3 Islam

CHAPTER 66

Muslim Ethics?

Ebrahim Moosa

The Idea of Ethics in Islam

As part of the Abrahamic tradition, Muslim ethics both resemble and differ from the way ethics is practiced in Judaism and Christianity. Given the geographical breadth of the cultures in which Islam flourished, one cannot ignore the complex crucibles in which Muslim ethics were formed. The genealogy of Muslim ethics can be traced to pre-Islamic Arabia, Islamic Arabia, and Persian, Greek and *sūfī* (mystical) sources, as well as later influences of an African and Asian provenance. However, the formation of ethics is not a mechanical and instrumental use of cultural resources. It occurs gradually as Muslim communities organically become established within different cultural and social settings.

The discipline of ethics has several synonymous nomenclatures in Muslim culture. It is most often described as the “science of innate dispositions” (*‘ilm al-akhlāq*), the “science of comportment or conduct” (*‘ilm al-sulūk*) or “science of mysticism” (*‘ilm al-taṣawwuf*). From these descriptions it becomes obvious that the emphasis is almost exclusively focused on the formation and cultivation of individual practices. Two terms, rich in semantic signification, shape the debate on ethics: “character” (*khuluq*, pl. *akhlāq*) and “civility” or “etiquette” (*adab*, pl. *ādāb*).

The word *khuluq* has deep roots in Arabic culture and its use is preserved with its early semantic field. The Prophet Muḥammad is described as being given an “extraordinary noble character” (Qur’an 68:4). The word *khuluq*, say lexicologists, means “religion” (*dīn*), “nature” (*ṭabʿ*) and “natural disposition” (*saḥīyya*), “chivalry” (*muruwwa*) or even “habit” (*āda*). Essentially, says the Indian encyclopedist Tahānawī (d. ca. 1777), *khuluq* “is a habitus or disposition (*malaka*) with which the spirit produces certain acts spontaneously, without need of reflection, seeing, and pretense.” The other key word is *adab*, meaning right conduct or norms of right conduct. A standard definition is:

Right conduct (*adab*) constitutes the sum of prudential knowledge that shields one from all error in speech, acts, and character. It signifies all the Arabic sciences, for they cumulatively promote etiquette. *Adab* is thus a *habitus* or disposition (*malaka*) that protects one from disgrace. A perfectly urbane and cultivated person (*adīb*) is one who possesses this *habitus*. Therefore it is said: “the way to ultimate reality is through [the practice of] right conduct.” (Khānzāda 1980, 4)

Any disciplinary practice that results in the cultivation of a virtue is called norms of right conduct. Ethics is thus the cultivation of this disposition through education and practice. In fact, the Arabic word *adab* derives from the root signifying a feast, *ma'duba*, in order to nourish the body; but in its changed morphology it denotes a disciplinary practice for the nourishment of the mind.

Persian culture had the most significant impact on the development of ethics in subsequent Islamicate cultures. When speaking about disciplining the self (*adab al-nafs*), early ethicists also meant the ethics of speaking (*adab al-lisān*), as well as the proper attitude in order to internalize the norms one learns in pedagogy (*adab al-dars*), as both aspects are indispensable components for a complete ethical formation. 'Abd al-Nabī al-Aḥmadnagī (d. 1769), also an Indian encyclopedist, describes the discipline of the self as shielding the limbs and religious symbols from harm. The principle of non-maleficence, the obligation not to inflict harm intentionally, is a feature of Muslim ethics.

There is a famous report in which 'Ā'isha describes her husband, the Prophet Muḥammad, as having a character that mirrors the Qur'an. He is described as the embodiment of the values of the Qur'an. In this pithy statement, the linkage between the Qur'an and ethical values should not be ignored. The Prophet Muḥammad embodies the virtues proposed in the Qur'an. *Imitatio* Muḥammadi is an essential part of Muslim ethical teaching and practice. In fact, the Qur'an, addressing the Prophet Muḥammad, declares: "Indeed you have been endowed with a noble character" (Qur'an 68:4). Numerous prophetic reports place an extraordinary emphasis on the need to cultivate good character, *ḥusn al-khuluq*. It appears as if the aesthetic quality of beauty (*ḥusn*), inherent in good, serves as an antidote to sinful behavior.

Muslim ethics is a responsibility-based ethics, invoking reciprocal rights and duties. Thus a range of social actors from parents, teachers, and professionals to every individual is an active moral agent. Ethical discourses are part of all the major disciplines of religious thought, ranging from the teachings of the Qur'an, the prophetic reports, juridical literature, theology, and mysticism to philosophy and literature proper.

Historical Trends

The formal discipline of the "science of ethics" takes shape under the rubric of a philosophical-cum-literary genre with writers like Miskawayh (d. 1030), Abū Ḥayyān al-Tawḥīdī (d. 1023), and Abū al-Ḥasan al-'Āmirī (d. 992). In political ethics, the work of Abū al-Ḥasan al-Māwardī (d. 1058), is significant.

Early Muslim pietists like Hārith al-Muḥāsibī (d. 857), 'Ālī bin Muḥammad Ibn Ḥazm (d. 1064), Rāghib al-Isfahānī (d. ca. 1108), and Abū Ḥāmid al-Ghazālī (d. 1111) combined the disciplining of the self with the observance of ritual and legal obligations, better known as positive law (*fiqh*). Obedience to the norms derived from revelation (*sharī'a*) enables the individual to develop an inner disposition that is analogous to the notion of conscience. Readers of ethical treatises are taught how to undertake a personal moral diagnostic on sincerity, how to cultivate virtuous habits and good character.

Law and ethics are inseparable. Two terms, *fiqh* and *sharī'a*, signify what we would call the law. The *sharī'a* refers to revealed normative discourses; *fiqh* (literally meaning "discernment") is the interpretation and application of these discourses. Law (*fiqh*) has to meet two ends: the practices must fulfill worldly ends and simultaneously serve as acts of salvation. The founder of the Ḥanafī school of law, Abū Ḥanīfa (d. 767), described *fiqh* as "the soul/self knowing its rights and its duties." In *fiqh* discourse, piety,

morality, theology, and law coalesce into a single coherent narrative. Thus Abū Ḥanīfa named a very brief catechism “The Greater Discernment” (*al-fiqh al-akbar*) that included teachings on doctrines, law, and piety.

