely Protestant, Anglican, and Roman Catholic. For the sake of mission, some 1,200 representatives of Protestant churches, primarily from Northern Europe and North America, met in 1910 for nine days in Edinburgh, Scotland, for the first World Missionary Conference. There, in worship together and small groups, they sought to listen and learn what they shared in common as a matter of Christian faith.

Charles Brent, Episcopal missionary bishop of the Philippines, was “converted” and with the support of the Episcopal Church’s General Convention sought a second conference on “Faith and Order.” Delayed by World War I, in 1927 the first World Conference on Faith and Order met in Lausanne, Switzerland. Represented were Protestants, Anglicans, Eastern Orthodox, and two unofficial observers from the Roman Catholic Church. Just two years earlier in 1925, Nathan Söderblom, Archbishop of the Lutheran Church in Sweden, convened representatives of Protestant, Anglican, and Eastern Orthodox churches to work together for peace and justice.

These two movements – called respectively, “Faith and Order” and “Life and Work” – set in motion the ecumenical movement. “Life and Work” focused on Christian service and witness to a broken world. “Faith and Order” focused on coming to shared understandings that churches might be united as communities of faith and worship. In 1948 these two movements came together in Amsterdam to form the World Council of Churches (WCC). Together they sought to unite churches in “the inhabited world,” which is the literal meaning of the Greek *oikoumenē*, or in English “ecumenical.”

The work of the two arms of the WCC reflected the claim that “doctrine divides, service unites.” Matters of ethics were thought not to be church-dividing. In fact, however, this reflected a mainline Protestant, post-World War II consensus. Matters of morals have been a cause of division in the church since the first century. For example, scripture evidences contrary convictions over the morality of the use of lethal force, property, and marriage and divorce. The religious establishment of the Roman Catholic Church in the West – in other words, Christendom – established a common morality enforceable by ecclesiastical and civil law. Still, differences over morals remained as evidenced in the Roman Catholic history of casuistry and in the differences between moral teaching and actual conduct, for example, regarding marriage and sexual relations.

Divisions over moral teaching continued within Protestant churches and between Protestant churches. Major moral issues of contention have included slavery and apartheid, the use of lethal force, conscientious objection to military service, questions of non-combatant immunity given modern warfare, capital punishment, the claims of human rights, and more individual matters such as contraception, abortion, sexual identity and relations, discontinuing of medical treatment, assisted suicide, and genetic engineering. Differences over these matters within churches were variously addressed and adjudicated in terms of teaching and discipline. In turn, differences between churches were not only differences over morals but differences over ecclesiology, over how authority and power were structured in determining membership.

In 1982, at its plenary meeting in Lima, Peru, the WCC adopted what has been the most widely engaged ecumenical document, *Baptism, Eucharist, and Ministry*. As the name of the document indicated, baptism, Eucharist, and ministry were seen as central to Christian faith and the life of the church. In response to the document, baptism and Eucharist as initiating and celebrating Christian faith were broadly agreed to by members of the WCC (which is to say by Protestants, Anglicans, Mennonites, and Orthodox members of the WCC) and by Roman Catholics. It should be noted, however, that Evangelical churches largely absented themselves from ecumenical work because of their theological convictions. Instead, since 1846 they have been affiliated in the World Evangelical Alliance.

Baptism and Eucharist are, however, one thing; the nature and structure of ministry as matters of authority for leading and insuring the integrity of Christian faith within the church are something else altogether. Nowhere are the challenges for the unity of the churches greater than in addressing the nature and structure of authority in matters of moral judgments. Different churches may be divided over who teaches and what is taught. They also may be divided over how churches differ in respecting or encouraging different voices in matters of morals.

Matters of ecclesiology and ethics are central to what we may call “ecclesial ecumenism.” Seeking an understanding of the basis for difference in moral judgments and for ordering moral authority is informed by what we may call “academic ecumenism.” In the end, though, ecumenism is a matter of practice, of what individuals and local communities of faith do together that express and form faith and life that extends beyond the local into the world. Ecclesial ecumenism is, in the end, for the sake of “practical ecumenism.”

Academic Ecumenism

Until the first half of the twentieth century, theological education was denominational in character. Roman Catholics, Orthodox, Protestants, Anglicans, and Evangelicals had their own seminaries and universities. This meant that the preparation of ministry within churches was focused on the history,

doctrine, and discipline of their own traditions. Teaching was assimilation into a distinct tradition as a matter of preparation for ministry. In the United States, major universities such as Harvard (1636) and Yale (1701) were founded to prepare a learned ministry to serve the churches of New England. The founding of other colleges, that became universities and leaders in theological education, sought similarly to prepare a learned ministry to serve Protestant churches in other parts of the developing United States. These would include Union Theological Seminary in New York City (1836) and the seminaries or schools of theology at Emory University (1836), Duke University (1838), the University of Chicago (1857), and Vanderbilt University (1873).

As universities developed to serve the broader public in the United States and eventually the world at large, theological education broadened from a narrow denominationalism to a critical, historical focus on Protestantism and its importance for Western civilization. Given faculty and curriculum, they remained Protestant and more specifically mainline Protestant. Similarly, Roman Catholic theological education – moving from diocesan seminaries to Roman Catholic universities, such as Notre Dame (1842) and the Catholic University of America (1887) – was the study of Roman Catholic thought and practice, a world apart from Protestant universities. However, this all changed in the late 1960s with the Second Vatican Ecumenical Council of the Roman Catholic Church (1962–1965).

In *Lumen gentium* [Light of the Nations] (1964), the Roman Catholic Church gave full expression to the possibility of salvation of those outside the Roman Catholic Church. Further, *Dignitatis humanae* [Of the Dignity of the Human Person] (1965) not only claimed that the dignity of persons required religious liberty in the political sphere but that the dignity of persons reflected that faith was a personal act that called for respect and understanding of the person. Given that Christians are called to be “one body,” to be one as the Father and Son are one (John 17:21), Roman Catholics were, therefore, called to ecumenism: to open the door and engage other Christians in order to discover the faith they shared in common.

Given this ecumenical mandate, Roman Catholics – ordained, religious, and lay, men and women – began doctoral studies in programs that had been Protestant only. In turn, Roman Catholic scholars joined faculties and curriculum broadened accordingly. More than Protestant and Roman Catholic, programs in theological studies and in the developing field of religious ethics increasingly became ecumenical. This included persons from across religious traditions and cultures, including those that cut across historic church identities, for example, from the Black Church, from liberationist and postcolonial church movements, and especially women who came from all traditions and movements. Major university programs, such as the Divinity School at the University of Chicago and Harvard Divinity School, moreover, included in their program of studies religious traditions other than Christianity. Comparative religious studies brought additional perspectives on the nature of religious faith and as a way of life.

Who was at the academic table brought critique and new perspectives in what was studied, how it was studied, and hence in what was learned. Together, the work of scholars since the last quarter of the twentieth century sought ways to make sense of the moral life beyond denominational identities. The field of religious ethics broadened from a focus on the nature and application of moral norms and rules to how communities of faith formed people and shaped the moral life, especially given the multicultural, post-Christendom, and postcolonial worlds of contemporary cultures and politics. This included work in theories of virtue, narrative theory and moral identity, accounts of moral development and formation, ritual studies and the relation of worship and ethics, organizational theory and theories of change, political theory and the nature of justice, peace studies and conflict resolution, trauma studies and reconciliation. As universities of study, religious ethics is informed and shaped by all the disciplines of study that make sense (as the Latin *universitas* means)

of the whole, of the world, of the universe. It is by its nature ecumenical. As such it informs the ecumenical understandings between churches.

The ecumenical development of the field of Christian ethics is reflected in the development of the Society of Christian Ethics (SCE) in the United States. The SCE began from a small group of approximately 25 Protestant seminary professors that had been meeting together informally in the 1950s. From this small group, the SCE was formed in 1959 and grew to more than 850 active members in 2019. Roman Catholics were, in 2019, approximately one-third of the total number of members. Protestant denominations totaled 40 percent of members with Anglican-Episcopalians, Lutherans, Methodists, and Presbyterians, each having more than 50 members. Members identifying as “other” or as “unspecified” were approximately 10 percent of the members. Mennonites and members of nondenominational churches were together less than 10 percent of the members. Five people identified as Evangelical and four members were Jewish. In terms of racial and ethnic diversity, membership was approximately two-thirds Caucasian, just over 5 percent were African-American, just under 5 percent Asian or Asian-American, and just under 5 percent Hispanic or Latino/a. Just under 20 percent of members were unspecified. In terms of gender, two-thirds identified as men, one-third of the members identified as female, and three persons did not specify.

While the development of the SCE reflects the development of an ecumenically informed discipline of Christian ethics, the focus of concerns shifted as a majority of members moved into teaching positions at colleges and universities. Reflecting the mission of universities to serve a multicultural world, college and university programs of religious study increasingly sought to address questions of ethics and society and to develop interreligious understanding through historical and comparative approaches to religion. This change of focus in programs at colleges and universities is broadly speaking ecumenical in that it seeks a global ethic to address problems in all “the inhabited world.” With this change, a new, interreligious ecumenism is conceived.

Ecclesiastical Ecumenism

For churches, the ecumenical challenge of seeking a unity of faith and life “that the world might believe” (John 17:21) was addressed through the WCC, in bilateral consultations and commissions between churches, and in the work of national and local councils of churches. In terms of ecumenism and ethics, the challenge was twofold. First, “what moral judgments do churches share together in order to offer common witness given the needs of the world?” Second, “how are churches to understand differences in moral judgments as matters of Christian faith?” The two questions, of course, are related. They reflect, respectively, the work and focus of the two main bodies that together formed the WCC in 1948, “Life and Work” and “Faith and Order.”

In its focus on life and work together, the WCC has – as have national councils of churches – brought together members of different churches to offer moral witness, service, and advocacy. This includes addressing poverty, human rights, empowering women, the well-being of children and youth, physical and mental health needs, HIV/AIDS, human trafficking, economic justice, food security, sustainable agriculture, water protection, and justice in care for creation, peace-building, healing trauma, and reconciliation.

While ecumenical in terms of participation, these programmatic initiatives of the WCC were also church-dividing. In 1992 the Joint Working Group representing the Roman Catholic Church and the WCC appointed a small study committee to work on ecclesiology and ethics. They sought to identify the basis for agreement and division over moral judgments and thereby the work of witness, service, and

advocacy. In 1996 they published a study document, *The Ecumenical Dialogue on Moral Issues: Potential Sources of Common Witness or of Division*. Broadly speaking, churches of different traditions agreed upon a basic moral vision given in Jesus Christ, an account of virtues that express the character of the Christian community as a moral community, and a set of moral values and obligations that indicate the goals and responsibilities of Christians.

Differences that divided churches in matters of morals reflect differences in specific moral judgments, how such judgments are formed, and how differences are addressed. As the study document says, churches have different pathways in their processes of moral formation and deliberation. This includes differences in understandings of scripture, liturgy, moral traditions, catechisms, pastoral practices, understandings of the world, prayer, and discernment. Differences that divide churches also include differences in the role of ministerial authority to teach and to demand obedience.

Concurrent with the work of the Joint Working Group, the WCC developed a study program among member churches to deepen understanding of what the church as communion (as *koinonia*) requires morally. Published as *Ecclesiology and Ethics* in 1997, the report from the WCC raised the outstanding question first raised by the WCC 1982 agreed text *Baptism, Eucharist, and Ministry*. Given differences in ministerial authority between churches, how are churches to move from baptism and Eucharist to matters of morals in terms of shared witness, service, and advocacy?

The Faith and Order Commission of the WCC drew together the work of the Joint Working Group in what is the second convergence text in its history. The text, *The Church: Towards a Common Vision*, was adopted in the spring of 2013 by the representatives of the churches of the WCC at the plenary meeting in Penang, Malaysia. Like *Baptism, Eucharist, and Ministry*, the text expresses the shared understanding of the church as communion, as local and universal. In terms of ecclesiology and ethics, the text emphasizes that questions of ecumenism and ethics and calls upon churches to seek together how and why they differ in not only what they teach but how they teach, how they determine who speaks for the church, and how they determine membership. In other words, the determination of moral teaching that results in witness, service, and advocacy is a matter of power and authority given changing social contexts and positions of privilege in the movement from established churches to postcolonial churches.

The first, bilateral, ecumenical dialogue that addressed ecclesiology and ethics was the Anglican-Roman Catholic International Commission (ARCIC). In 1994 they published an agreed statement titled *Life in Christ: Morals, Communion, and the Church*. The document offered a shared moral vision of life in Christ expressed in a set of moral values and obligations that indicate shared sources of moral authority. They went on to identify differences in moral teaching as the result of how structures of authority developed. The difference between Anglicans and Roman Catholics in seeking shared life in Christ was, they concluded, the differences between dispersed and centralized authority where moral teaching is commendatory rather than prescriptive and binding. The challenge for Anglicanism was thus the problem of clarity in moral teaching and unity in witness, service, and advocacy. The challenge for Roman Catholicism was the problem of legalism and formalism in moral teaching.

In 2008 the Episcopal Church in the United States and the Roman Catholic Church (the Anglican-Roman Catholic Theological Consultation in the USA/ARC-USA) continued the work begun in *Life in Christ*. In 2014, ARC-USA completed an agreed statement titled *Ecclesiology and Moral Discernment: Seeking a Unified Moral Witness*. Again, differences in teaching on specific moral matters, such as human sexuality, reflect differences in dispersed and centralized structures of authority. As in the two case studies presented – one on migration/immigration and the other on same-sex relations – there was

agreement that the purpose of moral teaching was to inform conscience and to bear witness, often prophetically, to the world. This requires, they concluded, clear moral norms offering clear moral judgments. However, moral discernment and witness are not necessarily tied to singularity of teaching. Moral conscience is also formed, or must be formed, in a process that requires hearing different voices offering different moral judgments given differences in histories and contexts.

What voices should be privileged, authoritative, in a church's teaching and discipline in order to form a holy community carries with it questions of how dissent may be limited or restricted. This opens the question of how the structuring of authority – dispersed or centralized – shapes or forms moral conscience and what then are the strengths and weakness of different ways of ordering ministry. A further question is whether or not different churches with different structures of authority and power are a gift that may make the church more ecumenical, more able to bear witness to God in all people and to all people in all lands.

Practical Ecumenism

Academic ecumenism provides the historical and critical understandings of the nature and development of Christian faith and life as given and shaped by the church. As a critical study of religion, religious ethics is integral to ecumenical ecumenism in its focus on moral formation, discernment, and judgment in the larger context of the world as that has developed into the multicultural, post-Christendom, post-colonial, religiously pluralistic world of the twenty-first century. This serves Christian leaders in ecclesial ecumenism in their own focus on forming the church that is both local and global that all “may be one ... so that they world may believe” (John 17:21).

In turn, ecclesial ecumenism serves a practical ecumenism. The ecumenical documents that have been written over the last seventy years are clear that life in Christ begins with life in the church. As a communion of the people of God, gathered locally and bound together globally, Christian faith and discipleship is celebrated and effected individually and corporately in worship and in such practices as prayer and devotions, scriptural meditations, shared fellowship, education, pastoral care, community service, evangelism, and advocacy for those in need.

Service together is why the original Life and Work Movement after World War I was understood to unite Christians. At the level of practice, it still does. And in that work, faith in Christ is shared, as it was in the 1910 first World Missionary Conference. In these face-to-face relations, Christian faith is rooted, indigenized. At the same time, in these relations, in worship and service, Christian faith is ecumenical as it extends beyond a tribe into all the world. In this sense, practical ecumenism is supported by ecclesial ecumenism and academic ecumenism, but practical ecumenism is where Christian faith is incarnate and from whence Christian ecumenism and ethics begins and ends.

CHAPTER 144

Family

Sandra Sullivan-Dunbar

The structure and conditions of “family” have varied across cultural and religious traditions, historical periods, and forms of political economy. Very rarely has “family” signified something like the contemporary nuclear family of Western post-industrial society that is the object of yearning by many of those calling for a resurgence of “family values.” Kinship structures have always existed in a mutually formative relationship with economic and political structures, and these structures have, in turn, shaped the religious and ethical imagination. Kinship terms have also been used in metaphoric ways to signify close affective, political, economic or religious ties, through fictive kinship categories.

In this entry, I examine family structures in ancient Israel and early Christianity before turning to contemporary debates about family structures and ideals in Jewish and Christian ethics.

Genealogy, Genetics, and Fictive Kinship

If we were to quickly brainstorm characteristics that signify “family,” undoubtedly one of the first to be mentioned would be genetic or genealogical connection. In Judaism, genealogy has held tremendous religious and political significance. The ancient Israelites, and later Jews, understood themselves to be descended from Abraham, who had received the promise of land for his descendants from YHWH. Israelites understood their twelve tribes to be descended from the twelve sons of Jacob, grandson of Abraham. YHWH was conceived as landlord, distributing land to the twelve tribes, who must pass it down within the kinship network. Other metaphors for YHWH invoke family relationships: they include father, mother, and redeemer (*go’el*) – this latter specifically referring to economic redemption. The *go’el* rescued kin from economic devastation, paying debts so that the land could be retained within the kinship network. Metaphors for Israel in relation to God include bride, son, daughter, and redeemed slave.

Early Christian writings and practice both acknowledge and transform importance of these genealogical ties. Jesus is placed within the genealogical story of Israel in Matthew 1:1–17 and Luke 3:23–38, which trace Jesus’s lineage back to David, Abraham and (in the case of Luke) to Adam. The decision to admit Gentiles to the early Christian communities (Acts 15) meant that the significance of this genealogy had to be relativized or reinterpreted. Paul argued that all those with faith become children of Abraham (Romans 4; Galatians 3). Within early Christian communities, the language of fictive kinship was

pervasive. God is described as Father, fellow Christians are brothers and sisters, disciples are children of God and heirs of God (Esler). This language provided early Christians with a new, “fictive” form of the genealogical ties so important to Jewish identity, and an alternative to the hierarchical and exclusionary family and patronage ties that structured Roman society (see below).

“Family” in the Hebrew Bible

The religious significance of family in Judaism and Christianity was shaped by the lived experience of family structures. The predominant family structures during the formative periods of Judaism and Christianity existed in a complex integration with political and economic relations.

There are various terms describing kinship organization in the Hebrew Bible. The smallest unit or *bayit*, often translated as the “house of the father,” was much broader than the paradigmatic nuclear family of today. Meyers suggests that the best translation of *bayit* is “family household,” where *family* signifies that aspect of ancient Israelite kinship and social structures originating in and organized around hereditary ties, and *household* signifies the inclusion of those not connected through biological reproduction (such as servants or sojourners), as well as the domicile itself and its economic assets (tools, land, etc.). The family was an economic unit, both productive and reproductive; children became economic assets when they began to work, probably at age five or six. There was no contemporary “work/family” distinction to navigate.

At the next level of social organization, the term *mishpachah* generally signifies several *bayit* or households closely connected to one another, geographically, socially, and economically. These might comprise an extended family, or a group of such extended families. Finally, the broadest unit of kinship organization is the *sevet*, usually translated as “tribe.” In the earliest centuries of Israel’s existence, governance was constituted through these broader tribal kinship networks. As recorded in the Book of Judges, judges were the political leaders of the tribes and justice was administered by tribal courts. The household or *mishpachah* as the central unit of Israeli society persisted through the monarchy and the second temple period, though as Blenkinsopp has argued, the monarchy set up its own centralized state court and temple to compete with the political and religious functions of kinship networks.

Kinship structures were also deeply integrated with economic relations. The earliest, pre-monarchical Israelites, in the period from roughly 1200–1020 BCE, settled the Palestinian highlands, a relatively inhospitable agricultural environment. Kinship relations were organized to secure subsistence and survival. Many of the provisions of the Hebrew law codes emerge from this period and originate in economic imperative. For example, as Meyers suggests, the strong emphasis on maintaining each family’s “inheritance,” or share of land granted by YHWH, may be rooted in variable local agricultural conditions and the need to pass down intimate knowledge of particular parcels of land.

Marriage in ancient Israel, as in surrounding Ancient Near Eastern societies, was contractual, and intimately tied to property rights, inheritance, and labor (both productive and reproductive). Women were transferred from father to husband in marriage agreements, in ways that paralleled property transactions in many respects. Marriage law incorporated economic protections for the wife in the event of a divorce. The institution of levirate marriage (Deuteronomy 25:5–6), according to which a man must marry his brother’s widow if the brother has died childless, was instituted to

ensure an heir for the deceased, maintaining property in the family line, as well as economic security for the widow.

Biblical laws aimed at economic security for marriage partners and offspring were supplemented by provisions to protect the most vulnerable in society, those who existed outside of protective kinship ties, or lost them. The codes repeatedly adjure particular care for widows and orphans, for the poor, and for strangers/foreigners, “for you were strangers in the land of Egypt” (Exodus 22:21, Deuteronomy 10:19). Some directives instituted communal responses to ongoing need, such as the provision of the fallow year (Ex 23:10–11) or leaving the edges of the field ungleaned for the poor to gather food (Deuteronomy 24:19–21). The commanded periodic remission of debts (Deuteronomy 15:1–11) and freeing of debt slaves (Deuteronomy 15:12–18) would, if implemented, prevent Israelites from falling into a permanent state of economic servitude, and would protect the kinship claims to particular parcels of land. This social legislation is intimately entwined with cultic regulation and religious memory; arguably, it envisions a society where all are included in the community and have their basic needs met.

In short, the religious ethics of the family in ancient Israel and early Judaism were also social and political ethics, because kinship structures were related to politics and economics – often, kinship structures were *constitutive* of politics and the economy; and when political and economic structures emerged independent of kinship relations, they had to be constituted through competition with kinship traditions and structures.

Family and Kinship in Early Christianity

An account of family structures and ideals in early Christianity must navigate the Palestinian Jewish context of Jesus’ followers and the early Christian urban communities that incorporated both Jews and Gentiles.

The Greco-Roman Context

Just as there is no word in the Hebrew Bible to correspond to today’s nuclear family structure, neither is there such a word in Latin or Greek. The Latin word *familia* referred to persons, but also material possessions, as well as persons who were possessions (slaves), and referenced relatives beyond the nuclear core. The Greek word *oikos* could refer to property or to all members of the household; *oikonomia*, semantic root of the contemporary word “economics,” referred to household management. The home was not private, a place of retreat from political and economic relations; on the contrary, political and economic relations were often conducted within the household space.

In the early Roman Empire, family relations were integrated into complex hierarchical structures of patronage, honor and shame, a system which distributed material, social, and political goods in profoundly unequal ways. Patronage relations were a form of fictive kinship – they incurred a set of mutually binding obligations between unequals that paralleled the obligations associated with kin and marriage relations. Honor itself was a primary social good; the individual received honor through his or her membership in a group, particularly a family group, and conversely, the group’s honor could be destroyed by the actions of an individual. This was particularly true of women’s sexuality; women’s virginity and

chastity were markers of family honor. As Osiek and Balch (1997) note, the strength of patronage systems is inversely proportionate to the effectiveness of government as an instrument for distributing power and material goods. Kinship and fictive kinship take over where the state cannot.

Palestine

The first-century Palestinian Jews who first heard Jesus's message existed within a family system that reflected both their Jewish heritage and the influence of this Roman social order. In Jesus's time, large elite Romanized households were established in Palestine, living from the agricultural produce of the surrounding peasant population, and gradually expropriating their lands. New Testament statements about the family and household must be understood against this backdrop. Jesus's parables drew upon the household and agriculture to image the kingdom of God; many scholars read Jesus's moral teachings as endorsing the mutual support that might enable survival in this oppressive economy.

Some aspects of the New Testament record, acknowledge, and even reinforce the importance of family ties. Of the several Jewish schools of thought on divorce in circulation in the first century, Jesus chose the most restrictive, that of the school of Shammai, which taught that a man cannot divorce a woman except for adultery (Brodsky). Jesus received hospitality (a form of patronage) in the homes of relatives of his disciples, attended weddings, and offered healing to petitioners' close relatives.

Other teachings and actions attributed to Jesus seem to encourage a rejection of family ties and obligations to facilitate total devotion to God (Mark 3:33; Luke 14:26), and predict family strife as a result of discipleship (Mark 13:12–13; Matthew 10:21, 34–37). Jesus's table fellowship with tax collectors, sinners, and his contact with unclean persons took direct aim at conceptions of honor and shame that structured Greco-Roman and Jewish social, economic, political, and family life. Disciples were encouraged to leave behind their *oikia* and *agrous* – their household and fields – the structures that located them within broader social and economic relationships, thus conferring security, identity, and material benefits (Mark 10:29–30, 31).

These seemingly contradictory threads make more sense when we remember how thoroughly kinship and family intersect with political and economic structures that that gave shape to life in Palestine. These structures could serve well-being or institutionalize exploitation. They could include or exclude. In addition to the multivalent nature of the New Testament witness in general, the pervasive intersection of family and kinship with social and economic structures virtually guaranteed that family would operate to oppress and exclude in some respects, and to serve human well-being in others. Thus, the New Testament's depiction of Jesus's nuanced and contextualized response to family relationships can be seen to reflect a consistent concern with ensuring inclusive structures that serve human well-being.

The earliest urban Christian worshipping communities were house churches. Roman religion was practiced in households, but these early Christian communities stood in tension with Roman household structures in many respects. Notably, the inclusiveness of the Eucharistic meal, while continuous with Jewish traditions of inclusion of the marginalized and vulnerable, would have stood in sharp tension with prevailing Roman status hierarchies. Most scholars see the household codes in the deutero-Pauline letters (Ephesians 5:22–6:9; Colossians 3:18–4:1) as evidence of increasing accommodation to Roman social and political norms. In sum, early Christian house churches adopted, stood in tension with, and sometimes transformed the household and kinship structures that allocated status and access to material goods and political power within first-century Roman society.

Contemporary Religious Ethical Reflection on the Family

Family and kinship structures have taken many shapes in relation to differing political and economic structures across the centuries. The canonized texts emerging from the earliest phases of Judaism and Christianity that we have just explored have influenced conceptions of family to some extent. Arguably, however, interpretations of the authoritative texts have been shaped by prevalent family structures and ideals more than they have shaped them (Satlow 2001). It is not possible to provide a comprehensive survey of this history here. Rather, I explore some contemporary discussions of family structures and conditions, continuing to argue that family structures always exist in interdependence with political and economic structures.

Since the seventeenth and eighteenth centuries, with the advent of social-contract political theory and classical and neoclassical economic theory, much Western thought has conceived of the family as separate from politics and the economy. During the Industrial Revolution, a significant portion of productive economic activity moved outside of the home and into the factory; over time, the work that remained in the home, domestic maintenance and child-rearing, was excluded from the conceptual domain of “work.” Those persons (primarily women) who managed the household and provided care were defined as dependents rather than economic contributors. Political theory moved from a patriarchal model, whereby political authority was passed down through kinship lines from fathers to sons, to the view that political authority derived from the consent of the governed, or at least of adult, property-owning males.

The home came to be understood as a private realm, one that should be governed by distinct, even contrasting motives from those that governed politics and the market. Whereas the latter were seen as places for the pursuit of enlightened and competitive self-interest, the family was theorized as a realm of altruism, moral formation, and affective concern. This understanding of family as private and as uniquely responsible for the moral formation of its members (and, by implication, for the moral quality of society as a whole) has saturated our worldviews.

Such a view of the family informs at least one important strand of contemporary Christian and Jewish ethics, as well as some secular discourse about the family. This school of thought puts forth the thesis that there exists a “crisis of the family” and that this breakdown in the “family” is more cause than effect of various social ills such as crime and poverty. Thinkers in this vein encourage renewed commitment to the intact, monogamous, permanent two-parent family as the site of child-rearing, while often emphasizing the contemporary value of gender equality within the family (Browning et al. 2000; Post 2000). Often, but not always, these thinkers prefer families formed around a heterosexual couple to those led by same-sex or other gender-variant couples. Concerned about high divorce rates, which they attribute to excessive concern with personal fulfillment, many critique contemporary parents for insufficient sacrificial commitment to their children. Many in this school use the language of “intrusion” to describe the state’s relation to the family. They express concern that the state will improperly intervene in family life and encourage the breakdown in individual responsibility and commitment that they diagnose as the cause of contemporary family ills (Browning et al. 2000).

Most of us would affirm the value of long-term commitment between partners, and loving concern for and moral guidance to children. However, this school of thought may give too little attention to the ways in which state and economy already shape the family. For example, most adults have little control over the working hours demanded by their employers, and the most marginalized workers tend to have the least flexibility in this regard. This can present significant difficulties for families balancing paid work

with care for dependent children or aging parents. Likewise, family does not exist as an entity separate and independent of the state, with which the state may or may not interfere (Fineman 2010). The state determines who may marry, the requirements for marriage, obligations of spouses to each other and to their children, how property is shared between spouses and children and how it is transferred after death. The state determines how much autonomy to allow parents in their child-rearing practices and when to intervene to prevent abuse, require vaccines or education, and so on.

The state can also redistribute monetary income toward those providing unpaid dependent care, a necessary human activity that occurs primarily, though not exclusively, within the family. The burden of dependent care in human life has increased. Unlike in the subsistence agricultural economy of ancient Israel and much of human history, children today are not economic assets, beginning to labor at a young age. Rather, preparation for participation in today's skilled service economy requires long years of expensive education and training. In addition, modern healthcare means that significant numbers of people live long enough to require intensive care in old age. Caregiving labor is typically uncompensated or radically undercompensated in a money economy; this contributes to widespread poverty and vulnerability among those providing and receiving care (Kittay 1999; Fineman 2010).

For some the idea of remunerating care seems like a contamination or commodification of love; it seems to suggest the heightened self-interest and failure of sacrificial commitment that worries some contemporary ethicists. The decision to raise children is often viewed as an expression of personal preference and fulfillment, rather than as a contribution to the society and economy. In the United States, state support for the economic labor of dependent care has been minimal. Those forms of state support that do exist have often been carefully crafted to exclude families of color (Abramovitz 2018).

Cognizant of such concerns, some religious ethicists, following the lead of feminist economists, philosophers, and political theorists, insist that we attend to the ongoing, inescapable economic functions of the family (Adler 1998; Albrecht 2004; Hinze 2015; Sullivan-Dunbar 2017). The family is economic not primarily in Gary Becker's (1991) sense of a location for the expression of preferences and utility maximization, but in the richer sense of "provisioning" articulated by feminist economists (Folbre 2012 and Nelson 1993). These ethicists tend to argue for a stronger state role supporting families in carrying out the demanding task of nurturing children and caring for dependent adults. They give less attention to encouraging particular family structures.

Different communities have resorted to different strategies for balancing care work with work in the paid economy. Privileged families may be able to imitate the widespread ideal of committed spouses together managing both productive and reproductive labor. Frequently, however, their apparent moral achievements have been founded upon the exploitation of others who are thereby excluded from the same family ideal (Cahill 2000; Albrecht 2004). For example, for much of the history of the United States, a large proportion of care responsibilities were met through indentured servitude and slavery. After slavery ended, a large portion of care needs continued to be met by women of color who were often shut out of other employment opportunities (Glenn 2010). In prosperous Western societies today, many families hire migrant careworkers. Many of these migrant women leave their own children behind in the care of other family members, neighbors, or even orphanages to care for the children of the wealthy (and to provide desperately-needed financial support to their own families). Ehrenreich and Hochschild (2002) describe a "care drain" from less-developed countries, a drain that repeats the past colonial pillage of other economic resources.

Those living in marginalized communities develop strategies to ensure material survival and appropriate care for children. Carol Stack (1974) described the kinship networks that assured care for

children in a low-income black community. Biological mothers often, but not always, raised their own children; where needed, other kin – grandmothers, kin of the child’s father, aunts, or sisters would step in. Black feminist social theorist Patricia Hill Collins (2009) describes such caregivers as “othermothers.”

In short, long-term commitment and sacrifice for other family members are important ideals and markers of Christian identity for many Christian ethicists. However, if Christian ethicists ignore the ways that economy and state shape the family, they will likely reinforce ideas and practices that end up exploiting marginalized groups – women, people of color, and migrants.

Contemporary Jewish Family Ethics

Most contemporary Jewish ethicists acknowledge the economic nature of the family more readily than do some Christian ethicists. The notion of marriage as a contract, through which the spouses are expected to contribute to the economic life of the community, to bear children and to carry on the life of the people of Israel, persists through the centuries of rabbinical legal interpretation and Jewish practice. The economic nature of marriage may be reconceived to better suit contemporary notions of economy and contemporary social norms, as in Rachel Adler’s revisioning of the Jewish wedding liturgy. Adler argues that the traditional Jewish marriage ceremony, *kiddushin*, still bears connotations of the acquisition of the wife as property. As an alternative, she puts forth the *B’rit Avuhim* or “Lover’s Covenant,” modeling the marriage on a business or financial partnership between equals. Adler explicitly affirms that marriage is (among other things) an economic institution, but her model depicts the couple as joint stewards of communal resources, rather than casting the wife herself as property.

Adler is very explicit that her *B’rit Avuhim* is intended *not* to be valid under halakhic law. If it is halakhic, then only the husband may initiate a divorce, even today. However, since adherence to *halakhah* is a strong marker of Jewish identity, this deliberate avoidance of halakhic validity does exact a cost. Adler offers an alternative account of the relationship of the wedding liturgy to Jewish identity: in it, the newly married couple become a *bayit b’Yisra’el*, a household among the people Israel. As such, they are responsible both for the continuation of the people of Israel (a form of reproductive labor), and for participating in the central Jewish task of *tikkun olam* or repairing the world. Thus, Adler connects the mission of the Jewish family with both religious identity and a broader social ethic.

Thus, we see religious ethicists, Jewish and Christian, mining, challenging, and reinterpreting ancient religious texts for guidance on family ethics that speaks to the contemporary challenges. In so doing, they necessarily make choices about thematic emphasis while drawing on a rich and polyvocal set of resources to address profoundly transformed realities for kinship and family structures and conditions.

CHAPTER 145

Interspecies Communities

Celia Deane-Drummond

Interspecies communities are about the specific ethical challenges that arise when different species are living in close association with one another and either accommodating to or competing for the same resources. Anthropological research that uses tools for investigating specific animal communities in their association with humans through an ethnographic approach is particularly illuminating for this topic. One can view such communities as a complicating factor when considering related moral challenges of, for example, ecology, animal ethics, justice, and sustainability. For example, ecological ethics tends to focus on issues such as resource scarcity or biodiversity loss, or possibly ecosystem stability rather than ethical significance of the interaction between species. Animal ethics gives priority generally to the worth of individual animals, and claims for their rights along analogous grounds to human rights, rather than viewing different animals in a complex community that includes humans and other living species. Justice, on one hand, is often narrowed to mean what is due to whom, and while it might be stretched to include those who are not human, or even the earth, as such as part of what counts as being morally considerable, it is rather harder to determine what is due to whom when the flourishing of different species are mutually entangled. Sustainability, on the other hand, is more used to dealing with what could be termed system ethics, but the multiple definitions of sustainability in terms of economic, social, and ecological flourishing orientated toward future generations does not necessarily take sufficient account of the complex entangled natural and cultural dimensions. Consideration of interspecies communities forces the questions about relationality in a way that presses beyond standard environmental ethics approaches that either consider the earth through a romantic perspective on wilderness, for example, or an equally alien treatment of living things just as ecosystem services.

Anthropologists have begun to take the social dimension of species other than humans very seriously in thinking through the dynamics of interspecies interactions and their significance in diverse religious and cultural settings. Indeed, the extent of human interaction on planet earth is such that many anthropologists believe that a “pristine” natural world is no longer really feasible, even “wild” species are impacted in some ways by human activities, encapsulated in a broader scientific narrative about the impact of humans that is gaining increasing influence known as the geological era of the Anthropocene. The start date of that era is debated, with anthropologists and many ecologists tending to favor a very early date coincident with the Holocene and the beginnings of human agriculture, while geologists favor a much later date beginning with the industrial revolution or the rise in the use of the steam engine.

Interspecies communities are also very significant historically, with coevolution of hominins and other species arising from the very beginning of human evolution in the Pleistocene era even prior to the birth of human agriculture and domestication of animals in the Holocene. These communities therefore need to be taken into account in debates on the evolution of morality and evolutionary ethics. These studies raise significant questions about moral theories, such as the relationship between language and morality; how far and in what sense virtue language can be extended to species other than human beings, and the extent to which domesticated animals, for example, need to be included when considering ethical frameworks for migrants, refugees, and broader questions of sustainability.

Case Studies

Consideration of the moral and ethical implications of interspecies communities, like its sister subject, ecology, necessarily starts from a specific context. In this case it is one that relies on social scientific and natural scientific research, particularly anthropology. Ethnological studies that use tools more properly addressed to human communities as well as ethological studies that study animal behavior are both brought to bear in this research. Given the close relationship between humans and other primates, much of this research began with close investigation of inter-primate associations. Anthropological research by Agustín Fuentes (2010) in Bali, Indonesia, for example, has traced the close interaction between the human Balinese community and the long-tailed macaque monkeys (*Macaca fascicularis*) that inhabit the Hindu religious temple complexes. There are social and biological implications of this close interaction that have been in place over many hundreds of years. Macaques seem to be aware of when they are or are not permitted to consume the food offered in religious ritual practices, and the Balinese assume that macaques are fully agential beings and actors in the overall setting in which they live. The monkeys are also viewed as an important part of the spiritual life of the sacred forest groves in which the temples are placed. Tourists who arrive to visit these Hindu temple complexes may be caught off guard as both parties are not attuned to their feeding habits in the same way. This then generates some ethical difficulties for the Balinese who on the one hand accept the presence of the macaques, but on the other hand need the income generated from tourist visits. At a biological level the Balinese agricultural practice is concentrated down river pathways, which have created migration corridors for the macaques, so that the population genetics of the macaques follows the geographical pathway that has been created by human activity. The point is that the behavior of the macaques is impacted by the activities of the human population and vice versa. Studies of this kind, known as ethnoprimateology, open up important theoretical questions about viewing human interactions with other species as a whole system, rather than distinct biological and social ones. Terminology such as natural-cultural contact zones speaks of this close, interlacing activity.

Another perhaps more surprising example is the association between hyenas, *Crocuta crocuta* and humans in the Muslim town of Harar, Ethiopia studied by anthropologist Marcus Baynes-Rock (2015). Hyenas in the wild are feared, and the hyenas in Harar are no exception. The difference in this case is that different clans of hyenas have formed close associations with specific human populations in Harar, and rely almost exclusively on food from human sources, both direct and indirect through human waste. As in the Balinese case, the close association with these animals has also attracted tourists, with local families managing specific feeding sites at specific times as a tourist attraction. Ethnographic and ethological

research has uncovered a complex social history in these communities, where rival hyena clans engage in battles over territory on specific urban sites that also have a specific human cultural history. The Ethiopians, like the Hindus in Indonesia, also weave the hyenas into their religious and cultural life. They are convinced, for example, that hyenas will revenge any attempts to deliberately harm them by a human agent. They also believe that hyenas have the power and authority to consume evil spirits and therefore play a direct role in the spiritual life of the community. The local population perceives hyena clans as having social structures and relationships that are close to that in human societies, such as the ability to hold meetings, make supplications for food, and speak in a detailed way to conspecifics and other humans who can understand them in hyena language. Religious rituals include offering particular meals of porridge to hyenas at specific times. In cases where hyenas have become sick, their treatment is very similar to the kind of response that would be given to a sick person in the community, with administration of smoke from burning rag, matches, and lime. Unlike other parts of Ethiopia, where hyenas are perceived as a threat to pastoralist practice, and so have largely disappeared, in Harar there were ways of managing the landscape that did not depend on their extermination. The local farmers in Harar grow “chat” which is used as a stimulant; but hyenas are tolerated as the farmers believe that they keep thieves at bay. Lions have also largely disappeared from this region, leaving hyenas to associate freely with the human population.

The close association between animals and humans and their entangled coexistence has been studied in most detail in hunter–gatherer and indigenous communities and includes numerous other associations such as those between humans and pumas, elephants, and lions and some where more than one species are involved. This should not, however, give the false impression that the only human societies that are tied up in multispecies associations are removed from Western or more materially developed cultures. Close and mutually shaping associations between humans and other animal species also occur in more modern societies, but urbanization has frequently disguised the intimacy of these relationships. How far back do such multispecies associations reach? While evolutionary anthropology relies to some extent on intelligent guesswork, given the fragmented nature of the artifacts left behind in the archaeological record, there is uncontroversial evidence that humans and hyenas, for example, coevolved over millions of years, as far back as the early Ardipithecines, over four million years ago. At this stage in evolutionary history hyenas were much larger megafauna, *Pachycrocuta*, that would have been even more threatening to fragile hominin communities of comparatively small size with respect to both stature and group. Other large predators such as saber-tooth cats and giant snakes roamed the landscape in what must have been a very threatening environment for early humans. One of the reasons why humans became what evolutionary biologists have called highly successful super-cooperators is that their existence quite literally depended on it. This implies that one of the key elements in human morality, namely, the ability to cooperate, arose because of the specific entanglement between human beings and other species.

These examples throw up important theoretical and practical issues for ethics that are worth exploring further. It is not enough, for example, to consider in isolation specific treatment of animals without situating this in the longer religious, cultural, and biological history of complex and sometimes ambiguous associations. It could be argued that the latent historical memory of being prey rather than predator has encouraged hostile treatment of animals as the default position. On the other hand, the incorporation of specific animals that would otherwise have been viewed simply as a threat into the religious and cultural lives of communities in a relatively peaceful coexistence shows that a dynamic but relatively consistent

multispecies community is possible to achieve through years of accommodation and mutual coevolution. There may too, be lessons here in comparative peacekeeping across disparate and conflicted human communities.

Beyond Anthropocentric Ethics

Humanity's relationship with other animals has historically been ambiguous, even though religious traditions such as Buddhist have affirmed the value of all living creatures. In the Western Enlightenment tradition, René Descartes (1596–1650) reinforced the view that other animals are simply automata and so do not possess the mind and the sensibility of human subjects. Indeed their characterization as lacking in subjectivity and the ability to either feel pain or suffer is one of the reasons why other non-animals have been treated so harshly. According to veterinary practice manuals anesthetics were used in veterinary operations as late as the 1970s in order to control movement rather than pain. Christian traditions have also not assisted in this process either with their historically strong emphasis on human exceptionalism and human uniqueness that cuts out moral consideration of creatures other than humans. Scholars need to search further back in the historical record to the early church to find a much greater emphasis on community and the value of life as a gift of the Creator. Thomistic thought, particularly once natural theology had been stripped away, left an instrumental view of ethics that was uncongenial to treating animals well. While there are other elements that can be retrieved, such as through natural law theory or virtue theory, for example, the influence of instrumental views of animals has proved dominant.