In the twelfth century, Ghazālī became dissatisfied with the popular and legalistic understanding of *fiqh* that was preoccupied with hairsplitting and arcane debates. True *fiqh*, he argued, meant more than just the law of marriage and divorce, contracts and sales. Issuing authoritative opinions or *juridical responsa* (*fatwā*, pl. *fatāwā*), Ghazālī said, was the least important part of the law. The earliest iteration of *fiqh* meant “the path of salvation in the afterlife.” The external law regulating one’s actions must be complemented by an inner discernment (*fiqh al-nafs*), said Ghazālī. *Fiqh* should ideally ensure that the practitioner develops a moral consciousness of the divine (*taqwā*).

Individual responsibility is at the center of Muslim ethics. Even if a jurist issues an informed opinion, the lay person is compelled to subject any ruling to the scrutiny of the inner forum of the conscience. The martyred jurist-mystic, ‘Ayn al-Quḍāt al-Hamadhānī (d. 1131), approves of expert knowledge and ethical guidance, but insists that it must be “an opinion of the heart” (*fatwā ’l-qalb*). For some ethicists, the heart is the seat of conscience and a more reliable ethical barometer than the jurists’ dispassionate reasoning. A report attributed to the Prophet says: “Solicit a response [*fatwā*] from your heart, even though the jurisconsult [*muftī*] had issued an opinion.”

Historian ‘Abd al-Raḥmān Ibn Khaldūn (d. 1406) points out that in early Islam *fiqh* was a *malaka* which he conceived of as a sociobiological-cum-moral disposition. Corrupted over time, this disposition became predisposed to soulless legalism. The professionalization of the law estranged it from its deeper ethical and moral impulses. It was the mystics who tried to revive ethics in its embodied form with an emphasis on autonomous intuitive cognition or aesthetic sensibility (*dhawq*), cultivated through extensive ascetic practices (*muḥāsaba*) and exercises in self-examination (*muḥāsaba*).

Theological Presuppositions and Legal Reasoning

Theological reasoning does indeed shape ethical and moral thinking. Competing theological schools of medieval Islam, namely the rational-pietist Mu‘tazila and the traditionalist-rational Ash‘arī schools, bequeathed rival moral theories. The Mu‘tazila promoted a doctrine of ethical objectivism in which reason and revelation were coeval. The Ash‘aris accepted discursive reason, but for them reason was always subject to the authority of revelation. Their position can be described as ethical subjectivism. For the Mu‘tazila, reason is capable of deciding if something is good or detestable; the Ash‘aris believe that something is good or bad because the divine discourse declares it to be so. Muslims affiliated to the Sunnī branch of Islam follow the Ash‘ari school or other analogous ones, while those affiliated to the Shī‘a branch developed their own type of rationality, also borrowing some ideas from the Mu‘tazila doctrine.

Modern debates on legal ethics are informed by premodern theological developments. Abū Ishāq al-Shāṭibī (d. 1388), the jurist from Muslim Spain, argued that one can rationally extrapolate the divine intent embedded in the shari‘a discourses. Shāṭibī theorizes a grand scheme of moral philosophy in relation to the law. The objectives of the shari‘a, he said, can be listed in terms of a three-tier hierarchical taxonomy of ethical categories or directives: (1) compelling necessity (*ḍarūriyāt*), (2) needs (*ḥājiyāt*), and (3) improvements (*taḥsināt*). Under the category of compelling necessity, the divine lawgiver seeks to

preserve and safeguard five ethical objectives: religion, life, property, reason, and paternity. Legal interpretations should ensure that the rules and judgments meet the broad rationality of these objectives, especially in areas where there are no prescribed rules. The category of needs urges the ethical-legal subject to seek out flexibility in order to eliminate hardship. The category of improvements promotes aesthetic perfection and ethical refinement to practices. A doctrine that also has broad currency is (4) public interest (*maṣlaḥa*). The assumption is that public interests are embedded within legal rules; one extreme view even considers public interest to trump the letter of the law. It is generally agreed that rules premised on custom and public interest considerations change with time and place.

Contemporary Approaches

Debates on contextual legal ethics remain muted in circles of traditional scholarship. Reformist and progressive tendencies take contextual ethics seriously. Very few traditionalist jurists – save for some in Iran and individuals elsewhere – are prepared to examine the letter of the law in terms of its ethical and moral imperatives as well as the altered human subjectivities over time produced by social, political, and economic changes. On issues such as the status of women within the family, marriage, and Islamic governance the ideological differences and methodological fault lines between the different Muslim approaches to ethics become apparent. By supplementing the inherited body of ethical knowledge, Muslim ethics can be updated as a discursive tradition. Of course, scholars have always debated the extent to which tradition is open to change, transformation, and updating. Mindful of this tension, one can outline some of the main contemporary approaches to Muslim ethics.

Kinds of Traditionalism

Traditionalism, or what some people call orthodoxy, is of course a highly differentiated category. *Doctrinaire traditionalism* is predominant in contemporary Islam. Here, the formalized legal and ethical opinions of past jurists form the canon of normative teachings. This normativity, rooted in the past, is regarded as universally valid and perfect as inherited from the ancients. To depart from the views of past authorities is only permitted in very limited instances. Furthermore, *fiqh* is not subject to historicization. Doctrinaire traditionalist circles are indeed receptive to ethics and mysticism. The weakness of this approach, however, lies in a static and idealistic notion of history. Authenticity lies in the experience and knowledge of the past savants of the tradition. Contemporary experiences do not qualify to influence adaptation and change to the law or ethics. Knowledge developed in the present is either resisted or reluctantly adopted in order to supplement or update the inherited corpus of ethical teachings. While rigidity is the face of traditionalism in the modern period, historically speaking this same tradition was much more robust and dynamic in its heyday. Versions of doctrinaire traditionalism are prevalent among large sections of Muslims in the Indian subcontinent, Africa, East and Central Asia, and the Middle East, and cuts across sectarian divisions of Sunnī and Shī'a.