More recently, a shift toward a much greater sensitivity to the worth of other animals and their place in human communities has been opened up by three intellectual developments. The first development, stemming from Charles Darwin's theory of evolution by natural selection, showed clearly that human beings and other animals shared an evolutionary history. It was no longer possible to view the evolutionary tree as simply culminating in human history, even if humans are the most dominant species on planet earth. The second movement is that of postmodernity, challenging cruder versions of humanism that stressed the importance of humans to the exclusion of other creatures. Everything comes under question in a postmodern world, leading to different ways of thinking about human nature, or even if there is a human nature. The third movement is that of feminism, which challenged the oppressive social and political structures that worked against women in particular, but also other vulnerable groups including animals and ecosystems. It is not surprising that one of the leading voices in considering multispecies communities is Donna Haraway (2008), who is also a leading feminist writer in animal studies. Animal studies, that take in literature and the social and political sciences, considers the social, political, and theoretical aspects of the way we treat other animals, so consideration of interspecies communities necessarily touches on this literature as well.

As other animals begin to be incorporated into the moral realm of humans, the possibility is raised of not just how animals might be treated, that is, their moral considerability, but also whether some social animals display forms of morality or virtue. Virtue language has traditionally been about human habits of mind, and the question of animal minds is a contested one, not least because many will deny the ability of animals to display a theory of mind, that is, to know, for example, what the other is thinking in a self-reflective consciousness. This topic also raises ongoing discussions about the relationship between

language and morality. Most evolutionary biologists believe that morality arose in an evolutionary history of humans prior to language, which itself is prior to organized religion. If morality is dependent on spoken language or even abstract reasoning as Immanuel Kant (1724–1804) supposed, then the idea that other animals can display any kind of morality is meaningless. On the other hand, if morality is more broadly construed to include established patterns in a complex social community, whether or not there is formal or conscious agreement to those patterns, then this opens up the possibility that at least some advanced social animals can display at least some of these characteristics. It needs to be added that overall many of those working in this field will now resist the idea that animal studies is best done through a comparative model, that is, making judgments about what humans can do against that which other animals cannot. Instead, each species is viewed as having its own integrity and with characteristics suited to its particular social and ecological domain. And those specific characteristics could include moral ones. Of course, interspecies communities muddy that approach, in that rather than perceiving a single species form of flourishing, it is necessary to be much more inclusive.

The Significance of Evolutionary Ethics

The above raises wider critical issues about biological and cultural aspects of morality and the relationship between them. Evolutionary biologists today are more reluctant than their predecessors to assume that genetic inheritance is the only form of inheritance. Unfortunately, most non-specialists still assume that evolution by natural selection in a broadly Neo-Darwinian narrative is still correct. This gives the impression that biological evolution is about genetic determinism, even though the process itself is dependent on the contingency of genetic mutations in given environments. It is not surprising that forms of evolutionary ethics that arise out of this paradigm present an evolutionary naturalism that is not necessarily palatable to either religious believers or religious ethicists. Evolutionary psychology has not necessarily assisted in such a clarification either, since its most dominant sociobiological approach gives the impression that there are fixed behavioral traits or characteristics that are passed down from one generation to the next. Genes for violence or language or cooperation seem to predispose people to act in certain ways and thus undercut the natural basis of freedom. However, the actual evidence for such genetic dispositions is relatively weak, for even if generalized tendencies have a biological substratum, this is not the same as understanding the genes as in any way being causative. Alternative evolutionary theories that are gradually gaining ascendancy include extended evolutionary synthesis (EES), where niche construction is not just an environment in which genes are selected, but an active process in evolution by the agents themselves. There is, in other words, a mutual malleability in the way these processes are set up in a dynamic system of interchange. This newer evolutionary theory is particularly significant for interspecies communities, since it means that those communities are themselves integral to the evolutionary process. The case studies highlighted above show more clearly how this might work, where the actions and interactions between different actors has a significant impact on the lives of all those in the multispecies commons.

The theoretical basis of how to conceive of such communities is more difficult to adjudicate. One possible example is actor network theory that has been proposed by Bruno Latour (2005). Another possibility is to use systems theory in order to work out the dynamics of the system as a whole, though this theory works best for global systems rather than smaller community structures. Niche construction has,

of course, a long history in ecological studies, stemming from the idea of *Umwelt* first pioneered by the German biologist Jakob von Uexküll (1864–1944), and then later taken up into more contemporary concepts of niche construction by evolutionary biologists such as Evelyn Hutchinson (1903–1991) and Richard Lewontin (1929–). The biosocial basis of religious ethics has an even longer history in natural law theory, which in its simplest form states that evil should be sought and good avoided, with a nested hierarchy of relationships grounded in living things seeking their own survival. While natural law was a popular foundation for legal theory or what Thomists called positive law, it has largely been replaced by economic goals that are themselves dependent on mathematical formulations of economic behavior. There are two possible responses to such a narrowing of scope to legal regulation. One is to widen the basis of legal theory so that justice and rights, for example, become extended to creatures other than humans. Another is to envisage a different *telos* or goal of flourishing, so that law has a theoretical framework orientated to the transcendental themes of goodness, truth, and beauty. One of the challenges of interspecies community ethics is working out the *telos* or goal of that community and what priorities should be given and for what reasons where there are clashes in intra- and interspecies interests. The difficulties with any communitarian or system approach are related to the dangers of individual difference and interests being suppressed in the interests of system flourishing. They are the opposite dangers of Kantian approaches to ethics that tend to favor the individual at the expense of the community. Some moderation of interspecies community ethics from the perspective of religious ethics will normally include love and compassion that takes account of or even gives ethical priority to the weakest members.

Future Directions

This is a new area of research and therefore there are many unanswered questions that could potentially be addressed. Key questions include discerning the ways in which different religious communities can learn from each other from their own experiences of living in interspecies communities. Different religious traditions will have different approaches to the domestication of animals, and in some societies animals freely associate with humans in order to gain protection from predators. These affiliations raise new and interesting questions about human societies and their entanglement with other animals. The evolution of morality is another important related question that is associated with an understanding of the evolution of consciousness and the mind. The definition of morality will shape how far and to what extent other animals are considered to possess any form of moral agency, though distinctive aspects of human morality include powers of abstraction and critical self-reflection that are of course impossible for other animals. In an interspecies context human action is not necessarily self-conscious of its impact on that community, so questions arise as to how far and to what extent deliberative choice is integral to moral agency. The frameworks for that moral agency will vary depending on the specific religious and social context of the interspecies community, which implies, from a purely evolutionary and anthropological perspective, a form of moral relativism.

Christian approaches to ethics will resist that slide into moral relativism and argue in favor of giving priority to the weak and, despite the dangers of anthropocentrism, will lean toward a stress on human dignity. One way to tease out questions about the evolution of morality in more detail would be to distinguish different aspects of what that morality entails, rather than assuming that it can be described

under one umbrella. For example, questions on the evolution of justice and altruism (love) that finds expression in human merciful action, humility, and so on, could have precedents of some sort expressed in a multispecies commons and in a community where the agency of other animals is recognized and respected. An argument in favor of animals having religious affections is rather harder to sustain, though not theoretically impossible. Indeed, if morality is considered as having a basis in moral emotions and inclinations, then desire could be seen as a primary motive in religious sensibility, and other animals, regardless of their status in terms of theory of mind, could potentially share religious affects. More anthropological research is needed in order to tease out in more detail the significance of these communities for human flourishing and practice, including religious practice.

The importance of domesticated animals in particular to human well-being has not been properly appreciated, and companion animals can be important in restoring psychological health to those who have been victimized. Those who are fleeing persecution, those who suffer domestic abuse, and those who are environmental refugees often speak of their need to keep their pets. Such intimacy also gives opportunities for the less welcome relationship of abuse, so that sexual abuse of animals is mirrored in pedophilia later in life, and violent abuse of animals is mirrored in extreme violence toward women and others. How far and to what extent the two are directly connected is unclear, but the close correlation speaks of the importance of interspecies relationships as a reflection of the health of human relationships considered more broadly. The closeness of relationships is also reflected in the dedication of pet owners to their pets. Hurricane Katrina, for example, is a good example where 44 percent of those who refused to leave their homes did so because they did not want to leave their pets. The work of NGOs and others in resettling those fleeing abusive situations of either domestic or structural violence has not yet taken sufficient account of the affiliation between humans and their companion animals, especially dogs, who commonly become incorporated into the human family as if they are family members. Such affiliations raise larger questions as to whether traditional approaches to moral decision-making, such as that through Catholic social teaching on the common good or natural law for example, can be broadened to include other animals and beyond that to the multispecies community niche.

CHAPTER 146

Labor and Trade

Christine Firer Hinze

Economic activity, most fundamentally, work, is a requirement for human survival, and a constituent human practice. Every major religious tradition emerged and evolved in contexts where economic activities, including work and trade, were givens of daily social life. In ancient and modern, traditional and secular societies, religions have consistently deemed economic activities morally and spiritually significant, and their teachings and followers have influenced, and been influenced by, ways work and commerce have been understood and practiced.

Each major religion posits a transcendent origin and destiny for humanity with implications for every aspect of living, including the economic. Religions' interpretive frames simultaneously valorize, relativize, and norm work and trade in light of larger spiritual visions and corresponding criteria of judgement. Economic activities are deemed reflective of the human condition as embodied, interdependent, intelligent, free, capable, industrious, and creative; and as finite, fallible, and corruptible. As distinctively human, these activities are never merely instrumental or technical, but carry moral and spiritual meanings and obligations. Comportment in work and trade thus affects and reflects the rectitude of individuals and communities.

In evolving, varied, and often contested ways, religions have reflected on work and trade light of their distinctive traditions and particular contexts. In so doing, theistic religions have been guided by three foundational tenets. Each “recognizes God as the ultimate source of value; acknowledges the centrality of the community; and holds out the promise that men and women (living in community) can transform themselves” (Pava 1998, 604).

An Ultimate, Transcendent Source of Value

Monotheistic faiths Judaism, Christianity, and Islam profess one divine creator, judge, and redeemer, source and center of all existence and all value. Their theocentric worldview exempts no aspect of life from religious significance or duty. Through creation, revelation, and sacred traditions, the Divine discloses the values and rules that must orient believers' daily lives, including their economic lives.

The Ten Commandments or Decalogue illustrate these faiths' ways of interpreting work. The first, fundamental command to worship the one God above all else is followed by the command to observe the Sabbath (Exodus 20:8–11, Deuteronomy 5:12–15; cf. Genesis 1:28; 2:1–3; 2:15).

Six days you shall labor, and do all your work, but the seventh day is a Sabbath to the LORD your God. On it you shall not do any work, you, or your son, or your daughter, your male servant, or your female servant, or your livestock, or the sojourner who is within your gates (Exodus 20:9–10).

This command at once acknowledges the importance of work and trade in people's lives, and requires their weekly cessation to rest, and to honor God. By forbidding work on Sabbath and other festivals, and requiring regular time for Torah study, Jewish laws create boundaries around the time and attention allowed for economic activities (Wilson 1997, 25–26).

Reinterpreting Sabbath commands in light of Jesus and the gospels, Christians came to gather on Sundays to worship the one God and commemorate Christ's resurrection. Among post-Constantinian Catholic, Orthodox, and Reformation Christian communities, Sunday observance included stopping daily labor and business for both worship and rest. Strictures against work were treated with varied degrees of flexibility, however, in part warranted by Jesus' teachings and example (cf. Matt. 12: 1–8; Mark 2:23–38, Luke 6:1–11) and in part dictated by changing demands placed on laborers (Strand, ed. 1982).

Muslims witness to Allah's primacy over work and business by taking time from daily labors to pray, and public communal worship on Fridays (Jumah, or Day of Assembly) (Goitein 1959). Yet rather than setting aside a day of rest, Muhammed prescribed weekly worship on midday during Medina's main market day. "It is evident from Surah lxii., 9–11, that Muhammad regarded it as not incompatible with the holiness of the weekly day of worship to be also one of flourishing business" (Goitein 1959, 193). Midday Friday worship was also a way to witness publicly before one's Jewish and Christian neighbors, "because on that day the people of Medina gathered anyhow to do their shopping." (Goitein 1959, 189; cf. Qu'ran, Surah lxii.9–11).

The ultimate source of value and center of allegiance looks different for a nontheistic faith such as Buddhism. Buddhists uphold a transcendent view of human destiny as moving beyond the cycles of *samsara*, to the ultimate liberation and fulfillment of Nirvana. This spiritually ennobling view of humanity is the transcendent measure against which Buddhists reckon work and trade's value and purposes.

Centrality of Community

Religious traditions emphasize personal agency and responsibility, but regard persons as inherently relational, embedded in and obligated to communities. Versus modern western views, personhood and agency are understood to emerge from and depend upon communal bonds. From conception to grave, human survival and well-being is exquisitely dependent on material-ecological and social conditions and relations. In the economic arena, human material needs, dependence on the earth, and reliance on one's skilled exertions with those of neighbors intersect and are addressed. These intertwined dynamics of personal agency, responsibility, and interdependence are deeply etched into the activities of work and trade.

Transformative Possibility

Religions variously identify the obstacles impeding human fulfillment and destiny, and the transformative paths by which these obstacles may be overcome. Economic activities and their fruits are valued insofar as they serve, or at least do not impede, this transformative pursuit. Performed justly and with right intent, work and trade can cultivate personal virtue and rectitude; by serving and positively shaping communities they may become expressions of virtue, indeed, worship. (Pava 615–16).

Paths to spiritual and moral transformation vary: for Buddhists, submission to the disciplines of the Eightfold Path and the Five Precepts; for Jews, following Torah; for Christians, Gospel-inspired discipleship as specified by church traditions and teachings; for Muslims, daily and lifelong adherence to the Five Pillars. Common emphases are the primacy of love of God (for theistic faiths), and of neighbor as God commands, and an ethics of work and trade that respects others' dignity, prohibits deceit, theft, or coveting, and promotes equity and reciprocity by "doing unto others as you would have them do unto you." Well-known in the Christian scriptures (Mt. 7:12), this "golden rule" is echoed "in Islam, 'No one of you is a believer until he desires for his brother that which he desires for himself.' Buddhism expresses it in terms of 'Hurt not others in ways that you yourself would find hurtful.' The Judaic rule is: 'What is hateful to you, do not to your fellow man. That is the entire law; the rest is commentary.'" (Bassiouni 1993, 117; Al Nawawi 13, Qu'ran 4:36; Samyutta Nikaya v. 353 Udana-Varga 5:18; Leviticus 19:18, Shabbat 31a, Tobit 4:15).

Religions' relational anthropology cultivated often-astute awareness of the impacts of individuals' actions on communities and vice versa. But in pre-modern contexts where social arrangements were considered fixed and natural, transforming economic institutions or structures was rarely thought possible, much less a duty. So, for example, "Buddhist teachings were generally less interested in [challenging inequality or] changing the current distribution of wealth" to meet some definition of economic justice, "than in cultivating the proper attitudes toward wealth, ... of giving and nonattachment" (Ornatowski 1996, 233). In the twentieth century, influenced by modern social thought and movements, more religious communities began to incorporate structural critiques and calls for institutional change within their ethical teachings concerning economy (Kind 2009).

In no religion, of course, is teaching equivalent to action. Religions' historical impact on adherents' economic behavior or surrounding societies has been perennially uneven, mixed, and never assured.

Religions' Ethics of Work and Trade: Brief Overview Buddhism

Buddhism's Four Noble Truths direct adherents toward liberation from the craving that causes suffering, and ultimately to release from the cycles of material death and rebirth (*samsara*), into Nirvana, or Enlightenment. Buddha's Eightfold Path of righteous living includes three, moral conduct components: Right Speech, Right Action, and Right Livelihood (e.g. Marques 2015, 84–94). Right livelihood requires making a living in ways that uphold the Five Precepts (not killing, not stealing, not misusing sex, not lying, not abusing intoxicants). "To be ethically sound, economic activity must take place in a way that is not harmful to the individual, society or the natural environment ... but rather enhance well-being in these three spheres" (Payutto 2000, 13; Vanijja Sutta AN 5.177).

Buddhists further judge an economic activity's value according to "which kind of desire is at its root." Activities motivated by or feeding the inferior desire of *tanha* (craving for material pleasure or other passing goods) increase suffering and undermine well-being. "Those working with *tanha* are motivated by the desire to consume," and because work delays gratification, "the work itself affords little enjoyment or satisfaction" (Payutto 1994, 28; 2002, 83). Alternatively, work performed with *chanda* (wholesome intention) aims at relieving suffering and promoting well-being. *Chanda*-motivated work offers intrinsic satisfaction as by it, people develop skills and talents, overcome ego-centeredness by joining with others in common tasks, and "bring forth the good and services needed for a becoming existence" (Schumacher 1968).

With Confucianism, Buddhist teachings counsel cooperation and moderation in life, work, and business (the "Middle Path"). Employers are admonished to treat workers with respect, fairness, and

benevolence, and workers to reciprocate with good work and loyalty to the employer (Sigālovāda Sutta, Dīgha Nikāya 31). In countries like China, India, and Japan, Buddhism encouraged habits of productive labor and supported lay accumulation of wealth, and many monasteries (as in Christianity) became sites of innovative business enterprise. But strong teachings on non-attachment and giving meant that lay labor and wealth and were regarded as instrumental to activities directly related to monk enlightenment or lay meritmaking through community service or donating to monasteries (Ornatowski 1996, 232).

Judaism grounds economic ethics in biblical creation and redemption narratives which emphasize obedience to Yahweh, and regard earning a living and cultivating the world through work and trade, even amid post-Edenic toil and sweat, as God-given tasks, subject to Torah law. Observing justice in business dealings, non-exploitation of vulnerable workers and the poor, and sharing due portions of labor's fruits with the needy are especially stressed (Deuteronomy 14:28–29, 24:14–1; Sirach 34: 26–27; Jeremiah 22:13; Isaiah 58:3–7).

At life's end, the Talmud states, one's business conduct will be among the first subjects of God's judgement (Talmud, Shabbat 31a). To live justly and avoid sin require Torah study, Torah (including Sabbath) observance, and working for one's livelihood in a manner that "lives Torah" (Mishna, Tractate Pirkei Avot 2:2).

Jewish ethicists have interpreted key Rabbinic legal principles to illumine just business practices that serve the community's welfare. So, for example: "The recognition of different levels of responsibility for charitable giving (Baba Mezia 7a)," prioritizes workers and businesses' responsibilities to family and to nearby communities. The *Kofin al midat S'dom* principle, or *kofin*, calls for waiving one's legal rights in economic situations where insisting on exercising them brings one no benefit, but waiving them would positively benefit another. The principle *Ufnim mishurat hadin*, or "beyond the letter of the law," highlights moral responsibilities beyond the legal rules, and may require waiving one's legal rights, even at some cost, in order to meet ethical obligations. Such principles help direct work and business practices toward the welfare of the community. But because caring solely for those within one's own community can be corruptive, ethical work and trade practices must also heed Torah commands concerning faithful Jews' concern for the wider society beyond the community, and ultimately all God's children. (Pava 1998, 607–613).

Christians, likewise, treat work and trade as distinctively human, necessary, and meaningful avenues for attaining material sustenance, cultivating and express skills and talents, and contributing to community welfare (e.g. Pope John Paul II 1981; US Bishops 1986, ch. 2, 97–98). Traditionally, economy, work, and trade are understood as serving God's "universal destination of created goods," that is, the divinely ordained purpose of the earth's resources to provide sustenance for all people (Spieker 2005). Economy's primary purpose is to provides avenues for all members to gain fair access a share of creation's resources, typically through work (Ryan, *Distributive Justice, Gaudium et spes*, 69; Paul VI *Populorum progressio*, 22) "The early church fathers affirmed not only the nobility of work but also the obligation to work diligently and not be idle." Honest work is necessary for a dignified life (Volf 2001, 72; cf. Pope Francis 2015 nos. 127–128).

"Stewardship" and "vocation," prominent Christian paradigms evaluating work, affirm that God charges humans to care for and cultivate creation, and that work carried out in this spirit is a calling or vocation by which one serves God and neighbor. (Witherington 2011). Much Catholic and Orthodox thought highlights work as co-creativity, cooperation, and participation in God's continuing creative activity. Related models depict human work as a sharing in God's eschatological work of recreating "a new heavens and a new earth" (Volf 2001, 91). By activating divinely-bestowed gifts (*charismata*) in their work, Christians bear the fruit of the Spirit into the realms of labor and trade, and contribute their humanization (Volf 2001, 113, 157, 190). Some Christians name holiness or witness as motivations for ethical business conduct. For others, humanistic values such as reliability and trustworthiness, or the

conviction that “since human beings are created in the image of God, they should all be treated with respect” shape economic and business behavior (Werner 2008). Such ennobling views press against amoral or reductive understandings of work as merely a means to subsistence or consumption, and affirm work’s unique status in both human and divine economies (Volf 2001, 197; John Paul II 1981).

Reformer Martin Luther famously deemed all honest work religiously vocational. But he maintained medieval suspicions of commerce and money-making, and was chary of the expansion of international trade. Luther warned against avaricious profit-seeking and self-serving business practices, and advocated governmental oversight of business in order to restrain price gouging and unjust dealings. John Calvin shared Luther’s appreciation of secular work as vocational. But in his urban Genevan context, Calvin encouraged commerce as useful for the common good. Those who engaged in trade, he saw, provided positive service to society, often at a risk to themselves (Eaton 2013, 5; Finn 2013, ch. 10). Post-Reformation Catholic ethics approached work and trade in casuistic ways, often grouping and treating questions of economic right- and wrong-doing within expositions of the Decalogue and its commandments against stealing, killing, dishonesty, and avarice (Davis 1943).

Arising at the turn of the twentieth century to address the “new things” wrought by modern social, economic and technical changes, Protestant social-gospel thought and modern Catholic social teaching contributed to distinctive developments in Christian ethics of work and trade (Dorrien 2011, 60–229; Himes et al. 2018). Both rejected amoral and laissez-faire market economics, and defended on theological and moral grounds economy’s inclusive, provisioning purposes. Both condemned work and business arrangements that exclude, exploit, or disserve the poor and working classes. With a modern awareness of social structures as humanly-constructed and changeable, both championed legal and institutional reforms to protect and empower the poor, workers, and their families. Attentive to contemporary social sciences and on-the-ground realities, twentieth century Catholic and Protestant ethicists deployed religious-ethical principles such as “the pursuit of the common good and the universal destination of goods; equity in trade relationships; and attention to the rights and needs of the poor in policies concerning trade and work,” to address myriad issues surrounding work and trade facing a technologically-advanced, globalizing, but persistently unequal economy (Pontifical Council 2004, no. 643).

Later-century Catholic teaching increasingly championed participation, preference for the poor, and solidarity with the vulnerable as powerful medicine against unjust social structures (Pope John Paul II 1987; Dorr 2016, chs. 11, 13). Peaceful reform, not violent revolution, was consistently advocated. Yet solidarity and the option for the poor carried potentially radical implications for political and economic business-as-usual. In a 1983 teaching document on economic justice, the Canadian bishops limned these implications bluntly:

The needs of the poor have priority over the wants of the rich; the rights of workers are more important than the maximization of profits; the participation of marginalized groups has precedence over a system that excludes them.

(Canadian Bishops 1983, 400).

Islam treats work and trade extensively – over 1,400 of 6,226 verses of the Qu’ran refer to economic issues – surely influenced by the fact that the Prophet Muhammed himself was a successful trader, from a family of traders (Wilson 1997, 117). Subjects of guidance in the Qu’ran include “commerce and politics, interest and debts, contracts and wills, and industry and finance.” More broadly, in a Muslim’s economic dealings, “every act that would remove righteousness and bring evil, whether it benefits the perpetrator or not, is forbidden” (Rizk 2008, 250).

In Islam work, trade, business, and merchants, are socially valued and esteemed (Ali 2005). The Qu'ran and related holy books yield a body of directives for promoting Islamic values of community, equality, and fairness through practices that curb economic abuses, moderate privilege, and protect and uplift the economically vulnerable. *Zakat* taxes the wealthy, then directs the proceeds to aid disadvantaged members of society “including the poor, the handicapped, the unemployed, dependents of prisoners, orphans, and travelers in difficulty” (Kuran 1989, 173). Islamic laws of inheritance curtail the growth of huge family estates. The well-off are obliged to live without extravagance and to give charitably to those in need. A duty to altruism requires that businesses and workers act with concern for others' welfare, refrain from harm, and contribute to the common good (Kuran 1989, 174).

In any economic activity, “It is immoral to acquire possession of income or wealth by stealing, cheating, dishonesty, or fraud” (Rizk 250, Qu'ran 83:1–4; 5:1). “Woe to those who give less [than due]/deal in fraud ... Do they not think they will be called to account?” (Qu'ran 83:1–3; cf. 11:85). Employers must pay fair wages and charge just prices, be transparent in their selling practices, and refrain from exploiting workers or customers. A range of injunctions and prohibitions concerning usury or interest-taking, profit-making on insurance, monopoly, speculation, and activities of middlemen, are meant to assure equitable sharing of risks and losses in business transactions, and to curtail the taking of unearned benefits, especially at the expense of more vulnerable others (Kuran 1989, 175).

Islam regards work as obligatory and salutary for self and society. Muhammed taught that “hard work caused sins to be absolved,” that “no one eats better food than that which he eats out of his work,” and, further, that “work is a worship.” Working with effort and quality is stressed, and succumbing passively to poverty is treated as akin to impiety (Ali 2005, 50). “Effort, competition, transparency, and socially responsible conduct” are central tenets of Muslim work ethics. Work is seen “as a means to further self-interest economically, socially, and psychologically, to sustain social prestige, to advance societal welfare, and reaffirm faith” (Ali 2005, 54, 56).

Workers' rights to fair treatment, just wages, and timely remuneration confer moral and religious obligations on employers; failing to meet them risks eternal condemnation. The three types of people Allah will oppose on Judgement Day include, “one who hires a worker, but does not pay him his right wages owed to him after fulfilling his work” (Sahih Bukhari 36:470). “Give just measure and weight, nor withhold from the people the things that are their due” (Qu'ran 11:85). “Give to the worker his wages before his sweat dries” (Ibn Majah III 16:2443).

Taking seriously Qu'ranic directives concerning work and trade, Muslim scholars debate over whether “there is a unique Islamic economic system, characterized by a well-defined ensemble of institutions, practices, and behaviors,” how and by whom such a system would be delineated and overseen, and what flexibility or adaptability to different cultures and contexts Qu'ranic economic teachings allow. As with modern Catholic economic thought, wide acknowledgment of Islamic economic principles guarantees neither consensus nor clarity on how they are to be related, prioritized, or operationalized (Kuran 1989, 185–186).

Modernity and Religious Economic Ethics

Theorizing the eighteenth-century shift into the era of modern industrial capitalism, Adam Smith maintained a traditionally normative understanding of economy, and, contrary to later interpretations, absolutized neither self-interest nor markets. Smith envisaged modern markets as remaining embedded in, and subject to

the moral demands of, their local communities and broader societies. “Smith’s ideal economic actor,” moreover, was “a person of goodwill, prudence, and self-restraint who operates both co-operatively and competitively in a social and economic milieu based on a foundation of morality, law, and justice” (Werhane 1991, 180).

But as new technologies and communications displaced household-agrarian with wage-dependent means to livelihood and fueled massive market expansions, large-scale business and trade became increasingly untethered from material, moral, and religious moorings in local communities. As economic globalization and pluralization weakened the normative influence on businesses of the communities they affected, secularization curtailed religions’ public authority and influence, and specialization reduced firms and managers to actors playing impersonal roles unrelated, and often unaccountable, to their social contexts. (Gonin 2015, 228).

Neoclassical economics theorized and helped legitimate a new orthodoxy which defined markets as socially-disembedded arenas coordinated by the impersonal workings of the price system, where rational individuals compete for profit and control over scarce resources by freely exchanging goods and services (Weintraub 1993). In practice, modern markets depend on high levels of cooperation and myriad legal and governmental supports. Yet market orthodoxy disvalues government interference and predicts the highest returns to businesspeople who excel at the competitive, self-interest-maximizing behavior of *homo economicus*, and to employees who best approximate the geographically and relationally unencumbered, single-minded focus of the “ideal worker” (Williams 2000, 1, 5; Nelson 2010).

For the vast majorities of workers and families dependent on wages for basic livelihood, this new economic milieu created acute vulnerabilities. Among nineteenth- and twentieth-century attempts to address them were a gendered, “family living wage” agenda (never realized by a majority in any nation) intended to support households via waged male breadwinner-dependent female homemaker couples, and labor and legislative struggles for just wages, working conditions, and benefits. In a third response driven both by necessity and by several waves of feminism, female participation in paid work rose worldwide throughout the twentieth century (Hinze 2015, 76–82). By 2008, the majority of households worldwide had dual (or multiple) earners, large numbers plying jobs lacking adequate pay, security, or benefits. Continuing to perform the bulk of unpaid labor in households and local communities, female wage-earners remained, overall, more vulnerable and less remunerated than men. (UN 2016, ch. 2) For poorer women, heavy responsibilities for family care work, bad wages and working conditions, and ideal worker-job performance standards exacerbated chronic economic precarity and endangered families’ health and safety (Heymann 2006).

As secular human-rights discourses and economic justice movements became prominent in the twentieth century, many religious bodies perceived welcome points of agreement with their own views on work and trade. These confluences facilitated religions’ collaborations with civic groups, non-governmental organizations, and broad-based movements in campaigns for economic inclusion and justice, especially for marginalized people and communities.

Twenty-First Century Contributions

Religions’ distinctive treatments of work and trade share significant convictions. These include understandings of economy’s aim as inclusive, material provisioning; of work as constitutive to humans’ survival, cultivation, and well-being; and of work and trade as subjects of moral and spiritual

accountability, to be conducted with honesty, fairness, and equity, giving special priority to protecting, including, and empowering the vulnerable. Wide agreement exists on workers' and families' rights to decent livelihoods marked by sufficiency, security, status, and sustainability. Acknowledging influential economic theories and prevailing practices, religionists assess work and trade-related activities, arrangements, and policies according to their contributions to economy's inclusive provisioning purposes. From simple exchanges to the complexities of a far-flung, globalized economy, labor and trade's legitimacy hinge on their present and future impacts on people's survival, dignity, and well-being.

By participating in ecumenical, interreligious, and cross-disciplinary ethical reflection, and in practical movements for economic justice, religious communities honor and illumine the material, embodied, realms of work and trade as sites where the quotidian and transcendent intertwine. Beyond merely supplying principles or scriptural texts that echo or add lofty resonances to secular economic-justice rhetoric, religiously-shaped ways of seeing world and economy offer distinctive ways to catalyze solidarity, fuel activist energies, and "open novel possibilities for advocacy and organizing, as well as new visions of worker justice more transformative and grander than those permissible when we approach these issues through a secular frame" (Glennon and Lloyd 2017, 218).

Religions also have long experience, for good and ill, in local-global institutional organizing, communicating across historical and cultural differences, and grappling with intramural and extramural disagreements and conflicts. This equips them with resources to offer economic-justice organizations and coalitions facing similar challenges. In local grassroots coalitions and in large NGOs, religious organizations and members perform key political-education and bridge-building tasks, mediating varied concerns and cultures through "ideology translation, relational repair, and inclusion monitoring" attuned to the situations and needs of the vulnerable and marginalized (Snarr 2009, 73).

Too often, religions' promise in these areas has gone unrealized, as religious adherents and institutions have instead benefited from, participated in, or legitimated unjust labor and trade arrangements. Yet to address contemporary labor and trade's urgent, complex contours requires all hands on deck, religions included. Several areas especially need religious-ethical and practical work: first, advancing economic theories and practices that norm and prioritize inclusive access to sustainable dignified work and provisioning; second, illumining the human faces and material underpinnings and impacts of globalized production and supply chains, trade and finance, and advancing strategies to assure accountability for these; third, addressing ubiquitous gender disparities, especially by recalibrating social and economic valuations and distributions of household and care-related labor; fourth, combating extreme economic inequalities by articulating frameworks and helping to operationalize strategies for ensuring (especially vulnerable populations) inclusive, equitable participation in trade and labor and their benefits.

CHAPTER 147

Marriage*

Eugene F. Rogers, Jr

The Vows of the Rite Present Marriage as an Ascetic Discipline for Sanctification

“For better for worse, for richer for poorer, in sickness and in health, till death do us part.” The vows make marriage an ascetic discipline, a school for virtue, a means of sanctification. Marriage takes desire, and turns it into devotion. Whether the dirty diapers come from small children, incontinent in-laws, or aged partners, there are enough to go around. What begins in eros ends, if it lasts, in agape. Marriage is not so much about satisfaction as sanctification, and no conservative has ever seriously argued that same-sex couples need sanctification any less than opposite-sex couples. Marriage sweeps us up into this great gamble: that God can prepare us for life with God, by binding us for life to each other.

Paul Evdokimov (1985) makes the crude but salient typology: Catholics tie marriage to procreation; Protestants to control of lust; while Eastern Orthodox tie marriage to training in virtue, or sanctification. Russian theologians even see marriage and monasticism as two forms of the *same* discipline: both vowed relationships that hope to bear us into God, by teaching us to bear with one another. The Orthodox call weddings crownings after their most dramatic feature: the placing of laurel or iron crowns on the heads of the newly-weds. They interpret them as crowns of martyrdom, of those who undertake a discipline. The advantage of this third approach is that “it easily accommodates the other two (procreation and lust-control) and orients both to a spiritual goal: growth into God. Traditional goods of marriage--children and faithfulness – make more sense within this sacramental context” (Jenkins and Kittredge 2011). A couple’s growth into God (they continue) “prompts them to welcome children and to practice faithfulness.” Marriage becomes a means by which God may bring a couple to God’s own self, by exposing them to each other: they may grow into the love of God, by practicing the love of nearest neighbor.

*This entry abridges and updates material first published in Good, Jenkins, Kittredge, and Rogers 2011. (Authors appeared alphabetically.) I separate, quote, and acknowledge words originating with one or more co-authors. The material I originated also benefited from reading and conversation among the co-authors and from the facilitator, Ellen Charry, and authors of an alternative account (John Goldingay, Grant LeMarquand, George Sumner, and Daniel Westburg) who offered improvements to an account they did not share. The material appears here by permission of the co-authors and the *Anglican Theological Review*. I thank Federico Altbach for an invitation to deliver this material in Spanish at the Universidad Católica Lumen Gentium on March 27, 2019, which published it in English with acknowledgment of the *Anglican Theological Review* and the *Blackwell Encyclopedia* as “Marriage as an Ascetic Discipline for Same- and Cross-Sex Couples,” *Puertas Lumen Gentium* (Mexico City) 3 (2019): 53–63.

“This account of marriage,” Jenkins and Kittredge point out (2011), “does not minimize procreation and chastity, but follows traditional marriage rites in upholding the context of those gifts”: “the union of Christ and his Church” (BCP, 423) by which “God was reconciling the world to himself” (2 Cor. 5:19). This is no new theology of marriage, but extends one that Orthodoxy never lost and that traditional marriage prayers and vows still imply. A *lex orandi* argument follows from the Book of Common Prayer. It avoids appeals to autonomy, individualism, or personal experience, but arises from the marriage prayer of the church. Can witnesses credit what they pray in the marriage rite (taking the whole rite as a form of prayer)? For example, they ask God to “make [the spouses’] life together a sign of Christ’s love to this sinful and broken world, that unity may overcome estrangement, forgiveness heal guilt, and joy conquer despair” (BCP, 429). Does the prayer make sense for two women or two men? Do same-sex couples also fit the marriage vows? Can God prepare them too for life with Godself, by binding them for life to each other?

“For better for worse, for richer for poorer, in sickness and in health, to love and to cherish, till death do us part” (BCP 1928, 301). The vows mark marriage as no privilege for spiritual heroes, for the adept or the perfect. To heroes, Paul commends celibacy (1 Cor. 7:9). Marriage like Eucharist provides medicine “not for the well but for the sick” (Mk. 2:17), for those who would follow Christ to be perfected in weakness for love of another (2 Cor. 12:9). The prayers of the church identify marriage as a discipline for sinners: “Give them grace, when they hurt each other, to recognize and acknowledge their fault” (BCP, 429). The discipline of marriage relies on the difficulty of living with another “in prosperity and adversity” not to avoid but precisely to *expose* our faults – in order to heal them. Nor does “when they hurt each other” confine itself to minor slights. Since the acknowledgment of hurt – the confession of sin – nourishes Christian growth and sacrament, the next prayer sets their discipline in the largest theater: “Make their life together a sign of Christ’s love to this sinful and broken world” (BCP, 429). The vows signal no privilege or right; they do not treat sexuality as a need to be satisfied. Rather they expect the promises of Hosea and Jeremiah to come true, that God will heal our waywardness and teach us to love (Hos. 14:4; Jer. 3:22).

“To love and to cherish”: the vows offer a means by which God may turn eros into charity. Not all marriages begin in eros, but it would be an odd account of marriage that ignored it. Patristic and medieval commentaries on the Song of Songs taught the Church to see in eros the hope for agape (for example, Gregory of Nyssa’s Homily 13). The vows do not turn eros into charity by relying on our self-control. That would be a plan designed to fail. Self-control is something you would hardly expect to come from *eros*. Rather, Paul commends marriage “if they *lack* self-control.” Marriage so often begins in eros, with its *abandonment* of self-control, that the rite names *not* all the things that humans can muster *against* eros. The rite invokes the very things that might defeat eros: for worse, for poorer, in sickness, till death. Marriage relies not on self-satisfaction or self-expression, still less on titanic self-control: it relies instead on self-dispossession for self-donation. It is “the daily version,” as Jenkins wrote (2011), “of finding one’s life by losing it, and it encompasses all the daily practices of lives lived in covenanted closeness: laboring to provide for one another and to support family, organizing a household and its daily table, maintaining and sharing property, caring for another in sickness and finally into death. The Christian covenant of charity challenges and heals just such distortions of self-giving.” If it begins in the self-dispossession of eros, it ends in self-abandonment to God. It turns not our attempts at self-possession but our self-abandonment into victory, on the pattern of Christ’s self-giving. It begins in mutual self-donation to the other, and ends in mutual self-donation to God.

How Can Sanctification Apply to Same- and Cross-Sex Couples?

Complementarity theories of marriage stress “difference.” If difference covers more than body-shape, which differences matter? God intends difference for blessing. Under conditions of sin, human beings turn difference to curse. There is enough difference to go around. The question is, *which differences bless?* The differences that lead to moral growth on the pattern of the incarnation are those, as Gregory Nazianzen says (Oration 14.7), that *turn our limits to our good*. The differences that turn our limits to our good are those that *cause us to need one another*, since love can exist only as relationally possessed. We need each other because we both yearn for and challenge one another. It is difference – as need – that excites longing. Same-sex couples are no strangers to that. Rather, they encounter yearning and challenge of the deepest, most heart-felt, most life-changing sort from someone of the *opposite*, not the *opposite sex*.

If I am in a same-sex couple, my spouse is the one who most *differs* from me in the morally significant sense: the one who makes me most vulnerable; the one who most escapes my control; the one who brings me to give myself; the one who challenges me; the one who confronts and stands over against me because with that one I disarm and donate myself. That one inspires and requires me to live out the relation of Christ with his bride: with whom in mutual self-donation I undertake the ascetic discipline of “for richer for poorer, in sickness and in health, for better for worse, till death do us part.”

It is thus marriage that makes the difference, the difference God intended, the difference that blesses, the difference that makes us different, that opens us up to challenge and change. The difference that marriage makes is the differentiation of the Spirit, by which the Spirit drives *eros* to sacrifice, as it drove Jesus for love’s sake. On this view, the Church should call to same-sex marriage those for whom someone of the same sex makes the moral difference. The Church should call to same- or different-sex marriage those who need sanctification. The Church should call to same- or different-sex marriage those whose witness she desires to the love of God for the church.

The mystery of Genesis 1 is that I am made in the image of another not my own. Creaturehood destines me to find my greatest good in one beyond my control, God. But the human other whom I love is another mystery beyond my control. God is a mystery, as a good too great for me to grasp, and I am a mystery to myself, as having my true good there. Genesis 1 portrays sexuality as reflecting or imaging this mystery: in the image of this mystery God created the human being; male and female God created them (Gen. 1:26).

Real desire, therefore, does not satisfy the ego, but loses it in self-donation. Too many queer people have tried opposite-sex marriages to gratify their egos and gain self-control. Only in same-sex or non-binary marriages can they undergo real self-abandonment because they undertake real self-donation to the other. Discipline hardly works without longing; all creation waits “with eager longing” (Rom 8:19). Sometimes we hear that same-sex couples should deny themselves and take up the cross. That misunderstands what Jesus did. With longing Jesus so loves the world, that he gives his life (Jn. 3:16). Jesus did not go to the cross by *denying* what he longed for: Jesus went to the cross by *following* his desire, because his love was for his bride. Jesus went to the cross by following his yearning, because he yearned for God. That is why marriage imitates the wedding of the Lamb, and initiates desire into charity: it practices the self-giving of a whole life to another. That is why Jesus prefers those whose desires run hot (Rev. 3:15) and avoids those whose desires grow cold (Mt. 24:12).

Marriage Rites Follow Ephesians 5, Where Marriage Embodies the Two Great Commandments, Signifying Love of God and Practicing Love of Neighbor

The marriage preface puts the discipline of the vows into a christological context and tells us straightforwardly what marriage means. Marriage “signifies the mystery of the union between Christ and his Church” (BCP 423). Referring to the miracle of the wine at Cana, the rite looks forward to Christ’s own marital donation of his body at the Last Supper when he says, “This is my body, given for you.” According to Catholic sacramentologist Bernard Cook, and based on the nuptial theology of John Paul II, those words of institution constitute Christ’s *marital* vow, by which he donates himself in his body to humanity. As the familiar hymn explains: “The Church’s one foundation/ Is Jesus Christ her Lord/ ... From heaven he came and sought her/ To be his holy *bride*;/ With his own blood he bought her,/And for her life he died.” (Note that the hymn reverses patriarchal power relations: the man dies for the woman.) Thus the *Book of Common Prayer* constructs marriage as a means of grace for sinners not just individually but for the whole church. “The idea that marriage could work sanctification is hardly evident by nature,” as Jenkins points out (2011); “it is a reality of the incarnation, by which the church hopes for its *own* salvation.”

Neither Jesus nor Paul quotes “be fruitful and multiply” from Genesis 1. Some traditional exegesis, noticing that feature of Paul’s quotations, argues that Paul associates “be fruitful and multiply” with what humans share with animals (procreation), rather than with what makes marriage. “The command ‘be fruitful and multiply,’ addressed alike to the animal world and the human being as ‘male and female,’ has caused western theologians completely to lose sight of the fundamental fact that the institutional word of marriage [the “one flesh” passage], addressed to the *human being* as man-woman *above the animal plane*, does not even mention procreation. It speaks of the ‘solitude’ of the nuptial communion (Gen. 2:18–24)” (Evdokimov 1985, 22). Likewise, Chrysostom (2002, 89–90) observes that the command “be fruitful and multiply” does not end there, but states a goal: “and fill the earth.” The earth, he says, is full. The command, in the perfect tense, has been fulfilled. And that was in the fourth century.

Ephesians, chapter 5, summarizes this line of thought as follows. Marriage begins in *eros*, and ends in *caritas*. *Eros* refers to the “one flesh” for which one leaves father and mother (Eph. 5:31). *Caritas* refers to loving the other as one loves oneself (v. 32). Marriage thus converts *eros* into the two great commandments about the love of God and neighbor. It testifies to the love of God by signifying Christ and the church. It testifies to the love of neighbor by enacting it toward the spouse. Marriage models Christ and the church, Ephesians suggests, not as a ‘state,’ but as a school for virtue. Same-sex and cross-sex couples can both witness to the love of Christ for the church, and they both need practice in love of neighbor.

The *Book of Common Prayer* follows the interpretation of Genesis in Ephesians 5, where marriage bears witness to both of the great commandments: it signifies the love of God, and it teaches love of neighbor. In turn, how and to whom the church offers marriage shows the great commandments’ scope. Ephesians denies, therefore, that the model of Christ and the church could reduce to a man and woman standing before the altar in static tableau. Rather, modeling Christ and the church is a *moral* matter, an *activity*, a discipline or discipleship; it requires the couple to *practice* the love of the neighbor as oneself (5:32). Love is to be practiced, not every now and then, but every day: not at a distance, but in the closest quarters.

The typology of “Christ and the church” does not reduce to male-female complementarity, even if it uses gendered language. Men have always represented the bride of Christ as members of the church. Women have always represented the priesthood of Christ as believers. Recently, they have represented the priesthood of Christ as ordained. Members of either gender may serve as a sign or represent a “type.” A “type,” in Greek, is a sign of something else. Ephesians is not saying that we should take our understanding of Christ and the church from how our marriages work. It says that we should understand marriage from Christ and the church. Marriage forms do not limit the love of Christ for the church, but that love gives marriage more to mean. The church, traditionally gendered female as Christ’s bride, embraces women and men. “The body of Christ,” while gendered male as a human being, is gendered female as the church. Such shifts remind us why Ephesians calls marriage a *mysterion* and treats it as a sign. It points beyond itself. Types do not limit representation: they open it to God’s work. That is why Paul, even if he could not have imagined same-sex marriage, restricts his advice on *who* should marry to the practical: “It is better to marry than to burn” (that is, with lust, 1 Cor. 7:9). He does not advise Christians to pair up male and female, in order to represent Christ and the church: he advises celibacy and marriage “if your passions are strong” (1 Cor. 7:36). Thus, both same- and cross-sex marriage may represent the marriage of Christ and the church, because Christ is a spouse to all believers.

Sexual Orientation Is a Christological Condition

A “christological condition” constructs sexual orientation as a more or less settled tendency by which Christ orients embodied desire toward himself, by orienting it toward another human being, taking up the body into the fulfillment of the commandments to love God and neighbor. In marriage we grow into wholehearted love of God, by practicing the love of nearest neighbor.

What is a sexual orientation? It is an orientation of desire. Since Christ “satisfies the desire of every living thing” (Ps. 145:16), a sexual orientation, theologically speaking, must be this: a more or less settled tendency by which Christ orients desire toward himself, through the desire for another human being. Stated another way, Christ, as God, is nearer to every creature than the creature is to itself. A sexual orientation is a way, a *tropos*, a turning-toward, in which the creature follows Christ to come as near to another person as a *creature* can come. Orienting desire to Christ makes sexual orientation a *moral* matter. The married know that they have learned the virtues – patience or temperance or courage, fidelity, hopefulness, and charity – because their spouse inspires a vulnerability that no one else could teach them. Eros makes a way to the heart; without the vulnerability it brings, charity grows cold. This is not a lesson of “sexual liberation,” if that “liberation” evades commitment and discipline. This is a lesson of the *incarnation*. The yearning of God in the incarnation, and in the marriage that mirrors it, cannot be bypassed but must be taken up to provide the energy for moral healing and growth.

A sexually oriented person is thus someone who develops and is morally improved through a relationship with someone of the *opposite* sex, typically but not necessarily the *opposite* sex. Those called to same-sex relationships are those who need them *for their own sanctification*. They need this because neither opposite-sex relationships nor celibacy could get deep enough to promote lifelong commitment and growth – growth on the pattern of the incarnation. That means growth through and not without the creaturely limitations that Christ took on, the limits he took to use for our good: the limits of time and

the body. Moral growth takes time. Further, it takes place when we are brought up against the limits and the finitude of our bodies, of our creatureliness. It does not bypass the body. We learn anew with Adam that we are yet creatures, and not gods. Many queer people have learned this in trying and failing to “go straight.” Finally, we learn anew with Christ to re-befriend our bodies, to see them as places for Christ to continue in us the incarnation’s project of turning desire into charity and even sacrifice.

“Like other natural aptitudes,” as Jenkins (2011) wrote, “sexual orientation is a christological condition; it shapes ways of participating in the body of Christ. God in Christ orients desire godward through various capacities to desire others.” The Spirit hovers over the waters of the womb to prepare all persons for inclusion in the body of Christ. What the Spirit prepares in the wombs of all mothers images what the Spirit prepared in the womb of Mary and anticipates what the Spirit prepares in the womb of the font: persons meant to find their destiny in Christ’s body. The Spirit distributes many and various ways to desire Christ, for the sexual differentiations and orientations that begin in the womb prepare us for “particular patterns of invitation” (Jenkins 2011) to put our bodies on the line for others.

Marriage Makes an Arena and Metaphor for the Atonement

The paradigm for the body in Christianity is Jesus’s remark, “This is my body, given for you.” With that, he subverts and redeploys a structure of violent oppression – the crucifixion – and turns it to a peaceful feast. He reverses the movement of the fall, which counted divinity a thing to be grasped. Jesus re-befriends the body, and creates the bread of heaven, by counting divinity *not* a thing to be grasped. At the Last Supper, he performs a deathbed wedding, as if he said: “You cannot violate my body.” “Take,” he says, “I give it to you.”

Any couple might blame the fall on the body, if they saw the body as something Christians are saved *from*, rather than honoring the incarnation to see the body as something Christians are saved *by*. Instead, Genesis and Philippians agree, the original sin is wanting to be like God. Genesis 3:5 names the temptation: “you will be like God.” They did not stoop too low, and then fall down: they reached too far up, and then fell over. They did not decline, they overreached. They did not drop, they toppled over (Moore 2002). In the Philippians hymn, the incarnation precisely reverses the fall: Christ “did not count equality with God a thing to be *grasped*.” Christ *undoes* Adam’s grasping after equality with God. Marriage teaches creatures to “have this in mind” (Good 2011): they participate in Christ’s reversal of the fall by loving each other as Christ loved them.

Only after the first couple grasped after wanting “to be like God” (Gen. 3:5) were “their eyes opened, and they knew that they were naked” (Gen. 3:7): They did not see that their bodies were *bad*, but that their bodies were *creaturely*. Their bodies told them *the truth*, *they were creatures*, and not God. Their bodies gave their overreach the lie. They felt shame because they failed to become God; they hated their bodies, because their bodies showed that they were creatures still. They *scorned* their bodies: but Christ, in the incarnation, took *on* a body, and re-befriended what Adam had scorned (Moore 2002).

Why did Jesus not climb down from the cross? – because he held himself accountable to put his body where his love was. Luke’s last temptation is “if you are the Son of God, throw yourself down” from the temple, the place of sacrifice (4:9). That becomes Matthew’s recommendation from the passers-by and thieves crucified with Jesus to “let him now come down from the cross ... let God deliver him” (Mt 27:42–43). Why would Jesus regard climbing down as a temptation? Because he has pledged his love in his body (“this is my body, given for you”) precisely to *these*, to humankind the grasper, the criminal, the

thief: and because to climb down from the cross would be to abandon his solidarity with Luke's thief, the thief on the cross (Luke 23:39–43), whom Christ took on a body to befriend.

To put one's body on the line in solidarity with another, for better or worse, in sickness and in health, till death do us part, is one place where couples daily and bodily receive and live out the atonement by which Christ re-befriends the body to overcome sin. They practice Christ's solidarity with his bride, the criminal, the thief on the cross. The gift of one's body "for better for worse," and the solidarity of one's body "till death do us part" are *not* practices that same-sex couples should be left out of, but practices that all couples need, and the church needs from them. Traditional Christians have no wish to deprive same-sex couples of their most promising source of help: yet on this account, the source of help is same-sex marriage, because it not only participates in Christ's atonement for sin, but does so "by daily practices of accountability far beyond what counseled celibacy can provide" (Jenkins 2011). Marriage for same-sex couples allows them to partake of Christ's solidarity with the thief on the cross whom he would not abandon, but did befriend, until death parted and paradise reunited them.

The final reversal of the fall is eucharistic, because redemption, like the fall, takes place by eating. Not only do Adam and Eve eat the fruit of the tree, but God then commands them that "in the sweat of your brow you shall *eat bread*" (Gen. 3:19). This command becomes the means of their redemption when Jesus gives his body as their bread, and the fruit of the vine for the fruit of the tree. That is why the marriage rite begins with Cana, which points forward to the Last Supper and the Wedding of the Lamb, and ends with the Eucharist, where "the newly married couple may present the offerings of bread and wine" (BCP 432). Their first married act follows Christ to reverse grasping by offering, and their first common bread replaces Adam's taking by force with receiving by gift. The gift that they receive – and that they may follow – is Christ's self-donation, his nuptial commitment to the church, to be where his body is.

The Third Vow Involves the Whole Community as Witnesses and Guarantors of the Marriage, Catching Them up into a Parable of the Trinitarian Life

However, there are not only two vows in the marriage rite. There are three. The third vow commits the people to uphold the couple. Marriage is not for the couple alone but also for the gathered church. The third vow saves marriage from *égoïsme à deux*, and delivers it to the Spirit who makes new witnesses.

Traditionalists invite us to consider the risks of including queer couples. But refusal to celebrate weddings incurs its own moral risk: "And again Jesus spoke to them in parables, saying, 'The kingdom of heaven may be compared to a king who gave a marriage feast to his son, and sent his servants to call those invited; but they would not come... Then he said to his servants, ... 'Go therefore into the thoroughfares, and invite to the marriage feast as many as you find.' And those servants went out into the streets and gathered all whom they found, both bad and good: so the wedding hall was filled with guests. But when the king came in to look at the guests, he saw there one who had no wedding garment; and he said, 'Friend, how did you get in here without a wedding garment?' And the guest was speechless. Then the king said to the attendants, 'Bind that one hand and foot, to cast into the outer darkness, where there will be weeping and gnashing of teeth'" (Mt 22:1-3, 9-13, RSV modified).

The priest or minister therefore prompts a *third* vow: "Will you do everything in your power to uphold this couple in their marriage," and the people answer, "We will" (BCP, 425). "The kingdom of heaven is

like a wedding *feast*”: the Spirit draws not the couple alone, but all who celebrate with them. One promises; the other returns the promise. That is not all. They do not promise by themselves. A congregation of witnesses promises also. In the third vow, not only the couple but also the witnesses participate in a relationship of promises. In this third promise, the Spirit draws not only the couple, but also the witnesses, into a parable of the Trinity, where there is one who gives a promise, one who returns a promise, and one who witnesses, upholds, guarantees, and celebrates the promise.

In this third vow, the Third Person of the Trinity, the Holy Spirit – the Spirit of fidelity, the Spirit of adoption (Rom. 8) – catches up the whole people into its own proper office of bearing witness to love. In the Spirit of fidelity (8:15), who reunited the Son with the Father to prove that love is stronger than death, the witnesses at a wedding hope to reunite the couple in times of difficulty. In the Spirit of adoption (8:23) that makes additional children for the Father from virgins and stones, the witnesses at a wedding hope the promises will produce a couple and perhaps also adopted or biological children and that the couple will with groaning in travail, bear them into children of God.

In the Spirit of witness, those who make these promises – these third promises, these promises of witness – put on the wedding garment. Those who make these promises at same-sex weddings may put on wedding garments as invited guests, or in place of those who would not come. Those who make these promises – these third promises – strengthen all marriages, not only the one they witness, but also their own, and not only their own, but those of others, because in these promises they uphold fidelity, undertake hospitality, and celebrate love (BCP, 430).

CHAPTER 148

New Religious Movements

Damon T. Berry

On March 26, 1997, at a mansion in Rancho Santa Fe, California, twenty-one women and eighteen men, all adults, all dressed identically, all members of a new religious movement known as Heaven's Gate, were found dead. They had poisoned themselves, and made videos explaining why. They explained that they were going to the "evolutionary level above human," and that to stay on Earth rather than to "leave" would have in fact been the real suicide. They were going to discard their earthly bodies and meet the spacecraft that was hidden in the tail of comet Hale-Bopp. Thereafter they would be in what they believed Christians had erroneously called Heaven, but was, in fact, a higher stage of human consciousness. These members of "The Heaven's Gate Away Team," borrowing the term from the Star Trek series that they were so fond of watching together, were pioneers in human evolution, not members of some "suicide cult."

These Heaven's Gate suicides came nearly twenty years after the atrocities in Guyana that came to be described as the "Jonestown massacre." The leader of the People's Temple, Jim Jones, lead nine hundred and nine members of the Temple to their deaths, most but not all from apparent cyanide poisoning, in an act of "revolutionary suicide." The deaths in Switzerland and Quebec, Canada, tied to Solar Temple in 1994 also shaped the public's reception of the discovery of the Heaven's Gate members. The Heaven's Gate suicides coincided with the height of the controversial and public trial of Dr. Jack Kevorkian's facilitation of assisted suicides. And at the center of both the Heaven's Gate incident and the Kevorkian trial were serious ethical questions concerning one's right to die. In fact, the two events were often referenced together in both the public imagination and in textbooks, as in the *Comprehensive Textbook of Suicidology* (Maris, Berman, and Silverman 2000).

This brief discussion of Heaven's Gate speaks to the ways in which new religious movements (NRMs) challenge ethical norms of the broader society and move to establish norms of their own. New religions often speak directly to larger ethical questions about personal agency, governmental control, and oversight over religious groups, and even how one describes such groups in scholarly work and in the media. As Hugh B. Urban, a historian of religions at Ohio State University, argues in *New Age, Neopagan, and New Religious Movements: Alternative Spirituality in Contemporary America* (2015), new religions offer specific and complex challenges to the academy, legal and regulatory institutions, and to broader society. It is those very challenges, some of which are explored here, that make the study of new religious movements in the context of ethics significant for all of us.

Ethical Challenges of NRMS to Scholarship

One of the ethical challenges that new religions offer to scholars of religion is the problem of defining them as religions. As scholars have debated for more than twenty years over even the possibility of providing a universal definition of religion, one that does not either present Protestant Christian categories as the measure of all that can be religious or in so doing exclude minority religious traditions, defining NRMs adds an additional layer of complexity to a question already heavy with ethical implications. The anthropologist Talal Asad, the cultural theorist Tomoko Masuzawa, and the scholar of religion Russell McCutcheon, for example, have each critiqued the field of religious studies concerning the role of normative assumptions and culturally biased perspectives in the very construction of the category “religion,” and particularly questioning the role of the category of “belief” as one that is relied upon by Western scholars because of their predominantly Christian context in which belief is assumed to be the orienting concept for what religion is supposedly concerned. In other words, what are the ethical concerns in constructing “religion” as an object of study?

New religions add another layer of complexity to the problem of defining religion. For much of the history of the term “world religions” the assumption was that these traditions are ancient. Indeed, the very notion of religions as traditions seems to beg the assumption that they are always old. And for some scholars, like Huston Smith (1916–2016), for something to be considered a bona fide religion meant that it had to pass what he called the time test. A case in point was his defense of members of the Native American Church (NAC) participating in the ritual practice of ingesting peyote, a small cactus plant with hallucinogenic properties that grows in the regions of the American South West and Northern Mexico.

For members of the NAC peyote is a sacrament, for them very similar to Christians’ views on the taking of bread or the communion wafer in services. It is taken to commune with the Creator, but also for the purposes of healing – spiritually and physically. Peyote is then often referred to in the NAC as medicine as well as a sacrament, in part because the ritual during which it is ingested is in fact a result of the historical fusion of traditional practices and Christianity.

The Huicholes, Cares, Tarahumaras, and the Lipan Apache had used peyote in rituals and for medicine for centuries. The Huicholes of the Sierra Madre Occidental mountain region had used peyote communally and in connection with the maize harvest, while other groups in the region where peyote practice had spread developed their own traditions. The ritual ingestion of peyote had been practiced and adapted to many cultural contexts for thousands of years, and had continued to spread to other Native American groups throughout the nineteenth and twentieth centuries.

The NAC emerged out of such peyote practices as they were adapted by Quanah Parker (ca. 1852–1911), and others. Parker was the son of a White mother and Comanche father who had become the principal chief of the Comanche. By the middle of the 1870s the Comanche had developed a peyote tradition of their own, and Parker helped establish this as the basis for what eventually came to be called the NAC by the first decade of the twentieth century. Sometime later, a man named John Rave (ca. 1855–1917) introduced peyote rituals among the Winnebago, and with his fellow Winnebago, Albert Hensley, developed a strategy of legitimating peyote practice by adding Christian elements, particularly the language of the sacrament, to make the practice more recognizably religious to an extremely hostile American government. As Thomas C. Maroukis notes in *The Peyote Road: Religious Freedom and the Native American Church* (2010), Hensley avoided calling peyote by its traditional

names, preferring to describe it as “medicine” and insisting that they were ingesting Christ’s body in part to ensure that the practice would be allowed to continue amid suppression of traditional practices targeted for extinction by American officials.

These efforts at achieving recognition as a religion were not always successful. As Maroukis demonstrates, there were persistent efforts by Catholic missionaries earlier in colonization of the region, and then later by the United States government after the Mexican–American War, to eradicate peyote religions. But the peyote traditions captured the attention of scholars precisely because of such concerted efforts by the American government to eliminate the practice. Some of these academics invested in defending the practice as well as recording the variants of practice. For example, the anthropologist James Mooney (1861–1921) had attended peyote rituals as early as 1891, and suggested to some of those practicing in Oklahoma that they incorporate so they might avail themselves of protections afforded to churches under the law. Some of them did in fact do so in 1918, calling themselves “Native American Church,” again in part to obtain recognition as a “real” religious organization before the American government. This fight for recognition continued well into the late twentieth century, and one major battle was waged in the late 1980s; one that reached the Supreme Court and helped to reshape the American legal landscape on the issue of religious liberty.

Al Smith and Galen Black, both members of the NAC, were fired from their jobs at a drug rehabilitation center in Oregon for taking peyote as part of their religious practice. Peyote was still at that time considered an illegal substance. Smith and Black filed for unemployment compensation from the state of Oregon and were denied because they had been fired for, as the state saw it, “work related misconduct.” They then sued the state of Oregon in 1987 in a state court under the First Amendment and lost. They appealed, and finally the Supreme Court heard the case as *Employment Division v. Smith* in 1989 (494, US 827, 1990). The Supreme Court ruled against Smith and Black in 1990, and in the majority opinion, written by Justice Scalia, stated:

Conscientious scruples have not, in the course of the long struggle for religious toleration, relieved the individual from obedience to a general law not aimed at the promotion or restriction of religious beliefs. The mere possession of religious convictions which contradict the relevant concerns of a political society does not relieve the citizen from the discharge of political responsibilities.

Religious and civil liberty organizations alike were horrified by the decision, especially fearing for the implications for religious freedom in the United States. Scholars of religion soon joined the discussion as well. Huston Smith coauthored a book with Reuben Snake, a Native American leader and elder of the Winnebago people, celebrating the endurance of the NAC, and explained the long practice of the very traditions the Supreme Court seemed to disqualify. Before this book was published in 1996, Huston Smith and Reuben Snake, and even Al Smith himself, appeared in a film documenting the history of the NAC and the Smith case. In this film Huston Smith describes why he thinks the NAC is an authentic religion and ought to be treated as such. Applying what he called the “time test” Smith argued that if one considers the long practice of using peyote in rituals, one has to consider that the practices of the NAC are in fact quite ancient, which qualifies the NAC itself as an “authentic religion.” In other words, what Al Smith and Galen Black were doing in ingesting peyote was in fact an authentic expression of religious conviction because they were enacting an ancient ritual that had endured centuries.

Given Huston Smith's statement concerning peyote use in the NAC, one is left to consider the consequences of such a standard for new religions that cannot avail themselves of a claim to long practice. Certainly we can sympathize with a defense of Native American practices long attacked by the federal government, but Smith's defense is not without its consequences. What are the possible outcomes of a more ubiquitous application of the "time test?" Such a standard not only challenges the validity of religions like Scientology, which was founded in the 1950s, but also perhaps Mormonism, which began in the nineteenth century, only decades before the NAC. Moreover, are we to say that Christianity and Islam were at some point in their histories not *real* religions, at least until their points of origin seemed far enough behind for them to be ancient?

The point is that the "time test" is arbitrary, illogical as a measure for categorizing something as "religious," and ultimately discriminatory. Scholars should consider the problematically normative and arbitrarily evaluative frame they establish in their study, especially the ways in which that frame serves in making a distinction between what religions are to be considered *real* and worthy of study, and those that are considered, at least implicitly, fake and unworthy of serious scholarly attention, or defense before the courts, or in the public discourse. Addressing the ethics of categorization in studying religion is therefore of significant importance. As scholars of religion continue to wrestle with the history of categories that had privileged predominantly Christian tropes, NRMs and the study of NRMs will continue to play a significant role in defining the kinds of questions concerning ethical practice in scholarship of religions.

NRMs and Ethics in Law and Government

In using the example of the NAC, we can already see that NRMs challenge not only scholars, but also legal and governmental institutions. To address the ruling against Smith and Black in 1990, the Religious Freedom Restoration Act (RFRA) easily passed in the US Congress, and was signed into law by President Clinton in 1993. This Act has in its own way come to challenge the legal boundaries of religious freedom in America, particularly concerning the future of statutes in the Affordable Care Act (2010) and even in antidiscrimination legislation at the state and federal levels. But the point here is that in the United States, Constitutional requirements, precedents in court rulings, and legislation like the RFRA all come to bear on how new religions can be at any given point in American history recognized as real religions, if they get tax exempt status, or if other privileges or protections afforded to religious actors apply to them equally. In this way ethical administration of justice in the courts is challenged by groups whose practices are not well known or understood by the very people charged with delivering impartial verdicts from juries and judges alike.

Religion is often the focus of governmental and legal oversight and regulation, and sometimes the object of specific restriction. In instances in which religious expression and membership are constrained by governing bodies, particularly significant ethical questions arise. For example, should governments restrict religious affiliation or activity that is thought to be harmful or if government officials deem a group dangerous. This question is raised in the context of extreme events like Jonestown, the Branch Davidians in Waco, Texas, and the deaths of people affiliated with Solar Temple. Should the government be doing more to protect individuals from seemingly predatory or dangerous religious groups? If they do, are they acting in a discriminatory way in restricting membership to targeted religious organizations or limiting non-threatening religious activities of their citizens?

The obvious concern is that claims acting to protect the public can be a claim made to cover other motives. For example, in the early 2000s the Russian government stated that Scientology could not be listed as a religious organization because it had not existed in the country for the minimum number of years to yet qualify as a real religion – fifteen years. When the ban was successfully challenged before the European Court of Human Rights in 2009, the Russian government listed Scientology as an extremist group, describing it as a threat to traditional spiritual values of the citizens of the Russian Federation. But the initial ban and then the later listing Scientology as an extremist group and a threat to the public needs to be contextualized within the other political interests that shaped these policy decisions. As professor of law Robert C. Blitt argued, the ban and the watch-listing of Scientology and other non-traditional religious groups in Russia signaled a broader trend of a growing relationship between the government and the Russian Orthodox Church that presented significant legal and ethical concerns as well.

The time test that Huston Smith used to argue that the NAC was in fact a religion to substantiate the broader claim that peyote practices of members of the church should be protected religious practice under the First Amendment of the Constitution was in the case of Scientology in Russia used to deny that Scientologists were practicing a real religion at all. Beyond that, Scientology was labeled a threat to the existing social and religious order in an extremely problematic context in which the national government overtly prefers the Orthodox Church. Some may find Scientology difficult to sympathize with, but the questions concerning the ethics of recognition, especially when the state can exercise supreme executive power to limit liberties based upon a lack of full recognition as a religion, makes the questions of how new religions are recognized or not by state bodies of concern regarding ethical governance. What also needs to be considered are the consequences of an organization being officially labeled a “cult” rather than a religion that can be severe. In China a controversy over banning one NRM on the basis that they were a “cult” has gotten even more global attention than the Scientology ban in Russia, in part because of the draconian response of the ruling government against the members of the NRM in question.

On October 30, 1999 the Chinese government announced through its embassy that the Standing Committee of the National People’s Congress passed an anti-cult law “to prevent and combat cults such as the now banned Falun Gong sect” (“China Issues Anti-cult Law” 1999). The announcement elaborated: “Cult organizations that have destroyed normal social orders and stability through illegal gathering, led to the deaths of practitioners and rapes of women and swindled money should be dealt with severely.” Political scientist Maria Hsia Chang (2004) and historian David Ownby (2008) both note in their books on Falun Gong, a NRM that emerged from the context of a revival in traditional Chinese practices in 1992, that the ban followed a protest in which approximately 10,000 members of the sect had peacefully conducted in April that year outside China’s communist party headquarters, just a short distance from the site of democratic reform protests that were held in 1989 in Tiananmen Square.

The result of the ban was yet further protests, this time at Tiananmen Square itself, where thousands of unrepentant Falun Gong practitioners had gathered to express their opposition to what they saw as an unwarranted and violent repression of their freedom to engage in what was previously seen by the government as a harmless and indeed positive, traditionally Chinese meditative practice. The exercise that Falun Gong practitioners engage in are akin to Tai Chi, with slow choreographed movements of the arms and the body combined with breathing exercises. The goal of such exercises, called by other schools of the practice, qigong (pronounced, chee-gong) or “life energy cultivation,” was an aid in one’s daily life, helping with focus, concentration, and general health and positive emotional disposition. As such, the larger qigong movement, as Ownby notes, was seen as positive, especially as it was regarded as fundamentally apolitical.

Falun Gong, though much of its early development is not well documented, seemed to run afoul of the government with its growing popularity under the sect's leader, Li Hongzhi, who had differentiated between qigong practices that came before and Falun Gong. Li set out to purposefully build a national movement that was organized around himself as a teacher of great and ancient truths, and the focus, in some sense, of all Falun Gong practice. Over time this began to worry government officials. When Falun Gong practitioners organized protests openly, challenging the official government, the government saw them as a direct political threat. And a short time after this Falun Gong was then officially described as a threat to general morals and social order in China.

As countries seek to become part of the larger liberal political global order, what are the limits of government control over the religious rights of their citizens, especially when they organize in civil spaces for what could be seen as politically motivated causes? Furthermore, with the very short time after the Falun Gong protests that the anti-cult law was passed, one has to wonder how new religions are targeted by governments under the auspices of protecting the public from “dangerous cults.” And in any case, what rights should a government have over the religious practice and organized activity, to say nothing over the right to peaceably address concerns that those citizens may have concerning their government's behavior? The ethical dilemmas in defining “religion” and administering justice regarding “religious liberties” are bound by similar concerns of fairness and the equal application of justice, especially where interests of executive power shape what is referred to as a “religion” and what is labeled a “cult.” And beyond the academy and the halls of executive power, much of this debate is happening in online and media spaces.

NRMs and Ethics in Media

Notions of fairness and the presumed right to free expression of religious belief, practice, and association, which are so central to the normative, liberal, political rationale that in many ways define a nation as either dictatorial or democratic, are put to the test when a new religion, often suspect in the minds of government officials and the general public, is targeted for repression. As later reports emerged concerning the imprisonment, torture, and murder of Falun Gong practitioners in China, and the possible selling of executed prisoners' organs on the black market by the government was discovered, the question concerning ethical governmental practice toward members of new religions took on new and international importance and urgency.

In North America, from Columbus, Ohio, to Ottawa, Ontario, Canada, and in other countries in Europe and in Australia, Falun Gong practitioners are often found publicly demonstrating their qi exercises, distributing literature about the healthful benefits of the practice, and criticizing the Chinese government for its brutal repression of the movement in the country of its birth. Falun Gong practitioners have also established media outlets and online resources to spread the practice, but also to criticize the Chinese government from abroad. One particular media organization, Flying Cloud Productions, has produced documentaries and feature films describing atrocities allegedly committed against Falun Gong members imprisoned by the Chinese government. One film, titled *The Bleeding Edge* (dir. Leon Lee, 2016), stars Anastasia Lin, Miss World Canada 2015 winner and Falun Gong practitioner. The director of this film, Leon Lee, previously directed a documentary for Flying Cloud on the harvesting of organs by Chinese prisons titled *Human Harvest* (2014), which won a Peabody Award in 2014.

With the use of celebrity and film media Falun Gong practitioners and advocates are able to make their criticism of the Chinese government quite public, and in a way the escapes the full control and censorship of the government, in part because most of this activity originates from the United States and Canada where Falun Gong practices and political speech against the Chinese government can be enjoyed with relatively little fear of reprisals from anyone. But we should remember that media spaces are not simply spaces where new religions can flourish unimpeded. In these spaces, news media, film, and on the Internet, questions about fair and equal access mingle with questions concerning the ethics of representation.

If we return a moment to the case of Scientology, we can see how contested media spaces are when dealing with new religions. As of 2017, A&E Network has aired the second season of Leah Remini's show, *Scientology and the Aftermath* (2016–2019). The show documents her own departure from the church of Scientology, of which she had been a member for most of her life since childhood, and features interviews with other former Scientologists who share their sometimes devastating experiences with abuses within the church. The church has responded by publishing its own website, leahreminiaftermath.com, attacking Remini and those who participate on the show with claims that “Remini’s brand of hate and bigotry is funded by A&E,” and that the show has led to vandalism against Scientology centers and threats of violence against Scientologists.

This is the latest battle in a longer war between Scientology and its critics. The “hacktivist” group Anonymous, for example released a YouTube video in 2008 announcing their war on Scientology, claiming “Anonymous has therefore decided that your organization should be destroyed. For the good of your followers, for the good of mankind, and for our own enjoyment, we shall proceed to expel you from the Internet and systematically dismantle the Church of Scientology in its present form” (“Message to Scientology 2008”). More recently, as of 2016, the church and media mogul Rupert Murdoch have rekindled a feud that started in 1960 when Murdoch purchased *The Daily Mirror* and its sister publication *Truth*. In the pages of *Truth*, Murdoch attacked Scientology, especially in a piece called “Bunkumology,” as sinister organization that was preying on the weak and gullible. Murdoch’s media campaign led to public investigations in 1963, to which the head of the inquiry concluded his final report stating that Scientology was “evil” and “a serious threat to the community, medically, morally and socially; and its adherents sadly deluded and often mentally ill” (Urban 2015, 146). Shortly after that it was banned in Victoria, Australia, and later still in two other states, until the ban was later lifted in the 1970s.

It should matter that government action to ban Scientology in some states in Australia was instigated by tabloid journalism, and that such fights in public media still occur. Whatever one thinks of Scientology or the controversies that have always surrounded it, the events in Australia bring to our attention some serious ethical questions once again. For example, what kinds of representation in media create responses to new religions that perhaps are not expressed when outrages are committed by other organizations that are considered more authentically religious? The sex abuse scandals that still affect the Catholic Church have not resulted in a serious push to ban Catholicism in Australia or to revoke tax exempt status in the United States. The reactions to the news of abuses within Scientology and of abuses in the Catholic Church warrant investigation so that we might consider if the reactions concerning these cases have been shaped in part by the ways in which new religions are portrayed in the media. And just as we discussed at the beginning of this entry, where an extreme action, like Heaven’s Gate occurs, associations are quickly made to other NRMs that seem to have done something similar, but not to religions that are imagined to be more mainstream. The mediation of information about new religions plays a part in the other concerns addressed in this entry. Scholars, legislators, and members of the broader public are all

subjected to the mediation of images and information that shapes our emotive responses that we describe as outrage. And where there is outrage, there is always already ethics.

Writing about new religious movements and ethics presents specific challenges. The category of NRMs is fraught, and abundant with the kinds of questions addressed briefly here. There is not really much that makes one new religion like another, except for the arbitrary designation of them being new, a criterion, as we have seen, riddled with ethical and intellectual problems. Does “new” mean having begun in the nineteenth century or later? Would this designation then only apply to new traditions that do not root their tradition in something older? Is Pentecostalism, which began in the first decade of the twentieth century, a new religion even if it emerged out of older Protestant practices? And if so, what exactly does it share in common with Scientology or Neopaganism? These questions are not rhetorical. They are the questions posed to us by the very category of NRMs, if one considers it with equity in mind as well as the ethics and consequences of recognition.

Finally, one cannot approach ethics in NRMs as one does in discussing ethics in Judaism, Islam, or Buddhism. Religions categorized as NRMs present a stunning diversity of doctrines and practices, mythologies, and positions on life and morality that do not always have historical relationships with one another. One is then left to consider the questions posed to academics, policy makers, and citizens by religious diversity, and to investigate the ways in which this diversity forces all of us to account for the normative assumptions we carry into debates about what constitutes religion, whose religion is protected, and how those religions are represented in the media.

CHAPTER 149

Peacekeeping

Irene Oh

The major world religions have all addressed the topic of peace; peacekeeping, however, is a specific term that evolved in the twentieth century as a result of international diplomatic bodies' efforts to minimize the eruption of violence after conflict. While peace and peacekeeping and the phrase, "keeping the peace," are used interchangeably in colloquial conversation, it is important to emphasize that peacekeeping as used by major international institutions such as the United Nations (UN) refers to a highly orchestrated and specific outcome of warfare in a globalized society.

The UN describes peacekeeping as possessing "unique strengths, including legitimacy, burden sharing, and an ability to deploy and sustain troops and police from around the globe, integrating them with civilian peacekeepers to advance multidimensional mandates. UN Peacekeepers provide security and the political and peacebuilding support to help countries make the difficult, early transition from conflict to peace." This particular definition of peacekeeping incorporates multiple norms including the need for recognized authority, multi-lateral and cooperative processes, recognition of military and police force, participation of civilians, and post-conflict development. Peacekeeping is not limited to international conflict, but can also be found within nations following civil war, political revolutions, and massive social upheaval. Because post-conflict neutrality is an important aspect of peacekeeping, however, international personnel are often deployed in peacekeeping missions in order to maintain a sense of fairness and impartiality in the fragile period after a cease-fire has been achieved.

Although the definition of peacekeeping is broad and varies by organization, the general principles of peacekeeping set by the UN are widely accepted: 1) Consent of the parties; 2) Impartiality; 3) Non-use of force except in self-defense and defense of the mandate. The United States military refers to peacekeeping as a subset of "stability operations" and more generally under "peace operations," which indicates the very wide range of responsibilities of peacekeepers. Peacekeeping can also be understood within the larger context of preventative diplomacy, peacemaking, and peacebuilding. As described by former UN Secretary General Boutros Boutros-Ghali in his 1992, "Agenda for Peace," the multiple aspects of post-conflict peace are mutually reinforcing. He writes, "post-conflict peace-building-action to identify and support structures ... will tend to strengthen and solidify peace in order to avoid a relapse into conflict. Preventive diplomacy seeks to resolve disputes before violence breaks out; peacemaking and peace-keeping are required to halt conflicts and preserve peace once it is attained. If successful, they strengthen the opportunity for post-conflict peace-building, which can prevent the recurrence of violence among nations and peoples."

Peacekeeping efforts have evolved significantly since the initial attempts by the League of Nations after World War I to oversee the processes of local elections. While it is commonly accepted today that peacekeeping efforts should require the consent of involved parties, the winning Allied Powers at the time were far more concerned about supervising democratic elections in former Central Power states than ensuring neutral and balanced peacekeepers. Needless to say, the peacekeeping and peacebuilding efforts following World War I were not long-lasting, and the advent of World War II, followed by the founding of the United Nations, resulted in significant changes to international peacekeeping efforts.

The first peacekeeping operation by the United Nations, the Military Observer Group in India and Pakistan (UNMOGIP), was established in January 1949 to oversee the cease-fire between the two nations in the border regions of Jammu and Kashmir. Renewed tensions in the region in 1971 resulted in the continued presence of UN Peacekeepers, over 100 of whom remain there at present. The UN's Department of Peacekeeping Operations are currently active in fourteen locations, predominantly in Africa and the Middle East. More than 100,000 personnel representing the military, police, and civilian populations from 125 countries serve in these locations at this time. In the past 70 years, over one million men and women have served as UN peacekeepers.

Although the UN is the dominant player in peacekeeping operations, a number of regional organizations, including the North Atlantic Treaty Organization (NATO), the African Union, the Organization of American States, and the League of Arab States, have also fielded peacekeepers in various conflict zones. The multiple functions of peacekeeping suggest that local peacekeepers may have advantages that peacekeeping forces from across the globe may not. The attempts to bring in local knowledge, including knowledge of religious and moral customs, however, need to be balanced against perceptions of bias that foreign peacekeepers avoid. (The majority of UNMOGIP peacekeepers, for example, come from Croatia and Korea, countries that are unlikely to be perceived as biased in the India-Pakistan conflict.)

Particularly for what are referred to as “law and order” operations that go beyond observation and maintenance of ceasefire zones, cultural knowledge of the region can be of immense help to peacekeepers. Such types of operations include elections monitoring, police training, and humanitarian and relief efforts. These interventions, unlike observation or interposition of cease-fire lines, require extensive interaction with locals. The UN states that its peacekeeping personnel respect “local laws, customs, and practices.” Particularly with regard to the observation of “local laws, customs, and practices,” knowledge of religious beliefs, customs, and traditions would be necessary for peacekeepers when interacting with local peoples.

Training for peacekeepers with regard to local belief systems varies tremendously from operation to operation. While there are prominent UN initiatives, such as the 2015 Fez Declaration and its forerunner, the 2013 Rabat Plan of Action, that clearly encourage local religious leaders to become involved in the processes of preventing or reducing conflict, no specific mention is made of peacekeepers in either statement. Rather, the documents refer to peace broadly speaking and encourage religious leaders to support organizations with shared causes. Presumably, this means engaging with peacekeeping forces, but the lack of specific reference to peacekeepers may suggest that this engagement be directed to peacebuilding and preventative diplomacy, rather than peacemaking and peacekeeping.

Appealing to people's religious commitments may also provide motivation to move beyond conflict that takes into account not only political and economic justice, but also possibly forgiveness and reconciliation. The difficulty of incorporating religious traditions explicitly in peace processes lies in the fact that religious beliefs may be responsible – at least in part – for the conflict at hand. Those responsible for

peacemaking, peacekeeping, and peacebuilding may believe that the most prudent course of action would be to ignore religion altogether. Because religious institutions and leaders have an intimate understanding of their communities' needs and possibilities, however, peacekeeping and peacebuilding are increasingly committed to finding ways to cooperate with local religious groups in order to fulfill their missions.

One possibility for bridging the gap between local religious leaders and peacekeeping is through religious nongovernmental organizations (RNGOs). These RNGOs are organizations that serve in the public interest at the national or international level and have an explicitly religious mission or affiliation. RNGOs have a long history of participating in the service of peace, if not explicitly peacekeeping. In 1947, the Nobel Peace Prize was awarded to the American Friends Service Committee and the London-based Friends Service Committee for their work during the Second World War. Some of the largest and most well-known RNGOs today include the Salvation Army, Habitat for Humanity International, and Catholic Relief Services.

Although RNGOs have played an influential role in shaping UN and international discourse on peace, RNGOs have largely been ignored, particularly in non-Western contexts. This reluctance to embrace fully RNGOs likely stems from the concern that RNGOs would use funds not for projects in the shared common interest, but rather to proselytize. Particularly in parts of the world where Christian organizations are viewed as circumspect due to their complicity with colonizing empires, funding agencies are reluctant to support RNGOs. Indeed, RNGOs that rely excessively upon governmental funding, as opposed to private donations, run the risk of becoming too closely allied with government interests and suffer both in terms of reputation and local effectiveness. Members of Pakistan's religious and political communities led a campaign against a number of NGOs, claiming that they were biased in favor of "Western" and Christian values. Along similar lines, funding agencies may be hesitant to support organizations, particularly Muslim ones, that may be perceived by donors as having ties to terrorist groups. Unfortunately, the fact that there are few Muslim RNGOs relative to their population in the world makes it far more difficult to accept the normalcy of non-Christian, and to some extent non-Jewish, RNGOs. Buddhist RNGOs, because they are few in number and due to the stereotype of Buddhists as peace-loving, tend not to attract controversy.

RNGOs vary tremendously in terms of both their scope of work and the type of services they provide. While many of the activities they pursue are not directly related to peacekeeping, other activities could be considered operational peacekeeping or peacebuilding. At the very least, many RNGOs focus on monitoring, or keeping track of developments in particular communities as they relate to the specific services that RNGOs provide. These services are typically oriented towards education, relief, and social services; some RNGOs may also lobby governments and international agencies such as the UN on behalf of issues such as debt relief or food distribution, which affect conditions for peacekeepers. In their monitoring and provision of services, RNGOs would be able to partner with peacekeepers in order to identify key religious leaders within communities to facilitate efforts by peacekeepers and peacebuilders to create and maintain conditions for peace. These projects would include supporting religious schools in the development of curricula that promote non-violent inter-religious engagement, providing financial and logistical aid to ecumenical organizations that provide relief services, and encouraging truth and reconciliation forums with commitments to long-term just peace.