Given the impact of modernity on some Muslim educational institutions in the Middle East and East Asia, often by means of coercive state-driven reforms, some sectors of Muslim traditionalism have taken on board elements of modernism in order to constitute neo-traditionalism. Here, both modernity and tradition are viewed as instruments for pragmatic ends. Some critics point out that this approach is

deficient in that it creates a dichotomous universe, effectively advocating the privatization of religion and also susceptible to the arbitrary use of tradition without a serious and rigorous knowledge project to sustain it. This neo-traditionalist approach is viewed with some skepticism by doctrinaire traditionalists for its eclectic and pragmatic mix of theological and legal doctrines derived from various schools.

Critical traditionalism is an emergent trend in Muslim ethics. Intellectuals who lean towards this ethical orientation view the juridical tradition as a work-in-progress. They invoke the critical thinkers of the past, historicize the tradition, and adopt contemporary knowledge and experience as part of tradition. Some in this trend identify themselves as progressive or critical Muslim thinkers. A growing number of scholars in the Muslim world, especially in Iran as well as those living in the Atlantic world, have succeeded in engaging both the Muslim and Western knowledge traditions. Often, those identified with critical traditionalism are engaged in new ethical and legal interpretations of the tradition. Here the attempt is to affect a new knowledge synthesis, starting with traditional Muslim religious sciences in a dialogical engagement with the modern social sciences and the humanities. Of course, this tradition appreciates the multiple and diverse identities of Muslims and the self-reflexive nature of their subjectivities. What sets the progressive or critical approach to tradition apart from other versions is its concern for the coexistence of the transcendent and the historical dimensions of a religious tradition. Norms are generated through the dynamic interaction between the transcendent authority and the mediation of human history. Each of these traditionalist approaches is a hermeneutical tradition and they vary in terms of their sophistication.

Doctrinaire traditionalists generally do not distinguish between facts and values. Some modernist influences on certain aspects of traditionalist thought have resulted in the anachronistic appropriation of values disembodied from practices. Since facts and historical realities continue to change, the challenge for critical traditionalism is to develop a hermeneutic that accounts for differences in practices rather than valorizing change along the lines of social Darwinism or modernist absolutism.

Modernist Transcendentalist Approaches

The hallmark of the modernist transcendentalist approach is that it is almost exclusively a revelation-centered hermeneutic without engaging with the equally important lived experience of the community (Sunna) as embodied in history. Even though this approach has some faint premodern antecedents, it received a boost in the modern period in the wake of a revolt against orthodox authoritarianism and clerical monopoly of authority. It also partly stems from a failure of nerve to deal with history. Exaggerated skepticism that reports of the Prophet may have been corrupted during their transmission has also undermined the status of historical sources and implicitly eviscerated the historicity of tradition. Thus, there is an almost exclusive reliance on the Qur'an as the idealized source of norms and a refusal to attach any credibility to history. There has been little attention to the fact that even transcendent values become manifest in competing and diverse formats.

Of course, anchoring an argument on the authority of a divine text can be rhetorically persuasive, but it also predisposes it to modernist absolutism. Ethics in the transcendentalist key plays down differences and insists that the latest iteration of ethics is the most perfect incarnation of the revealed norms. Past communities are implicitly judged as having failed to discover the true norms – only us moderns have grasped it. But this approach does have the advantage of appealing directly to the authority of scripture with the aura of deriving fresh inspiration from the revelation.

A major weakness of this approach is that it presumes that all norms are self-explanatory and literally derived from the revealed sources. It fails to account for the role of the interpreter as co-author of the normative tradition and our changing subjectivity in both the interpretation and practice of ethical traditions. It is a short step from transcendentalism to text-fundamentalism, with its accompanying ethical fundamentalism.

Conclusion

In order to reinvigorate law and ethics, many modern-day Muslim thinkers have sought relief in the doctrines of public interest and the ethical objectives of the law as construed centuries ago. However, these theories are employed in instrumentalist fashion. Contemporary Muslim thinkers have yet to devise a satisfactory ethical theory in which the dialogic of transcendent norms and history are effectively demonstrated. Perhaps the challenge for Muslim ethics is twofold. How does one foster a law and ethics that continuously responds to a dynamic and changing universe? And how do such changing theories and practices retain their sacrosanct character and simultaneously also meet the psychological criteria to serve as salvific practices and performances? It remains to be seen whether the critical traditionalist/progressive approach can address this pertinent issue of ethical theory.

CHAPTER 67

Origins of Islamic Ethics: Foundations and Constructions

A. Kevin Reinhart

Scope of the Entry

Islamic ethics is a term that provokes as much as it defines. Do religions have ethics or is the term irreducibly philosophical? And philosophy, as W. C. Smith (1984) has argued, is itself a competing religious tradition. Given that no religious tradition originates in a cultural vacuum, is “origins” a meaningful term?

Here, by “ethics” we mean norms for the moral life, and also second-order reflection on where the sources of moral norms are to be found, as well as how norms are to be derived from them. By “origins” we mean Islamic stipulations found particularly in the Qur’an that shaped Muslims’ moral action and reflection. In addition, we will discuss structural features and lacunae in those sources that were decisive in helping to create what we know as Islamic ethics. Finally, we will briefly show how these three helped form Islamic ethics in its early classical form.

In this entry we distinguish between “Islamic” – religion in the commonsense understanding of the term – and “Islamicate” – other cultural features of the society in which Islam was the dominant cultural force. This means that Islamicate *falsafah*, the tradition derived particularly from the peripatetic tradition of Greek philosophy, will not be considered here. Nor will we discuss the *adab* tradition of cultivated scribal cultural norms (Hodgson 1974 II, 169–196). Rather, it is from the Qur’an, the Sunnah, the Prophet, and the early community (as remembered and (re)constructed by subsequent Islamic scholarship), and from *kalām* theology, and above all from the shari’a or legal–moral sciences that we will draw our argument.

Impinging Norms

Historical Islam arose on the cultural fringes of the Eastern Mediterranean world.¹ In the cities of the Eastern Roman empire – Antioch, Beirut, Damascus, Alexandria, Smyrna, Caesarea, and, of course, Athens and Constantinople – the full range of Roman, Greek, and Christian moral content and technique

My earlier studies in Islamic ethics have profited from guidance by Ronald M. Green, Walter Sinnott-Armstrong, Bernard Gert, and Matthew Bagger.

1 We use this term to refer to the Islam of academic history. It is of course Muslim doctrine that Adam was the first Muslim and that from his time forward some form of Islam – perhaps corrupted but still grounded in Islam’s primordial truths – was in the world.

Encyclopedia of Religious Ethics 3 Volume Set, First Edition. Edited by William Schweiker.

© 2022 John Wiley & Sons Ltd. Published 2022 by John Wiley & Sons Ltd.

was freely in play. In the Persian empire the rich body of moral and religious thought was supported and propagated by the state. Non-Orthodox Christian and several varieties of Jewish thought found a home in greater Persia as well.

It is nearly impossible satisfactorily to sort out the extent to which any of these elements might have influenced the pre-Islamic Arabian world, or the Prophet himself. While it is unlikely that, say, Stoic ethics was read in Mecca, it is clear that to some extent all of these traditions formed a sort of *koiné* substrate to the moral and intellectual life of those living in the Eastern Mediterranean region.

Once Islam appears, it shares many structural features of its ethics with the older Near Eastern traditions. Among the things that Muslims shared with Jews and Christians was the belief that membership in a given community gave one a monopoly on truth and therefore salvation. Muslims also shared with them an ethical cosmology. Time was seen as moving toward a predetermined endpoint at which moral conduct would be eternally rewarded and vice would be punished. These traditions also shared a view of “progressive revelation.” God’s unfolding providence is manifested in an increasingly precise and detailed set of injunctions – on how to act, and for all to know how God regarded their community and those outside it. At a general level it is hard to say more than this: certain general ideas from other traditions show up in the earliest Islamic ethical understandings. This is hardly surprising when Islam was understood, among other things, as a movement to reform the previous two Near Eastern traditions (see Smith 1963).

Pre-Islamic Arab Ethics

It is easier to discern pre-Islamic Arab ethics in the ethics of early Islam. One example is “thanking the benefactor” (*shukr al-mun'im*). Someone who provides a benefaction to someone, particularly the giving or saving of life, has a claim (*aqq*) on the person benefacted. The benefactor is entitled to satisfaction (*riḍā*) and also to “thanksgiving” (*shukr*), that is, the public acknowledgment of the benefaction given to the benefactor. God has given humankind life, and what satisfies him in return is acknowledging his benefaction by moral conduct and observing the cultus (Qur’an 5:6–7). The Qur’an takes for granted this relationship of the giver and gifted and it is the basis of God’s claim to obedience and observance from humankind. In this manner, a pre-Islamic view of gratitude as a virtue passed into later Islamic society and became part of the social glue that held Islamic society together (see Mottahedeh 1980). Similarly, Muslim *convivencia* with the People of the Book (Jews and Christians) may be rooted in the pre-Islamic practice of *al-jizyah ‘an yadin*. This is a pre-Islamic practice of granting armistice in return for some gesture of subordination (Bravmann 1972, 199ff.). Such a gesture removes the need to defeat or kill an otherwise antagonistic enemy. Muslim disinclination to force conversion in the way Christians and Jews did may be located in this pre-Islamic warfare practice. In other domains, pre-Islamic values may be present in antithesis. Islamic rules of marriage and chastity are understandable seen as reactions against the anarchy of marriage and descent types in the Arabia of the sixth and seventh centuries. Other features of seventh-century Arabia – polygamy, slavery, warfare – are all taken for granted in the Qur’an, but disciplined, moderated, and re-understood.

Specifying the outside influences on the formative period of Islamic ethics is difficult. We have too little information on the Persian, Jewish, and Christian worlds at that time. Moreover, any one of these could have influenced the pre-Islamic Arab world and then, indirectly, Muslims, rather than directly

influencing Islamic morals and the premises that undergird it. For the study of Islamic ethics' origins, we are on firmer ground if we look to what all but the most radically skeptic scholars acknowledge to be the authentically early Islamic text: the Qur'an.

Qur'anic Ethics

The Qur'an is not a work of analytic ethics but a hortatory work that sometimes specifies the good, but more often assumes that humans know it. As the Qur'an understands it, the central fact of human life is that humans have moral agency (Qur'an 81; 82:5). The response of humans to the fact of agency is shaped, however, by their temperament.

Human beings are not fallen. The transgression of Adam was not a cosmic event that determined human nature, but the failure of one human being – the Prophet Adam – to obey God. That failure of course had consequences. Adam and his progeny were expelled from the Garden. Yet this was not, as for Christians, the origin of a permanent estrangement from God. In fact, Adam repented and was reconciled with God (Qur'an 2:31–8). Still, the Qur'an presents humans as inclined to be obedient to God in difficult times, but indifferent to God's commands when things go well (Qur'an 17:83). They are hasty, oppressive, and ignorant (Qur'an 17:11; 13:34; 33:72). Yet they also “love faith” and hate ingratitude, wickedness, and rebellion (Qur'an 49:7). Humans are God's bondsmen and bondswomen (the meaning of the common phrase “‘Abdallāh”) and owe God fealty and obedience.

Throughout its pages, the Qur'an assumes human beings can discern God's claim on them by the use of “reasoning” from signs² and “thinking” or “reflection.”³ Muslims are urged to reflect and consider, on the assumption that reflection is a means to moral knowledge. How it is that reflection leads to morality is not clear. Do we possess knowledge that we come to know through reflection, or do the structures of reflection lead us to moral knowledge? Yet the fact remains that the Qur'an constantly urges its hearers to do good (to parents, orphans, enemies, wives, husbands) without specifying of what the good consists. If humans can know the good, are they free to act upon that knowledge?

Human Volition

Theologians and philosophers require consistency, but that is seldom a feature of religious insight and vision, particularly one with a kerygmatic focus like that of the Qur'an. Islamic theologians became preoccupied quite early (see below) with the question of whether humans lived in a predestinarian world. The Qur'an keeps two insights bound together that might seem to be in tension but, for its distinctive vision, are not. The first is that, despite the perspicacity of the Islamic summons, humans respond in ways that disappoint. Moral conduct is sometimes outside the boundaries of suasion and intent. To this fact, the Qur'an responds: “Whom God leads astray, you can find no path for him” (Qur'an 30:29). “God caused their hearts to go astray. And God does not guide a corrupt people” (Qur'an 61:5). And, classically, “God leads astray whom He wishes and

² The Qur'an uses verbs from the root *-q-l-*; the noun form means “intellect” (*‘aql*).