Although there is ample evidence of religions' role in promoting violence, religions also undoubtedly function in the service of peacemaking and peacebuilding. Religious institutions, so long as they are able

to admit to and confront their complicity and culpability in violent conflict and the perpetuation of injustice, can become a force for just peace. As partners with other institutions, religious organizations can draw from rich theological and spiritual resources to develop profound and persuasive arguments for economic, social, and political justice. Religious institutions and leaders, as they reflect changing norms of justice, can issue powerful statements about the importance of human rights, gender equality, and environmental protections in the establishment of just and lasting peace. Perhaps more importantly, they can also use their considerable resources to promote people and organizations that support these ideals.

Each of the major world religions finds ample support in their seminal texts and sources to promote peacekeeping, broadly speaking. Because rich interpretive traditions can be found in all of these traditions, texts can be revisited over time to provide meaning and significance to address current needs, whether they be to encourage violence or to uphold peace. The Abrahamic traditions of Judaism, Christianity, and Islam, have in common vibrant histories of scriptural interpretation that can be applied to the topic of peacekeeping. Many writings regarding principles of warfare that come out of these traditions also have relevance to peacekeeping. Finally, when writing about religious ethics and peacekeeping, one must keep in mind how easily religious beliefs and texts can be interpreted to justify war and violence; ignoring these aspects of interpretive traditions in discussions of peacekeeping – or claiming that such interpretations are inaccurate – are likely to be viewed as biased apologetics. This perception of bias weakens the persuasiveness of arguments for peacekeeping. The fact of the matter is unfortunately that while many would prefer to categorize religions as inherently peaceful, this has not been the case empirically. Interpretation alone has repeatedly failed to end conflict and to promote peace. Rather, interpretation in the service of action and at the level of institutional change appears to be the most meaningful way to integrate religious ethics into peace processes.

Each of the major world religions – Hinduism, Buddhism, Judaism, Christianity and Islam – offers resources for peacekeeping. In addition to localized knowledge of religious beliefs, practices, and rituals that may be important for peacebuilding, religious institutions also provide ways of encountering the peace process beyond militaristic considerations. Religious texts and teachings take into account the very human needs of a community in order to move beyond conflict and towards the possibility for forgiveness and reconciliation. Religious leadership can also articulate the parameters of social and economic justice post-conflict within a theological framework. Perhaps most importantly, religious traditions often appeal to a transcendent ideal – whether it be divine or rooted in humanity – that encourages communities to push past the conflict at hand and to put in place concrete measures that build towards a shared vision.

Mohandas K. Gandhi's teachings on *satyagraha* and *swaraj* emerge out of his meditations on Hinduism and other religious and philosophical traditions. These concepts take into account the full cycle of peace-making, peacekeeping, and peacebuilding. Translated as “truth force,” *satyagraha* is the theoretical basis of a nonviolent strategy for change that is rooted in a commitment to seek the truth not just for oneself, but for interconnected life. Truth, in Gandhi's understanding of the term, emerges from a profound knowledge of what is actual reality as opposed to false desires – themes that can be found in the *Upanishads* and the *Bhagavad Gita*. We actualize this truth by seeking justice for all in a nonviolent way (*ahimsa*). One's commitment to *ahimsa* reflects the acceptance of interconnectedness because harm to others is in essence harm to oneself. (On a practical level, change that is brought about by nonviolent resistance and protest has historically proven to be longer lasting and more effective than change that is

brought about through violent revolution.) *Swaraj*, commonly associated with India's self-governance and economic independence after colonial rule, is similarly founded upon the seeking of true equality among peoples, including the ability to see one's own peoples as capable and deserving of autonomy. The remarkably peaceful transition of India from colonial rule to independence under Gandhi's leadership is a model for peacemaking, peacekeeping, and peacebuilding. The theoretical basis for the transition to independence emerged out of familiar religious and philosophical narratives for Indians is particularly noteworthy when analyzing religious ethics and peacekeeping. Because every conflict has its unique aspects, peace plans are most effective when they are crafted for the particular communities affected; that is, the meaningfulness of peacemaking, peacekeeping, and peacebuilding needs to be tied into deeper cultural and religious values in order for peace to be more persuasive than war.

Although tremendous diversity exists within Buddhism, the different schools of Buddhist thought agree upon the importance of compassion and the example of the Buddha. Both of these have implications for political and social justice broadly speaking, and for peace processes more specifically. Deeply critical of the Hindu caste system, the Buddha rejected his own royal status and sought to find a means for all persons, regardless of the circumstances into which they were born, to achieve liberation from suffering. Buddhism at its core could thus be considered a very democratic belief system in its rejection of discrimination and embrace of all of humanity. The Buddhist ideal of compassion for others, especially one's enemy, can be profoundly motivating during peace processes. Even if such a lofty goal cannot be attained, the possibility of compassion becomes a yardstick for peacebuilding.

While many aspects of Buddhism speak to peace, the "engaged Buddhism" movement initiated by the Vietnamese Buddhist monk, Thich Nhat Hanh, during the height of the Vietnam War is perhaps the most closely aligned with the work of peacekeeping. Hanh and other engaged Buddhists tie meditative practice and mindfulness with social justice and development work. Nhat Hanh teaches that in order for conflict to end peacefully and to establish a just community, members of that community need to be at peace not just with each other but with themselves. The interconnectedness of individuals to social peace is reflected in what Nhat Hanh calls "interbeing," or the awareness of how all aspects of existence are one and the same; as such, when we care for others, including animals and the environment, we care for ourselves. This deep and rich understanding of peace is necessary if communities are to move beyond peacekeeping and to engage meaningfully in peacebuilding.

In the case of Judaism, any discussion of peacekeeping would necessarily need to address the role of Israel in the Middle East conflict. The state of Israel presents a very complicated, highly contested situation for peacekeeping. Recent pronouncements declaring Israel a "nation-state of the Jewish people" have been raising concerns about prioritizing religious-ethnic identity over democratic principles. This move by the Israeli government, while intended to preserve a people that have suffered and continue to suffer persecution and discrimination, also potentially compromises fundamental values of equality. Whether such a declaration will accelerate a two-state solution for Israelis and Palestinians has yet to be determined.

Jewish religious texts do not address directly the current Israeli-Palestinian conflict, but they do speak to the broader issues of justice and preservation. Politicians and religious scholars have mined biblical sources as well as rabbinical teachings to argue for a just peace in a region mired in cycles of violence and corruption. Unfortunately, these same texts have been used to justify policies that perpetuate human rights abuses and prevent the peaceful stabilization of the region. One could argue that the idea of *shalom* should guide followers of Judaism in navigating the complex politics and history of the region.

Shalom refers not just to the absence of violence, but to a sense of well-being and wholeness made possible by the existence of a just society. Taken in this way, *shalom* reflects the goals of peacekeeping and peacebuilding.

In Christian thought, the just war tradition provides rich resources for thinking about peacekeeping. Just war theory, which describes ethical considerations regarding decisions to enter into war (*jus ad bellum*) and conduct during war (*jus in bello*), might be considered precursors to the possibility of peacekeeping and peacebuilding (*jus post bellum*). Indeed, peacekeeping and peacebuilding extend some of the ideas behind just war theory; the former are much more likely to be successfully carried out when affected parties believe that conflict was entered into justly and warfare conducted honorably. When affected parties believe that the conflict was unjustly entered into and that the rules of wartime conduct have been egregiously violated, peacekeeping is far more fragile and peacebuilding becomes a monumental challenge.

Even when atrocities have been committed and conflict has been clearly unjust, there are theological resources within Christianity to enable believers to move beyond conflict and into possible peacemaking, peacekeeping, and eventually peacebuilding. When Archbishop Desmond Tutu was named chair of South Africa's Truth and Reconciliation Commission in 1995 following the end of apartheid, he played a pivotal role in making forgiveness the primary objective of the inquiry. While not stated in explicitly Christian terms, forgiveness as the main goal of the TRC clearly drew from Christian beliefs: Jesus died to forgive all of humanity's sins. In order for South Africa to move forward, the truth had to be documented, appropriate amnesty and punishment meted out, and forgiveness and reparations awarded. While not without flaws, South Africa's TRC was considered to be very successful in large part because its prioritization of forgiveness over (but not eliminating) punishment encouraged perpetrators to participate in the commissions so that the harms of apartheid could be acknowledged. Forgiveness in the TRC was understood not simply as altruistic, but also in everyone's self-interest. Forgiveness not only allowed perpetrators of violence the possibility of amnesty, but the structure of the TRC recognized the power of the victims of apartheid, black South Africans, to forgive their white fellow citizens. The peacebuilding of South Africa could now begin.

Of course, within the immense diversity of the Christian tradition, a wide range of beliefs on war, violence, conflict, and peace exists. Although most Christian denominations accept the occasional need to use force to end conflict, there are several denominations that have long traditions of nonviolence. These denominations, including the Society of Friends (Quakers), Mennonites, and Church of the Brethren, believe that war violates Christian beliefs, and its members have often sought conscientious objector status in wartime. The refusal to bear arms and to kill another human being, however, does not preclude participation in other wartime efforts. As such, they have committed themselves to relief and reconstruction efforts during and after conflict. Their work is born out of the belief that the divine exists in all human beings and forms the basis for their decision to provide services to persons and communities during and after conflict regardless of their role in the conflict. This stance is ideal for the position of neutrality that is expected of peacekeepers.

Compared to the other major world religions, Islam in our post-9/11 world received a tremendous amount of attention in both the mass media and in scholarly work. As with the other world religions, Islam has resources that can speak to the many virtues of peace and justice. Indeed, Islam, literally translated as submission to God, shares the same etymological root as the Jewish term *shalom*. However, since 9/11, much of the focus has been on the ways in which violent terrorist groups such as al-Qaeda and the

Islamic State of Iraq and Syria (ISIS) have used verses of the Qur'an and *hadith* (reports about the Prophet Muhammad) to justify horrific violence against humans, the destruction of art and historic monuments, and illegal possession of large swaths of territory. Although scholars debate whether some verses, such as the "sword verse," Sura 9:5 urging Muslims to kill polytheists and idolators unless they convert to Islam, should be abrogated because of the highly specific context in which the verse emerged, the mere existence of the verse in the Qur'an weakens arguments against its validity. The Qur'an is considered by many Muslims to be perfect and unchanging, so the presence of verses such as 9:5 cannot easily be interpreted away, even as there are other verses in the Qur'an, such as Sura 2:256 ("there is no compulsion in religion") acknowledging that conversion to Islam under duress is invalid and should be discouraged.

The example of the Prophet Muhammad, described in *hadith*, can also be manipulated to encourage violence and to justify the acts of groups like ISIS. Muhammad was a religious, political, and military leader, and Muslims can point to his militaristic conquests of parts of Arabia to encourage a "return" to the early days of Islam. However, Muhammad was also by all accounts a diplomatic leader who in many ways improved the lives of girls and women and showed respect and compassion for non-Muslims. In theory, early Muslim rule was relatively tolerant and allowed the *ahl al-kitab*, or the People of the Book, meaning Jews and Christians, to practice their religions freely. Needless to say, these examples are not persuasive to the members of violent extremists, but as with the other world religions, these aspects of the tradition when thoughtfully integrated into policies and institutions championed by Muslim leaders themselves, can play a vital role in peacekeeping and peacebuilding.

Inter-religious dialogue is a popular, but not necessarily effective, strategy in peacekeeping. While peacekeepers and peacebuilders stand to benefit by learning about the religious traditions and ethical codes of the specific communities affected by conflict, the most powerful examples of religious ethics in peacekeeping and peacebuilding involve peace processes led by religious leaders, often with the support of their institutions, who are able to harness the power of religious commitment to create a just peace within their own communities.

CHAPTER 150

Religion and Religious War

John Kelsay

The Political Context of War

Human beings are reason seekers and reason givers. Moral discourse seems to require that people engaged in certain behaviors respond to queries by giving reasons that justify their actions.

War provides a particularly good example of this seeking and giving of reasons. The term is most properly used in connection with violence between established political communities. With some qualifications, it may also be used to describe violence within political communities (“civil” war) or conflicts between established communities and “non-state” actors (for example, terrorist groups.) Given this connection with politics, it is not surprising that the reason seeking and reason giving connected with war typically reflect political interests. Those who engage in war usually seek to fulfill political aims; for example, defending territory or protecting citizens’ rights. Augustine of Hippo wrote: “No one goes to war except with the goal of attaining peace.” For Augustine, all human communities may be described as the embodiment of some balance between peace, order, and justice. War is thus a political activity, carried out with the aim of establishing, maintaining, or defending the *pax-ordo-iustitia* connected with particular political communities.

The Ancient Connections Between Religion and War

With this in mind, the ancient association of religion and war hardly seems strange. Religious activity, like war, has political dimensions. War is a means to political ends, while religion provides a kind of cosmic foundation to political life. Images of the divine as king, judge, or warrior point to the relation of religion and politics. As one of the oldest texts in the Bible has it, “The Lord is a man of war.” Or, in a very different cosmic setting, the Ṛg Veda speaks of Indra, “best of warriors,” the “thunder-armed.” Phrases like these depict deities as defenders of justice. As such, notions of divinity provide models for human agents who strive on behalf of a just social order. Even as war is a political act, it also becomes a matter of religious practice.

Examples of “religious war” abound in ancient religious texts. Some of the most important in shaping discussions of religion and war occur in the biblical story of the Israelite exodus from Egypt and the conquest of the “promised land.” The book of Exodus relates the story by which God delivers an enslaved people from oppression. In Exodus 15, the people celebrate God’s victory over Pharaoh:

I will sing to the Lord,
 For he has triumphed gloriously;
 Horse and rider he has thrown into the sea ...

As the story continues, the people of Israel wander through the wilderness, struggling yet protected by their divine defender. When they finally enter Canaan, the land promised to their ancestors, the Israelites fight to take possession from the inhabitants. It is crucial that they do so at the order of God, who fights for and with them, so long as they honor God's directive. As each city is taken, "all that is in it shall be devoted to the Lord for destruction" (Joshua 6:17). The book of Joshua presents this "ban" as an aspect of worship (see Niditch 1993). The lives and property of the enemy are thus offered as a sacrifice, which is considered God's "portion" as the protector of the people. In other traditions, the ban seems more a condition for the preservation of a just political order. Deuteronomy 20, for example, sets forth rules of war that distinguish between "the towns that are very far from you" and those "that the Lord your God is giving you as an inheritance ... [in which] you must not let anything that breathes remain alive ... so that they may not teach you to do all the abhorrent things that they do for their gods, and you thus sin against the Lord your God."

Such stories did much to entrench the notion that religion and war should be intimately related. For Christian theologians like Ambrose and Augustine, the Hebrew or Old Testament traditions seemed in one sense the prototype of a *just war*. In another sense, however, the Israelite stories presented a problem. For the New Testament depicted Christ as saying: "Do not resist an evildoer ... Love your enemies and pray for those who persecute you ... Be perfect, therefore, even as your heavenly Father is perfect" (Matthew 5: 38–48). In the writings of these Christians, we find the beginnings of a way of thinking about war that specifies considerations governing the justification of war (the *ius ad bellum*) and the conduct of war (the *ius in bello*.)

A full and formal statement of "just war criteria" would not be developed until some centuries later. Even at this point, however, one may consider that the justification of war required such things as (1) authorization by legitimate public officials; (2) a just cause; (3) righteous intent; and (4) a conscientious estimate with respect to (a) the proportionality of damages done to the good achieved or the evil avoided, (b) the prospects for success, (c) the possibility that means other than war might attain the desired goal, and (d) the likelihood that war will establish, maintain, or defend peace (that is, the *pax-ordo-iustitia* of a political community). With respect to the conduct of war, one may further consider that just fighting required (1) avoiding direct attacks against noncombatants and (2) avoidance of weapons or war strategies that inflict disproportionate harm. In expressing such concerns, Ambrose and Augustine helped to found a tradition that informs Christian practice to the present. Historical studies trace developments by which the various criteria governing the justification and limitation of war received specification through the efforts of canon lawyers, church councils, political leaders, military commanders, diplomats, and other contributors to Western civilization (see Russell 1975; Johnson 1999).

War in the Modern Age: A Plurality of Traditions

The just war tradition first emerged in the West as an aspect of Christian practice, specifically with respect to the civilizing mission of the church in Europe. As the church divided into the churches, and Christendom into the nations of Western Europe, just war thinking took its place as one of several ways

of reflecting on the morality of war. Of these, the set of concerns associated with international law present the closest analogue to just war tradition. But various forms of pacifism are also important, as is the just war thinking of non-Christian religious and cultural traditions (Kelsay 1993; Bartholomeusz 2002).

International Law

The modern notion of international law owes much to ancient and medieval ideas about the *jus gentium* or “law of nations.” The idea was that the practice of existing communities reflected a set of norms that should guide thinking about the justification and conduct of war. Formal treaties were one source of the law of nations, as was the less formal “customary practice” observed among the nations of Europe. These sources speak to the possibility of third-party mediation as means of avoiding war, of agreements to forego the use of certain types of weaponry, and of conventions governing attacks on cities and the treatment of prisoners of war. In the sixteenth and seventeenth centuries, writers like the Protestant Grotius and the Catholic Vitoria argued for the extension of these notions to the world as a whole. Vitoria in particular made the case that considerations of justice developed among Christians should be relevant to dealings with the natives of the Americas. For him, as for Grotius, the law of nations had universal significance and should guide relations between all the peoples of the world.

Many contemporary writers agree. One of the strongest trends in modern political thought focuses on the development of international institutions able to put into practice the ideal of a universal law of nations. Following World War II, the Charter of the United Nations expressed this hope, reserving the right of war to the international community, except in cases of national self-defense. The Geneva Conventions and attached protocols codified norms governing the protection of noncombatants, treatment of prisoners of war, and the use of weapons of mass destruction. Representatives of all major religious and cultural traditions have expressed ideas consonant with the judgment that disputes among nations should be referred to international authorities whenever possible, and that war should only be justified as a last resort: for individual states, in cases where established borders are violated or threatened; for all other cases, as determined by the UN or its Security Council.

Despite such support, many questions remain unanswered. Some of these bear on the relationship between just war and international law traditions. Some argue that just war tradition assigns the right of war to particular political communities, each embodying a particular *pax-ordo-iustitia* (Ramsey 1983). While the UN provides a useful forum for these communities to deliberate about common interests, and for diplomacy intended to mediate disputes, it does not embody an actual order capable of replacing the *pax-ordo-iustitia* of particular communities. Until it does (Ramsey argued) no state can or should give up the right to employ military force in order to secure its interests, defined in terms of the *pax-ordo-iustitia* it embodies.

Paul Ramsey made this argument in the context of the Cold War, when US–Soviet competition often rendered the UN unable to act in accord with the mandate expressed in its Charter. However, even after the end of the Cold War, many express similar judgments. US-led action aimed at regime change in Iraq in 2003 is but one of a number of events that raise questions regarding the possibility of the UN as the *locus* of authority for an international rule of law. Arguments regarding humanitarian intervention and the proper means of dealing with international terrorism also indicate important points of contention between the just war and international law traditions.

Pacifism

Pacifist perspectives also present an alternative to the just war tradition. Here, one should note that the term “pacifism” is apparently a modern invention, dating from political debates in Edwardian England ca. 1900. It has come, however, to stand in general for attitudes of opposition to war or to participation in war. In that sense, the phenomenon is longstanding, and many contemporary pacifists find inspiration in early Christian or other religious texts.

Many such ancient examples are controversial, in the sense that it is often unclear whether opposition to war is based on the judgment that killing is wrong, or whether it is really based on other factors (for example, early Christian judgments that service in the Roman army involved idolatry). A later Christian writer like Erasmus of Rotterdam, whose arguments focus on the terrible waste engendered by war, presents a similarly “qualified” pacifism, in the sense that his opposition to war is not absolute. Contemporary opposition to war is often of this type. It rejects war for most purposes, but preserves military action as a last resort for national self-defense or the prevention of genocide, albeit only with international authorization.

More thoroughgoing forms of pacifism may be found, first, among advocates of non-violent political action, and second, among Christian writers who find inspiration in the political ethics of the Radical Reformation of the sixteenth century. With respect to the first, the examples of Mohandas K. Gandhi and Martin Luther King, Jr. provide important guides. Here, the idea is that action for justice should involve “strong persuasion” in the form of an appeal to the conscience of those involved in injustice. This action should be non-violent, since military force does not appeal to conscience, but to fear. In the short run, non-violent action may not yield the desirable results, but the “long arc of the universe” is on the side of those who consider it better to suffer injustice than to inflict it. With respect to Radical Reformation pacifism, some writers insist that the refusal to bear arms is a constitutive aspect of Christian discipleship. The way of Jesus is the way of suffering love. Any use of military force violates Christian vocation, as the example of Jesus shows that the proper role for human beings involves the practice of suffering love in humble reliance on God (Hauerwas 1992; Yoder 1994).

In their 1983 pastoral letter *The Challenge of Peace*, the US Catholic bishops said that both pacifism and just war tradition are valid expressions of Christian discipleship. Nevertheless, the bishops’ argument suggests that just war tradition remains primary, for at least the following reasons: (1) the peace for which Christians hope is eschatological, meaning that it is fully revealed at the end of days, when the Kingdom of God is fully revealed; (2) until the end, political action takes place in a world where justice requires the defense of innocents against aggressors; (3) while non-violent forms of defense have a certain *prima facie* desirability, those who would act for justice must be prepared to use armed force, or else become complicit in the suffering of victims of aggression; (4) when force is required, it should be governed by norms of justice, as indicated by the just war tradition (National Conference of Catholic Bishops 1983).

Islamic Thinking

Non-Christian traditions also provide an important source for thinking about war in the modern age. Recent studies indicate the strong affinities of the Islamic “judgments concerning armed force” with just war tradition (see Kelsay 1993; Johnson 1997). Historic judgments by Islamic scholars indicate that war

should be considered in the context of political ethics and that it should be authorized by legitimate public authorities for the cause of establishing, defending, or maintaining a just public order. The tradition also requires righteous intention on the part of those fighting. Further judgments indicate that war should be undertaken following an assessment of the likelihood that other measures will not work, that costs will be proportionate to benefits, and that there is a reasonable hope of success, in the sense that fighting will yield a more satisfactory balance between peace, order, and justice. *Ius in bello* criteria are reflected as well: Muslim fighters are to avoid direct attacks on noncombatants, and discussion of particular weapons and tactics indicates a concern to avoid disproportionate damage to one's enemy. As with the just war tradition, Islamic judgments concerning armed force develop over time, in connection with specific military and political contexts. It seems clear that the Islamic and just war traditions have much in common, however, which makes it all the more critical to understand why, at the beginning of the twenty-first century, conflict between Western and Islamic societies seems so ubiquitous. We shall return to this point in a moment.

It is worth noting that inquiry into the war thinking of a number of other traditions is only beginning. The work of the late Tessa Bartholomeusz (2002) suggests some directions for inquiries into a Buddhist just war tradition. More systematic inquiries with respect to Hindu, Confucian, and other great traditions are sorely needed to provide a more complete picture of the relations between religion, politics, and war.

Contemporary Issues

For most of the twentieth century, advocates of the just war and other traditions were preoccupied with conflicts related to the Cold War rivalry between the US and the Soviet Union. In this context, discussions of ethics focused on policies of deterrence, especially those involving nuclear weapons, or on counter-intervention, for example in Vietnam. In the post-Cold War era, discussion quickly turned to the occurrence of an exceptional number of bloody "civil" wars. In some cases, these seemed an ironic result of the end of the US–USSR competition for influence. In Yugoslavia, for example, Soviet influence had been important in sustaining policies intended to suppress religious and ethnic rivalries. For a variety of reasons, these lost strength in the early 1980s. Shortly after the 1991 collapse of the USSR old rivalries between Serbs, Croats, and Muslims reemerged, at times with genocidal intent, as Yugoslavia dissolved into a number of independent states.

In this and similar cases, most discussion focused on questions of intervention. According to the UN Charter, intervention within the borders of a sovereign state should only be undertaken when internal conflicts threaten to "spill over" into neighboring states. Even in these cases, UN authorization is required. The Soviet–US rivalry rendered this point moot during the Cold War, as each power possessed the right to veto any intervention contrary to its interests. With the end of the Cold War, however, the UN sent forces into one part of the former Yugoslavia (Bosnia-Herzegovina). While the forces were constrained by rules of engagement in ways that led to much criticism, they were nevertheless critical in separating the warring parties and beginning a process of disarmament. In another sector (Kosovo/a), however, a threatened veto by Russia prevented UN action, and the US turned to NATO in order to orchestrate an effective intervention. While many questioned the legality of this action, in the end most agreed that intervention was necessary to prevent genocide, and that the result (regime change in Serbia) was a desirable end. As the discussion about US-led action aimed at regime change in Iraq shows,

questions about intervention (when it is appropriate, how it should be organized, and, above all, who authorizes it) remain critical matters for religious and moral reflection.

The attacks on New York and Washington, DC on September 11, 2001, seem to put discussions of intervention in a different light. In particular, the statement on national security strategy issued by the Bush administration in October 2002 indicated that US policy will include an option of preemptive military action in cases where states may be considered hostile and are known to have programs for the development of weapons of mass destruction. Advocates of just war, international law, and other traditions responded by indicating that preemptive action requires that the threat from an enemy be imminent. The arguments of the Bush Administration make clear, however, that the events of September 11, 2001 mean that US policy must be set in the context of an ongoing struggle with “terrorist groups of global reach.” This means that the enemy is not confined to or governed by the political–territorial institutions of an established state. Rather, groups like al-Qa’ida view the world as a battlefield, so that the various states are really more or less useable “centers for operations” in an ongoing war against the United States and its allies. Given this, the Bush “doctrine” of preemption appears to mean “striking while there is time” to prevent al-Qa’ida and other groups from taking advantage of the resources provided by states hostile to the US. Defenders of the Bush administration’s policy stress that at a time when hostile forces have the capacity to use chemical, biological, or nuclear weapons, the notion of imminent threat takes on a new meaning (see Elshtain 2003).

Post-Cold War conflicts also raise important questions with respect to what might be called “the return of religious war.” Fighting in the former Yugoslavia and ongoing struggles with al-Qa’ida seem to many to bring back the kind of warfare where fighting is commanded by a deity which itself joins in the fighting. Thus much evidence suggests that Serbs understood themselves as the protectors of the borders of Christian civilization, seeking to rid their land of a Muslim intruder. Al-Qa’ida’s rhetoric suggests that policies advocated by the US are understood to violate Islamic tradition. Even in cases where the role of deity is quite different, the return of religious war seems evident. In Sri Lanka, for example, the Sinhala majority construes struggles with Tamil rebels as a defense of territory necessary for the preservation of true Buddhist practice. In the conflict between Israelis and Palestinians, Israelis who settle in Palestinian territory often speak in ways that suggest they are reclaiming the land promised to their (biblical) ancestors. Some Palestinians, in turn, speak of the land from the Red Sea to the Jordan as a trust given by God to the Muslims until the Day of Judgment, and say that no human being has the right to negotiate or otherwise give it away.

Religion and Total War?

Given the longstanding relations between religion and war outlined in this entry, such arguments are not surprising. Religion and war meet in connection with the drive to establish, maintain, and protect the order associated with particular political communities. War is a means to attain such goals. Religion provides an important source of legitimation for the *pax-ordo-iusititia* embodied by particular communities.

Despite such ancient links, many find the association of religion and war disturbing. For example, Pope John Paul II speaks of religious war as the worst form of idolatry. The pope’s judgment certainly points to changes in the conception of deity from ancient to modern times. It also points to shifts in

Christian political thought, whereby the spiritual aims of faith and the temporal purposes of political order are distinguished more clearly than in ancient times. The pope's statement also resonates with a judgment common to modern thought: that "war is more humane when God is left out." Modern thinking about war is built on the memory of Europe's Wars of Religion, in which the tactics of various groups mirrored the biblical "ban." Given this, many interpreters of just war and other religious-moral traditions consider that those who believe themselves fighters for God are prone to war without mercy.

Whether the judgment "religious war equals total war" is justified is a matter for further inquiry. Much Islamic thought suggests that placing war in a religious context, in which those who fight for God's cause must observe God's limits, is the surest way to attain the goals of honorable combat. And even the biblical notion of the ban must be read in the context of rules that indicate that most wars are fought according to *ius in bello* limits (as, for example, in engagements with cities "far off" in Deuteronomy 20, or in the pronouncement of judgments against those who kill indiscriminately in war in Amos 1 and 2). Even the 1998 *Declaration concerning armed struggle against Jews and Crusaders*, in which leaders of al-Qa'ida and other groups argued that contemporary political conditions require Muslims to fight Americans and their allies without distinguishing civilian and military targets, probably does not provide evidence for a simple equation between religious war and total war. If this is the case, there may be reason for advocates of *ius in bello* restraints to focus less on the fact of religious justifications for war, and more on the limits that particular religious traditions stress must always be an aspect of the conduct of just and limited war.

CHAPTER 151

Censorship, Disclosures, and Privacy

Jonathan Rothchild

Framing the Debate

Debates about censorship, disclosure, and privacy typically address competing claims involving rights and goods, including perspectives concerning individual privacy rights and rights to free speech, considerations of public safety, a public right to information, state power, and wider claims about transparency, efficiency, and decency. Such debates engage long-standing, theological and ethical questions involving human agency, the common good, responsibility, and the rule of law, but they are also shaped by shifting legal and cultural interpretations of rapid changes in technology and emerging forms of social media. A right to privacy helps preserve our human dignity and sense of moral autonomy, but no right to privacy – whether framed in terms of a right to be left alone, a right to one's space for moral deliberation, a right to be free from governmental intrusion, or a right to determine the best ways to live out one's own (and perhaps one's own family's) life – is absolute. The 1974 United Privacy Act restricts disclosures without consent, but it includes twelve permissible exceptions. Key questions in the debates about censorship, disclosure, and privacy include: What are the reasonable expectations to a right to privacy? In what ways do one's actions, say, participating in a public rally, using social media, or entering an abortion clinic, impact one's right to privacy with respect to state interests and public safety? Do corporations have a right to disclose information (and benefit financially from such a disclosure) about consumers' preferences and patterns of behavior? Do governments have a political mandate and legal permissiveness to become surveillance states that track all digital selves at all times? If data monitoring yields precise drone missile strikes or the arrests and convictions of gang members, do we celebrate these achievements or worry that they have come at the cost of the eclipse of privacy in our society?

Signs of the Times: Disclosure, Privacy, Power, and Social Media

An estimated 2.5 billion people worldwide use the Internet on a given day. Internet searches leave indelible footprints that others can use for a range of purposes. Employing "cookies" to collect information related to website searches, companies can marshal this information to improve user efficiency and convenience (e.g. easily reloaded web pages commonly visited by the consumer, retrieval of saved passwords, and consumer information such as credit card numbers). Companies can additionally develop algorithms based on search preferences and credit card purchases to direct consumers to targeted advertisements and recommended

sites and other information that may be of interest to consumers based on these preferences. To what extent are consumers willing to have companies anticipate their needs and provide market-driven options at the potential cost of eroding parts of their privacy and agency? Companies are legally compelled to protect consumers' privacy (through privacy policies that disclose the ways in which a corporation collects, uses, and shares the data of customers or clients), but the selling of consumers' information to third parties as part of a data mining industry (consisting, for example, of consumers' reading habits, clothing preferences, food choices, and other information) has increasingly become an accepted practice.

Evaluations of these factors must consider perceptions and practices regarding the sharing and collecting of information. In George Orwell's dystopian novel, *1984* (1949) individuals attempted to evade the watchful eye of Big Brother. Philosopher Jeremy Bentham (1748–1832) envisioned the panopticon as a mechanism for a single corrections officer to observe numerous prisoners without their knowledge. Michel Foucault (1926–1984) held that such surveillance – as knowledge is power – becomes the basis for disciplinary control, normalization, and manipulation of docile bodies. These perspectives identify social control as a critical implication of information gained about an individual. Questions about social control emerge, for example, through "stop and frisk" techniques used by police officers. Are such techniques legitimate forms of information gathering that reveal illegal activity and promote social order? Or, are such techniques forms of social control that are highly racialized (and tantamount to racial profiling) violations of privacy rights and result in disproportionate numbers of persons of color entering into the criminal justice system?

Important shifts have occurred in the proliferation of social media postings on platforms such as Facebook, Twitter, Instagram, Snapchat, and other forms of communication and media. Voluntary disclosures about one's own life or opinions about world events, celebrities, politicians, and other persons suggest that many individuals intentionally seek to share information with as many people as possible. Users voluntarily share intimate information about their health (e.g. by wearing an Apple Watch) or proudly display their most embarrassing moments (e.g. by uploading a video on YouTube). The perception among social media users appears to be that the one who informs – rather than the one who receives the information – holds the power. By posting information about oneself or others one elicits responses (e.g. through Facebook likes or trending numbers on Twitter) that sustain more intimate relationships but also help to shape wider (potentially global) discourse. This sense of power has been occasionally exercised in hyperbolic and nefarious ways. Several shocking examples include individuals brazenly using Facebook Live to broadcast their carrying out of physical assaults and other crimes in a celebratory fashion. Yet, in whatever form it is exercised, this power of sharing information is often undercut by the recognition of how little control users have over the information that they and others post on social media. In entering into digital space and participating in ever-evolving forms of discourse, individuals relinquish various degrees of their privacy and become data sets that can potentially become exposed, instrumentalized, and manipulated.

Other privacy issues arise in the era of social media and new systems of information. Privacy settings exist for platforms such as Facebook in order to limit the recipients of communication between users, but other aspects of privacy – such as using a Twitter handle that allows one to be anonymous, at least publicly – can encourage online bullying, forms of shaming, and inflammatory and socially destructive comments. Social media can facilitate social cooperation, form online communities around shared concerns, and express collective moral outrage against a broad range of political, legal, and social injustices. Moreover, many argue that free speech rights should be extended to social media in the same way as

traditional forms of communications and media, without imposing a range of censorship options (e.g. blocking or deactivating accounts, requiring persons to self-identify). However, social media can also attenuate interpersonal communication and create emotional and psychological harm by recipients of criticism. Online users can hide their identities, for example, to generate negative publicity about a competitor's business, to lure minors into illegal sexual encounters, and to beguile vulnerable persons into disclosing sensitive financial information (through phishing scams and other schemes). By hiding their identities, or, as increasingly became common during the Trump presidency, *intentionally* using one's real identity online users are empowered to spread information ("alternative facts") that may misrepresent the truth about themselves and the world. For these reasons, the relationship between the disclosure of information (in terms of the one who discloses, what is disclosed, and how this disclosure can empower or disempower the discloser and individuals impacted by the disclosure) and privacy will increasingly become complicated and contentious.

Censorship and Disclosure: Contested Claims about Privacy, Security, and Power

Notions of censorship historically have been linked to exercises of state power, usually a totalitarian or fascist regime, to limit or deny the free expression of individuals, communities, and other entities, particularly in response to public statements critiquing the state. Censorship typically has related to the purity of ideas and doctrines (political or religious/antireligious) and conformity to expected norms and practices where the government suppresses free speech and silences forms of resistance. Censorship can be interpreted as a betrayal of the liberal state whose primary purpose is to remain a neutral arbiter and protector of human rights, whereas others contend that censorship operates as a regulatory instrument that can properly guide state intervention in the face of politically and socially destructive speech such as hate speech. Some forms of censorship – that is, restrictions on the disclosure of information and freedom of speech – may in fact protect individual privacy. For example, in the 1989 case of *Department of Justice v. Reporters Committee for the Freedom of Press* (489 US 749), the Supreme Court held that the refusal to disclose an individual's personal FBI crime record to a third party is justifiable under the personal privacy invasion exemption of the Freedom of Information Act. Recent approaches to censorship have reconfigured censorship not as a political response to and constraint against speech but rather constitutive of it and mediated by social dimensions. Analyzing the relationship between censorship and social forms, gender theorist Judith Butler (1977) argues that censorship produces speech that is not merely privative but formative as well.

At a broader level regarding censorship and disclosure, does the American public have a right to access to information about the activities of the United States government? Much debate centers on WikiLeaks, a non-profit organization founded in 2006 by Julian Assange that releases classified information and publishes news leaks, diplomatic cables, and other information. Information released by WikiLeaks has addressed issues such as the war in Afghanistan, prisoners detained in Guantanamo Bay detention camp, and, during the 2016 presidential election campaign, emails from the Democratic National Committee and members of Hillary Clinton's campaign. Some view WikiLeaks as providing news and information that the public has a right to know as a matter of democratic transparency. Others contend that WikiLeaks violates individual privacy rights (e.g. by disseminating personal information such as social security numbers, phone numbers, etc.) and potentially destabilizes political structures and unfairly disrupts political processes.

Another massive disclosure of classified information was leaked by Edward Snowden in 2013. A former contractor for the United States government, Snowden disseminated information pertaining to the National Security Agency's (NSA) global surveillance programs (code-named PRISM) which had been administered in cooperation with telecommunication companies and European governments. Some praise Snowden as a patriot, whereas others view him as a traitor. Information disclosed by Snowden painted a picture of the immense scope and the detailed precision of the surveillance carried out by the NSA. Using NSA's programs such as XKeyscore, an analyst nearly has real-time access to the contents of any user's emails, web searches, and Facebook posts; it is estimated that there nearly one trillion call and Internet records stored in NSA databases. The documents released by Snowden indicate that the NSA monitors ordinary citizens – not just those who are suspected threats to national security. This monitoring, which appears to realize Orwell's dystopian vision, has betrayed public trust even if it has not generated widespread resistance among the general public.

Wiretapping and Searches and Seizures

A number of Supreme Court cases pertaining to wiretapping and domestic surveillance have shaped the scope of privacy laws. In a 1928 landmark decision, the Supreme Court ruled in *Olmstead v. United States* (277 US 438) that an unauthorized wiretap did not violate the constitutional rights provided by the Fourth Amendment (a right to be secure in their persons, houses, papers, and effects against illegal search and seizures) and Fifth Amendment (a right not to be compelled to self-incriminate in criminal cases). In the majority opinion, Chief Justice Taft noted the deleterious effects – including a negative impact on society and greater immunity for criminals – of disallowing evidence gained through unauthorized wiretaps. In an important dissent, Justice Brandeis voiced concern over the implications of the decision for "the sanctities of a man's home and the privacies of life."

The majority's opinion in *Olmstead* held forth until a series of cases in the 1960s. In 1961, in *Mapp v. Ohio* (367 US 643), the Supreme Court determined that evidence obtained in violation of the Fourth Amendment may not be used in state law criminal prosecutions in state courts. Moreover, in 1967, in *Katz v. United States* (389 US 347) the court reversed *Olmstead*, holding that persons can expect a reasonable expectation of privacy in places such as a public phone booth and that wiretapping in such places violated the Fourth Amendment. In the 2012 case of *United States v. Jones* (565 US 400), the Supreme Court considered the legality of installing a global positioning system (GPS) tracking device on a vehicle and using that device to monitor the vehicle's movements. The court unanimously concluded that such a device constituted a search under the Fourth Amendment, where the majority determined that by physically installing the GPS the police had trespassed against the defendant's "personal effects."

Domestic Surveillance, the War on Terror, and Religious Freedom

Edward Snowden's leaking of information and other disclosures, including the so-called "torture memos" and other declassified information, have generated debates regarding the legal limits of mechanisms designed to confront the new paradigm of the war on terror. These debates consider issues such as prisoner treatment, harsh interrogation practices, and extraordinary rendition. Can the threat of an imminent

terrorist attack, sometimes referred to as the “ticking time-bomb scenario,” justify harsh interrogation techniques and torture that violate a person’s right to privacy but might disclose valuable information? There are competing teleological (typically framed in terms of goods such as the utility of information that may preserve human life or promote political objectives) and deontological (commonly conceived in terms of the limits of information gathering in light of moral boundaries and rules) arguments regarding torture. Elaine Scarry repudiates torture in terms of privacy and dignity: torture deconstructs a person’s humanness and makes the tortured speak the torturer’s words instead of his or her own.

Did the September 11th attacks necessitate a reevaluation of privacy rights and governmental duties to override them on the grounds of national security? President Bush cited presidential prerogative and military necessity to argue that the executive possesses privileges protected by constitutional and statutory authorities, among them the congressionally passed Authorization for the Use of Military Force (AUMF) (September 18, 2001). Among various provisions, the AUMF includes the authority to order warrantless foreign intelligence surveillance within the United States. In 1978, Congress passed the Federal Intelligence Surveillance Act (FISA) which authorized special court orders for four purposes: electronic surveillance; physical searches; installation and use of pen registers/trap and trace devices; and orders to disclose tangible items. The electronic surveillance portion of FISA created a procedure for judicially supervised electronic surveillance (wiretapping) conducted for foreign intelligence gathering purposes. The Bush administration held that the statutory provisions of FISA permitted exemptions that allowed for presidential discretion without judicial approval to implement strategies as necessitated by security exigencies. The FISA Amendments Act of 2008 amended the original FISA act and placed limits on the scope and rationale for surveillance. The USA Freedom Act, enacted on June 2, 2015 to ratify but amend the USA Patriot Act (October 26, 2001), imposed new limits on the bulk collection of telecommunication metadata on US citizens by American intelligence agencies, including the NSA. It also restored authorization for roving wiretaps and tracking so-called lone wolf terrorists.

Such surveillance is designed to gather sensitive security information for utilitarian ends. Would not such utility of information justify surveillance and outweigh any concerns about individual privacy rights? Some perspectives express concerns about deeper issues around political duties and religious liberties that appear neglected in the current conversations. For example, the government infiltrated the Truth Project, a group that met in a Quaker meeting house to discuss nonviolent ways of countering military recruitment in high schools. The formal religious character of the project is not the primary concern; what is at issue for critics is the Truth Project’s contrarian perspective, which challenges the status quo through nonviolent means – thus resonating with the prophetic religious critiques of Martin Luther King, Jr., and Paul Tillich, two theologians monitored by government agencies. Opponents of surveillance affirm that the exercise of religious freedom to interrogate, gainsay, and counter government policies has been compromised by political mechanisms such as spying and planting agents in mosques, churches, and political action groups. In addressing these issues, is there a way to achieve balance between state interests in security and order with fundamental rights and freedoms held by individual citizens?

Religious communities have also been both the proponents and recipients of censorship. Recent studies of letter writing in late antiquity, for example, demonstrate the ways in which Christian letter writers employed strategies of secrecy and self-censorship to elude political and ecclesiastical forms of censorship. In the fifteenth and sixteenth centuries, the Catholic Church conducted means of interrogation such as the Inquisition through the Congregation for the Index of Prohibited Books. The Inquisition safeguarded orthodoxy by investigating and prohibiting the dissemination of heretical texts

and heterodox ideas. During the Second Vatican Council (1962–1965), the Catholic Church acknowledged the unfortunate nature of the Inquisition. In *Dignitatis Humanae*, the Declaration on Religious Freedom promulgated by Pope Paul VI on December 7, 1965, the Council defended religious freedom as a vital expression of an individual that has its foundation in the dignity of the person and is expressed through revelation and reason. There are debates among current Catholic theologians as to whether or not the magisterium can and should censure a theologian or believer who exercises dissent – as an exercise of one's own (private) conscience – in response to official Catholic teaching. There are global threats to the freedom of religion, including, for example, China's banning of the spiritual movement of Falun Gong since 1999.

Obscenity, Disclosure, and Privacy

Pornography websites have been prevalent since the origins of the Internet. In the last two decades, new technology has evolved pornography into more interactive sites, where performers stream live via webcam and can respond to a viewer's specific requests through immediate payments. However, legal questions about privacy rights and public decency concerns existed long before the creation of the Internet. The writings of seminal authors such as Flaubert, Baudelaire, Zola, Lawrence, Joyce, and Nabokov all received censure for writing material judged to be obscene. An 1868 English case *Regina v. Hicklin* determined that any material that could corrupt was deemed obscene and therefore could be banned. The Comstock Law was passed in 1873 in the United States and furthered this view of suppressing the trade and circulation of obscene literature and articles of immoral use. In *Ex Parte Jackson* (96 US 727, 1878), the Supreme Court ruled that provisions of the Comstock Act that prohibited the mailing of certain items were constitutional, but it also held that the government could not open an individual's correspondence unless it had a warrant pursuant to the Fourth Amendment. The provisions of the Comstock Act were further upheld in 1957 when the Supreme Court ruled in *Roth v. United States* (354 US 476) that obscenity – that is, material deemed to be obscene such as nude photography and literary erotica – is not protected by the First Amendment.

Would such a broad definition of obscenity infringe on individual rights? How would such a definition comport with changing cultural perspectives on sexuality and individual freedom? In 1973, in *Miller v. California* (413 US 15), the Supreme Court developed a three-prong test that appealed to an average person's sense and adult community standards to evaluate if the material appealed to prurient interests, depicted sexual conduct in a patently offensive way, or lacked serious literary, artistic, political, or scientific value. Some interpreters argue that the *Miller* test is overly conservative and presumes a narrowly heteronormative conception of sexuality. In the 1997 case of *Reno v. American Civil Liberties Union* (521 US 844), the Supreme Court unanimously struck down provisions of the 1996 Communications Decency Act (CDA) pertaining to "indecent transmission" and "patently offensive display" because it abridges First Amendment speech rights. Other thinkers, such as feminist theorist Andrea Dworkin, differentiate between obscenity and pornography, where the latter is much more pernicious as it functions as a system of sexual exploitation that dehumanizes, subordinates, and abuses women.

A related set of privacy–decency considerations pertain to sexual practices, bioethical issues, and forms of punishment. In 1965, the Supreme Court ruled in *Griswold v. Connecticut* (381 US 479) that

Connecticut's ban on the use of contraceptives violated the right to marital privacy. Drawing on Justice Brandeis's dissenting opinion in the *Olmstead* case, the court found that marital privacy precedes the political basis for a right to privacy. Some commentators have expressed concerns about this construal of marital privacy, noting the potential violent sides of privacy and the necessity of state intervention in cases of domestic abuse. In 2003 in *Lawrence v. Texas* (539 US 558), the Supreme Court struck down the sodomy law in Texas (and, by extension, invalidated such laws in other states) on the grounds of a right to privacy. Various courts have also upheld the right to privacy as the basis for right to consult with an attorney and a right against self-incrimination (*Miranda v. Arizona* [384 US 436, 1966]), a right to abortion (*Roe v. Wade* [410 US 113, 1973]), and a right to refuse medical treatment such as a ventilator (*In re Quinlan* [70 NJ 10, 1976]). Are there public order and safety reasons for overriding rights to privacy? The Health Insurance Probability and Accountability Act (HIPAA) Privacy Rule recognizes the legitimate need for public health authorities and others responsible for ensuring public health and safety to have access to protected health information to carry out their public health mission. In weighing privacy and threats to public safety, courts have upheld the requirements that convicted sex offenders register with local governments (to comply with the Sex Offender Registration and Notification Act). Other cases have involved public shaming punishments for offenders (e.g. requiring signs such as "I am a delinquent child support payer" or "I drove drunk"). Do such public forms of shaming encourage offender accountability and rehabilitation or do they constitute cruel and unusual forms of social sanctions?

Conclusion

Debates regarding the relationship between censorship, disclosure, and privacy will continue to be informed by evolving social, ethical, political, and legal interpretations about the functions of the state and political life, the meanings of individual agency and rights, and the pursuit of commonly-shared values and goods. Privacy rights shield individuals from obtrusive political and social structures, but, as feminist thinkers and others have increasingly argued, the boundaries between the personal and political are fluid. States have duties to intervene to protect privacy rights. Does censorship affirm or obviate those rights? Do government surveillance programs offer security at the expense of privacy rights, including the right to exercise religious freedom? Does government censorship of materials deemed obscene protect common decency or impose social norms on individuals? New forms of social media and related shifts in perceptions and practices of information sharing will continue to raise these and other questions.

CHAPTER 152

Civil Rights and Protest Movements

Tobin Miller Shearer

Religious involvement in civil rights and protest movements raises important issues about violence and nonviolence, church–state relations, how social change happens, and the ways in which religious groups shape and are shaped by social protest initiatives. Scholars have long explored the role civil rights and social protest movements have played in society but only recently begun to examine the particular role that religious communities have played in those protest movements. Given the often-volatile nature of protest movements, scholars have also started to analyze the relationship between violence and religious groups who take to the streets in pursuit of social justice.

Social Movement Theory

Social movement scholars have articulated numerous theories in their efforts to explain how social movements arise, spread, and collapse. *Resource mobilization theory* suggests that movements rise and fall according to their ability to muster the economic, institutional, political, and social resources needed to change human practices, perspectives, and policies. *Structural-functionalist theory* posits that all social systems seek a stable state of equilibrium. Social protests arise in response to disruptions to that equilibrium in hopes of achieving a new stable state. *Political process theory* suggests that movements consist largely of rational actors pursuing state-sponsored change in moments when internal divisions or breaks in oppression open the possibility of state advocacy. The state-focused nature of this theory has highlighted conflict and social movements' external interactions.

Additional theories offer more direct explanations. *Relative deprivation theory*, for example, simply contends that those who recognize they are being treated unjustly in comparison to others may rise up to change that inequity. Likewise, *authority conflict theory* suggests that movements arise in response to assertions that current power holders are illegitimate. Other theoretical approaches focus on the reasons that people take risks to join social protest movements, how ideas for change spread through social networks, the role of the elite, and the emotional conditions that keep movement members engaged.

Theories that examine cultural dynamics, however, offer particular insight into religion's role in social movements. Whereas many prior theories had treated protestors as rational actors focused on achieving their stated goals, cultural resource theory highlights the symbolic, rhetorical, and identity elements of protest actions. Organizers also design symbols to represent their cause, fashion arguments to awaken

people to their grievances, and foster solidarity to create a sense of collective identity. Religion offers resources to support all these ends. For example, religious symbols have figured prominently in the anti-abortion movement, religious arguments have underpinned many of the arguments articulated by abolitionists in their attempt to win over the broader public, and religious commitments have figured prominently in developing a collective civil rights movement identity. Although religious groups and actors contribute multiple resources to social protest movements, cultural elements predominate due to the particular affinity of religious action to symbolic discourse, moral argument, and collective bonding.

These theories have proven helpful in analyzing how social movements have unfolded in the past and to a degree how they continue to unfold in the present, but they have not yet been able to predict when and where new social protest movements will arise in the future. Even more problematically, the theories thus far discussed rarely address or take into consideration the particular dynamics of religious community members and their engagement with social change movements. With few exceptions, even in the case of cultural resource theory, social movement scholars have more often focused on art than on religious ritual, on poetry than on scripture. Yet, the evidence from civil rights and social protest movements as far-flung as the base ecclesial communities of Brazil and the water protectors of South Dakota make clear that religion often figures prominently in determining how those movements unfold and the degree to which they achieve the ends sought.

Central Tensions

To understand the particular role played by religion in civil rights and protest movements, one central tension requires examination. It is this: protest is inherently conflictual, but religion, in its most general sense, finds conflict problematic. As social institutions focused on the transcendent, religious communities aim to put their adherents in touch with the divine. In most instances, that transcendent connection between believers and the divine results in a resolution of conflict rather than the creation thereof. Religious communities thus tend to foster acceptance of the status quo except in those cases where the fundamental values of the community conflict with those of the social or political settings in which they find themselves. Despite the prominence of fundamentalist protest movements, the most common experience of religious practitioners is dampening conflict rather than exacerbating it. As such there has been at best an uneasy relationship between the practice of religion and social protest.

That fundamental tension is likewise present in religious groups' relationship to the state. By their very nature, social process protest movements are prone to incite or be associated with violence because they challenge both the state's goal of maintaining authority and its ability to sanction violence. Even in those instances where social change movements do not directly challenge the exercise of state-sponsored violence, their oppositional stance heightens tensions that can trigger a violent response. When religious communities bring their moral mandate to bear on state-sponsored violence or other social inequities, the state pushes back. When faced with state opposition, religious groups then confront the limits of their relative dependence on or freedom from a comfortable relationship with the state or the status quo more generally. Religious historians have long observed that, in the case of established religious groups, the largest story is one of religious communities being unable to sustain an oppositional stance to the state given their need to remain financially and organizationally solvent.

This is not to say that religious practitioners have avoided social protest movements entirely. Take, for example, the preponderance of religious leaders in the mid-twentieth-century civil rights movement in the United States. Ordained clergy abounded. Churches provided space for mass gatherings, logistical support, and a rhetoric capable of spurring people to take risks, critique the status quo, and mobilize the human potential necessary to overturn racial segregation. Members of religious communities have also been involved in the abolition movement in Britain and the United States, the movement against the Vietnam War in the United States, and the solidarity movement in Poland. Issues of transcendence aside, religion is no stranger to social protest.

Religion and Violence

Amid these tensions about religion's role in social conflict the particular question of religion's relationship to violence emerges as both central and enduring. Here again, religious scholars differ in their assessment. Most famously, historian and philosopher René Girard argued in his "mimetic theory" that violence is so central to human interactions that it gives rise to the sacrifice of a ritual victim or scapegoat to keep more widespread violence at bay, a ritual that serves as the basis of religion and then, over time, the criminal justice system. From this Girardian perspective, religion forestalls violence even as it engages in it (Girard 1979). Roger Friedland's and Richard Hecht's study of contested sacred centers in Jerusalem, Israel, and Ayodhya, India, suggests that religion invites violence as competing groups set up contradictory truth claims and sacred spaces (Friedland and Hecht 1998). By contrast, well-known religious studies author Karen Armstrong argues that religion is not inherently violent in the sense that is popularly understood in the West. Rather, it is most often political pursuits in the interest of empire that have caused those conflicts blamed on religion. Armstrong contends that religion has been just as likely to encourage values of community and mitigate violence as it has been to destroy community and encourage violence (Armstrong 2015).

These broad theoretical claims provide a framework for examining the more focused topic of the ways in which religious groups have promoted violence or nonviolence in social protest movements. Many religious communities hold nonviolent values as part of their core commitments. In addition to the historic peace churches in the West such as the Mennonites, Amish, and Quakers, many Eastern religious communities such as Buddhists, Hindus, and the Jain, promote nonviolent values. Others demand that practitioners be prepared to engage in violence for protection of the religious community and promotion of its values. Mainline Protestant denominations, for example, have regularly encouraged their members to participate in the military in support of colonial or capitalist initiatives. In addition to these Christian groups, some Islamic and Jewish communities have fostered animosity toward regional neighbors. Suffice it to say that religious practitioners have a mixed record on the perpetuation or diminishment of violence.

In the case of the civil rights movement, an emerging body of evidence suggests that those who brought religious resources into public spaces – such as the demonstrators who knelt in prayer in the midst of marches or rallies – actually increased the possibility of violence rather than decreased it. Likewise, those who sang, wore religious vestments, or recited liturgies during the height of 1950s and 1960s activism were as likely to anger their opponents as convince them of their ways and bring them into the fold. In the same way, in the movement for Indian independence from Great Britain led by

Mahatma Gandhi, the nonviolent principles of satyagraha and ahimsa did not always promote less violence, at least in the interim. So, too, when the pope spoke to the solidarity movement in Poland, his words did as much at points to increase foment as reduce it.

In the midst of negotiating questions of institutional solvency when in conflict with the state, religious communities have also had to make decisions about how they will respond to violence associated with their oppositional stance. In situations where a given social change movement has broad public support, violence is less likely to erupt. But when protestors employ tactics perceived by the general public as illegitimate – such as happened in 1969 when Black Power advocate James Forman demanded reparations from the white churches who had participated so readily in the campaign to pass the 1964 Civil Rights Act – violence often increases, thereby forcing religious communities to decide whether they will participate in, separate from, or lend their support to violent means.

Religious communities have chosen a variety of paths. In Nicaragua in the 1970s, some Roman Catholics celebrated a pro-revolutionary mass known as the “Misa Campesina Nicaragüense” even as the Catholic hierarchy moved to prohibit it. Through its subsequent underground celebration and dissemination, the mass generated popular support for the Sandinista revolutionaries who then overthrew the Somoza family dictatorship. In a similar manner, base ecclesial communities throughout South America have fostered opposition and resistance, some of it violent, to dictatorships in their region. By contrast, during the Nazi regime, the more radical members of the Confessing Church in Germany opposed anti-Semitism but did so nonviolently. Most specifically, recent scholarship has called into question the widely asserted claim that the well-known theologian and martyr Dietrich Bonhoeffer participated in an assassination attempt on Adolf Hitler. Likewise, Islamic leaders from across the globe condemned the terrorist attacks on the World Trade Center on September 11, 2001. No single path has defined religious communities’ decision about how to participate in or eschew violence.

Civil Rights Movement as Case Study

The scholarly debate about US civil rights movement strategies highlights many of the unresolved questions regarding the use of violence by religious community members. The dominant narrative about the civil rights movement emphasizes the ethic and principles of nonviolence promoted by Martin Luther King, Jr. History books feature images of famed Montgomery bus boycott icon Rosa Parks meekly cooperating with law enforcement officers, young protestors being spun around by fire hoses, and marchers falling to the ground as helmeted men sprayed tear gas and brandished batons. Even members of the Student Nonviolent Coordinating Committee (SNCC), the radical, youth-led, frontline shock troops of the Black Freedom Struggle, stayed true to their name and practiced nonviolent principles even as white Southerners murdered, beat, and imprisoned their colleagues. Nonviolence, whether strategically adopted or religiously grounded, did indeed dominate the most public and high-profile organizations and leaders of the civil rights era.

Recent scholarship has, however, begun to challenge this nonviolence narrative. In his aptly titled book, *This Nonviolent Stuff’ll Get You Killed: How Guns Made the Civil Rights Movement Possible*, journalist, professor, and former SNCC activist Charles E. Cobb, Jr., argues that not only did armed self-defense reduce the loss of black life in the South during this period, but that rural blacks did not perceive a contradiction between their support of nonviolence and their practice of armed self-defense. In fact

Cobb argues that many individuals at the grassroots joined in the civil rights struggle because of its nonviolence and felt that they should use their weapons to protect those who practiced nonviolence in order to further their radical agenda (Charles E. Cobb 2014). Cobb's findings buttress similar arguments made about other proponents of armed self-defense such as Robert F. Williams, Gloria Richardson, and the Deacons for Defense. Although an ethic of nonviolence permeated civil rights movement organizations, in many instances nonviolent groups and individuals were able to organize voter registration campaigns, speak out against segregation, and challenge elected officials because white Southerners opposed to integration knew that many members of the black community had rifles and shotguns and would shoot back if shot at.

An ethical determination of whether armed self-defense or active nonviolence proves more effective at achieving civil rights and other social protest goals seems less important than the recognition that, at least in the case of the black freedom struggle in the South during the 1950s and 1960s, the two approaches could prove mutually reinforcing. In the desegregation movement in Birmingham, Alabama, for example, some of the same individuals who attended nonviolence-focused mass meetings would then escort home leaders like Reverend Fred Shuttlesworth in cars bristling with guns. Rosa Parks, the very icon of passive nonviolence, spoke with deep appreciation for the life and witness of Robert F. Williams, the author of the highly influential book *Negroes with Guns*, at his funeral. Regardless of how passionate and articulate proponents of nonviolence like King, James Lawson, Diane Nash, and Bayard Rustin could be, the religiously based arguments for nonviolence did not always convince gun owners to lay down their weapons and march without an armed escort.

Recurring Tensions

And yet a tension remains. Some scholars emphasize the ambiguous role of religion in social conflict, noting that established religious organizations in particular aim to attract as broad an audience as possible and therefore will back away from social conflict even while being critical of the status quo. Others contend that religion in general and ritual in particular empower adherents to engage in social conflict through their resistance to the dominant social order. Still others, such as widely respected scholar of religion Martin Marty, argue that religious communities are far more likely to be changed by social conflict than to change society in the midst of conflict (Marty 1964). In the end, the question is not so much whether religious adherents will be engaged in social protest, but rather how their religious engagement will change social protest movements – and themselves – when so involved.

The religiously based civil rights groups who proved so influential though not definitive in promoting nonviolence also demonstrate this reciprocal relationship between religious communities and social change movements. King's Dexter Avenue Baptist church in Montgomery and the National Baptist Convention (NBC), the country's largest black religious organization, show how black religious groups experienced significant internal change even as they sought to change society. Dexter Avenue congregants repurposed old hymns with new lyrics as they inspired supporters of the 1955–1956 bus boycott. At the same time, despite encouraging, praying for, and guarding King's parsonage after white supremacists bombed the building, King's parishioners realized that their church was no longer thriving. They had, in effect, lost their pastor to the national civil rights struggle. Even though they understood that nonviolence afforded many benefits, they also recognized the cost it exacted on those placed at its fulcrum.

At the national level, debates over civil rights issues in society also changed church organizations. King backed a candidate for the presidency of the NBC who was supportive of the activist methods employed by groups like King's Southern Christian Leadership Conference (SCLC). The incumbent NBC president, J. H. Jackson, publicly criticized the direct-action methods adopted by the Freedom Riders in 1961 in their bid to integrate interstate bus transportation in the South. His criticism of the Freedom Riders, and through that of King himself, led to Jackson's reelection in Kansas City, Kansas, that same year. So contentious were the debates in Kansas City, that delegates came to blows and one member sustained injuries so severe that he died from them a short while later. In the aftermath, King's supporters led a walkout from the convention that eventually resulted in the formation of a separate organization, the Progressive NBC. Eventually removed from his leadership position in the NBC, King participated in the new organization. Once again, protest movements had changed a religious group.

A very different kind of change takes place when activists protest against religious groups themselves. Emblematic of the issues that emerge when religious groups become the focal point of protest action are the kneel-in demonstrations held at segregated white churches in the US South. In response to white congregants' refusal to welcome black worshippers to their congregations, by April 1961 as many as two hundred separate demonstrations took place at segregated white churches across the country. Although in some instances, demonstrators succeeded in integrating the targeted congregations, in far more settings, white deacons turned away black visitors and their white allies, often calling the police to support their efforts. Amid the high drama that unfolded on church entryways and front steps, much of the debate turned on the perceived sincerity of the integrationists. Those defending segregation accused the demonstrators of insincerity, of just wanting to cause trouble, and of not really being intent on worship. In return, the integrationists declared that those blocking their entry were the true hypocrites. The unresolved debates over perceptions of insincerity and respectability, with all their racial baggage, helped maintain racial divisions in the Christian community even after many of the previously segregated congregations rescinded their official segregationist policies.

Range of Protest Involvement

Yet, such activism directed at religious groups has been far rarer than those instances where religious communities join in activism focused on political targets. A few case studies make evident the breadth of issues emerging when religious groups join in the demonstrations. Examples from the US civil rights movement and India's bid for independence from Britain have already made evident the range of possible approaches. More examples abound. At the individual level, South African Anglican Bishop Desmond Tutu played a central leadership role in the anti-apartheid struggle during the 1970s and 1980s. Tutu credited the several hours that he spent praying every day as key to his long-term participation in the difficult and risky work of overturning racial segregation. In this case, his religious commitments emboldened and strengthened his participation in social protest despite opposition from some of his co-religionists.

At the corporate level, members of the base ecclesial movement in Latin America opposed military dictatorships. Emboldened by a practice of grassroots bible study, many base community members in countries like Brazil spoke out against military dictatorships during the 1960s. Amid heavy governmental

oppression, the base communities fostered community ties, risk-taking, and a belief in the possibility of change. As in the case of Bishop Tutu, religious practices emboldened and sustained religious community members to critique and undermine anti-humanitarian policies and practices in the face of violent and deadly reprisals by both the military and extrajudicial death squads.

Gender, Religion, and Social Change

The relationship of religious communities to social protest movements has also been shaped by gender. Religious studies scholars have explored patriarchy and sexism at length, often noting – at least in the context of the United States – women’s lay leadership in the midst of a clergy dominated by men. In the midst of that patriarchy, women have found multiple ways to raise their voices and exercise leadership. One of the arenas in which that leadership has been expressed has been that of social protest.

Taking the black church in the United States as an example, African-American women have pushed past male dominance in the midst of challenging racial discrimination. Historian Evelyn Higginbotham, for example, has documented the multiple ways that members of the NBC’s women’s auxiliary criticized the US government for supporting Jim Crow, reached out to collaborate with white women in joint evangelism efforts, and fostered leadership skills within their own sphere of influence (Higginbotham 1997). In great migration-era Chicago, charismatic congregational leaders like Elder Lucy Smith and Mary Evans not only subverted gender norms through their dress and pastoral styles but also, as historian Wallace D. Best has shown, through their support of those rural black southerners who had relocated to the North and found themselves still confronting white racism (Best 2005). Likewise, Ella Baker, the woman who was almost single-handedly responsible for the civil rights era organizing success of the National Association for the Advancement of Colored People (NAACP), SCLC, and SNCC, drew on the religious teachings of her youth as she worked to overturn the sexism internal to the male-dominated civil rights organizations and the racism and prejudice of society.

Transcendence and Social Roles

It is religious groups’ interest in the transcendent that sets them aside from other social groups such as unions, political parties, and social clubs. To be certain many religious communities embody political and social dimensions. For example, the black church in the United States has served multiple roles given that it was one of the few black institutions that survived amid the oppression of slavery and Jim Crow. Simultaneously a center of worship, a venue for political organizing, and the premier social location for maintaining healthy community networks, the black church was both a social and religious hub. But even when religious communities hold multiple, socially dense roles, the transcendent, and its connection to religious adherents, remains primary. The means, motives, and modes of engaging with social change movements will, in the end, turn on how any given religious community understands their position in the sacred universe and the resultant obligations for pursuing justice and social equity in the present moment.

CHAPTER 153

Domestic Violence

Shannon Dunn

Domestic violence (DV) refers to physical and mental abuse perpetrated by one intimate partner against another. While DV is distinct from other types of violence, DV should not be viewed in isolation from social practices of domination that are often structural and systematic in nature, for example, sexism and racism. While physical and psychological abuse can be perpetrated by either a spouse or domestic partner regardless of gender or identity, the focus of this entry is on the physical abuse of women in the heterosexual marital relationship. One reason for this pertains to the relative historical continuity of DV as a moral and legal problem within several religious traditions. This entry focuses on Jewish, Muslim, and Christian traditions in particular. How do practitioners interpret, and justify their interpretations of, sacred texts and traditions on wife-beating? In addition to focusing on textual hermeneutics and conceptions of authority, we must examine the role of modern secular legal systems in regulating DV and the role of women in the family more generally. How have ethical discourses involving DV evolved in various religious and secular legal traditions pertaining to marriage and divorce?

Contemporary feminist theologies and legal theories have played a critical role in challenging and reforming religious teachings on DV. Feminist critique, broadly defined to include secular as well as religious voices, has identified underlying ideological and social causes for DV, as well as paths toward reducing and eventually ending such violence. Some of the most comprehensive scholarship on religion and DV points to the need for an intersectional approach. Such an approach entails examining violence in relation to multiple factors of identity and community, including gender, race, religion, and class.

The Jewish Tradition

Jewish feminist thinkers have connected the phenomenon of wife-beating and its historical acceptance as a practice in Jewish communities – with the inequality of women within the Jewish tradition. Naomi Graetz (2013) has argued that Jewish texts and scholars have dealt with DV for thousands of years, but often in terms of apologetics and denial. Although women are ascribed spiritual or ontological equality with men, they occupy a lower place in the social hierarchy. Additionally, the community's lack of protections for women in such situations also reflects socially embedded patriarchal assumptions and privilege.

A major governing framework for marital relations in biblical times was the ownership of the wife by the husband, following the teaching in Genesis 3:16, “the husband shall rule over the wife.” Graetz

points out that the women-as-property theme is continued in Exodus through the commandment that forbids coveting the neighbor's wife, and the transfer of women from fathers to husbands (Deuteronomy 24:1). Rachel Biale (1995) notes that according to the Halakhah (Jewish law) women are "acquired" by men through money, deed, or by intercourse. A woman can "acquire" herself by divorce or death of the husband. Acquisition implies the purchase of property, and the transfer of money. Biale explains, however, that the acquisition of a woman in marriage is not equivalent to the purchase of property since marriage designates a sacred act of setting aside the wife for the husband only (1995, 48). Monogamy is not presupposed on the part of the husband. Jewish feminist scholars have argued that the traditional legal language for Jewish marriage is fundamentally incompatible with egalitarian relationships.

Marriage has historically played an important role in the life and perpetuation of the Jewish community. For those persons who transgressed laws regulating marriage in biblical and postbiblical times the consequences could be severe. Since the covenant of marriage transcends the commercial nature of acquisition, and belongs also to the realm of the sacred and holy, transgressors (adulterers) could be punished with execution. Historically, divorce was permitted, but often discouraged. Husbands had the sole power to release the wife in divorce (give a *get*).

Graetz identifies various arguments with regard to the permissibility of wife-beating in different historical and cultural periods. Early rabbinic sources treat the injured wife as a form of damage to the husband's property. This could lead to an odd scenario in which monetary reparations go to the husband, since the husband already owns what belongs to the wife (2013, 313). Not all rabbis were comfortable with the prospect of a man benefiting from his ill-treatment of his own wife, given that the wife occupied this ambiguous space between property and covenanted partner. Additionally, the rabbis permitted limited wife-beating under Jewish law for a wife's bad behavior, which included not performing household duties correctly and refusing sexual intercourse with the husband. Later, rabbis sometimes forbade wife-beating in all cases, while others allowed it for "educational" purposes. Graetz explains that while Jewish scholars today disagree on the permissibility of wife-beating, dominant interpretations of Halakhah in the twenty-first century give men more authority than women (2013, 323).

Jews in the contemporary North American context may inhabit both halakhic and secular socio-legal worlds, which can lead to difficulty in resolving conflicts within the family. Jewish groups that do not recognize the legitimacy of secular courts in dealing with family law may provide further obstacles to abused wives seeking justice. Orthodox and Ultra-Orthodox Jews may decide not to utilize secular courts to resolve marital issues, and insist on the authority of the religious divorce, or *get*. The *get* is the sole prerogative of the husband. If he is an abusive person, he may refuse to give his wife a *get*, making her an estranged *agunah*, a highly stigmatized figure in the Orthodox Jewish community. The *agunah* may not remarry without the *get*, and is "chained" to her husband.

In addition to abused women encountering discrimination within the Jewish community, they may face additional discrimination from secular state law enforcement officials. Adam Koblenz explains that many Jewish women may be afraid to report DV to law enforcement. (2009, 269). Some Jews are concerned that "airing the dirty laundry" of the Jewish community will increase anti-Semitic prejudice. Domestic violence is severely underreported among American Jews, and Orthodox women in particular have concealed incidents of DV for the sake of maintaining the appearance of a peaceful home or *beit shalom*.

Feminist interpreters of the Jewish tradition, such as Adler (1998) and Plaskow (1991), have brought teachings about gender equality into sustained conversations with major tenets of Judaism. In doing so, they have helped to make visible the contrast between the governing assumptions about gender, community, and

conceptions of the sacred, in the premodern world and those in the contemporary period in North America. Among the most pronounced differences today are: the moral conviction that women should have equal rights and opportunities to men; the idea that religion is a matter of the private sphere, and that secular law is privileged over religious law in many aspects; and a view of sacred texts' meaning and authority as constituted by interaction with the reader and reader's community over time and place (hermeneutics). In light of these changes, these scholars find it urgent to identify past assumptions that gave license to wife-beating, argue against them, and utilize frameworks with which to construct a just sexual and relational ethic.

The Islamic Tradition

Several factors have shaped Islamic discourses on DV in North America and elsewhere. These include ideas about gender equality, the reality of modern state secularity and the relative privatization of religious belief, and questions related to the authority and interpretation of sacred texts and traditions. Scholarship on gender in classical and contemporary Islamic legal traditions has illuminated the different epistemological frameworks for premodern and modern Muslims, as well as the ways that male-dominated gender hierarchies have functioned historically in each. Susannah Heschel (2015) observes that Muslim and Jewish feminists share more in common than with Christian feminists, owing to the roots of their respective religious traditions in legal systems. Moreover, like Jews, Muslims living in the United States also face prejudice on account of their religious and ethnic backgrounds. In the aftermath of 9/11 and the war on terror, a large number of Americans have uncritically accepted the stereotype that Muslim men are more violent than other men. Many Muslim communities are wary of exposing Muslims to additional scrutiny from law enforcement. This fear has created a conundrum for community advocates working to end DV, who work from within the tradition to condemn violence within the Muslim community but also fight against harmful stereotypes about Muslims.

Within Islamic sacred texts and traditions, there exist teachings that sanction gender inequality. The most infamous is verse 4:34 of the Qur'an, which appears to allow a man to hit his wife if she expresses disobedience toward her husband. While scholars of Islam have debated the exact meaning of this verse, it is generally understood to reflect a hierarchical relationship between men and women, in which men are the guardians of women and women are to be obedient to men. Ayesha Chaudhry's (2015) exhaustive treatment of the history of Muslim exegetical work on Qur'an 4:34 is helpful in showing how precolonial and postcolonial cosmologies differ with regard to gender. The precolonial cosmology is marked by a gendered hierarchy in which men stand above women, closer to God. The postcolonial cosmology envisions greater parity between men and women, who are equidistant from God. Global socio political trends gave rise to the development of Muslim feminist theology and the ideal of egalitarian gender relationships. Prior to Chaudhry, progressive Muslims like Amina Wadud (1999) argued against the hierarchical gender scheme that 4:34 presupposes and reinforces.

In classical Islamic jurisprudence, the major paradigm structuring gender relationships was that of the male ownership (*milk*) of females through marriage, slavery, and concubinage (Ali 2010). In drawing a comparison with premodern Jewish traditions, DV may have been justified in terms of its disciplinary function. Similar to late antique Jewish thought, free women were not, strictly speaking, the property of men, even though they were not exactly considered autonomous individuals. Hina Azam (2015) argues that free women in the Sunni Islamic classical legal framework were, in essence, the synthesis of person/thing,

or property/proprietor. Women, like men, were answerable before God and therefore had a capacity for moral agency as well as inherent dignity, which is distinct from a Muslim feminist argument for gender equality that we find in the postcolonial context. Although Azam's work deals with sexual violation in classical Sunnī Islam, this insight can provide further reasoning for why Muslim interpreters of 4:34 historically experienced discomfort with the practice of wife-beating and frequently sought in their arguments to restrict it.

In the postcolonial context, intra-Muslim arguments about the permissibility of wife-beating occur within a milieu of questions about Islamic identity, and the rejection, acceptance, and/or modification of Western gender norms, such as gender egalitarianism, to suit the needs of Islamic communities. These negotiations take place both within Western democratic countries governed by secular law and Muslim-majority nations in which religious law (shari'a) is dominant. Lisa Hajjar (2006) maintains that since the 1970s, state governance constitutes the most significant factor in whether DV is taken seriously as a crime. Muslim-majority states that have implemented some form of Shari'a often interpret it in ways that restrict women's rights, which is not necessarily concordant with the Islamic tradition as a whole, but rather central to the political goals of ruling elites. Hajjar observes that ruling elites in modern Islamic states often seek to placate Islamic hardliners who hold patriarchal worldviews, and thus they fail to criminalize activities like DV. This leads, among other things, to the conflation of the tenets of "true Islam" with practices of violence against women in popular imagination (in both Islamic and Western contexts). In order to effectively address DV in such contexts, Hajjar argues for the importance of using Islamic arguments about human dignity instead of secular feminist arguments about equality. The rhetoric of dignity does not necessarily disrupt gender hierarchies, for example, and may appear less threatening to elites and hardliners. Practically speaking, however, there seems to be significant overlap in how the concepts of dignity and equality are interpreted in the context of anti-DV arguments.

In the United States, Julianne Hammer (2013) questions the use of feminist rhetoric of equality as the best solution for dealing with DV in Muslim communities. Hammer examines several Muslim organizations that raise awareness and provide tools to deal with DV. Groups like the Peaceful Families Project (PFP) in Virginia employ language of gender complementarity, in which men and women have distinct biological as well as social roles. While Hammer argues that secular feminist methods may be inadequate for solving DV in Muslim communities, she finds it interesting that Muslim activists often eschew feminist methods on the basis of antipathy toward Western secularism, but actually end up adopting techniques of interpreting the tradition similar to those employed by Muslim feminists (2013, 246). For example, PFP engages in a re-reading of Qur'anic verses, like 30:21, which states that God established love and mercy between spouses, in order to argue that God's plan for men and women precludes violence.

In light of these findings, we ought to consider that male/female inequality plays a role in domestic violence, but more specifically that multiple and intersecting experiences of inequality may increase the likelihood of abuse, or compound the problem of DV. People use religious ideas to justify hierarchical relationships, including economic and racial hierarchies. Inversely, people may employ religious ideas and practices to resist violence. Women living in political contexts in which women's rights are not fully recognized, and ideas of hypermasculinity are normative, may be more vulnerable to abuse. Women who are marginalized on account of their minority status based on race, religion, and/or class, are likely to be targets of violence – both within the home and outside of it. The underreporting of DV in Muslim and Jewish communities offers proof of intersectional conditions of oppression. It is therefore necessary to

connect the violence experienced by communities as a result of licit or illicit discrimination with practices of violence against women. The section “The Christian Tradition” discusses DV in the Christian tradition, highlighting the experience of African-American and Native American women in this context as well.

The Christian Tradition

The Christian tradition was also forged in a patriarchal context in which men were understood to be superior to women. Despite some inclusion of women in the ministry of Jesus, for example, early church fathers used Genesis 3:16 to argue for the subservience of women to men. Historical justifications for wife-beating and other forms of violence against women within the tradition frequently relied on a God-ordained conception of male dominance and female submission. The frequent conflation of men’s power with divine authority influenced legal reasoning about the acceptability of DV, especially with regard to rules around marriage and divorce. An emphasis on gender equality in nineteenth- and twentieth-century Anglo-American culture, in part as a result of the first wave of the feminist movement, altered how American Christians justified the practice of DV.

Reva Siegel’s article (1996) examines a shift from the way Anglo-Americans viewed wife-beating as a practice permissible for a wife’s chastisement to a practice shielded by notions of privacy in marriage. The rise of companionate marriage undermined the authority-based marital status regime of common law, and along with that, the master’s practice of chastising his wife (1996, 2144). Due to the advancement of an ideal of gender equality in marriage, the idea of the husband-as-master fell into disfavor. Gender-hierarchical language was replaced with the language of privacy. The focus on privacy in the home, however, meant that the state did not routinely intervene in DV complaints (this changed as late as the 1970s in the United States). Siegel argues that practices of DV continued through a process of transformation. The Victorian discourse of the private sphere allowed practices of DV to continue, relatively unchallenged, by the white elite Christian men who benefited from the practice. Siegel notes that the wife-beater became a demonized figure in the late nineteenth century, and statutes against wife-beating were more consistently enforced among African-Americans and immigrants than against whites.

Ann Taves (1995) observes that the people at the top of the social hierarchy get to define what counts as violence. “Because the Euro-Christian tradition in its dominant forms has legitimated, indeed tended to sanctify, social relationships which are simultaneously patriarchal, Eurocentric, and heterosexist, violence has traditionally been defined rather narrowly within mainstream Christianity” (1995, 263). In Christian empires but also in places where, despite secularization, Christianity retains cultural hegemony, this statement implies that women have consistently faced the threat of DV. The threat of such violence has been magnified for non-white and non-Christian women, whose communities often suffered from other forms of violence.

Dolores S. Williams (1994) maintains that any robust analysis of DV against African-American women must account for the history of slavery, the denial of economic opportunity for African-American men postslavery, and practices of police brutality that have persisted into the twenty-first century. African-American women have historically experienced high levels of interpersonal violence, whether inflicted by slave masters, police, or their partners. This experience of violence on multiple levels is distinct from the experience of most white women. Williams connects the lack of control experienced by African-American men with their consequent need to exert control over the private sphere. She writes that

patriarchal societies “sanction men’s feelings that they have the right to control their families, including women” (1994, 40). For male members of an oppressed group, acts of DV may express feelings of helplessness and anger.

Another minority population within the United States that has experienced high levels of violence by the state and by domestic partners is Native American women. With regard to DV, non-Native men have assaulted Native women on reservations in high numbers. A 1978 US Supreme Court ruling, *Oliphant*, determined that Native tribes with their own courts were not allowed to charge non-Natives for criminal activity in this area. Thus, non-Native men could abuse Native women largely without legal consequence. In 2013, Congress reauthorized the Violence Against Women Act (VAWA), and allowed tribal courts jurisdiction over a limited amount of domestic and dating crimes committed by non-Natives on reservations – a change that DV activists have largely regarded as positive.

The discussion of DV and Native women should also be placed in the larger history of European colonization and domination of Native people. Under colonization, Native Americans were frequently forced to relocate, which alienated them from traditional kin structures, and cultural practices and norms. Moreover, they were denied opportunities for employment and education, resulting in poverty and psychological hardship. Hart and Lowther (2008) argue that as a consequence of colonization, Native women internalized ideas of themselves as “dirty” and “uncivilized,” which contributed to the difficulty in getting women to report abuse, but also more fundamentally to expect better treatment in intimate relationships.

The variation of practices related to gender and authority among Native tribes makes it hard to find any singular solution to the problem of DV for Native women. Sherry Hamby argues that because of the distinct nature of each of the over 500 Native tribes, more empirical research must be conducted in order to produce more “culturally congruent violence research and more active programs against domestic violence with American Indians” (2005, 191). The 2013 renewal of VAWA with the new provision is a corrective step for the federal legal protection of Native women on reservations.

Three observations seem germane to this discussion. First, DV refers distinctly to violence in the private sphere of household and private property, but is inseparable from wider social practices of domination and violence, whether legal or illegal, visible or covert. Second, following Taves’s observation, marginalized communities and groups, while frequent recipients of violence, often lack the power to authoritatively name violence as such. In the antebellum slaveholding Southern United States, for example, the law reflected the white slave owner’s view that enslavement of African-Americans could not constitute violence. For many years, federal law has deprived Native American women the right to prosecute non-Native men for DV. Finally, Christian teachings, like those of other religious traditions, can be used in the service of maintaining a hierarchical social order based on gender, race, and class, or can be employed to challenge such an order.

Patterns and Other Observations

This entry addresses DV in the context of three religious groups in North America, and thus omits information about DV in other traditions and cultures. The major reason for this editorial choice is to focus on common themes and patterns in response to the problem of DV. In particular, these groups engage with premodern texts and traditions that unambiguously grant privileges to men, such as those that permit a husband to physically discipline his wife. The rereading and ongoing interpretation of

these texts, and the canons of which they are a part, constitutes an important facet of religious identity for Jews, Christians, and Muslims. This frame allows for greater emphasis on the common historical and social questions posed to analyses of DV in the twenty-first century related to secularism, feminism, democracy, colonialism, and racism. The question of who gets to define the actions that constitute violence is as necessary to think about in our contemporary context as it is when we study earlier periods. Members of the dominant social group are often reluctant to recognize their power in defining violence, not to mention in deploying it against other groups. It is imperative, then, for scholars to maintain a critical awareness of this power dynamic in analyses of DV in various cultures and subcultures.

When communities, including the state, can more fully recognize DV as a social problem with interlocking causes – such as sexism, poverty, racism, colonialism, and substance abuse – they will be able to address it more effectively. Thoughtful advocacy work will take into account the concrete realities of the community experiencing DV, including sexism, classism, and racism. The work of creating gender egalitarianism, in which men and women have equal opportunities and recognition before the law, is still integral to the solution. In addition to seeking the criminalization of perpetrators, a society has to be willing to offer educational resources, offer community rehabilitation programs for offenders, and work toward justice beyond a crime-and-punishment model of treatment.

Practices of domination, abuse, and control are unfortunately features of many cultures, whether religious or not. We need to conceptualize DV not strictly as a personal or private phenomenon, or as limited to certain communities, but as a problem that the wider public has a stake in ending. By adopting a more comprehensive view of the ways that DV is connected to other forms of violence, scholars of religious ethics have an opportunity to better analyze the factors that lead to DV within specific communities, and identify possible solutions that are appropriate to those communities.