³ Using verbs from the root *f-k-r*, whose nominal form (*fikr*) means “thought” or “reflection.”

guides to Himself those who turn to him” (Qur’an 13:27). Despite exposure to the good, persuasion, and revelation, one has to recognize that there are incomprehensible limits to some human moral actions.

Yet the Qur’an is nothing if not a call to moral conduct and moral reform. This would make no sense in the absence of an effective human volition. Repeated discussions of justice, the fact that God does not oppress and so others ought not to oppress their fellows, would be incomprehensible unless humans could freely act. “Who wishes, let him have faith; and who wishes, let him reject,” says the Qur’an (18:29). For “God does not charge a soul beyond what it can encompass. He has for it only what it has earned, and against it what it has earned” (Qur’an 2:286). God’s absolute authority is assumed, yet so is humankind’s capacity to act, and so, to be held responsible.

Individual and Community

Moral responsibility is the individual’s. It is he or she who will be judged for acts done and undone. The Qur’anic imagery of the Last Day focuses on experience – fear, foreboding, gratification, and ease – all sentiments that are experienced individually. There is no sense that mere membership in any community, including the Muslim, is sufficient to guarantee moral behavior and hence a felicitous outcome on the Day of Judgment. At the same time, the Qur’an envisions a community sharing with Christians and Jews certain values, but sociologically apart from them (Qur’an 5:51). It is a community constructed by “commanding the good and prohibiting the reprehensible,” a community in which Muslims offer “advice” to one another (Qur’an 7:79; Cook 2000). It is also a community that replaces the tribe and other kinship groups for purposes of marriage and association (Wagner 1977). Within the community, ethical requirements are shaped by roles: fathers and guardians, adult children responsible for parents, wives and mothers, husbands. What is required of one depends in part on what role one has (Qur’an 2:215; 2:180; 4:36).

Failure to act rightly is described as “going astray,” but also as “betrayal,” “enmity,” and “reneging on one’s contract” (Qur’an 20:121; 49:7; 66:3–4; 2:98). In later Qur’anic passages (that is, those that come first in the text of the Qur’an), there is a strong sense that ethical failure (e.g. fornication, lying, rejection of the Prophet and his message) makes the rejecter not just someone astray (*ḍāll*) but also an ingrate (*kāfir*) and an enemy of the community and of God (Qur’an 9:13–14). This perspective revalorizes the relationship between individual and community. It is not surprising that (a) some believed membership in the community guaranteed salvation, and (b) struggles over the issue of what constituted membership in the community and what merited expulsion raged so fiercely in early Islamic history (Hodgson 1974 I, 214–230).

In sum, there is no doubt that pre-Islamic pagan and Islamic Arabs shared values and ethical practices with Christians, Jews, Persians, and others in the Eastern Mediterranean milieu. Yet, given the state of the historiography, it is neither possible nor very interesting to try to determine the non-Arab, non-Islamic “influences” on Islam. With pagan Arab influences, we may be on somewhat firmer ground, though that ground is still mushy from speculation. The Qur’an gives us good evidence of early Islamic norms, not least because, read carefully, it is sometimes at variance with later Islamic ethics. The Qur’an represents humans as weak but capable of acting ethically, which it commands them to do. It exhorts Muslims to act virtuously, frequently without specifying what constitutes virtuous practice. It assumes humans can, by revelation, reflection, and intellectation, know the good from the bad. The Qur’an assumes human agency while recognizing that some seem doomed to act unjustly. Qur’anic ethics is

individualist while recognizing that knowledge can come from a community and is shaped by social and communal identities. What you must do sometimes depends on who you are.

Lacunae and Islamic Ethics

The key to the historical development of Islamic ethics is the structural tension between the appearance of a highly prescriptive tradition and the actual absence of a great deal of ethical prescription. The Qur'an requires one to act well, and very occasionally specifies in some detail what the good is. More often it simply exhorts the Muslim to do the good without further information. This created the expectation of detailed prescription without satisfying that expectation.

Take, for example, the repeated Qur'anic injunction to do "good deeds."⁴ What constitutes or defines the good act? Ethicists looking for a Golden Rule definition of the good, or a utilitarian definition, or indeed any definition at all will search in vain. Rather, the Qur'an assumes that its hearers, certainly in the context of the 610–632 CE period of its revelation, would know the good from the not-good. In another passage, Muslims are told to "vie with one another in good works" (*khayrāt*), but the good works in which one is to compete are assumed to be known (Qur'an 2:148; 3:114). Indeed, a very common term for the good is *al-ma'rūf*, literally, "the known." Yet because it is known, it is not specified.

This would seem an argument for a kind of moral intuitionism. As Islamic ethical thought developed, nevertheless, the very prescriptivism of parts of the Qur'an text, especially in the chronologically later passages (generally toward the front of the Qur'anic text), where the details of contracts, of marriage, and divorce are spelled out, sets up an expectation of precise stipulation that is frustrated by such general terms as "the known" and "good works."

The Qur'an's anticipation of listeners' moral consensus can be accounted for by its rhetorical strategies. Its text is very often an attempt not to innovate, but to recast what the listener already knows. Hence the text is allusive, intertextual. In Chapter 12 (*sūrat Yū suf*), the genealogical narrative of Genesis that explains, through the Joseph story, how the Canaanite Hebrews came to be exiled in Egypt, becomes instead a story of prophetic trial and triumph that foreshadows the mission and challenges of Muḥammad. Similarly, the morally corrective passages in the Qur'an give Arabians a new perspective and new reasons to do the good, which they likewise already know. It is not to ignorance but to heedlessness that the Qur'an attributes human failings. So the Qur'an's prescriptivism and moral exhortation are in tension with the lack of actual Qur'anic textual prescriptions.

At first, the coherence of Arabian society in effect glossed over the gap between prescriptivism and prescription, but the transition from the marginal, lightly urbanized, relatively "mechanical" society of early Islamic Arabia to a complex, highly urban society dissolved the shared values that constituted the moral intuition of Arabs. To provide further "moral data," more information to fill the void left by the disappearance of the organic Arab culture, Muslims essentially enlarged the corpus of scripture. Added to the now-standardized Qur'anic text were anecdotes of norms and practices by exemplary members of the community, eventually almost exclusively of Muḥammad. These anecdotes, called *ḥadīth*, taken as a

4 *ṣāliḥah* pl. *ṣāliḥāt*; and in various verbal forms; the root appears 171 times.

whole, constituted the Sunnah, the exemplary norms of Muslims. One may see these as the articulation (and often invention) of norms to fill in the gaps created by such vague terms as “the good” or “good deeds.” The gaps that provoked amplification through scripture also allowed the insertion of local practices and conventions. The indigenization that resulted was not only geographical and cultural, but also temporal. It was the way in which Islamic practices and values changed over time, a process Muslim jurists recognized in both their theory and their practice.

Evolution from Qur’anic to Third-Century Islamic Ethics

Qur’anic ethics was perhaps initially imperfectly understood and assimilated. It was certainly mixed with conventional norms of pre-Islamic Arabia. These norms, together with the practices of Muḥammad and of enthusiasts for the new religion, constituted Islamic ethics at the Prophet’s death. The religious transformation of Islam during the two-year War of Apostasy after the Prophet’s death (632–634) and the Liberation (*fath*) of Egypt, Syria, Iraq, and Iran (634–656) must have seen a shift as dramatic as that of Judaism after the destruction of the Temple or Christianity after the conversion of Constantine. During this period the caliphs Abū Bakr, ‘Umar, and ‘Uthmān reconstituted a fissiparating Islamic entity. They vindicated the truth of the Qur’anic message by subjugating much of the known world to Muslim Arabs.

Islam was now a free-standing entity. There was no Prophet to consult, nor could the Prophet consult God on behalf of the community. Muslims had to develop a practical moral epistemology, and techniques by which to discern what might be truly Islamic. The tradition preserves some accounts (perhaps authentic because contrary to later orthodoxies) about the abrogation of Prophetic practice by Abū Bakr and ‘Umar to reshape Islamic practice according to contemporary conditions (see Motzki 2002). The successes of Abū Bakr in preserving “Islam” and of ‘Umar in spreading Muslims, transformed Islam from a local ethnic cult to, eventually, a universal religion.⁵

The success of the “Emigrants” in conquering the Eastern Mediterranean lands and Persia was seen as a confirmation of Islam’s truth. History was now twinned with Islam and Islam was understood to be efficacious in the larger world as it had been in the Arabian peninsula. This confirmation of Islam, together with the leisure and power that the Islamicate conquests had brought, led to the development of religious specialists. These were individuals who, by reason of personal piety, expertise, or lineage were believed to have insight into matters Islamic. Islam’s success also gave them a task; namely, to bring human action into line with God’s imperatives and so to continue the harmony between God’s desires and Muslim action that, so they believed, had led to historical success. These experts elaborated the Qur’anic and praxic corpus into what became Islamic theology, law, and the ascetic spirituality that eventually was called Sufism. At first these formed three interpenetrating domains: the spiritual–ascetic, the legal–moral, and the theoretical.

5 That it was an ethnic cult at its beginning – at least in Arab understanding – is suggested by Qur’anic emphasis on the Qur’an as an Arabic document, and the Prophet as a national and ethnic figure. (Qur’an 7:157, where references to “illiteracy” should be read instead as “national.” See EI2 s.v. *ummī*; Qur’an 16:103; 26:195.) Moreover, when the Arabs emerged into Syria the testimony of non-Muslims is that these earliest Muslims – describing themselves as “Emigrants [in God’s way]” – refused access to Islam to non-Arabs (Hoyland 1997, 337–343). Later piety wishes to depict Islam as perfectly formed by the time of the Prophet’s death.

Islamic theological ethics was concerned initially with two problems: membership in/leadership of the community, and predestination/moral responsibility. In the moral rigorism of early Islam these issues were inextricably bound together. Did moral failure mean expulsion from the community? Did moral failure disqualify one from leading the community? Was there a moral obligation to overthrow a corrupt leader? If acts were preordained by God as some passages of the Qur'an suggest, then was moral criticism possible? Was rebellion a defiance of God's providence? (Watt 1973).

In a letter attributed to al-Ḥasan al-Basrī (643–728) for the caliph 'Abd Marwan we see the beginnings of systematic thought about preordination. This develops into the theological position of Human Capacity (*qadar*), held most famously by the Mu'tazilah theological school. Al-Ḥasan worked through the issue by contextual and commonsense readings of crucial Qur'anic texts.

God – He is exalted – has said {If you reject (*kufṛ*), God has no need of you, though He is not pleased with the rejection of His bondsmen; and if you acknowledge (*shukr*) He is pleased therewith for you. (39:7)} Were, “rejection” (*kufṛ*) what God decreed (*al-qadā'*) and determined (*al-qadar*), then He would have been pleased with it, as something He occasioned. God does not decree something and then be displeased with it; neither are injustice or oppression any [part] of the decree of God: but His command to do the virtuous (“the recognized” *al-ma'rūf*), and justice, and good deeds, and to be agreeable to one's kin is His decree.

On this question of human capacity, the response of al-Ḥasan's critics was largely pious slogans and a repudiation of the capacity of logic and precise argumentation to determine religious truth. In addition, *ḥadīth* were forged condemning the *Qadariyyah* by name. By the early 930s, scholars like Ibn Kullāb (d. ca. 854) and al-Ash'arī (d. ca. 936) had begun deploying the techniques of formal theology in defense of predestinarian positions. Eventually, for many, it became a matter of dogma that capacity is God's alone. Elaborate metaphysical constructs were created to reconcile predeterminism with human responsibility. Yet, at the level of moral sensibility, it is not clear that this dogma had any impact. Indeed, theology ceased by the twelfth century to be a significant moral science, for Muslims. They seem to have regarded things over which humans reasonably have control to be matters of moral responsibility, and those over which they did not have control to be God's decree.