CHAPTER 154

Gender Discrimination

Rosemary Kellison

As extensive scholarship on gender and religion has shown, gender discrimination – specifically, discrimination against women or against persons who in one way or another fail to conform to social norms of masculinity, femininity, or the rigid line between the two – has been practiced in a wide diversity of religious communities. As other entries in this encyclopedia show, such discrimination has taken a wide variety of forms including, among others, highly gendered definitions of appropriate social and familial roles; practices of marriage and sex that reflect male ownership of or dominance over women; systematic exclusion of women from positions of authority in religion, government, and the workplace; and widespread homophobia and transphobia. These forms of discrimination have commonly been justified by invoking authoritative resources from religious traditions. Indeed, as Kecia Ali (2006) points out, practices related to gender are often some of the most jealously guarded by tradition given their centrality to identity and thus to the boundaries communities draw around themselves. One might therefore assume that the study of gender discrimination would have a long history in the field of religious ethics. To the contrary, however, the field of religious ethics itself has not been immune to practices of gender discrimination. On the twenty-fifth anniversary of the field's flagship *Journal of Religious Ethics* (JRE), Barbara Andolsen (1997) published a piece in which she pointed out the relative dearth of JRE articles discussing issues related to gender discrimination or feminism; even more striking was the complete absence of any articles on womanism. It was another eighteen years before the JRE published its first focus issue on feminist ethics, the introduction to which echoed Andolsen's critique but also noted that in the past several years, there had been a significant increase in the number of works devoted to issues of gender and feminism, not only in the JRE but in other venues as well.

This entry examines some of the different strategies that religious ethicists have employed in their analyses of gender discrimination, particularly in the contexts of Muslim and Christian traditions in the West, as well as some of the debates that have subsequently arisen. Religious ethicists' interest in gender discrimination has specifically to do with how communities' particular ways of understanding and enacting the relationship between bodies on the one hand and identity, social roles, and behavior on the other come to be seen as good or bad, moral or immoral, normal or abnormal – and how such socially shared understandings work to develop, and to privilege or disadvantage, certain kinds of persons. In particular, ethicists analyze the practices by which these norms are constructed, justified, enforced, and challenged. Historically, ethicists have tended to focus their attention on those practices related to the making and exchanging of moral arguments. Taking gender seriously, however, expands the range of

practices relevant to ethical analysis to include, among others, those related to worship, politics, and governmental and other institutions, as well as those related to realms often designated as “private” or “bodily”: marriage and parenting, household chores, hygiene, and dress. All of these practices are part of the means by which gender is constructed and enforced, at the levels of both individual selves and broader social and political structures.

Increasing attention to gender in the study of religious ethics has not only revealed gender discrimination within the communities studied (though there has been a significant amount of scholarship that has done just that, in the context of a diverse range of religious traditions) but also within the academic field itself. Additionally, the resulting focus on embodied practices and the particular contexts in which they are enacted has also significantly impacted both how religious ethics is studied and the substantive conclusions religious ethicists reach. For example, Andolsen authored one of the few early JRE entries in which gender plays a central role. Her article on the Protestant virtue of agape made clear that awareness of gender has a profound impact on ethical analysis. Andolsen (1981) showed that agape, interpreted as other-regard or self-sacrifice for others, has significantly different implications for women, given the pervasiveness of women’s practices of caring and sacrificing for others; in fact, she argued, cultivation of this virtue may in some cases do harm to the women who practice it. More recently, a number of scholars have followed Andolsen’s example, arguing that studying the practical experiences of diverse women, including their experiences of discrimination and violence, as well as of persons who identify as intersex, trans, or non-binary, leads to new understandings of central ethical categories including human rights, moral agency, and intention. Methodology, too, can be transformed by analysis of gender. The emphasis on practice and its relationship to the cultivation of particular kinds of gendered selves, for example, has motivated new interest in ethnography as a method for religious ethics.

That increased attention to gender results in these expansions of the boundaries of religious ethics and challenges to its central concepts is evidence of the centrality of gender in humans’ moral lives. Given how fundamental gender has been to the organization of human societies, to understandings of the body and personhood, and thus to the construction and maintenance of moral norms, studies of ethics that neglect the role of gender are incomplete. Moreover, such accounts can themselves perpetuate gender discrimination; by failing to critically analyze its existence, ethicists contribute to the process whereby gender is made to seem natural and therefore unchallengeable.

While there is widespread agreement among ethicists studying gender on these points, significant debates persist. In particular, this entry focuses on different ways of interpreting moral traditions and their authority. The authority of religious traditions has often been invoked to justify gender discrimination. The gender-constituting practices described above have histories; they emerge from traditions and are justified with reference to traditions, whether as continuations of or challenges to them. In the context of religion, these traditions are often understood by their adherents to be founded in texts of divine or otherwise transcendent provenance, practices of persons or communities seen as bearers of special authority, and the history or customs of a community passed down over time. The centrality of tradition and its authority for gender discrimination raises several important questions for religious ethicists. Can (and should) analysis of gender proceed independently of any particular tradition? To what extent can traditions be reinterpreted or rewritten? Given that analytical concepts and theories too emerge from particular traditions, how can such frames be applied in comparative analysis involving more than one religious tradition and/or cultural context? How might these approaches affect other areas of ethical inquiry outside questions specifically tied to gender? Which

way of approaching tradition affords the most liberatory possibilities for challenging or dismantling gender – and is such an objective an appropriate goal for scholarly work?

Because of the role traditional authority has played in constructing and justifying gendered practices like these, some liberal feminist scholars have been skeptical of, or even hostile to, traditions. In their view, moral inquiry is most likely to arrive at just conclusions when it proceeds independently of any particular tradition. Susan Moller Okin (1989), for instance, advised skepticism about theories of justice that arise from cultural or religious traditions. She argued that though such theories are often characterized as dealing with universal justice, they are in fact representative not merely of the perspective of a particular culture, but only of a particular segment of that culture: elite men. In her chapter “Is Multiculturalism Bad for Women?” (1999), Okin considered the impact of this particularism on the specific issue of gender discrimination. She argued not only that the world’s cultural and religious traditions are inherently gendered, but that most make men’s control of women a central goal.

Seyla Benhabib (2002), another liberal feminist, criticizes Okin for essentializing cultures – presenting them as unified wholes without internal differentiation and debate. This approach leads scholars to overlook important instances of contestation and diversity within traditions. For example, while Western scholars sometimes refer to hijab (veiling) as a single practice in which Muslim women either do or do not engage, Benhabib argues that in reality there are a wide variety of veiling practices representing a wide range of interpretations of not only hijab itself but also broader political and theological issues. In spite of this critique, Benhabib follows Okin in opposing a tradition-based approach to the study of gender and justice. Benhabib suggests that social agreements emerging from traditions do not reflect genuine (that is, rational and free) consensus. Building on Okin’s point that positions presented as characterizing a whole tradition’s single perspective are often reflective of the views of only a powerful few, Benhabib argues that taking a tradition-based approach can therefore make scholars complicit in the enforcing of authority structures.

For these reasons, both Okin and Benhabib argue that gender discrimination is best addressed not from the perspective of any particular cultural or religious tradition but rather by appealing to universal norms, which may conflict with the gendered norms and practices of particular communities. For example, Okin (1999) noted the potential for conflict between specific groups’ norms and the liberal norm of gender equality. Benhabib similarly contrasts the gendered practices of many “traditional cultures” with the “universalist moral language, which is context independent,” of women’s rights (2002, 40). This idea of “context independence” is central to the liberal feminist argument. While both Okin and Benhabib urge careful attention to particular context, criticizing other liberal philosophers for abstractness that fails to connect philosophy to real persons’ lived experiences, both also suggest the possibility of transcending local, gendered conceptions of justice with a universal one that promotes gender equality.

Both Okin and Benhabib endorse a content-rich definition of liberal feminism as consisting of certain norms, such as gender equality or universal respect. However, the idea that any norm is truly context independent is hard to defend. Even liberal feminist norms that claim universal applicability arise from a particular (modern Western) context. Recognition of this fact is especially important for religious ethicists engaged in comparative or cross-traditional work. Assuming that liberal feminism is a universal response to gender discrimination may lead scholars either to force distinctive practices and arguments into familiar categories or to overlook culturally specific practices and arguments by which gender is complicated or challenged.

Elizabeth Bucar argues that anthropological study of Iranian Shi'i Muslim women reveals the cultural specificity of many of liberal feminism's central concepts, which are inadequate and even inaccurate in describing the practices by which these women affirm and challenge gender norms. Not only do some of the women she studies explicitly reject the label of "feminist," but their praxis is best described, Bucar (2011) argues, not as an example of the autonomy at which liberal feminism aims but as an example of "dianomy," wherein both oneself and traditional sources are considered morally authoritative. Similarly, in her study of Egyptian Sunnī women, Saba Mahmood (2005) argues that liberal feminist conceptions of agency and freedom are so specific that they leave feminists unable to recognize many examples of women's flourishing. Moreover, the goals of women engaged in practices that challenge or reconstitute gender are not necessarily the same goals assumed by liberal feminism. Bucar's and Mahmood's ethnographies thus raise the possibility that scholars' use of a liberal feminist framework may lead to the same kind of reinforcement of existing power structures of which Benhabib warns, though between Western and non-Western societies rather than within a particular community. It is in part for this reason that both of their projects are much less explicitly prescriptive than those of liberal feminists, whose work is premised on the notion of universal norms, like gender equality, at which both scholarship and activism ought to aim.

Both Bucar and Mahmood argue that critical analysis of gender requires attention to the contextually particular embodied practices by which the self is formed, including those by which gender is constructed, enforced, and sometimes reimagined. It is in part through their focus on practice that they are able to identify gaps between the praxis of the women they study and gender norms of those women's communities as well as central concepts of feminist discourse. Their recognition that such gaps exist is significant for the ethical study of gender, as these kinds of inconsistencies between practice and stated norms are often the sites at which norms are contested. To ignore them is thus to produce only a truncated analysis of the workings of gender. Bucar's and Mahmood's methodologies are thus in part a response to the work of ethicists who engage in analysis solely of moral discourse as found in such disciplines as theology, law, ethics, and philosophy.

A second kind of response to the liberal feminist approach has come from scholars for whom the context of a particular tradition is a central aspect of their studies of gender and gender discrimination. Rather than seeking a universally applicable moral framework with which to examine and critique gender, immanent critics analyze gender in particular communities using concepts and critical methods derived from those communities' traditions themselves. The method of immanent critique follows from the recognition of two points: first, that moral norms and concepts emerge from traditions considered authoritative within particular communities, and second, that traditions are susceptible to reinterpretation and reconstruction. Immanent critique thus shares with the anthropological approach an emphasis on the particularity of contexts and the diversity of means by which gender discrimination is enforced and contested, but differs in its greater focus on authoritative traditions within those contexts. Additionally, though they share the suspicion of universal normative aims, many ethicists have employed immanent critique to make contextualized normative arguments intended to challenge gender discrimination. Whereas liberal feminists worry that a focus on traditional discourse may result in the reinforcement of such discourse's justification of norms and practices resulting in gender discrimination, immanent critics see appeals to tradition as a possible source of liberation. For these thinkers, it is *because* of tradition's authority, coupled with tradition's flexibility and reinterpretability, that grounding one's argument against gender discrimination in traditional sources is so effective.

In many religious communities in which scripture or other sacred texts are regarded as foundationally authoritative, gendered norms and practices are justified by particular interpretations of those texts. So, for example, women's exclusion from pastoral roles in some Christian communities may be justified by referring to Paul's disapproval of women teaching men as expressed in a New Testament epistle, or the practice of hijab among some Muslim women may be explained by hadiths in which Muhammad advises veiling of postpubescent women. Rather than denying the authority of those texts, some scholars seeking to subvert the authority of these practices instead reinterpret them, attempting to show that when read properly – that is, informed by the texts' particular historical contexts and with a priority on the texts' principal themes and values – these sources do not encourage gender discrimination. Elisabeth Schüssler Fiorenza (1994), for example, focusing on details of Paul's historical context and on his statement that in Christ there is “no longer male and female,” denies that his writings are essentially patriarchal. Lisa Cahill (1996) offers a similar “liberative” rereading of the New Testament on gender. Amina Wadud (1999) and Asma Barlas (2002) argue for a “holistic” interpretation of the Qur'an based on its overarching principles and historical context rather than the details of specific verses. On the issue of veiling, then, Wadud concludes that cultivation of the underlying Qur'anic virtue of modesty is what matters, not any one historically specific practice.

Immanent critiques result in the endorsement of normative aims that are particular to, and justified by, specific religious traditions. By appealing to foundational texts to support their arguments against gender discrimination, these critics implicitly accept the premise that such texts are the most authoritative moral sources for the communities of which they write. At the same time, however, they seek to challenge traditional forms of authority by contrasting the principles of these reinterpreted texts with historical practices they understand as resulting from misreading of those texts. In other words, this style of argument identifies certain sources (typically, scripture or other sacred texts and examples from the lives of sacred figures) as communicating a set of values fundamental to a given religious tradition; historical deviations from those values may be judged as failures to enact “true” Christianity, “true” Islam, and so forth. For this reason, this style of argument has been criticized by some as resulting in the same kind of essentialism of which Okin was accused. Ali (2006), for example, argues against attempts to determine what counts as “legitimate” or “authentic” Islam. For one, though Ali agrees that predominant trends in the Shar'ā legal tradition and resulting social practices have supported gender discrimination, she adds that the tradition also contains precedents pushing in other directions; allowing only the Qur'an and Sunna to stand in for “Islam” itself thus closes off resources that could be useful to immanent critics. Moreover, she suggests that such arguments exhibit a certain kind of dishonesty in their failure to grapple with the complexities and difficulties of the texts they cite. For instance, she notes that egalitarian and androcentric accounts of marriage coexist in the Qur'an. These inconsistencies mean that even an interpretive approach that emphasizes the Qur'anic principle of justice over particular social practices will require confronting difficult questions about what justice entails. Wadud herself has in more recent work moved in this direction by “say[ing] ‘no’” to Qur'anic verses that deeply contradict contemporary understandings of gender justice – understandings that, she emphasizes, are themselves informed by the Qur'an (2006, 202–203).

Practitioners of immanent critique see it as a means of disrupting traditional understandings by providing alternative ways of interpreting authoritative sources, thus answering Benhabib's fear that ethics done from the perspective of a particular tradition necessarily ends up reinforcing existing gender hierarchies. But for some ethicists, grounding one's arguments in reinterpreted authoritative sources

does not go far enough toward dismantling gender hierarchy, given that those traditional sources were almost all written by men and thus fail to represent the experiences of women in general and non-elite women in particular. Thus, part of the project of these immanent critics is to recover and treat as authoritative other sources – particularly, the practices and experiences of ordinary women – within the traditions they study. Ali's and Wadud's comments above, critiquing the Qur'an using a language of justice shaped by the Qur'an itself as well as by contemporary women's experiences, provide one example. In her elaboration of womanist theology, Katie Cannon (1995) argues that the particular experiences of Black American women (of slavery, sexual and economic exploitation, and marginalization) become sources for their immanent critique of American Christianity, leading them to become prophetic figures working to realize the Bible's promise of justice and simultaneously exposing the hypocrisy of white Christians. Because these lived experiences are often incongruent with predominant stereotypes about black women, Emilie Townes (2006) calls their retrieval part of a project of "countermemory" that helps to challenge the authoritative essentialism that makes traditions so amenable to the promotion of gender- and race-based discrimination. These projects demonstrate the importance of intersectionality in the study of gender discrimination in religious ethics, as they highlight how its experience is shaped by other aspects of identity including race.

The recovery of ordinary women's experiences as authoritative traditional sources is consistent with Okin's and Benhabib's call for normative projects that are connected to concrete human practices and experiences. It has therefore been a productive approach for ethicists who support the project of elaborating universal, or at least widely shared, norms of gender justice, but disagree that context independence is necessary (or possible) for achieving that goal. One way of making this argument is to demonstrate how, once expanded to include women's experiences, particular traditions can be invoked to contribute to a shared understanding of gender justice. Several ethicists working on both the Christian and Muslim traditions have in recent years argued for the ways in which the particular experiences of women and the particular resources of their moral and religious traditions might support (and also critically improve) shared discourses of human rights and gender equality.

Others argue that analysis of the particular lived experiences of women in different communities shows that some aspects of those experiences (such as motherhood, care, or conflict resolution) are very widely shared, enabling them to serve as a starting point for shared conceptions of justice. Cahill (1996) describes sex and reproduction as shared human experiences that, though "institutionalized" differently in different communities, are promoted by the same values (such as sexual equality) in those different contexts. Importantly, Cahill argues, it is only through the recognition of others' particularity – and especially, their particular embodiment – that these shared experiences can be identified. Moreover, promotion of the values emerging from those experiences is likely to look quite different in different cultural and traditional contexts. But, she emphasizes, such diversity in application does not prevent the judgment that some practice or norm is better or worse at promoting these values in a particular setting.

The study of gender in religious ethics has grown dramatically in recent years, but more work is needed, particularly in the context of non-Abrahamic traditions and with greater attention to the diverse ways in which gender discrimination interacts with discrimination against racial, ethnic, and religious minorities, queer and trans persons, and persons from lower socioeconomic backgrounds. The variety of approaches to this work that have been developed illuminate important questions regarding tradition and authority that are relevant beyond the issue of gender, but in which gender plays a fundamental role. In contrast to liberal feminist philosophers, religious ethicists tend to contextualize their studies in rela-

tion to the specific traditions from which norms and practices of gender emerge and with reference to which those norms and practices are justified. Those who take an anthropological approach focus on the practices of ordinary women and are wary of universalizing normative claims. Immanent critics, by contrast, often make normative arguments that are justified by appealing to new interpretations of traditionally authoritative sources or by expanding the canon of traditional sources to include ordinary women's experiences. In spite of these differences, there is widespread agreement among religious ethicists writing about gender that gender discrimination is a regular and pervasive feature of the traditions and communities we study; that, consequently, religious ethicists ought to employ gender as a central category in their analyses; and that when they do so, both their methodology and their conclusions will be substantively affected.

CHAPTER 155

Genocide

Atalia Omer and Ernesto Verdeja

What does it mean to think of genocide in terms of religious ethics? This question immediately highlights the need for contextuality, to avoid limiting the analysis to the question of theodicy and thus positing the relation between religious ethics and genocide as one of reaction. The other mode of connecting religion and genocide appears inconceivable because surely religious traditions do not condone or cause the destruction of human communities. Neither a discussion of otherworldly caused calamity nor vague assumptions about the essential prosocial and humanistic impulses inscribed in religious traditions will help us think about genocide through religious ethics. Indeed, we need to reverse the question: what can we learn about religious ethics through a contextual examination of genocidal events? On the one hand, genocide stands in obvious contrast to the ethics of religious traditions. On the other, religious people and institutions certainly participate in genocidal practices, justifications, and rhetoric. Indeed, functionalist and sociological accounts of religion illuminate the centrality of violence to defining communal boundaries, social cohesion, and morality (e.g. Durkheim 1915; Girard 1977, 1986; Strachey and Freud 1961). While religious traditions have a long history of authorizing force and targeted killings, the focus of this entry is limited to the question of religious ethics and genocide in modernity.

Genocide does not just happen. Its occurrence is always explicable in terms of human agency and the systems of meanings and justifications that humans weave. To the degree that religion and genocide are linked, human actions and their ideological underpinnings constitute the main targets of analysis. Certainly, the study of religious ethics cannot rest on the presumption that religious traditions offer countervailing forces to collectivistic genocidal proclivities. In addition to identifying the complicity of religion with genocidal practices, also relevant are explicitly religious actors' responses to atrocities that reach the depths of traditions' ethical commands and spiritual practices in challenging chauvinistic ethics of solidarity through an articulation of universalistic concerns with humans as humans. Religiosity, in other words, is both implicated in genocidal violence and in resistance to mass targeted murder and other forms of communal destruction, as well as in resources for transgenerational healing processes. Indeed, the discussion of genocide and religious traditions illuminates the need to examine religion within its historical (and, in this instance, genocidal) contexts. This entails paying careful attention to nationalist and imperial/colonial discourses, along with their embeddedness within modernity and secularity as well as their Christian- and Eurocentric legacies (Anidjar 2003, 2014). This entry proceeds in several steps. First, what is meant by genocide is examined, then an exploration of complicit actors and institutions in genocidal contexts is given, and finally the place of religious resistance to genocide is considered.

What Is Genocide?

It is crucial to clarify the legal working definition of genocide. According to Article 2 of the Convention on the Prevention and Punishment of the Crime of Genocide adopted by the United Nations (UN) General Assembly (United Nations 1948), genocide is defined as “acts committed with intent to destroy, in whole or in part, a national, ethnical [*sic*], racial or religious group.” A wide array of practices qualify. The timing of the convention, like the timing of the Universal Declaration of Human Rights, is not incidental, but rather denotes the impact of World War II. While recent scholarship on human rights challenges the centrality of the Holocaust and European fascism on the birth of the human rights regime (Moyn 2010, 2015), the Holocaust is pivotal in the background – through the person and work of Raphael Lemkin – of the UN convention and its definitional work and applicability, both globally and comparatively. Lemkin’s legacy has been conscripted into a variety of agendas (e.g. Dirk Moses 2010; Loeffler 2017). His contested legacy indicates that enshrining genocide as a category of crime in international law does not solve the fluidity of its interpretation as encompassing not only obvious instances of mass killing, but also a whole spectrum of practices (such as systematic rape or the forced removal of children for the objective of “cultural assimilation”) intended to destroy entire communities.

Indeed, genocide studies, as a scholarly field, has grappled with the Holocaust. One set of conversations interprets the genocides of the twentieth century as “intrinsic” and integral to broader world developments. These include the collapse of the Ottoman Empire, the European imperial order, and its eventual disintegration into totalitarian and dictatorial regimes (Levene 2014, 5; see also Snyder 2010). Or it examines the Holocaust within the broader story of European colonization and racial (e.g. *Lebensraum*) and frontier imperialism (Kakel III 2013; Kay 2006; Madley 2016). Another set of conversations lessens the uniqueness of the Holocaust through a global comparative study of analogous cases that likewise challenge the conceptual and empirical boundaries of genocide by questioning whether the Holocaust should constitute the metric according to which all other cases are measured (e.g. Dirk Moses 2013). This line of critical genocide studies also investigates hidden and forgotten genocides, identifying biases as well as sociocultural and political mechanisms that enable sites of remembering and forgetting (Bloxham and Moses 2010; Hinton et al. 2013; Lemarchand 2011). In particular, the fluidity of the conceptual and empirical boundaries of genocide manifests in efforts to differentiate it from other practices such as “ethnic cleansing,” broadly understood as the forced removal (through terror and killing) of civilian populations from their land, which is a central mechanism in exclusionary nationalist programs. The difficulty of differentiating “ethnicity” from “religious identity,” as in the Balkans, illuminates why the analysis of religion and genocide immediately works against the abstraction of religion from ethnicity, nationality, and cultural contextuality. This is regardless of whether the Bosniak Muslim or Orthodox Serb actually operates within any theological depth or belief.

A scholarly exchange between Shaw and Bartov (2010) reveals this complexity. In response to Bartov’s complaint that counting “ethnic cleansing” as genocide dilutes the meaning, Shaw retorts that “the idea of ‘ethnic cleansing’ is contaminated by perpetrator assumptions (the idea that removing and murdering people ‘cleans’ society, the opposite of any genuine idea of purity in social relations)” (2010, 249). Indeed, Lemkin’s awareness of the potential convergence of genocide studies with politicized scholarship on the Israeli–Palestinian conflict led him to distance himself from his pre-World

War II political Zionist identification in order to promote the more universal concept of genocide (Loeffler 2017). The question of whether the “ethnic cleansing” of Palestinians in 1948 constituted genocide points us back to nationalism, colonialism, and modernity as key to the analysis of religious ethics and genocide. Now, it is important to catalog a few instances where religious institutions, authorities, narratives, and people were deeply implicated in articulating mass killings, as well as other forms of communal destruction, as morally justifiable and even “benevolent.” This is to avoid theorizing religion as a force countering the logic of modern secular genocides. Succumbing to such logic would entail an unreconstructed modernist account of “religion” as interiorized and individualized in terms of “belief,” cognition, and choice, and as neatly differentiable from ethnicity, nationality, culture, and other identity markers.

Religious Institutions and Actors within Genocidal Contexts: Complicity

The topic of genocide and religious ethics is linked to a broad examination of religion and violence and is consistent with exclusionary nationalist rhetoric and practices. The study of genocide, in particular, however foregrounds the relevance of religion to “state-organized murder” (Bartov and Mack 2001, 1), clearly evidenced in modern cases, including those of the Armenian, Jewish, and Rwandan genocides. Authoritative religious experts such as Kittle in Nazi Germany (Ericksen 2001) or others who partook in the Institute for the Study and Eradication of Jewish Influence of German Religious Life (Heschel 2008) actively worked on manufacturing and disseminating so-called “Aryan Christianity.” This enhanced the respectability of Nazism and its genocidal practices (Bartov and Mack 2001, 5), which were sanctioned down to low-level military chaplains who offered spiritual refuge and comfort to foot soldiers at the ground zero of a murderous regime (Bergen 2001). Indeed, Bartov and Mack (2001) conclude that, with some exceptions, German churches during World War II exhibited “a combination of resentment, approval, silent indifference, or narrow-minded concentration on religious piety resulting in moral numbing in the face of widespread inhumanity” (6).

There is nothing particularly unique about the case of Nazified Christianity. Nor did it emerge out of nowhere. The groundwork had been prepared by antecedent philosophical and theological developments from Immanuel Kant in the eighteenth century (Lawrence 2014; Mack 2003) and his positing of the “Jew” as a foil to his conceptions of rationality and autonomy, to the founding comparative religious studies scholar Max Müller in the nineteenth. A product of his era, Müller differentiated Judaism and Christianity through the mechanism of philological and racial theories, thereby disrupting, but cohering with, classical anti-Jewish interpretations of supersessionism. This detour to the eighteenth and nineteenth centuries is to stress that the manifestation of atrocities does not signal the absence, but rather the presence, of various intellectual and theological scaffolding, which contributed to the apparent morality and/or justifiability of their occurrence.

Years after the Holocaust, in 1994 Rwanda, churches turned into killing chambers and some church leaders into executioners. Longman (2010) writes:

Organizers of the genocide, exploited the historic concept of sanctuary to lure tens of thousands of Tutsi into church buildings with false promises of protection; then Hutu militia and soldiers

systematically slaughtered the unfortunate people who had sought refuge, firing guns and tossing grenades into the crowds gathered in church sanctuaries and school buildings, and methodically finishing off survivors with machetes, pruning hooks, and knives.

(4–5)

In addition, in some locations, “clergy, catechists, and other church employees used their knowledge of the local population to identify Tutsi for elimination. In other cases, church personnel actively participated in the killing” (Longman 2010, 5). Like the military chaplains in Nazi Germany, the appearance that churches supported the genocidal regime was further strengthened when death squads held masses before killing episodes. “In some cases militia members apparently paused in the frenzy of killing to kneel and pray at the altar” (Longman 2010). Indeed, “practicing Christians could kill their neighbors without feeling that they were acting inconsistently with their faith” (Longman 2010, 191).

How can the practice of genocide and killing be consistent with religious ethics? This is the question. And it can only be confronted contextually by resisting the abstraction of religion and religiosity, along with religious ethics, from an examination of power and other substantive variables associated with identity, such as ethnicity, race, and nationality. The overwhelming evidence of active participation and the enabling of genocide by religious leaders notwithstanding, official responses of the Catholic Church attributed blame to individual sinfulness of clerics rather than the church writ large (Longman 2010, 7). Still, *Nostra Aetate* or the Declaration of the Relation of the Church with Non-Christian Religions (also referred to as Vatican II), which was promulgated in 1965 by Pope Paul VI, presented an effort to grapple with the Christian sin of the Holocaust and to reassess the Church’s relations with Jews and other faith communities (see also Ochs 2011). Even while the Nazis distanced themselves from religious institutions, their capacity to implement racial policies drew strength and public traction from centuries of Christian anti-Semitism.

That the Nazification of Christianity drew on established intellectual patterns of racializing religion has also been noted. The Christian process of atonement for the one sin against Jews (the Holocaust), Jewish Palestinian liberation theologian Ellis (1997) contended, has been pivotal for rendering the suffering of Palestinians invisible and inaudible (see also Magid 2017). The invisibility and inaudibility of Palestinians illuminate the relevance of interrogating religion and the ethics of confronting the memory of genocide on the level of discourse, with a special emphasis on the endurance of orientalism in authorizing communal-targeted violence. Certainly, the case of Palestine has become a site for contesting genocide’s definitional boundaries (e.g. Shaw and Bartov 2010) as well as for highlighting the complex ways in which religious meanings, institutions, and people inform, in the *longue durée*, the possibility for murderous policies to be enacted and publicly supported as morally justifiable. This is where the fields of critical genocide studies and religious studies could converge in expanding the interpretive scope of the analysis of religion’s relation to genocide. Anti-Semitism’s religious roots are as relevant to a comparative analysis of religion and genocide as is orientalism and the othering of Muslims. Indeed, these two discourses are related and coextensive with the construction of Christian modernity (Anidjar 2014).

The disciplinary convergence of orientalism and anti-Semitism in underwriting Christian modern coloniality illuminates that the relevance of religion to an underpinning discourse informing the ground zero of genocidal episodes is broader than the story of Nazi Germany. As orientalism authorizes the ethnic cleansing of Palestinians, beyond the immediacy of examining why religious actors and institutions became engrained with the Hutu’s genocidal agenda, the events of 1994 in Rwanda illuminate the

enduring colonial legacy of churches and their long-term relevance to modern genocides and policies of ethnic cleansing. Indeed, the very classification of the inhabitants of Burundi and Rwanda into distinct ethnic groups was manufactured by Belgian and French colonialisms and sanctioned by churches (de Lespinay 2001) and missionaries who had complex and mutually benefiting relationships with colonial authorities. That years later the Hutu–Tutsi distinction constituted the boundaries along which genocide occurred stresses the long-term impact of colonialism, which itself was authorized and sanctioned by claims to religio-cultural superiority, racial imperialism, and civilizational mission. Accordingly, settler colonialism, dispossession, classification, and elimination of human communities were necessary for “progress” and modern-state making.

The colonial legacy, likewise, tells the stories of multiple (and eventually hidden) genocides and communal destruction in the form of the transatlantic slave trade, for example (see Hinton et al. 2013). Like the South African regime of apartheid, the American institution of slavery was authorized with religious warrants, allowing for high consistency between slaveholding and Christian beliefs (Rae 2018). Of course, this institution was likewise challenged by, among other paths, reclaiming Christianity from slaveholders’ interpretations as were the religious warrants employed openly to authorize the apartheid era (Villa-Vicencio 1977, 1992).

At the time of its ratification, the Genocide Convention’s definitional scope resonated, for many activists such as W. E. B. Du Bois, with the legacy of slavery and its endurance in Jim Crow laws as well as the ghettoization and segregation of African-Americans. Such activists pointed to the interrelation between an analysis of race and racialization, colonialism, and the practices of genocide (Civil Rights Congress 1951). Such practices always involve power and knowledge production that determine patterns of perpetuating, remembering, and forgetting, where some atrocities are remembered and others are hidden or construed as necessary stages in teleological conceptions of modernity and progress (Hinton et al. 2013).

Indeed, employing genocide as a comparative term intersects with intellectual and political processes of decolonization, which delineate the intersections of race and religion in the taxonomies of exclusionary nationalisms and imperial programs. These processes also involve examining, as Du Bois had done, the modern logic of what Foucault calls “biopolitics” and how its grammar underpins both Jim Crow America and the Warsaw Ghetto in that it seeks to control life and death in their totality. Following Agamben’s (1998) notion of the “bare life” and resonating with Arendt’s discussion of naked and disposable humanity in Nazi concentration camps (1973, 296), Du Bois (1952) recognizes the Warsaw Ghetto and the death camp as highly consistent with a broader racial geography that underpins modernity.

Biopolitics, as a central technology of modernity (Agamben 1998, 123) is more aptly captured in Achille Mbembe’s concept of “necropolitics” (2019) denoting the power to dictate death. This conveys the relevance of race and colonialism to the discussion of genocide, a policy often targeting racialized religious communities framed also along and through national and ethnic lines of identification. This point returns us to the complex relations between “ethnic cleansing” and “genocide” (Mojzes 2011) and how religious symbols, vocabularies, historical narratives, and textual sources are employed to construct exclusionary interpretations of nationalisms, which contain the potentiality for genocidal policies.

Sells (1998), for example, examines the emergence and consolidation of the national mythology of Christo-Slavism or “the premise that Slavs are by essence Christian and that conversion to another religion is a betrayal of the people or race” (51). Accordingly, and consistent with any other forms of ethno-religious nationalism’s invocation of authenticity through mythologizing and converging narratives of religious and national existential threats, Muslims in the Balkans are merely the product of forced

conversion and thus alien to the land. Through his examination of Christo-Slavism, Sells explains that the Bosnian genocide “was religiously motivated and religiously justified. Religious symbols, mythologies, myths of origin (pure Serb race), symbol of passion (Lazar’s death), and eschatological longings (the resurrection of Lazar) were used by religious nationalists” (Sells 1998, 89). Political entrepreneurs in the late 1980s and leading up to the war in the 1990s manipulated the story of the 1389 Battle of Kosovo and the martyrdom of Prince Lazar in his fight against the Ottomans. The battle supposedly denotes the martyrdom of the Serbian nation in the name of Christendom. The politicians of the 1980s did not invent this mythology. Indeed, Sells shows how already in the nineteenth century, artistic works portray Prince Lazar as a Christ-like figure, a symptom of the reliance of Serb nationalism on this long circulating mythology in constructing its identity.

The question of the relation between religion and genocide will need to examine the role of religion in such nationalist mythologizing. This is especially the case considering that political entrepreneurs and manipulators do not invent such myths *ex nihilo* and that they resonate culturally, even if not through simplistic conceptions of causality. The trajectory between the consolidation of such exclusionary mythologies and, in the case of Bosnia, the events of, say, Srebrenica in July 1995, when more than 8,000 Muslim Bosniaks (mostly men and boys) were systematically massacred by the Bosnian Serb forces, defies reductive accounts of religion that seek its isolation as either a dependent (epiphenomenal) or independent (causal) variable. Religion interacts with the production and reproduction of national ideologies in myriad complex ways.

In addition to this clear case of genocide targeting Muslims, many regions in the former Yugoslavia were “ethnically cleansed” as a result of the wars, presenting particular challenges for religious leaders as potential instruments of healing. Decades later, the Bosniaks, Serbs, Croats, Jews, and others in Bosnia and Herzegovina (BiH), for instance, remain deeply segregated in terms of education, residence, and so forth. Further, the memories of cohabitation and intermingling are distant, and communal and ethnic markers are synonymized with religious ones. The synonymy of ethnicity and religion, once again, highlights the biologizing of religious modes of identification: to be a Muslim means to be a Bosniak – an ethnic and thus biologically (racially) inscribed identity, whose sustainability supposedly depends upon the logic of biopolitics/necropolitics. One of the ironies of genocidal histories is their capacities to “transform ... an imaginary community into a ‘real’ one by attempting to obliterate the members of the imagined group” (Hinton et al. 2013, 9). The boundaries between Orthodox, Catholic, Muslim, and Jew in BiH are real in this regard. Religion explicitly participates in such geographies.

Indeed, one common denominator of modern genocides – one directly related to the legacy of religion as a comparative category of taxonomy employed within colonial structures (Chidester 1996, 2014) – is the construction of religious groups in racial and cultural terms rather than in terms of theologies and/or contents and intricacies (as well as internal pluralities) of beliefs and methods of learning. “People were murdered,” Bartov and Mack (2001) write, “because they were Jews or Armenians or Bosnian Muslims, regardless of whether or not they (or their killers) actually believed in Jewish, Christian, or Muslim precepts” (2–3). The dynamics and structures of modern nationalisms signaled the transformation of religiosity into “culture” and “heritage” or “our values” (e.g. Roy 2010), which are nevertheless presented as causes worth dying, discriminating, or killing for. The conflation of religion and other markers of political, cultural, and social identification allows for the supposed subordination of ethics to the logic of realpolitik. It does so in ways that facilitate the sanctioning of violence, regardless of genocidal intent, by religious authorities as well as other manipulators of religio-cultural symbols and meanings,

whether these are the theologians of the Nazi regime, the priests of the Hutu-directed genocide in Rwanda, or the Serbian paramilitary leaders of the former Yugoslavia.

Nationalisms themselves and their claims of authenticity (and a sense of existential threat, martyrdom, and/or civilizational mission) rely on mythologizing communal coherence, often by targeting supposedly inauthentic communal elements (Marx 2003). Indeed, the language of authenticity does not constitute a perversion of modern nationalism (Fein 1990). It is highly consistent with this modern political mode of imagining social organizations in terms of the biological metaphor of “pollution.” Nationalist mythologizing should not simply be accepted as given, but rather always be open for hermeneutical scrutiny and contextual power analysis that examines why, how, and by whom religious meanings, institutions, and people become conscripted onto exclusionary schemes with potential genocidal outcomes.

The reverse processes, or how religion disentangles from and challenges chauvinistic patterns, is also relevant and demands that we scrutinize what counts as “religious” to begin with. This category fluidly intersects with race, ethnicity, nationality, and other markers that work to flatten and essentialize “religion” (often through ethnicization and racialization) as identity, often without any theological or ethical depth. In fact, what is “ethical” for leaders such as Ratko Mladić in Srebrenica or Théoneste Bagosora, in Rwanda, is subordinated to the logic of colonialism and biopolitics/necropolitics (segregation, division, classification). In the case of the former Yugoslavia, such flattening is understood in terms of a selective retrieval of religious motifs in the construction of national mythologies, without dismissing the many other variables that contributed to the emergence of chauvinistic interpretations of national identities. In the case of Rwanda, religion’s complicity needs to be primarily understood, as noted, in terms of the churches’ links to colonization and the invention of ethnic divides in Rwanda.

Notably, in all the cases touched upon above, from transatlantic slavery and the Holocaust to Bosnia and Rwanda, extensive discourses involving religion operate in a variety of forms, including in terms of institutional support and theologizing the justness of “purification” and sanctity of slavery. These modes of involvement contribute to authorizing the atrocities of genocide or their potentiality. Their sanctification is framed as both ethical and necessary for the survival of nations (often interlaced in the mythologizing of ethnoreligious nationalism with the apparent threat to the survival of religious traditions themselves) and for their self-actualization and/or promulgation of manifest destiny or “progress.”

Religious Resistance

The complexity of the discussion of religion, and specifically religious ethics and genocide, relates to the fact that religious leaders and religiosity also have a strong record of resisting genocidal or potentially genocidal regimes and policies (e.g. Doughty and Ntambara 2005). Authoritative interpreters of traditions have the hermeneutical capacity to tap into constructive memories of cohabitation and resources promoting tolerance in the same ways that they can access divisive and violence promoting cultural currents (Dulin 2017). The religious fields, however, always intersect with and are populated by multiple and fragmented authorities. What counts as an “authoritative” interpretation of religious tradition is not always self-evident. Nor are such authorities confined to traditional religious institutions and their modes of training and reasoning.

Still, stories of bravery and actions of resistance grounded in religious convictions abound. In Hungary, during the Nazi era, Margit Schlachta, who founded (in 1923) and led the Roman Catholic Society of the Sisters of Social Service (Sheetz-Nguyen 2001), publicly condemned anti-Jewish laws as soon as they passed. To resist the forced removal, deportation, and eventual elimination of Jews, the Sisters sheltered many Jews. They likewise supplied Jews with baptismal certificates. Consequently, “they were willing to de-value a specific Christian sacrament and practice for the sake of universal charity ... motivated by a universal interpretation of religious dogma” (Bartov and Mack 2001, 9). Ironically, it was often the recognition of the human as human, regardless of their various affiliations, that generated an urgent moral requirement to respond to their suffering and prevent their destruction. This is “ironic” in that seeing human in their nakedness and looming perishability is not only the essence of biopolitics/necropolitics, but it also deepened humanistic compassion and courage grounded in religiosity as interpreted in embodied and embedded ways. In the case of the Sisters of Social Service, the supposed “devaluation” of the sacrament of baptism indeed denoted its sacralization through saving lives.

The ability of religious actors to respond with compassion, in ways that see humanity beyond narrow communal divisions, often invokes references to Emmanuel Levinas’s discussion of the face of the other (e.g. Smith 2011) and his contention that relationality ought to be assessed in terms of ethical responsibility (e.g. Levinas 1995, 86). Levinas writes about an obligation to the other who is seen exposed in their defenselessness and dehumanization as a mechanism for asserting one’s humanity, but often also as a mirror of one’s murderous potential (1997, 294). In their powerlessness, the other embodies an “ethical resistance to power” (Smith 2011, 243). Thus, the relationality to the face “is incommensurable with the exercise of power” (Smith 2011, 243) and offers optimal resources to resist the logic of biopolitics/necropolitics. Levinas’s phenomenology of the stranger conveys, therefore, that the face is “the primordial site for both moral goodness and radical evil” (Smith 2011, 244). Accordingly, Levinas employs religious tropes and imageries “to highlight the radical moral authority the Other possesses” (Smith 2011, 247) and to denote that the divine can be contemplated through this essential asymmetry (Smith 2011, 247). However, despite the appeals of Levinas’s phenomenology as fundamentally ethical, religious actors are not particularly disposed to resist the murderous tendencies of chauvinistic politics demarcated along religious and/or ethnic lines. They can, as noted, offer their sanctuaries for the murderous acts and their prayers for the spiritual comfort of those engaged in such acts. Levinas himself failed to recognize the suffering of Palestinians by Zionist policies and actions, illuminating once again the need to examine the question of genocide and religion discursively and through the lenses of decolonization (see Slabodsky 2015, 93–114).

To conclude, comprehending the active participation and/or complicity of religious actors, institutions, and leaders with genocidal episodes requires that we contextualize religion within a broader analysis of nationalism, colonialism, modernity, and biopolitics/necropolitics. The insights from critical genocide studies, therefore, broadens the analysis of religion and genocide beyond the obvious acts of violence as mass killing to a deeper engagement with religion’s complicity with discursive violence, including the elimination of religio-cultural diversity through conversion in the context of colonialism and racial imperialism. Understanding religion and resistance to genocide and acute violence illuminates religious actors’ appeals to universal ethics, which enable them to see the suffering other as a human deserving life and, through this relationality, engage in ethical resistance to power. Of course, being Christian or Jewish or Muslim or otherwise religious can also be perfectly consistent with engaging with (and celebrating) the acts of enslavement and massacres as ethically sound or at least as requiring the suspension of ordinary ethics for the demands of *realpolitik* or messianic and apocalyptic scenarios.