We can see the early stages of another ethical tendency in a letter to the caliph 'Umar b. 'Abdal 'azīz attributed also to al-Ḥasan. There is little direct engagement with the texts of scripture in the letter; but, rather, a reflective spiritual engagement with its sentiments. This leads al-Ḥasan to an ascetic, world-renouncing perspective that devalued not only the pursuit of wealth but also any esteem for one's time in this world except as preparation for the next. It reveals an epistemology that was the very essence of later Sufism, one that valued contemplation and religious experience as sources of a religious knowledge that informed and paralleled scriptural knowledge.

Know that reflection prompts to righteousness and acting according to righteousness; remorse over evil prompts to leaving [evil]. What passes away – though it be much – is not the equal of what abides, though seeking it be arduous. Bearing temporary pain followed by long ease is better than hastening to temporary ease that is followed by abiding pain.

[The world] was presented, with its keys and its treasures, to our Prophet, upon whom be God's blessings and peace. He did not take them, though there would have been no sin in it, but he

scorned to accept them, though there was no impediment to doing so: He would not have been diminished a whit in God's sight. But the Prophet knew that God loathed a thing, so the Prophet loathed it; [He] belittled a thing so [the Prophet] belittled it; [God] disparaged a thing so he disparaged it.

These sentiments were not only those of marginal ascetics but were embedded in sermons, books of advice, and countless hortatory works. What is striking is that the devaluation of the world did not mean disengagement from it. The people who wrote and listened to these works participated in politics, married and had children, were employed, and lived in houses. Yet their valuation of these activities was remarkably low.

The continued engagement with the world and suspicion of radical removal from it results from a third ethical trend in early Islam. Islam's legal-moral sciences (called *fiqh*) and its ancillaries were to be the central intellectual discipline of Islam. They were the lens through which Muslims regarded virtuous and vicious acts and the instrument with which they sought to probe, categorize, and understand the good and the reprehensible. The inception of Islamic jurisprudence is seen in a letter plausibly attributed to the caliph 'Umar b. 'Abdal'aziz (r. 717–720), to whom allegedly the letter just quoted was addressed (Ibn 'Abd al-ḥakam and 'Ubayd 1927, 198 [my trans.]; see Reinhart 2001).

The “religion of God,” who sent His Book via Muḥammad, which he sent down to him, is to obey God and follow His command and avoid what He proscribed and observe His Boundaries (*ḥudūdah*)⁶ and do His Duties and permit what he permits and forbid what He forbids and acknowledge His right (*ḥaqq*)⁷ [to do so] and to judge according to what He has sent down in [the Book]. Whoever follows the guidance of God is well-guided and whoever impedes one from it {Has gone astray from the Path (Q2:108)}.

The task of Muslims, as they early understood it, was to determine what God had forbidden and allowed, to find his boundaries, and do his duties. While in the period of 'Umar b. 'Abdal'aziz these key terms probably had limited meanings, they opened up to the increasingly diverse world in which Muslims found themselves and incited assessment of all that confronted them.

By the time of al-Shāfi'ī (d. 820) less than one hundred years later, Islamic ethics is embedded in a nascent science of Islamic jurisprudence. The result, eventually, is a world which is sacramentalized. No act is of indifferent value: every act is either required, encouraged, permitted, discouraged, or forbidden (Reinhart 1983). Finding God's Duties (*farḍ*) is now a task for specialists with a distinct disciplinary epistemology. The motivation remains piety and apprehension of the Last Day. Yet the system is now on its way to becoming a complex casuistry that can estimate the virtues and vices of every possible human act and some that, if not impossible, are at least improbable.

6 Later *ḥadd* (pl. *ḥudūd*) comes to be a technical term for the five crimes for which there are mandatory punishments (drunkenness, theft, adultery, slander, highway robbery). At 'Umar's time I do not think it had this restricted meaning, but meant rather the bottom-line rules of moral conduct.

7 The word means “truth,” “right,” but here, also, the claim that someone has on someone or something.

Conclusion

Islamic ethics originated in a complex world of various and competing norms – of other religions, Hellenistic reflection, pagan heroics, and debts of honor. The Qur'an no doubt reflects, and in many cases assumes, the existence of these norms, but refashions them in characteristic ways. As important as what the Qur'an says, is what it does not say. Those silences were challenges to Muslim scholars in the centuries to come.

Within two centuries, three characteristic approaches to ethics had appeared: a theological, speculative approach; an ascetic-spiritual approach; and a legal praxic-oriented approach. Though the legal approach developed into the “queen of the Islamic sciences,” the other two did not disappear. Together, they formed a rich reservoir of possibilities and approaches that subsequent Muslims draw from and elaborate upon.

CHAPTER 68

Islamic Ethics: Differentiations

Abdulaziz Sachedina

This entry emphasizes an inherent plurality in Islamic ethical discourse. The pluralist nature of Islamic religious discourse is inevitably bolstered by the absence of a religious institution resembling a church and an organized body of experts speaking on behalf of the entire tradition. Muslim theologians-cum-jurists belonging to different schools of thought have maintained a variety of opinions regarding human moral agency, sources of moral cognition and methods of ethical deliberations, and classifications of moral acts as required or recommended, forbidden or reprehensible. This entry will outline the main schools without going into all the subsequent variations that appeared, sometimes within a single school of ethical thought. Its essential argument is founded upon the variations in hermeneutical strategies pursued by representative Sunnī and Shī'ite theologians, to differentiate between the two main trends of ethical thought that dominate discussions about the ontology of moral action even today: (1) rationalist-objectivist and (2) theistic-subjectivist ethics. These two trends have also been a marked rationalist-traditionalist divide among Muslim scholars. Clearly, theological disputations about human freewill and predestination in relation to God's justice provided the critical evaluation of a moral act and its ascription to a human agent. Accordingly, I shall limit my analysis of differentiations to theological ethical discourse. Philosophical ethics, with its emphasis on purification of the human soul through the perfection of human character, which was taken up by Muslim philosophers and mystics, is beyond the scope of this entry.