CHAPTER 156

Racial Discrimination

Jonathan Tran

This entry examines racial discrimination. It starts with a paradigmatic case which it then complicates in order to bring out complexities often associated with racial discrimination. After surveying conceptual distinctions surfaced by those complexities, the entry revisits a set of background meta-ethical difficulties related to issues of moral psychology and specifically the concept of intention. Because intention is given such a large role in ethical treatments of racial discrimination and because intention requires for its coherence a full-bodied moral psychology then conceptual clarity in our thinking will continue to elude us, a theoretical reality that reflects (and practically pales in comparison to) the day-to-day realities endured by those dealing with racial discrimination. It is, of course, not only treatments of discrimination that suffer conceptual confusion on this side of a developed moral psychology, but these offer particularly disastrous instances of that confusion. Religion finds a role in this entry through the suggestion that religion is one way moral communities develop psychologies of intention; thence, religious discourse represents at least a source for an important yet missing conceptual feature. Absent these developments, ideas of postracialism will present themselves as our best alternative, and several versions of this will be considered in conclusion.

A Paradigm Case

Let us begin with a paradigm case of racial discrimination. An African American man named Sam applies for a typing job at Typing Services R Us. A white candidate named Ben applies for the same job. Other than the fact that Sam is black and Ben is white, everything else so far as the job is concerned, including typing ability, is equal. The manager, Pat, chooses Ben over Sam just because Ben is white and Sam is black. Most would consider this a clear-cut case of racial discrimination: a situation where a choice, a discrimination, is made based on race, even more so when the manager offers the rationale, “white people make better employees than black people” (see Fryer and Levitt 2003).

In order to get at what is problematic about this case, consider two variations. The first has the manager, due to circumstances, completely unaware of Sam being black and Ben being white. As well, this variation has it that not everything else is equal – Ben scored better than Sam on the company’s typing test. Pat chooses Ben and explains, “I chose Ben because all else being equal he types faster than Sam, and I need really fast typists since that’s what we do at Typing Services R Us.” In this case, the manager

chose Ben but as far as we can tell (we will return to this in a moment) the choice, the discrimination, was based on typing speed rather than race. Most would view this variation not only not illicit but properly prudent. This version of events furnishes us with our first distinction, that there is good and bad discrimination; it is the qualifier less than the discrimination as such that matters.

A second variation returns race to a determining role, but with a different end: the manager chooses Sam over Ben *because* Sam is black and Ben is white. Asked about the choice, the manager gives the following rationale: “black people do not have and have never had the opportunities, including typing training, white people have. In making my decision I definitely tried to do something about that.” Race again plays a decisive role, but relative to the initial case reversed in terms of choice, consequence, and justification. Some will countenance this use of racial discrimination insofar as it benefits rather than harms African-Americans qua African-Americans. While others would say that there can be no situation where racial discrimination is good (benefits to some come at the cost of harm to others, they will say), at least some would identify this second variation and its attending rationale as one where racial discrimination can be good. Adding to our distinctions, then, we can say that just as there can be good and bad discrimination there can be, at least in some people’s minds, good and bad racial discrimination.

To get at one last distinction let us return to the first variation. Recall that in this case Pat is not aware that Sam is black and Ben is white, and thinks the decision has been made simply – “all else being equal” – on the needs of the job, namely typing speed. Similar to the second variation Pat observed, however, there may exist circumstances that disadvantage some, and advantage others, in terms of relevant qualifications. If it is the case that African-Americans as a group are thusly disadvantaged for whatever reason, this would mean that Typing Services R Us and potentially every other industry company will – “all else being equal” – consistently hire white over black candidates: a past and present state of affairs that would, projecting into the future, systematically shut African-Americans out of the industry. Now imagine not just the typing industry but many more besides, and then the ensuing societal consequences for education, housing, health, and so forth. We then face a whole world unconducive to African-American success. Add to this the many other worlds (chattel slavery, Jim Crow, segregation, etc.) that African-Americans have already endured and we begin to see how the word “disadvantage” does not quite capture the severity of things. The phrase “all else being equal” when applied to African-Americans in comparison to whites begins to lose sense, or its sense coheres through willful ignorance (African-American achievement despite all things being *unequal* impresses all the more). Even though none of this resulted from the direct discrimination of the original scenario, by proxy discrimination still occurs for Bob and continues systematically down the line (see Alexander 1992). Another distinction then distinguishes between direct and indirect (proxy) racial discrimination where indirect discrimination is bad similarly to how direct discrimination is bad. Efforts like those articulated by the manager of the second variation are the attempt to affirmatively, rather than passively, repair these conditions through creative modes of redress (Graham 2002).

Our complicated case and its variations have established three important distinctions: good and bad discrimination, racial and non-racial discrimination, and direct and indirect bad racial discrimination. Other distinctions can be drawn, but sticking with these is sufficient to highlight an important point: not all discrimination is bad, and neither is all racial discrimination bad. We have seen how some discrimination is prudent, and we can expand this to say that most discrimination is necessary, natural, and non-racial. Even explicit racial discrimination can be used for good, as in the second variation where the manager sought to level a systemically and historically uneven playing field. None of these, in other

words, is racist unlike the original scenario where Pat did not hire Sam and offered racist reasons. If all that ethically mattered about racial discrimination was straightforward cases like that one then a paradigmatic definition could be issued and judgments rendered accordingly. This would be messy but not especially complicated work. However, the variations significantly complicate things. Now, in the rendering of moral judgments one must take into consideration how just these three distinctions (remember that there can be others) exponentially increase the number of ways a scenario can be morally described (Anscombe 1958a, 1979). Reexamining the first variation through the lens of indirect racial discrimination shows how something with no obvious relation to race turns out obviously racial – the supposedly racially-blind typing test used by Typing Services R Us resulted in sweeping racial consequences for Ben and everyone else down the line.

Consider also the second variation where the manager was aware of broader racial conditions and undertook reparative efforts. In seeking to address those conditions was Pat inadvertently continuing and even exacerbating them? As Supreme Court Chief Justice John Roberts famously said in rejecting similar affirmative actions, “The way to stop discrimination on the basis of race is to stop discriminating on the basis of race” (551 US 701, 2007). Justice Roberts represents a broadly held view that does not explicitly deny racism’s systemic and historic conditions, but only thinks the best way to address those conditions, the best reparative work to be done, is to think beyond racialized terms, to think beyond race. At least on policy matters, this view doubts the possibility of good racial discrimination. Others would respond to this argument by casting it in the same light they would the manager of the first variation, who presumed the possibility of race-neutral typing tests all the while acceding unwittingly to racial conditions.

Before turning to the role of intention in these matters, consider the real-life example of racial profiling routinely used in law enforcement. Here, police use race as part of a repertoire of preemptive measures. Potential crimes are profiled against racial types where an associational logic discriminates amongst possible perpetrators. Examples abound: terrorists tend to look Middle Eastern, ergo ...; serial killers have historically been white males, therefore ...; and so on. Is anything wrong with this kind of racial discrimination? Some have argued that racial profiling is only practically, but not necessarily, wrong, and that under the right conditions the practice can even be good since it protects innocents, and especially so when beneficial for those of the profiled group (Risse 2006; Risse and Zeckhauser 2004). Practically, it can be challenging for police officers to use the tactic without abuse and, practically, it can be tricky for racialized societies to use the tactic without prejudice. But, the argument goes, these are bad applications of an otherwise not necessarily bad tool. Others have responded by arguing that racial profiling is practically wrong *because* it is necessarily wrong; for them, there is no way to racially profile without continuing and exacerbating conditions necessarily entailed in racially conditioned societies (Lever 2005, 2007, 2009, 2017; Lippert-Rasmussen 2006, 2013). There is for our purposes no need to dive into these debates. It enough to bring in racial profiling as a lived example of the complexities revolving around racial discrimination, where its goods and ills have been argued for and against.

The Primacy of (and Trouble with) Intention

The initial case whereby the manager chose Ben over Sam based on race is for most people obviously wrong, and the wrongness is expressed in the rationale “white people make better employees than black people.” Conversely, most would not consider wrong the manager’s actions in the first variation,

especially because Pat did not know that Sam was black and Ben was white. Yet, there could be, even in that scenario, as already laid out, plausible racial effects. So how are we to think about this?

One significant approach has been to turn to intention: what did Pat intend? Seen in this light Pat in the initial case is culpable insofar as he acted with racist intent. Pat's actions intended to discriminate against Sam using Sam's race as the decisive factor. Treatments of racial discrimination that accordingly base normative judgment on intention and imagine intent as internal to persons (something like a mental state) assume investigatory postures: insofar as racial discriminatory intent is discovered we have a problem. Following that discovery, there may be further investigation into the moral status of that discrimination, as in our second variation; but tellingly, any such further investigation will also have to do with intent, "Is the intent behind this instance of racial discrimination good or bad?" The status of identified intent in this secondary investigation, just like the presence of intent in the first investigation, makes the whole case revolve around intent and intent as internal to persons.

The problem is that there are plenty of cases in which intent cannot be found, at least not as readily as in the paradigm case, and yet something still rightly strikes us as wrong. This was the case in the final scenario about systematic and historical conditions and their institutional effects on Sam and those down the line. If one is committed to intent as the primary consideration and racist intent cannot be discovered one faces several possibilities: there is no moral problem with discrimination in this case; we are working with too narrow a conception of intention; or, intention should not play the role we've assigned it (with the implication that the paradigm case is not so paradigmatic after all).

In an illuminating essay, legal theorist David Strauss examines "discriminatory intent" as the concept through which US courts have historically considered racial discrimination cases (Strauss 1989; see also Strauss 1986, 2013). He arrives at two startling conclusions. First, over the course of its history the American judiciary and specifically the Supreme Court have considered several versions of "racial discrimination" only one of which focused on intention as its guiding doctrine. Others considered things that we would now associate with indirect and institutional racism and its historic and systemic conditions and effects. These other versions included intent, but in those approaches intent is seen as expressive of action, intent as that which makes action intelligent, not something internal to persons and causally prior to action. Once the Supreme Court and thence every lower court settled on the narrow conception of intent as the doctrine by which discrimination was to be understood, all these other considerations became irrelevant. This background history helps us understand Chief Justice John Roberts' aforementioned comment about "stopping discrimination based on race." What seemed naive now makes sense – for Roberts and his colleagues precedent determined that discrimination only be understood the one way (Murakawa and Beckett 2010). The implications of this foundational narrowness would have it that not only is the manager in the initial case wrong (making that case truly paradigmatic) but so is the manager in the second variation so far as he sought racial redress racially.

The second conclusion Strauss draws out is that intention, now the principal doctrine for the judiciary's treatment of racial discrimination, is hopelessly speculative and ultimately incoherent. Let us deal with the incoherence first. According to Strauss, discriminatory intent is premised on a conceptualization of impartiality that proves absurd, mainly for the reason that impartiality, or what is often called colorblindness, can only obtain by ignoring race as a determining social fact of American life. Imagining racial impartiality as a standard and that standard as the starting point for all considerations of racial discrimination is, Strauss shows by analogy, tantamount to asking whether abortion negatively affects pregnant men the same way it negatively affects pregnant women. The absurdity lies in the fact that men

cannot be pregnant and to entertain that possibility, as the basis for law no less, is to ignore a basic fact of life. Likewise, to imagine racial impartiality as a starting point for how we think about racial relations and the role of discrimination in those relations is to ignore a basic fact of life. To be pregnant is to be a woman and to be black in America or to be white in America is to live down the line from chattel slavery, Jim Crow, segregation, and so on; we might call this an anatomical fact of the body politic. Discriminatory intent as treated by the courts is premised on a blatant factual error leaving it incoherent as a concept. Every application following will show forth this incoherence.

Now on to the speculative character of intent and the peril of granting it so much weight. We came across this earlier when considering the investigatory posture assumed by internalized and causal formulations of intention. In most cases, individuals are not going to offer rationales of the kind, “white people make better employees than black people” so the search for intent will require further investigation. For instance, even expressed intentions, if the investigation gets that far, require interpretation. This is demonstrated simply by following the comment, “white people make better employees than black people” with the questions, “what might he have meant by that?” or “was that belief as decisive or as representative as we think?” Conceptualizing intention as internal allows it to become mysteriously abstract, leaving it inscrutable, perhaps a reason for its allure as an explanatory concept in cultures that prize individuality. But this leaves us confused when talking about social evils like racism: “Pat didn’t really mean that” or “Pat’s naiveté is culpably part of the problem.” The confusions might not be immediately evident when surveying the word’s ordinary and specialized uses. Ordinary people and Supreme Court justices just seem to know what they mean when they speak of intention. But what if one of the big reasons we have so little grasp of the moral significance of racial discrimination, racism, affirmative action, reparations, and racial profiling is because we discuss those things using a concept that has gotten away from us? This would at least offer some explanation for why we continue to wrestle so mightily with these issues. To be clear, the charge here is not about people having *lost* their concepts and therefore *no longer* making sense to one another, with the familiar nostalgic implications (Diamond 1988; Stout 2004). The issue is not that people do not make sense to each other, though certainly some people do not, but rather that they do make sense but the content of that sense is not substantive enough to bear things like serious moral notions. To explain this it helps to revisit some meta-ethical dilemmas.

In the 1950s British philosopher Elizabeth Anscombe presented a paper entitled “Modern Moral Philosophy” (Anscombe 1958b). Part of Anscombe’s argument was that moral judgment is severely hampered, perhaps to the point of ruin, by the lack of an established moral psychology. What she meant was that until one had a picture of what human beings *are* it does no good to suppose how human beings *ought to be*, in matters of racial discrimination and whatever else. No moral judgment can work out if it does not stem from a full-bodied picture of what is being judged. Saying whether something is good or bad presumes knowledge of what that thing is supposed to be. It would, for instance, be ridiculous to expect of horses academic essays. Essay writing, academic or not, is not an attribute of those things we call horses. One would, however, be within one’s rights to complain that an author’s academic submission failed to meet standards, just like one might complain that a horse is too slow, too obstinate, and so forth. Without agreement around what is under consideration normative judgment (normative judgment being judgment under a description of how something normally ought to be) cannot get off the ground (Anscombe 1979).

When Anscombe spoke of the need of moral psychologies what she was after was a picture of what it means for humans to act so that we have a way to assess subsequent human actions. Such a picture

would need to include the various features that make up humanness (i.e. beliefs, desires, intentions, soci-ality, etc.) and theories of how those features worked in relation to one another. Anscombe herself provided one such account in *Intention*: obtaining what one desires puts one on a path that requires negotiating what one believes about the world in relation to others; intention is found on the surface of action and their retrospective descriptions (Anscombe 2000; Kovesi 1967; Pinches 2002; Ryan 2011). From that picture one gains a sense of what it means to be properly human, enabling judgment of specific actions relative to that picture.

In the absence of this kind of moral reflection, moral judgements will take on other forms, staking matters on things like political or social duty or more likely consequences. Anscombe's historical point was that moral treatment based on consequences, a mode of moral reasoning she described as "consequentialism," has, absent a moral psychology, taken over for how modern societies think about ethics. Part of the reason people were drawn to accounts of morality based on duty or consequence was that no consensus could be reached on the properties of humanness, and coincidentally moralities based on duty and consequence did not require them. Under the guidance of duty or consequence racial discrimination and other issues will be treated through considerations of contractual rights and obligations of citizenship or utilitarian consequentialist calculations of racial policies. Anscombe was not denying that such conversations could be had, but only that they had much to do with morality. If we should want to consider these things morally, we would need to look elsewhere than duty or consequence.

Contemporary considerations of racial discrimination dependent on concepts of intention then proceed without a sufficient sense of their central doctrine. This is a significant lacuna. It puts us in a situation where we know intention is important but do not know why and therefore remain unable to produce much beyond confused and confusing thinking: "Pat didn't really mean that *and* his naiveté is culpably part of the problem." The institutionalized results look something like the sorry history and reasoning pointed out by Strauss. Conceptually, we can understand the Supreme Court's odd thinking on discriminatory intent as the attempt to adapt the language of intention to the philosophical projects of duty and consequences, culminating in a situation where people do not understand their obligations (e.g. sanctimoniously demanding political correctness or angrily rejecting it) and in resignation turn to cost-benefit analyses in order to determine whether the various prescriptions are worth their while; one can predict the results. The legal history is both microcosm and precursor to societal and personal confusions on matters of race, racism, and racial discrimination. It is not simply the fact that these issues go on and on but also that we believe we have found a way forward when in actuality we are stuck. Having committed ourselves to that one way, we continue to face additionally two things: further entrenchment and forfeiture of other options. The point is not only that we need less abstract accounts of intention (see for instance Bratman 1984, 1999) but also that those accounts will only do what we need within broader moral frameworks. In this way our difficulties with treating racial discrimination is epiphenomenal for our difficulties with treating anything at all.

Anscombe is often associated with something called analytical Thomism. Part of what it means to so characterize her is to say that Thomas Aquinas's moral psychology availed for her the kind of moral judgment she found otherwise missing in modern moral philosophy. Of course, it is not only Christianity that subscribes to full-bodied accounts of practical reason as a theoretical basis of normativity. Remember that it was from Muslims that Christians received an Aristotelian philosophy that inscribed the moral life as ends-directed and it was first Islam that prioritized in the moral life practical rather than theoretical

reason. It can be argued that the Judaism from which Christianity came represented a way of getting on in the world that did not have as part of its philosophical infrastructure the speculative aspects of Greek philosophy. Thomas Aquinas's prioritization on human moral psychology returned to the form if not the content of the Judaism at the origins of Christianity. Regardless of how one understands Christianity, Islam, and Judaism in relation to one another (the abrupt history cobbled together here notwithstanding) there can be little doubt that all three religious traditions carry normative accounts of humanness. To be sure, internal and external debates about what counts as human comprise significant parts of their respective discursive histories, but these disputes demonstrate the importance of the matter, how centrally these communities place moral description in the corporate work of normativity (for one rendering of contemporary forms along these lines, see Burrell 1992, 2000, 2014). This is also what is missing in many modern moral treatments of racial discrimination.

The Roman Catholic philosopher Jorge Garcia attempts to follow Anscombe's lead by offering an account of racism that looks at the character of racial discrimination in terms of relational disregard. In his appropriately titled entry, "The Heart of Racism," Garcia argues from a moral psychology of human action whereby a person's respective wants guides that person's behavior; individual desire shapes the heart of one's actions, making it intelligent, and hence is the proper aim of moral assessment (Garcia 1996; see also Garcia 1997, 2001, 2003). In the case of our initial manager, Pat's hiring decision came from a place of disregard for Sam insofar as Sam was black. Against the anticipated objections, Garcia believes that his account can accommodate the historical, systematic, and institutional dimensions of racism which in this view begins as, and leads to, individual disregard. In an astute critique of Garcia's argument, Charles Mills demonstrates how Garcia's argument comes up short. While we cannot get into Mills's whole argument, it is enough to say that Garcia does not provide a robust enough picture of human action to account for the many contours of racism, leaving himself vulnerable to critiques by political theorists like Mills (Mills 2003; see also Faucher and Machery 2009; Shelby 2002). Garcia's account of the racist heart depends on an implausibly autonomous picture of persons. Human mutuality proves too complex to speak of individuals short of the realized conventions, including racial ones, that comprise personhood. In his attempt to establish the role of individual character as important for matters of race, Garcia ends up passing over the crucial roles history, systems, and institutions play in the constitution of one's character (Cavell 1999; Hauerwas 1975; Tran 2017). For our purposes, this limitation proves the rule: Garcia was not wrong for attending to humanness in his treatment of racism and racial discrimination; he simply did not go as far as his intuitions could have taken him (Garcia 1990, 1991, 1995, 1997, 2008, 2011).

The Consolation of Postracialism

In the absence of modes of ethical reflection that can help us think through things like racial discrimination some have taken a different tack: hope for a society where racial discrimination drops out because race no longer matters. This movement is often referred to as post-racialism, but it is not quite correct to refer to *a* movement since there are several versions (see Bantum 2016; Gilroy 2000; Gines 2014; Glaude 2008; Hollinger 2006, 2011; Shelby 2014; Sundstrom 2008; Taylor 2014; Winant 2006, Winters 2016). Consider briefly three and their respective implications for racial discrimination:

- 1) We have as a society matured to the extent that race no longer plays the deleterious role it once did. Where and if racial discrimination creeps up, it is simply the death cry of a bygone era.
- 2) As a consequence of intermarriage and immigration race is or will soon no longer be discernable; it may still have meaning, but its meaning will be far different than what it is now. Once races are no longer identifiable, racial discrimination will end.
- 3) While neither (1) nor (2) is currently the case, they one day will be and we might as well aspire to them. Expanding the spirit of Chief Justice Roberts's words, we should begin to act now as we want to be: the way to stop discriminating on the basis of race is to stop discriminating on the basis of race.

No matter the many and significant differences between the three or their respective plausibility, they are the same in imagining a world where racial discrimination ceases to be. Rather than treating racial discrimination as the significant moral issue that it is, we look to circumvent matters by dropping race out of the equation. Especially if Anscombe is to be believed that we lack the resources to know how to think about racism beyond duty and consequence, we should seek another way. Or so the thinking goes.

CHAPTER 157

Religious Discrimination

Loren D. Lybarger

Introduction

Religious discrimination is a moral and legal concept as well as a sociological one. Morally and legally, it refers to a class of actions that violate religious freedom conventions and the associated value of tolerance. Article 18 of the Universal Declaration of Human Rights declares that:

Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance
(United Nations General Assembly 1948)

This provision expands earlier similar concepts contained, for example, in Article X of the French Declaration of the Rights of Man and of the Citizen and in the First Amendment of the United States Constitution, which links freedom of speech and assembly to the prohibition denying the right of the government to pass laws favoring (“establishing”) any particular religion or preventing the practice of religion.

The freedom of religion stipulations in the laws of France and the United States drew on an older conception of “toleration” that evolved during and after the Wars of Religion. Beginning with the Peace of Augsburg (1555) and then finally with the Peace of Westphalia (1648), the institution of toleration required the Holy Roman Empire to recognize Lutheranism and Calvinism and the sovereignty of rulers embracing these Protestant movements. It also granted individuals associated with Lutheran, Calvinist, and Roman Catholic Churches the freedom to express their beliefs, practice their religions, and migrate to territories ruled by sovereigns supporting their respective creeds.

Sociologically, religious discrimination refers to boundary-setting practices through which religious traditions and their associated communities, cultic and national, establish a shared identity in relation to perceived distinctions with other, competing religious traditions and communities. In setting boundaries, discrimination practices create status hierarchies. The discriminating group perceives itself as orthodox, enlightened, and thus superior; it perceives the targets as heretical, ignorant, and therefore inferior. For purposes of this entry, “religion” refers to cultural systems that promise salvation in relation to crises in society, the human body, and nature (Riesebrodt 2010). This promise is embedded within first-order practices that presume the existence of superhuman powers and the capacity to communicate

with and obtain the assistance of those powers (Riesebrodt 2010). Religious traditions are second-order practices that comment on, delineate, recommend, and defend (against competitors) the first-order practices (Riesebrodt 2010).

Empirically, religious discrimination manifests in two interrelated forms: (1) legal handicaps imposed on specific religions and (2) culturally conditioned prejudice, whether held by a majority population or by a minority group, toward members of other religious communities deemed heretical, “unbelieving,” and threatening. Legal handicaps can include “blasphemy” provisions as in Pakistan that serve to protect the status of the official state religion against the claims of competing sects. Pakistan’s Constitution guarantees the right of other religions to engage in their practices but a later amendment, the so-called “blasphemy” clause, limits the freedom of these other groups, particularly Ahmadi Muslims, to express and practice their beliefs publicly (see the Second Amendment in the Constitution of the Islamic Republic of Pakistan 1974). The underlying rationale for the amendment is enforcement of the superior status of specifically Sunnī Islam, the state’s established religion, and the declared source of Pakistan’s laws.

Legal restrictions can take other, subtle forms. As in Pakistan, Denmark has an officially established religion, Lutheranism. The country does not limit the public expression of other recognized religions through blasphemy laws. It does discriminate, however, through the tax code. A percentage of the national income tax that all Danes pay goes to support the Lutheran Church. Danes also record all births and deaths through an online church-based registry although objections from non-Lutherans have led to the creation of an alternative registration process. No other recognized religion in Denmark receives similar state financial support or performs a similar bureaucratic function (Laegaard 2011).

In explicitly secular states, like the United States, in which the First Amendment to the Constitution bars the official establishment of religion, courts and administrative agencies nevertheless must adjudicate the question of what is and is not a religion. This question arises, for example, in relation to the exemption of religious organizations from federal and state taxation, an exceedingly complex area of law. The Internal Revenue Service can strip a religious organization of its tax exempt status if it determines that the organization, because of the political behavior of its leadership, for example, has become a political lobbying group primarily. The criteria, however, are not entirely straightforward and are often politically contested. In May 2017, in response to pressure from Evangelical supporters, for example, President Donald J. Trump announced guidelines relaxing the Internal Revenue Service’s standards for determining the distinction between religious and political activity (Wagner and Bailey 2017).

The second type of religious discrimination, culturally conditioned prejudice, operates beyond the formal legal mechanisms of the state. Such discrimination can function, among other ways, through expectations of endogamy within religious communities. Various groups such as Orthodox Jews, Muslims, and Christians might institute actual prohibitions and exert reinforcing pressure through implicit community expectations or explicit sanctions (e.g. excommunication) against interreligious and even intra-religious marriages. If such marriages occur, often a community will require one or the other partner to renounce his or her prior religious loyalty and convert, thereby maintaining group cohesion.

Religious communities might also identify particular groups as threats and direct violence toward them in cases of extreme discrimination. The goal of violence in these cases is to reimpose status distinctions and hierarchies. Buddhist classifications of non-Buddhists in dehumanized terms – of Tamil Hindus in Sri Lanka, for instance – have provided justifications for violence to reinforce Buddhist dominance in a given region (Jerryson 2016; Tambiah 1992). Since September 11, 2001, Muslims have encountered not only increased law enforcement scrutiny but also spiking anti-Muslim sentiment in US society

(Pew Research Center 2017). A majority of white Evangelicals, in particular, believe Muslims do not belong in the United States (Shellnut 2017). Assaults on mosques and individual Muslims have accompanied this broad anti-Muslim sentiment (Kishi 2016). Culturally conditioned prejudice and discriminatory laws typically intertwine: prejudice can provide the inspiration and impetus for legislation handicapping a particular religious group, and such laws can justify and reinforce prejudice in the society and culture at large.

The remainder of this entry describes quantitative research that utilizes the twofold sociological definition just described. This research has sought to document and explain the prevalence, scope, and causes of religious discrimination. Underlying these studies is an implicit concern to understand the phenomenon of religious discrimination so as to strengthen religious freedom provisions. Recently, however, the idea of religious freedom has come under sustained criticism for its putative incoherence, ethnocentrism, and use as ideological justification for violent interventions by the United States and other Western powers in the Middle East and Central Asia. This entry describes and assesses this criticism, concluding that although there are dangers inherent in a notion of religious freedom, the concept nevertheless remains necessary to the prevention of abuses of conscience and to the defense of vulnerable religious minorities.

Measuring the Prevalence of Discrimination

A recent series of quantitative studies has established strong correlations between discriminatory laws and cases of religious discrimination (e.g. Akbaba 2009; Akbaba and Fox 2011; Finke, Martin, and Fox 2017; Fox 2013; Fox, James, and Li 2009; Sarkissian, Fox, and Akbaba 2011). Utilizing the religion and state minorities dataset, the studies analyze a diverse range of cases against various indicators of religious discrimination defined as “state restrictions on the religious practices or institutions of religious minorities that are not placed on the majority religion” (Akbaba and Fox 2011, 454). Their results reveal that no society registers a complete absence of religious discrimination; rather, there exists a spectrum of discriminatory practices and experiences.

In an early study, Akbaba (2009) surveyed 32 countries from North America and Europe to the Middle East and North Africa, Central Asia, Southeast Asia, and East Asia for the period between 1990 and 2004. The study utilized 24 indicators of discrimination, including:

restrictions on public observance of religious services, festivals and/or holidays, including the Sabbath; restrictions on building, leasing, repairing and/or maintaining places of worship; restrictions on access to places of worship; forced observance of religious laws of another group; restrictions on formal religious organizations; restrictions on the running of religious schools and/or religious education in general.

(Akbaba 2009, 329)

The study found that Western democracies, in which religious freedom guarantees were institutionalized, had significantly lower levels of discrimination compared with societies in other regions in which such provisions were weak or nonexistent. It found, as well, that although religious discrimination in the Middle East and North Africa was relatively high, it did not significantly exceed discrimination on average in Asian regions. Finally, the study found that despite the relatively low averages in Western

societies, rates of discrimination, especially against Muslims, had intensified after the attacks of September 11, 2001.

Akbaba and Fox (2011) and Fox (2013) followed up on the Akbaba (2009) findings by analyzing religious discrimination in Christian-majority states in Europe, the former Soviet Bloc, and North America, and Muslim-majority states in the Middle East and North Africa region, respectively. These studies used the same dataset and a similar list of discrimination indicators as Akbaba (2009). Akbaba and Fox (2011) sought to determine, in particular, not only the overall level of discrimination against religious minorities in Christian-majority societies but also whether Muslims in these settings experienced greater discrimination than other religious minorities. The study found that Muslims did not confront proportionately greater discrimination than other minorities. Moreover, the levels of discrimination in Christian-majority countries, with the exception of former Soviet Bloc states, were relatively low compared to non-Christian-majority countries. Fox (2013) focused on Muslim-majority countries. The study found that 45 of the 47 identified minorities – and all of the non-Muslim minorities – encountered religious discrimination. Minority Muslims, for example, Shi'a in majority Sunni countries, experienced the lowest level of discrimination. Christians contended with higher levels than Muslim minorities. Hindus, Baha'is, Druze, and Buddhists confronted the highest levels of discrimination.

Determining the causes of these varying levels of discrimination remains difficult and susceptible to value judgments. Claims about the “intolerance” and “theocratic nature” of Islam, for example, have too often substituted for empirically grounded analyses. Fox, James, and Li (2009), utilizing the “minorities at risk” dataset, offers an example of an empirical approach: the study demonstrates a strong correlation between “state religious exclusivity” and religious discrimination. State religious exclusivity refers to a situation in which a state has established an “official” religion “to the exclusion of all others.” The Kingdom of Saudi Arabia, which supports Wahhabi Salafism, restricting or repressing other forms of Islam and excluding non-Muslim religions, constitutes an extreme example. State support for a particular religion need not result in religious discrimination, however. Bowen (2010) demonstrates through a comparison of France and Indonesia as limit cases – one country does not establish or privilege any religion (France) while the other makes Islamic scriptural sources a basis of its legislation – that two very different regimes can nevertheless develop similar policies that mitigate religious discrimination. Such policies include extending legal protections and privileges to multiple “recognized religions” and preserving the supremacy of the state's authority over religious texts as the originating point for law.

Alongside structural political variables (e.g. state religious exclusivity), Sarkissian, Fox, and Akbaba (2011) found, as well, that cultural or “ideational” factors appear to explain varying levels of discrimination against minorities within a given society. In Muslim-majority contexts, for example, Hindus, Baha'is, Ahmadis, and Buddhists can experience greater degrees of discrimination than Christians. The reasons for the variance are historical and rooted in religious texts: Islamic religious tradition and political practice have traditionally recognized Christians and other so-called “Peoples of the Book” (*ahl al-kitāb*) as fellow monotheists, albeit misguided ones, and accordingly have not only tolerated but also granted such groups a certain degree of autonomy to organize their internal affairs in relation to their own religious laws and practices. Hindus and Buddhists have not always received the same level of qualified acceptance. Ahmadis and Baha'is, decried as apostate or heretical movements by authoritative religious bodies, have experienced high degrees of discrimination, formal and informal. The identity of the group thus correlates with the level of religious discrimination directed toward it. Finke, Martin, and Fox (2017) have confirmed and expanded these findings regarding state religious exclusivity and ideational factors.

Examining cases of 500 minority religions globally, they conclude that minority religious communities contend with discrimination when the state perceives them to be competing with the officially sanctioned religion and to be a danger to the cohesion of the wider society. A lack of independent judicial protection also contributes to the probability of discrimination in these instances. The identity of the community, moreover, can mitigate or reinforce the degree of prejudice and persecution.

The Asadian Critique of “Religious Discrimination”

Since the September 11, 2001 attacks and the subsequent US-led wars in Afghanistan and Iraq, a group of scholars across a range of fields, including Middle East studies, religious studies, and anthropology, have advanced a trenchant critique of the religious discrimination concept and the associated notion of religious freedom. Taking their cues from the writings of Talal Asad, these scholars have sought to debunk these terms and the underlying notion, rooted in international human rights conventions, of religion as a matter of individual conscience that they share. The criticisms trace the origins of the religious freedom idea to specifically Western discourses of secularity and individual rights and to the formation of the modern state and the corresponding secularizing delimitation of a restricted (privatized) yet always contested religious sphere. They note, moreover, the link between these Western concepts of religion and individual rights and the projection of Western power. The US wars in Afghanistan and Iraq – and the accompanying transformation of Islam into a symbol of atavistic religious extremism that threatens democracy and thereby justifies Western military intervention and confirms Western cultural superiority – constitute the prime contemporary examples of this phenomenon.

Among the Asadians, the work of the late Saba Mahmood is most forthright and persuasive in advancing these arguments. In a series of publications, beginning with *Politics of Piety* (2005), she puts forward an unrelenting critique of the supposed Orientalist underpinnings of liberal secularism, especially liberal feminism, and of Western notions of “tolerance” and human rights. In her analyses, Mahmood essentially inverts the object of interrogation and the corresponding trajectory of blame: secular-liberalism and the political order it imposes on the rest of the world, not Islam and Muslims or any other group deemed to contradict secular tolerance, are the true threat to the broad range of human possibilities for human flourishing, including “illiberal” ones that appear arbitrarily to restrict the agency and rights of women.

Mahmood expands these assertions in a subsequent critique of US governmental initiatives to promote a modern reform of Islam compatible with a secular-liberal order in the post-September 11, 2001 period (Mahmood 2006). She begins first by debunking the twin conceits of secularism: that it excludes (or should exclude) religion from the public domain and that it remains neutral with respect to particular religious claims. Following Talal Asad’s criticism of French *laïcité*, she argues that “secularism has sought not so much to banish religion from the public domain but to reshape the form it takes, the subjectivities it endorses, and the epistemological claims it can make” (Mahmood 2006, 326). In doing so, secularism and the secular state operate theologically, determining licit and illicit forms of religious doctrine and practice. Thus, in Mahmood’s paraphrase of Asad’s point, the “secular liberal state’s ongoing regulation of religious life should be understood not so much as an exception to the norm of liberal rule, but rather as an exception in the Schmittian sense: as an exercise of sovereign power” (Mahmood 2006, 327). An example of how the modern secular-liberal state redefines religion is the passage by the US

Congress of the International Religious Freedom Act (IRFA). Signed in 1998, the IRFA justified the expansion of the power of the US government to regulate “religious life on an international scale in the name of enforcing and protecting religious freedoms” (Mahmood 2006, 326). The significance of this law appears through the Asadian lens “as not an abrogation of the doctrine of secularism but its reasonable extension – particularly in light of the fact that the United States has emerged as *the* global power, one aspiring to render its definition of ‘the exception’ sovereign over the entirety of the geopolitical landscape” (Mahmood 2006, 326).

Another example to which Mahmood points is the George W. Bush administration’s “Muslim world outreach” (MWO) project. The MWO, which received initial funding of \$1.3 billion, advocated a “reformed” Islam receptive to the conditions and values of a secular democratic order, especially those of moderation and tolerance. The initiative directed its money to:

training Islamic preachers, establishing Islamic schools that counter the teachings of the now notorious fundamentalist *madrassas*, reforming public school curriculums, and media production (which includes establishing radio and satellite television stations, producing and distributing Islamic talk shows, and generally shaping the content of public religious debate within the existing media in Muslim countries) [with] the aim of ... foster[ing] what is now broadly called “moderate Islam” as an antidote and prophylactic to fundamentalist interpretations of Islam.

(Mahmood 2006, 331)

In the MWO, the secular state takes it upon itself to determine licit (reformed, liberal) and illicit (fundamentalist, illiberal) forms of religion and to actively intervene against the latter in defense of the former and of the secular order into which compatible forms of faith are to be integrated.

In later publications, Mahmood and other scholars sympathetic to Asadian antifoundationalism have deepened and broadened the assault on the religious freedom concept and the secular-liberalism that grounds it. In *Religious Difference in a Secular Age: A Minority Report* (2015), Mahmood turns the tables on secularist assumptions, arguing on the basis of fieldwork with Egyptian religious minorities that political secularism in Egypt has exacerbated, not solved, the problem of sectarian conflict, prejudice, and inequality in that country. In Sullivan, Hurd, and Mahmood (2015) the critique widens to include topics spanning deconstructive and genealogical analyses of the religious freedom concept as well as diverse empirical case studies from across the globe. Both types of contribution aim to demonstrate the incoherence, contingency, and bad faith of “religious freedom” as a concept and policy, especially in the context of the “neoliberalism” that takes root globally from the 1980s onward. They also seek to show the empirical and causal complexity of actual cases of state repression of, or majoritarian violence against, minority religious communities. Regarding the former point, the incoherence of the concept, the authors observe, “the deployments of religious freedom are multiple and contradictory, at times used to identify the virtuous and condemn the oppressor, other times on behalf of women and minorities, and sometimes to serve narrow sectarian interests of missionaries, governments, and religious authorities” (Sullivan, Fallers, and Mahmood 2015, 9). Multiple parties invoke the concept. What it means remains unclear at best. At worst, it serves to justify secular-liberal interventions that do great violence to societies or groups seen to be in violation of religious freedom norms.

Moreover, the authors point out, the forces at work in apparent situations of religious discrimination are often political and economic in character, not religious. The authors offer Pakistan as an example, “seen by many as a poster child for the urgency of the need for religious liberty” (Sullivan, Hurd, and Mahmood 2015, 3). They acknowledge that “violence against minorities (Ahmadis, Muslims [e.g. the Shi’a], and Christians, in particular) has increased over the past several decades, and intolerance toward dissenters has taken root” (3). The authors claim, however, that “the key historical factors that have produced this climate of intolerance and hatred are political and economic and thus cannot be addressed through religious liberty advocacy alone” (3). President Zia ul-Haq (1978–1988), in a bid to curry Islamist support, curtailed rights for women, minorities, and political opposition forces. Pakistan’s Inter-Service Intelligence, with the quiet support of the United States, moreover, actively cultivated the Taliban as a proxy force in Afghanistan. The authors conclude that “foregrounding religious freedom as *the* key to understanding Pakistan’s problems today blinds us to the political and economic pathologies of Pakistan” (emphasis in original, 4).

The Rohingya Muslims of Myanmar bear out similar conclusions. Careful examination reveals racial, ethnic, economic, and political factors at play; sorting which ones are the primary causes is next to impossible (Sullivan, Hurd, and Mahmood 2015). Nevertheless, government, media, and academics persist in claiming the absence of religious freedom is the main reason for the persecution of Rohingya (Sullivan, Hurd, and Mahmood 2015). The insistence plays into the hands of Buddhist majoritarian forces, which also construe matters in religious terms. Emphasizing religion consequently exacerbates rather than ameliorates the Rohingya situation (Sullivan, Hurd, and Mahmood 2015).

The Limits of Asadianism

The Asadian line of critique provides a salutary warning about the ideological and analytical pitfalls of religious freedom and religious discrimination discourse in a period in which the United States, with backing from other Western powers, has pursued a “global war on terror.” In its strong form, however, the critique undermines the foundation for defending any notion of universal rights. In *Religious Difference in a Secular Age* (2015) Mahmood exemplifies this problem by ultimately dismissing religious freedom as a dangerous and highly ideological slogan that masks the operations of power. The universal norms that human rights doctrines attempt to establish are, at best, highly relative, adapted, and deployed for a range of contested political projects. At worst, invocations of religious freedom serve to deceive. Sullivan, Hurd, and Mahmood conclude:

Listening to the deployment of this phrase *religious freedom*, across many contexts and registers, we have come to see it as a deeply ambiguous, even at times intentionally duplicitous, legal standard in domestic and international law, one that is often dependent on parochial anthropological and philosophical understandings of the human and of human society
(emphasis in original, Sullivan, Hurd, and Mahmood 2015, 8)

Not all contributors to *Politics of Religious Freedom* view religious freedom discourse in such dim terms. Laborde, while acknowledging the criticisms, argues nonetheless that the liberal state can expand

what counts as religious faith and commitment and thereby extend conscience protections to a wider range of expressions (Laborde 2015). Still, the overwhelming tendency in the volume is to view religious freedom discourse with great skepticism. Wendy Brown's chapter, the volume's final word on the matter, concludes that, contrary to the conceit of secularism to have achieved a liberation from religious authoritarianism on behalf of individual conscience, what actually has transpired has been to demand submission to an alternative regime of truth. As Brown puts it: "freedom's imbrication with sovereignty means that freedom is always driven and limned by the desire to be governed by the true authority, whether that authority is self, reason, God, family, revolution, rights, or philosophy" (Brown 2015, 332). Essentially, the liberal secular state has substituted one God for another.

Can state sovereignty itself, whether imitating, joining with, overturning, or displacing that of God, ever fail to invoke divine right or divine succession in its quotidian juridicism as well as in its exceptional words and deeds? Has any state not made its citizens oath-swearers? Has a state ever gone to war without a God on its side? No more than secular subjects, it would seem, can secular states be religiously free.

(Brown 2015, 333)

Brown's point is simple and true: power, if it is to be sustained, requires a normative justification instilled within and accepted by the governed. But not all such justifications for domination are identical. The invocation of natural law as a foundation for a constitutionally delineated set of rights is not the same thing as the invocation of the divine right of kings. The two assertions constitute historically, discursively, and analytically distinct conceptions of authority. To suggest that it all boils down to theology may be a neat polemical flourish but it ultimately confuses matters. Movements like the Moral Majority, radical Jewish religious nationalists, and the Muslim Brotherhood have taken direct aim at secularism, perceiving correctly that it contests and displaces religious justifications for the political order. This is not to deny the point that secular orders do not exclude religion so much as redefine its normative and institutional location: religion may cease to serve as a foundation for law; but the law might nevertheless recognize a distinct sphere for religion. Still, maintaining the analytical distinction between the two normative conceptions is crucial to understanding the specificity of, and potential for conflict between, political projects that invoke one or the other as a foundation.

The relativizing of rights discourse or, worse, the redefinition of it as "theological," has another unfortunate effect: the undermining of any universal foundation to contest oppression, religious or otherwise. Stateless groups, women, and minorities, including religious minorities, have relied on human rights conventions to fight repression. Palestinians, to cite one example, regularly invoke UN resolutions and the Hague Conventions in response to the abuses perpetrated against them by the Israeli state as well as by the Palestinian National Authority and Hamas. The invocation of rights in this context has not been without contradictions: the decades-long military occupation has led to cynicism but also productive critique of the so-called "human rights industry." The critique, however, is indicative of the demand for effective implementation of rights, not for their suspension or abrogation (Allen 2013). Similarly, in Argentina, the campaign to bring to justice the leaders of the military junta that "disappeared" more than 30,000 individuals between 1976 and 1983 has grounded its efforts in human rights. Groups like Las Madres de la Plaza continue to appeal to human rights frameworks in their protests against neoliberal economic policies, the erosion of state-supported social programs, and attempts to minimize the scale of the atrocities during the period of state terror (Lybarger, Damico, and Brudney 2018).

Women, too, especially those contending with regimes that invoke religious justifications for gender inequalities in law, invoke concepts of equality, democracy, and rights in their effort to forge a specifically secular space in which to achieve gender equity. In her critical review of Mahmood's *Politics of Piety*, Selim (2010) notes the dangers inherent in reifying religious milieus as distinct "life worlds" that secularism seeks to "reform" or "liberate" (and thus effectively erase, in Mahmood's view) rather than seeing them as actively constituted political positions engaged in a *Kulturkampf* aiming to restore a religious patriarchal order:

daʿwa [Islamic proselytizing] is not the "natural" expression of an ontological form of Egyptian women's agency grounded in "sentiments ... and sensibilities" that are finally untranslatable in terms of progressive "western" ideals, but an active political movement that explicitly strives to convert – or expel – the other.

(Selim 2010, para. 10)

As a political force, the women's *daʿwa* movement, in its appeal to lower-middle class and working-class women, has "facilitated the steady shrinking of the space in which Egyptian women have historically struggled to achieve full citizenship and equality under the law, whether at home, in the workplace, or on the street" (Selim 2010, para. 10). Selim effectively restores the secular-religious distinction that Mahmood and the Asadians elide (e.g. in their reduction of the secular to the theological). She does so because she perceives correctly that secularism constitutes a distinct political project that contests the premise of countervailing fundamentalist religious conceptions of social order. Selim concludes: "if we were to shift the terms of this conversation from the United States to Egypt, the 'lifeworld' in actual danger of becoming 'extinct or provisional' is that of feminism itself – dissident, secular, and anti-colonial" (Selim 2010, para. 12). The loss of this feminism would be "another great tragedy for Egypt and the region as a whole" (Selim 2010, para. 12).

For all of its contradictions and cynical manipulations, secularism and its attendant conception of universal human rights, including religious freedom, nevertheless provide ground on which to stand in contesting authoritarianism no matter what transcendent value it might claim for itself. Without such a framework, the basis for declaring abuses, including abuses of religious freedom and individual conscience, and mounting interventions to prevent and end such abuses evaporates. To speak of declaring, intervening, and ending risks the potential for the sorts of arrogant, imperialist violence of which the Asadians are so keenly and rightly critical. Yet, doing nothing or insisting that the "real" violence lies elsewhere, with the secular-liberal state, for example, hazards a dereliction of moral and political duty especially toward those most vulnerable to repression and discrimination: racial, ethnic, sexual, class, gender, religious. Not all forms of "intervention" are to be embraced but neither is intervention to be foreclosed on principle. The failure to act can be as morally reprehensible as an action undertaken under false pretenses or one that institutes repression in its own right.

Additionally, with particular regard to religious discrimination, the analytical emphasis on the "theological" hypocrisies of putatively secular power among the skeptics has the ironic and unfortunate result of reinforcing power at the expense of rights. The insistence of the critics of rights discourse that power and not religion is the crux of the matter unwittingly betrays the secularist biases of modern social science as much as it reflects the postcolonialist desire to expose the imperialist pretensions in politics and in the academy: the "true" explanation, as the thinking goes, is not

religion or religious freedom but rather “harder,” “more real” power interests. Religious freedom is merely a pretext masking actual material forces. Empirically and methodologically, however, this secularist bias can distort understanding of religious discrimination cases as well as undermine demands to implement religious freedom.

Conclusion

The tendency among the critics to dismiss the concern for religious freedom and religious discrimination as hopelessly ideological and analytically incoherent ignores the findings of the quantitative research described at the outset of this entry. These studies employ a clear definition of religious discrimination and measure its value neutrally in relation to multiple indicators across diverse societies globally. The warnings of the critics are not entirely misplaced, however: situations of religious discrimination invariably entail a range of complicating factors – political, historical, and economic – and there is a need for qualitative studies that probe these intersecting variables. Moreover, the discourse of rights has too frequently furnished justifications for violent interventions whose underlying objectives lie elsewhere, for example, in geopolitical interests. These considerations should spur a refining of definitions and analyses and a reinforcing of conventions, however, not a minimizing or dismissing of religious discrimination. Scholars, human rights activists, and governments have an intellectual, moral, and legal responsibility to address discrimination, religious and otherwise. Religious minorities facing discrimination, moreover, invoke human rights covenants and principles of democratic equality in their calls for support. What should the reaction be? Is a coordinated global response possible in the absence of a universally accepted frame of rights? The complexity of religious discrimination and state manipulation of rights discourse should not lead to abandoning such a universal frame but rather to improving and reinforcing it. A commitment to democratic rights and basic human dignity requires no less.

CHAPTER 158

Torture

Amy Laura Hall

Introduction

This entry should need only one word. No. Lisa Hajjar begins her essay “Does Torture Work? A Sociolegal Assessment of the Practice in Historical and Global Perspective” by stating, “If an article addressing the question ‘does torture work?’ had been solicited for the *Annual Review of Law and Social Science* a decade ago, it would have seemed as anomalous as an article entitled ‘does genocide work?’” (Hajjar 2009). More words are necessary. The 2008 guide to jurisprudence offered by the Association for the Prevention of Torture and the Center for Justice and International Law defines torture as including the following elements: physical pain, a person inflicting or ordering another person to inflict pain and, that this person is hoping to gain information related to the aims of someone who has something to gain related to the family, state, or nation involved (Hajjar 2009). Every form of accepted international law, from the United Nations to the European Union to the Geneva Convention, and every recognized world religion prohibits causing pain in order to secure truthful words from someone who is afraid for their own life or the lives of people they care about. Torture is both immoral and, according to even the most basic of definitions regarding “truth,” ineffective. So, again, why would not an encyclopedia article on “Torture” for an Encyclopedia of Religious Ethics need more than one word?

In “Crucifixion as Parodic Exaltation,” Joel Marcus presents a question in interpreting the use, during the Greco-Roman era, of prolonged, spectacularly public executions on elevated, crosswise structures. Why? There were speedier ways to kill someone. What work was the cross doing for the authorities of that era? He explains, “in the ancient Greco-Roman context, the idea of bringing a person down by raising him up must still have struck people as incongruous, and presumably those responsible for the practice would have been cognizant of this irony” (Marcus 2006). The “human object lesson” that was crucifixion “gained maximum visibility and hence optimal deterrent power.” Marcus writes “this strangely ‘exalting’ mode of execution was designed to mimic, parody, and puncture the pretensions of insubordinate transgressors by displaying a deliberately horrible mirror of their self-elevation.” He continues, “people of any class who had not shown proper deference to the emperor,” people who “demonstrated disdain for imperial rule,” were particularly subject to this form of torture. “The graphic tableau of the cross” is, Marcus argues, “a prime illustration of Michel Foucault’s thesis that the process of execution is a ‘penal liturgy’ designed to reveal the essence of the crime” (Marcus 2006, 79).

In *Fear: The History of a Political Idea*, intellectual historian Corey Robin enumerates different uses of fear as a means of control. Specifically, Robin is interested in “political fear,” by which he means “a people’s felt apprehension of some harm to their collective well-being . . .” (Robin 2004, 3). He links different ways that political fear works, and his analysis is helpful for thinking about how torture works politically. Robin explains that “political fear,” while “often associated with government acts,” is not unrelated to “the fear a woman has of her abusive husband, or the worker of her unkind employer.” Although by some accounts “these fears” are merely “personal, the product of an unfortunate but entirely private derangement of power,” Robin continues, “they are political . . . [and] spring from pervasive social inequities.” These established rules of order are, in turn, sustained by fear. Fear “sustain[s] long traditions of rule over women and workers” (Robin 2004, 3).

Robin explains that, during times of war, the form of fear used most obviously is to present “public objects of apprehension and concern” (Robin 2004, 18). The effort to normalize torture in the United States, and, to some extent, in other countries participating in the ongoing “war against terror” has involved depicting Muslim people as “public objects of apprehension and concern.” There has been another, related, political use of fear – a fear that “hover[s] quietly about the relationships between the powerful and the powerless, subtly influencing everyday conduct without requiring much in the way of active intimidation” (Robin 2004, 19). Linking Marcus’s insight about the use of crucifixion as a “display” or “liturgy” to warn against insubordination to state power, torture may “work” to, as Hajjar words it, “deter opposition and signal the costs of resistance.” Hajjar quotes Henry Shue’s 2004 essay on torture, noting that the purpose of torture may be “intimidation of persons other than the victim.” She continues, summarizing other essays on “modern torture regimes”: “Terroristic torture is an invisible spectacle because people are made fearful of torture that they know is occurring but do not actually see” (Hajjar 2009, 323). Torture, as a spectacle, as a possibility, as a hidden but known reality, may be used as part of a complex of social control.

Logistics of Torture

In a February 2016 essay for the *New York Review of Books* entitled “The Psychologists Take Power,” Tamsin Shaw follows up on an independent report issued in July 2015 after an investigation “into the collusion of APA [American Psychological Association] officials with the [U.S.] Department of Defense and the CIA to support torture.” Shaw’s essay is one resource for understanding that the “enhancement” involved in “enhanced interrogation techniques” involves an assessment of how best to dismember another human being’s psyche or, as some religious ethicists would say, how most effectively to destroy a person’s soul. As the US mainstream media continued to use the term “enhanced” when describing what was and is defined by international law as torture, the story Shaw covers is vital to the logistics of torture. She explains: that, by way of the July 2015 report, “we learn that following the attacks of September 11, in December 2001 the APA adopted an emergency ‘Resolution on Terrorism’ to encourage collaborations that would help psychologists fight terrorism.” This effort was, Shaw suggests, part of what passed for common sense at the time, as different professional organizations in the United States attempted to prove themselves useful. She continues, “The APA resolution resulted in a meeting, in December 2001, at the home of Martin Seligman of ‘an international group of sixteen distinguished professors and intelligence personnel’ to discuss responses to Islamic extremism.” This was not a niche

gathering; “Stephen Band, the chief of the Behavioral Science Unit at the FBI, later reported that ‘Seligman’s ‘gathering’ produced an extraordinary document that is being channeled on high (very high).”

Shaw notes that, according to documents related to the 2015 APA report and the 2014 “Report of the Senate Select Committee on Intelligence Committee Study of the Central Intelligence Agency’s Detention and Interrogation Program,” officials designated early on to determine whether “enhanced” forms of interrogation would yield information related to national security judged the “enhancement” recommended by Martin Seligman’s team of psychologists to be completely useless, again prompting the question “why?” Quoting Shaw’s summary here: “many techniques were tried . . . including sleep deprivation, keeping [Abu Zubaydah] in a freezing room and waterboarding him eighty-three times, to the point that he was hysterical, vomiting, and ultimately ‘completely unresponsive, with bubbles rising through his open, full mouth.” If torture does not “work,” then what work was torture doing at this time?

Given that torture does not “work” to procure intelligence, why have people working under the direction of the Central Intelligence Agency of the United States tortured people? To put the question crudely, what “work” does torture do? What “work” has been wrought by torture in the last two decades? This encyclopedia entry – this set of words containing information about torture – comes from a location central to one agency’s pursuit of intelligence. The applicable definition of “encyclopedia” in the *Oxford English Dictionary* is as follows: “A literary work containing extensive information on all branches of knowledge, usually arranged in alphabetical order.” This entry on torture comes from the vantage point of North Carolina in 2019. The North Carolina Commission on the Inquiry of Torture issued a report in September, 2018: “Torture Flights: North Carolina’s Role in the CIA Rendition and Torture Program.” The commission included legal scholars, clergy, veterans, and physicians working together to document how and why Johnston County Airport in Smithfield, North Carolina was used as a launching site as part of the United States Rendition, Detention, and Interrogation program. North Carolina was involved in trafficking people by air to places where people were assigned the task of torturing other people in the presence of other people tasked with recording words.

In his “Foreword” to the report, Alberto Mora, Former General Counsel (2001–2006), Department of the US Navy identifies the basics. He explains that the “connection between North Carolina and the government-sponsored torture of the era is clear: aircraft operated by at least one local company, based at North Carolina airfields that were subsidized by North Carolina revenues and subject to a measure of North Carolina regulation, and flown by North Carolina pilots, were engaged in the transport of dozens of captive individuals to multiple foreign sites, some managed by US officials, others by foreign governments, to be tortured” (Read 2018, 4). This 2018 report was part of an ongoing effort by citizen groups across the United States to document US sponsored torture. There was a saying about the Italian government under Benito Amilcare Andrea Mussolini. Tourists were said to have noted that Mussolini “made the trains run on time.” In their report, the North Carolina Commission documents how North Carolina made the rendition planes run on time.

Linguistics of Torture

In the United States, the word “torture” has become diluted in the cultural lexicon. This entry is written from a state that functions as a hub of the US military and of defense contracting to institutions of higher education. The author is interested in the dilution of the word and legal definition. To write accurately

about torture for this lexicon requires that the author ask the reader first to note how accustomed most readers in the United States have become to use of the word casually in polite company. The word “torture” has been used as a joke. As in, “this is torture!” People in the United States hear this word used in gridlocked traffic, while someone is trying on a swimsuit in front of a department store mirror, to describe a badly written song on the radio. The word “torture” has, through common parlance and also through film and television, become something rhetorically other than what it is, technically. Actual torture has also been diluted, visually, through the use of images on a screen.

Torture has been used repeatedly since September 11, 2001 in Western, popular culture, to entertain, to warn, and to frighten – from *Game of Thrones* to *24* to *Homeland* to complicated, story-driven video games. Actual people have been tortured as “human object lessons,” to use Marcus’s phrase, with originally limited, targeted viewing. And, at the same time, fictionalized depictions of torture have reached a wide, general audience. As recently as April, 2019, John Powers, a television critic for National Public Radio, summarized the popularity of *Game of Thrones* as “the world’s most popular show” at that time. Powers noted that “journalists are even writing elegiac articles about how, given our fragmented media environment, *Game of Thrones* may be the last TV series that everyone watches at the same time in order to be part of the conversation” (Powers 2019). While some journalists have been attempting for almost two decades to draw attention to a systemic, carefully orchestrated system of actual torture, watching (and commenting adroitly on) television series that depict torture has become a civic ritual, even a responsibility to be “part of the conversation.”

Seventeen years prior, in an essay for *The Christian Science Monitor*, Gregory M. Lamb noted the precipitous increase in television violence after September 11, 2001: “So much for media critics’ expectations that grisly fictional violence on TV would abate after the sobering events of September 11. Scenes of torture and sadism appeared on network entertainment TV at a rate nearly double that over the previous two years” (Lamb 2002). Lamb also named in particular a Parents Television Council (PTC) study that reported, in 2008, the show *24* was depicting procedural torture as commonplace: “A Parents Television Council review found that *24* showed 67 scenes of torture in the first five seasons. [The main character of *24*] Jack Bauer has been involved in more than 160 separate instances of violence since the show began (all six seasons) and has killed at least 71 individuals” (Lamb 2002). Other television programming was keeping up: “there were 110 scenes of torture on prime-time broadcast programming from 1995 to 2001. From 2002 to 2005, the number increased to 624 scenes of torture. Data from 2006 to 2007 showed that there were 212 scenes of torture” (Lamb 2002).

Bush and Cheney administration officials were open about their appreciation and emulation of the show *24*. In a succinct, 2008 review of two (then recent) books on torture – Jane Mayer’s *The Dark Side: The Inside Story of How the War on Terror Turned Into a War on American Ideals* and Philippe Sands’s *Torture Team: Rumsfeld’s Memo and the Betrayal of American Values* – journalist Dahlia Lithwick begins by noting, “The lawyers designing [the Central Intelligence Agency’s] interrogation techniques cited Jack Bauer more frequently than the Constitution” (Lithwick 2008). She continues, “according to British lawyer and writer [Philippe] Sands, Jack Bauer – played by Kiefer Sutherland – was an inspiration at early ‘brainstorming meetings’ of military officials at Guantanamo in September 2002.” Lithwick explains that “Diane Beaver, the staff judge advocate general who gave legal approval to 18 controversial interrogation techniques including waterboarding, sexual humiliation and terrorizing prisoners with dogs, told Sands that Bauer ‘gave people lots of ideas.’” Quoting Michael Chertoff, the Homeland Security chief, in his words to the Heritage Foundation about the show, it “reflects real life.” Lithwick continues:

“Even Supreme Court Justice Antonin Scalia, speaking in Canada last summer, shows a gift for this casual toggling between television and the Constitution. ‘Jack Bauer saved Los Angeles – He saved hundreds of thousands of lives,’ Scalia said. ‘Are you going to convict Jack Bauer?’” Lithwick concludes “The problem is not just that they all saw themselves in Jack Bauer. The problem was their failure to see what Bauer really represents within the legal universe of 24.”

Jane Mayer, the author of *The Dark Side* (one of the books reviewed by Lithwick) summarized the legal universe created by the show 24 in a 2007 essay for *The New Yorker*: “Each season of 24 . . . depicts a single, panic-laced day in which Jack Bauer . . . must unravel and undermine a conspiracy that imperils the nation” (Mayer 2007). She continues: “Terrorists are poised to set off nuclear bombs or bioweapons, or in some other way annihilate entire cities. The twisting story line forces Bauer and his colleagues to make a series of grim choices that pit liberty against security.” Mayer concludes that the show hinges on the choice, “invariably” for “coercion,” as, “[w]ith unnerving efficiency, suspects are beaten, suffocated, electrocuted, drugged, assaulted with knives, or more exotically abused.” And, “almost without fail, these suspects divulge critical secrets.”

This “unnerving efficiency,” with which “suspects divulge critical secrets” is not only unnerving but in direct contradiction to the facts about gathering “intelligence” through torture. Lisa Hajjar draws on historical scholarship on torture in Europe to explain “its basic flaw was recognized since the Roman era: What it proves is the individual’s capacity to endure pain rather than the veracity of the statements elicited.” Hajjar quotes J. H. Langbein’s 1978 essay for the *University of Chicago Law Review*, “Torture and plea bargaining,” “Judicial torture survived the centuries not because its defects had been concealed, but in spite of their having been long revealed” (Hajjar 2009, 319). The visual loop of torture continues to be part of the concealing of both basic, logistical truth and a longstanding, principled, moral consensus unequivocally against torture.

In a 2005 *New York Times* essay “Normalizing Torture on ‘24,’ ” Adam Green notes a pattern that links different ways fear works politically-socially with how torture works politically-socially. Torture is, by one sociolegal universe, not only necessary to procure “intelligence” but creates ligaments to connect people in a social body. Suffering torture becomes a macabre form of bond. This is another way that torture has “worked” politically in the United States. Green’s narrative summary is necessary to understand the perhaps counter-intuitive claim that torture has worked to *domesticate* torture.

What is most striking about torture on 24 is how it affects not only politics but also emotional and professional relationships. The C.T.U. data technician Sarah Gavin, interrogated with tasers to discover if she were a terrorist mole, subsequently returns to work showing no signs of trauma. Indeed, she marshals the clarity of mind to renegotiate her terms of employment with her superior, who approved her interrogation just hours earlier. The war-protester son of Secretary of Defense Heller, more alienated than ever after a session of sensory deprivation in a C.T.U. holding room, receives a strikingly paternal lecture from his father about why that treatment was appropriate. Even Audrey’s husband, Paul, somehow rises above his grievance to view his erstwhile tormentor as a buddy, helping Jack extract documents from a defense contractor and fend off attack – and even loyally taking a bullet for him. In all of these interactions, torture doesn’t deaden the feelings between people, rather it deepens them. . . . It is often noted that torture goes against the tenets of human community in two fundamental ways. Because torturers deny the basic humanity of their victims, it’s a violation of the norms governing everyday society. At the same time, torture constitutes society’s ultimate

perversion, shaking or breaking its victims' faith in humanity by turning their bodies and their deepest commitments – political or spiritual belief, love of family – against them to produce pain and fear. In the counterterrorist world of *24*, though, torture represents not the breakdown of a just society, but the turning point – at times even the starting point – for social relations. Through this artistic sleight of hand, the show makes torture appear normal. (Green 2005)

Note that the creators of *Game of Thrones* elicited what Terri Gross called (approvingly) “a huge and fanatical international fan base” by way of repeated scenes of rape, graphic violence, and prolonged sequences of human beings torturing human beings. The title of that review was “*Game Of Thrones* Keeps Its Finger On The Pulse,” a phrase that warrants another question: What are the characteristics of a social body that has been trained to pulsate in this particular way (Powers 2019)?

Torture is “Funny!”

“The Good Place” (2016–the present) is a television series produced in the United States specifically and explicitly about morality. The show has as its core conceit a universe in which the main characters are set up to be tortured for eternity by their proximity with one another. The show's creator, Michael Schur, has explained his aim for *The Good Place* is to bring moral philosophy to a mainstream, television audience. Schur has literally made torture a laughing matter. To quote the title of a *Vanity Fair* article: “*The Good Place* Makes Eternal, Hellish Torture So Hilarious.” Schur explains: “We've always tried to keep it sort of cartoon-y and silly, because what is actually happening is obviously awful for everyone.” He elaborates thus: “I have a 9-year-old son, and part of my thinking whenever we do something about how someone is being tortured is, ‘Would my 9-year-old son laugh at this?’ That's the sort of target audience for that kind of joke is, a 9-year-old boy . . . I've gamed it out in my head” (Bradley 2017). One possible reading of the series is that it upends the logic of suffering in shows like *24* and *Game of Thrones*, depicting visually an alternative form of living together toward mutual flourishing. This fact of an era remains. During the same two decades when the United States might have been, under different circumstances, engaged in a United Nations investigation about US sponsored torture, popular culture made “torture” a household word.

There are counterexamples. Yasiin Bey underwent the standard procedures for forcibly feeding a person imprisoned at Guantanamo Bay in 2013. Bey, known professionally in his career as a musician by the name Mos Def, underwent these procedures as part of a documentary directed by Asif Kapadia, in coordination with Reprieve, a human rights organization based in London, in an effort to bring awareness of the ongoing conditions at the US military prison at the Guantanamo Bay Naval Base in Guantanamo Bay, Cuba. In describing the effort, the *Guardian* notes, “in its fight against human rights abuses there is no substitute for the court of public opinion” (Ferguson 2013).

“Real Patriots”

The actual facts of whether torture “works” to elicit intelligence have been established since the Greco-Roman era. Regardless of the court of public opinion, the courts of ethics have been clear about the morality of torture for decades. This is what must strike a reader at present. The United Nations Convention

against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment was established in 1984 and, from the outset, in Part I, Article 1 of its founding resolution, it defines torture as:

... any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in or incidental to lawful sanctions. (United Nations 1984)

There are multiple practices covered by this definition: prolonged and repeated pouring water into a human being's face so that he or she feels as if they are drowning; forcing prolonged confinement in a small space alone, without even intermittent contact with another human being; putting another human being, while naked, into a freezing cold space, causing hypothermia; shocking another human being, while naked, on their genitalia; and forcing water into another human being's anus. This is not an exhaustive list. These were some of the practices encouraged under the auspices of the US Central Intelligence Agency after September 11, 2001. These practices are not allowed under US law and are explicitly disallowed under international law, including prohibitions established through the Geneva Conventions following World War II.

People working with and in the US have been assigned the role of torturer; people have been assigned the role of assigning the role of torturer; people have assigned the roles of these practices, determining who is best suited to which role. And people have been assigned the role of popularizing the necessity of these practices. There have been organizations and working groups of psychologists, filmmakers, musicians, clergy and scholarly writers charged with the work of determining how to implement the “deterrent power” of torture in the United States and abroad (to use Joel Marcus's phrase again). To paraphrase General Dwight D. Eisenhower in his departing speech, torturing other human beings became, after September 11, 2001, an industrial complex. Again, when threatened with torture, most human beings will respond with an answer that the executioner of such pain seems to be eliciting. But torture may “work” in that it may spread fear across a region, a nation-state, a village, or a family.

Scott Horton is an investigative journalist who has written extensively on US sponsored torture. In his 2015 essay for *Harper's Magazine*, “Company Men: Torture, treachery, and the CIA,” Horton writes that when “the Senate Select Committee on Intelligence released its torture report – or, more accurately, a redaction-studded version of the report's executive summary . . . [the authors] avoided the tepid style of most congressional prose, opting instead for a clinical, precise, and engaging narrative that patiently unfolds one of the most dysfunctional and embarrassing episodes in the history of American spycraft.” Horton contrasts the Senate Select Committee on Intelligence's narration with a story that was much more popularly regarded as truthful, a 2012 movie directed by Kathryn Bigelow, starring Jessica Chastain as a CIA operative serving on a team to use supposed intelligence to carry out the execution of Osama bin Laden. The Senate report “makes for an instructive comparison with *Zero Dark Thirty*, which was written and produced with the CIA's secret backing. The film tells the story of post-9/11 intelligence in the way Langley [a metonym for the Central Intelligence Agency] would like to have it told. But the Senate report unmasks the film as sheer fiction.” The report “has the distinct advantage of being true.”

This course of events was not inevitable. It was possible that the United States could have embarked on a thorough, public reckoning with the facts eventually highlighted by the (partial) publication of the Senate Select Committee on Intelligence's report in 2014. But there were new "objects of apprehension and concern" (to use Robin's phrase) in the form of "ISIS" (the Islamic State) and November elections for members of the US Congress. During an August, 2014 press briefing, Barack Obama, then in the middle of his second term as President of the United States, responded to a question about the Senate report by referring to people involved in the practice of torture as "real patriots," conceding that, although "we tortured some folks," and that torture is "contrary to our values," the acceptance of torture as a necessity is ethically conceivable. To quote from that briefing, President Obama explained, "I understand why it happened. I think it's important when we look back to recall how afraid people were after the Twin Towers fell and the Pentagon had been hit and the plane in Pennsylvania had fallen, and people did not know whether more attacks were imminent, and there was enormous pressure on our law enforcement and our national security teams to try to deal with this." He continued, "it's important for us not to feel too sanctimonious in retrospect about the tough job that those folks had. And a lot of those folks were working hard under enormous pressure and are real patriots" (Kludt 2014). His wording encourages empathy not only for the enlisted men and women expected to carry out torture, but for the people above them in the hierarchy who created the moral and legal architecture that made torture seem plausible.

In order better to understand the court of public opinion created at that time, and thus President Obama's own political options, it is helpful to note two images from a media source distributed widely in the United States in 2014. The line running underneath the address label for *The Week* was, in 2014, "ALL YOU NEED TO KNOW ABOUT EVERYTHING THAT MATTERS" (Capitalization in the original, 2014). In September of 2014, the two editions serving as parentheses around September 11, 2014 featured images about "ISIS." In the September 5, 2014 edition, the highlighted article was "Back on the Job: Obama's decision to respond to ISIS's challenge," with a political cartoon on the cover featuring Barack Obama, looking directly at a badge that would be known to most readers in the United States as a sheriff's badge from the "Western" classic *High Noon*. That storyline asks a basic question about a man's willingness to engage in a showdown against a murdering gang. In this case, the object of "apprehension and concern" is personified by a caricature of another man with brown skin, with a beard and a turban. The badge is engraved with the word "SHERIFF" and "OF THE WORLD." *The Week* also announced "The Best of the U.S. and International Media" on September 12, 2014, with a related image, of two young men looking at the image of a poster featuring a Muslim imam pointing, in a style referencing the Uncle Sam military recruitment poster from the United States in World War I and II, with the words "I WANT YOU" across the bottom. Two young men with brown skin are looking up at the poster. One young man has on an athletic jersey and is holding a basketball. To the side of the drawing is another brown-skinned young man with an athletic jersey, walking away from a basketball court and toward the poster. The racial dynamics are not subtle. Would the first African-American President of the United States be up to the task of performing as Sheriff of the World, or, as the second image implies, would he be on the side of the three other brown-skinned young men, "Joining the jihad" (Kludt 2014).

Postscript

Joel Marcus writes in his essay on crucifixion: "The greater the insolence, the higher the cross; the proper response to excessive haughtiness was, in the words of the Clint Eastwood film, to 'Hang 'Em High!'" If the work of torture in the years after September 11, 2001 was in part to strike fear and deter haughtiness,

and if the work of torture on television was in part to dull the sense that torture is neither moral nor normal, then it is my hope, as a citizen and a scholar in religious ethics that people will summon defiance and clarity. At a 2011 conference held in Durham, North Carolina, "Toward a Moral Consensus Against Torture," Scott Horton named as a possible, very unintended consequence of the US program in torture the acceleration of resistance that came to be known as the "Arab Spring." With the 2004 publication of images of US coordinated torture of human beings at the Abu Ghraib prison, Horton proposed, people suffering under dictatorships in the region gathered courage to resist regimes held up through a combination of foreign (often US) aid and torture. This possibility, that, contrary to American grand strategy, the exposure of actual torture may have elicited such courage helps this author to continue her pursuit of our common discipline.

CHAPTER 159

War and Non-State Group Violence

H. David Baer

Armed conflicts between states and non-state organized armed groups raise a distinctive set of moral issues which have assumed greater saliency since September 11, 2001. The so-called war on terror, which many understand to be a worldwide armed conflict against non-state organized armed groups, has challenged existing moral and legal frameworks for thinking through the ethics of war, producing important refinements to the international law of armed conflict while also generating significant debate. These debates center on concerns about how correctly to interpret and apply the rule of distinction. Insofar as the resolution of these debates depends also on *ius ad bellum* determinations, the debate over distinction in non-state conflicts raises broader questions about the ethics of war.

Religious ethicists generally consider issues of war from within the framework of just war theory. Just war theory distinguishes between *ius ad bellum* questions, which concern the conditions under which a state may rightly go to war, and *ius in bello* questions, which concern the proper use of force within the conduct of war. Central to *ius in bello* is the principle of discrimination, which stipulates broadly that armed force should be directed only against an enemy's counterforces. This broad principle of discrimination is closely related to the much more determinate rule of distinction known to international humanitarian law. The rule of distinction, laid out clearly in Article 48 of *Additional Protocol I to the Geneva Conventions*, requires, among other things, that parties distinguish in the conduct of hostilities between combatants and civilians.

Combatants, Civilians, the Rule of Distinction

Combatants and civilians hold different status and enjoy different protections. According to international law, combatants representing a state party to a conflict have a right to participate in hostilities. They enjoy what is sometimes called the "combatant's privilege," which means they are permitted to kill in war. If captured, *privileged combatants* are entitled to the protections afforded prisoners of war in the Third Geneva Convention. The corollary of the combatant's privilege is lethal liability. By virtue of their status as active members of the armed forces of a state party to a conflict, privileged combatants are legitimate targets of attack, and remain such for the duration of the war.

By contrast, civilians are legally immune from attack; they cannot be targeted. This immunity is corollary of the fact that civilians do not participate in hostilities. Civilians who choose to participate in

hostilities forfeit their immunity from attack. That does not mean, however, that they gain combatant's privilege. Rather civilians who become fighters are frequently described as *underprivileged combatants*.

As the name suggests, underprivileged combatants enjoy fewer protections than privileged combatants under international law. Members of an organized armed group fighting on behalf of a state party to an armed conflict (e.g. partisans) as well as civilians rising up spontaneously in a *levée en masse* are entitled to prisoner of war status if captured, provided they keep the rules of war. To this extent they enjoy some of the combatant's privilege. These exceptions aside, however, all other underprivileged combatants can be punished for acts of war they commit as combatants in accordance with domestic law. They are also legitimate objects of attack, although the extent to which they can be considered targets has become an open question.

The laws of war have been widely understood to stipulate that underprivileged combatants remain legitimate targets only so long as they are directly participating in hostilities. *Direct participation in hostilities* is a legal concept rooted in the language of *Additional Protocol I*. The meaning of the concept has become the focus of considerable debate since 2009, when the International Committee of the Red Cross (ICRC 2008) adopted an *Interpretive Guidance on the Notion of Direct Participation in Hostilities under International Humanitarian Law*. According to the *Interpretative Guidance* direct participation is constituted by acts which: (1) meet a necessary threshold of harm, (2) are part of the direct causal chain which produces the harm, and (3) are carried out within a belligerent nexus; that is, they are acts intended to support a party to the conflict. Civilians lose their immunity from military attack while they are participating in hostilities directly, but regain that immunity as soon as they cease from direct participation.

Underprivileged and privileged combatants are therefore identified differently. Privileged combatants are identified by *status*, that is, by their *membership* in the armed forces of a belligerent state. They retain their combatant status regardless of whether or not at a given moment they are directly participating in hostilities. This makes them permanent combatants for the duration of the war. By contrast, underprivileged combatants are identified by their *activity* or *function*, that is, by their direct *participation* in hostilities. They assume combatant status only so long as they participate in hostilities. This makes them temporary combatants.

The functional definition of underprivileged combatancy has been criticized by some, who allege it gives irregular combatants an unfair advantage fighting against privileged combatants. According to critics, the functional definition creates a "revolving door," whereby individuals can adopt the role of combatant at the moment of attack while benefiting from civilian protections at all other times. This problem, according to critics, is only compounded when fighting terrorism. Most of the time terrorists are not directly participating in hostilities, even as they plan their attacks and design their weapons. If we define terrorists as combatants only when they commit an attack, say the critics, we grant them a civilian immunity they do not deserve.

Responding to the force of these criticisms, legal scholars have started to develop a concept called *continuous combat function*. The ICRC's *Interpretive Guidance* proposed that irregular combatants assume a continuous combat function when they become members of the organized armed group of a non-state party. As long as such fighters retain their continuous combat function, they remain legitimate objects of attack. Judged by this standard, individuals belonging to terrorist organizations could be considered underprivileged combatants even when they are not actively engaged in an attack. The concept of continuous combat function might thus be construed as broadening the notion of direct participation. Individuals with a continuous combat function are continuing to participate in hostilities even when not immediately engaged in an attack.

Nevertheless, difficulties with the definition of underprivileged combatant remain. One cannot tell for certain whether fighters with a continuous combat function are being identified by virtue of function or status. The *Interpretive Guidance* offers the concept as part of its interpretation of direct participation in hostilities, which suggests the concept is related to activity. Presumably, individuals with a continuous combat function are *participating* in hostilities continuously. At the same time, individuals are identified as having a continuous combat function by virtue of their *membership* in an organized armed group. This suggests they possess a *status*, analogous to the status of combatants belonging to the armed forces of a state. Moreover, insofar as certain combatants are being identified on the basis of their membership in an organized armed group, one might wonder whether the notion of continuous combat function is performing any real conceptual work.

Religious ethicists and just war theorists have not considered questions concerning the definition of combatants at the level of detail found within the legal community. The just war principle of discrimination, however, would not appear to warrant, at least at first glance, a sharp demarcation between regular combatants and organized irregulars. Insofar as underprivileged combatants represent armed counterforce, they are military targets for the same reason as are privileged combatants. Although civilians who temporarily and spontaneously take part in hostilities reasonably regain their immunity from attack once they put down arms, the principle of discrimination itself seems to suggest that we ought to distinguish civilians who temporarily participate in hostilities from those irregulars who, by joining an organized armed group, assume a role in an ongoing conflict analogous to that held by the members of a regular armed force. The term continuous combat function interpreted in light of the just war principle of discrimination might, therefore, be understood as a placeholder for a set of criteria which are to be applied when attempting to determine whether an individual has joined an organized armed group. Whether international humanitarian law understands the term this way, however, is uncertain.

Even if continuous combat function is understood as a placeholder for criteria of membership, the criteria themselves are unclear and contested. International jurists disagree about whether to construe the criteria narrowly or broadly; that is, they disagree about how intimately involved with an organization an individual must be before taking on a continuous combat function. Must an individual be actively involved in the direct causal chain leading to a terrorist attack to have a continuous combat function; or does providing general support and resources, such as financing and shelter, count as membership in an organized terrorist group?

Targeted Killing

Targeted killing has emerged in recent decades as a central tactic in the so-called war on terror. Although the definition of targeted killing is not completely settled, it can be characterized as the premeditated, intentional killing of individually selected persons who are not in the physical custody of the party targeting them. Often targeted killings are carried out by unmanned drones or missiles, which can strike far from the field of battle. Critics allege that such killings amount to extrajudicial execution, whereas defenders claim the persons being targeted are members of organized armed groups with a continuous combat function. A crucial and contested issue, therefore, concerns whether targeted killings are properly evaluated within a law enforcement paradigm or according to the laws of war.

No serious debate exists over whether targeted killing is permitted in international armed conflicts between states. Such killings have clear precedent, including the oft cited case of Admiral Yamamoto

Isoroku, a commander of the Japanese navy whose airplane was deliberately shot down by US forces in World War II. Although Admiral Isoroku was specifically selected as a target ahead of time, no one disputes that targeting him conformed to the rule of distinction and the laws of war.

However, targeted killing today is most frequently directed against non-state actors, in particular, suspected terrorists. The contemporary controversy, therefore, concerns whether or not the so-called war on terror can be considered an armed conflict.

The laws of war distinguish between international and non-international armed conflicts. International conflicts, by definition, are conflicts between states. Non-international conflicts take place between a state and a non-state actor. Many legal scholars argue that non-international conflicts are also territorially circumscribed. By definition, they say, non-international conflicts occur within the territorial boundaries of a state. Although, in their view, targeted killing as an act of war is permitted in non-international conflicts, it is only permitted in non-international conflicts that are properly defined. For example, members of al-Qaeda engaged in a war in Afghanistan, or members of ISIS participating in a Syrian civil war, can be individually selected as targets because they are members of a non-state party to a conflict. However, members of al-Qaeda or ISIS residing in the imaginary country of Ruritania cannot be targeted as if they were participating in the wars in Afghanistan and Syria. According to this widely held legal view, outside geographically defined armed conflicts, the proper legal framework for responding to terrorists is law enforcement. The members of al-Qaeda or ISIS living in Ruritania are not directly participating in a specific armed conflict. Therefore, they should be arrested and tried according to the norms of law enforcement. To select in advance terrorists in Ruritania as targets to be killed, according to this line of reasoning, is to engage in extrajudicial executions.

Some legal scholars have expressed dissatisfaction with the approach described above. They object to the disjunctive definition of armed conflicts as either international or non-international. This false dichotomy, in their view, fails to take into account the nature of global terrorism and the actual practice of states. Such scholars argue that the laws of war should be expanded to include a third type of “transnational” armed conflict, a category more apt to the phenomenon of global terrorism. Governed by the laws of war rather than law enforcement, transnational conflicts would allow for the targeted killing of members of non-state armed groups which are parties to a global armed conflict against specific states.

Thus whether targeted killing in the “war on terror” can be justified hinges largely on *ius ad bellum* questions concerning *with whom* a state may go to war. Considering this question from the point of view of just war theory, one cannot say it admits a ready answer, nor has it received sustained attention from contemporary religious ethicists. That just war theory would endorse the rigid dichotomy between international and non-international conflicts found in international law is far from self-evident. At the same time, one must admit that the just war criteria frequently invoked by religious ethicists do not offer much guidance on how to distinguish between different types of armed conflicts; much less do they tell us how to distinguish between armed conflicts and situations of law enforcement.

A first step toward addressing such challenges might be to define the universal characteristics of every armed conflict. At the very least, every armed conflict would seem to require: (1) a high threshold of violence and harm and (2) the presence of an organized party to a conflict. Only acts of violence of sufficient intensity or duration would seem to threaten a nation’s basic security in ways that qualify as an armed conflict. Moreover, the ability of a party to sustain the threshold of violence which threatens a nation’s security would seem, at a minimum, to depend on a level of organization and structure characteristic of armed groups.

A general definition of armed conflict that cuts across the dichotomy between international and non-international conflicts might, on the one hand, open up theoretical space for a category like transnational conflict. Moreover, if the relevant just war principle for the conduct of every armed conflict is the principle of discrimination, then one might argue on just war grounds that, regardless of how the armed conflict is classified in international law, global terrorist organizations are the types of entities against which a state can apply counterforce. This would mean a case could be made on just war grounds for the targeted killing of individuals participating in transnational conflicts.

On the other hand, a general definition of armed conflict which insists on a high threshold of harm would imply that not every act of terrorism could be viewed as part of an armed conflict. Awful though they are, most acts of terrorism (e.g. street bombs, knife attacks, runaway vehicles, etc.) do not reach the threshold of harm characteristic of acts of war. One must distinguish, therefore, between acts of terrorism and terrorist *attacks*. Many acts of terrorism fall below the threshold of harm reached in mass shootings, instances of domestic violence which no one suggests should be handled according to the laws of war. Such acts of terrorism do not amount to the armed *attacks* characteristic of armed conflicts. Thus, insofar as global terrorist networks are plotting and committing acts of terror rather than acts of war, to view those networks as parties to an armed conflict would be a misclassification. In such cases, global terrorist networks would more closely resemble the Italian mafia than a non-state party to an armed conflict, and the targeted killing of their members would be illegitimate.

A general definition of armed conflict certainly allows for the possibility that some acts of terrorism cross the threshold of harm characteristic of armed attacks. The 9/11 attacks on the World Trade Center are recognized by most as both an act of terrorism and an act of aggression. Whether justifying the response to 9/11 requires developing a new category of transnational armed conflict is less clear. The 9/11 attacks were perpetrated by a terrorist organization territorially located in Afghanistan, protected by the Afghanistan state. The US response in Afghanistan was both an international and non-international conflict that fit squarely within the framework established by international humanitarian law. Perhaps the capability to mount terrorist attacks of sufficient violence to cross the threshold of harm characteristic of acts of war depends upon state sponsorship and protection. In that case, the justified military response to such attacks would fall comfortably within the existing categories of international and non-international armed conflict.

What the just war approach to these issues might be remains an open question, and one hopes religious ethicists committed to just war theory will take them up with increasing vigor. Questions about distinction and the use of force against non-state groups in the fight against global terrorism are likely to remain prominent in public debate for years to come.