Ethics in the sense of structured moral reasoning is a post-Qur'anic development that one studies in Muslim theology, rather than in the juridical corpus of the Shari'a. Some Western studies on Islamic ethics have argued that the essence of Islamic ethics should be sought in the Shari'a rather than Muslim theology (Reinhart 1983). Yet while the Qur'an offers normative moral guidance, it also takes seriously the cultural-historical context connected with the application of these norms in assessing moral responsibility. There is recognition of relativity in the matter of application. The Shari'a integrates only part of the ethical concerns connected with human conscience or intuitive ethical knowledge in its legal ordinances (Fakhry 1994a). As demonstrated below, Islamic legal theory recognizes an overlap between legal and ethical action guides without pronouncing the resolution as more than what the Sacred Lawgiver wishes humans to know, namely, moral and religious duties whose performance guarantees salvation and reward in the Hereafter.

Theological Debates Arising from the Qur'an

Islamic theological debates were shaped by the question of human agency and divine providence. These early debates had their genesis in the determination of the responsibility for the sinful behavior of those who were in power. Did they act as God's free agents or were their acts predetermined by God's overpowering will? To be sure, the Qur'an suggested a multifaceted correlation between divine predetermination and human responsibility. Inasmuch as human beings are free agents, they can reject God's guidance, although, because of their innate disposition (*fiṭra*) prompting or even urging them subtly to believe in God, they cannot find any valid excuse for this rejection. When human beings choose to reject this guidance, God denies further guidance to them (Qur'an 16:104). This denial of guidance clearly pertains to the guidance that would lead to the procurement of the desirable end, not to the initial moral guidance that is engraved in the hearts of all human beings, in the form of an innate disposition, to guide them toward the good end.

Significantly, it is at this point that theological differences among Muslim scholars become striking. These differences are rooted in two conflicting conceptions of human responsibility in the procurement of divine justice. The scripture-based discussions on human ethical responsibility were dominated by the proponents of the two major schools of Sunnī Muslim dialectical theology: Mu'tazilite and Ash'arite. Shī'ite Muslim theology shared its ethical epistemology with Mu'tazilites.

The basic Mu'tazilite thesis is that human beings, having been endowed with an innate capacity to know right and wrong, and having been endowed with free will, are responsible for their actions before a just God. Furthermore, good and evil are rational categories that can be known by intuitive reason, independent of revelation. God created the human intellect in such a way that, if unhindered by social traditions and conventions, it is capable of perceiving good and evil objectively. This is a corollary of their main thesis that God's justice depends on the objective knowledge of good and evil, as determined by reason, whether the Lawgiver pronounces it so or not. Without such objective ethical knowledge, and in the absence of any contact with a prophet or sacred scriptures, no human being can be held accountable for his or her deeds. In other words, Mu'tazilites maintained a form of rationalist objectivism (see Hourani 1971) that was further elaborated by guidance through revelation.

The Mu'tazilite standpoint was challenged by Ash'arites who rejected the idea of natural reason as an autonomous source of religious-moral guidance. They maintained that good and evil are as God commanded them in the scripture. It is presumptuous to judge God's action. For Mu'tazilites, Ash'arites argue, there is no way, within the bounds of ordinary logic, to explain the relationship of God's power to human actions. It is more realistic to maintain that everything that happens is the result of God's will, without explanation or justification.

However, Ash'arites distinguished between the actions of responsible human beings and actions attributed to natural laws. Human responsibility is not the result of free choice; rather, God alone creates all actions directly. How does a human being become accountable for his or her actions? This was the source of moral quandary. If human acts are predetermined by God's will, then what is the purpose of the Day of Judgment and the final reward or punishment? Ash'arites introduced the doctrine of "voluntary acquisition" to answer this question. In some actions, they maintained, a special quality of voluntary acquisition was superadded by God's will, thereby making the individual a voluntary agent and responsible for his or her action. Human responsibility is the result of God's will known through the revelation (the Qur'an and the Tradition, ascribed to the Prophet). This attitude of Ash'arites to ethical

knowledge is theistic subjectivism. All ethical values are dependent upon determinations of God's will expressed in the form of revelation, which is both eternal and immutable.

Both these theological standpoints were based on the interpretation of Qur'anic passages. On the one hand, the Qur'an contains passages that would support the Mu'tazilite position, which emphasized the complete responsibility in responding to the call of both natural guidance and guidance through revelation. On the other hand, it has passages that could support the Ash'arite viewpoint, which upheld the omnipotence of God, and hence denied humans any role in responding to divine guidance (Rāzī 1938). The Qur'an allows for both human volition and divine will in the matter of accepting or rejecting faith that entailed the responsibility for procuring justice on earth.

The Nature of Islamic Ethical Discourse

When one considers the normative sources for standards of conduct and character it becomes obvious that besides scriptural sources, Muslim scholars recognized the value of decisions derived from specific human conditions as an equally valid source for social ethics. Early on, the theologian-jurists conceded that the scriptural sources could not easily cover every situation that might arise, especially when Muslim political rule required rules for urban life, commerce, and government in advanced countries. How exactly was the intellectual endeavor to be directed to discover the rationale (*'illa*) behind certain paradigm rulings provided in God's commandments, in order to formulate principles for future decisions?

The question had important implications for the administrators who were faced with the practical necessity to make justifiable legal rulings. There was a fear of reason in deriving the details of law. The fear was based on the presumption that if independent human reason could judge what is right and wrong, it could rule on what God could rightly prescribe for humans. It was admitted that although the details of the revealed law can be known through reason and aid human beings in cultivating the moral life, human intelligence was unable to discover what the reason for a particular law is, let alone demonstrate the truth of a particular assertion of the divine commandment. The divine commandments to which one must adhere if one is to achieve a specific end prescribed in the revealed law are not objectively accessible to human reason. Judgments of reason were arbitrary, as demonstrated by the fact of their contradicting each other, and reflected the personal desire of the legal expert.

One problem, then, was resolving the substantive role of reason in understanding the implicit rationale of a paradigm case and elaborating the juridical-ethical dimension of revelation as it relates to the conduct of human affairs in public and private spheres. Another problem was situating credible religious authority empowered to provide validation to the ethical-legal reasoning associated with the philosophy behind legal rulings. On the one hand, following the lead of Sunnī jurists like Shāfi'ī (d. 820) and Aḥmad b. Ḥanbal (d. 855), Sunnī Islam located that authority in revelation. These scholars maintained the Sunnī doctrines expounded by the predominant Ash'ari Sunnī theologians. Among these doctrines was the one that maintained one could work out an entire system of Islamic law based on juridical elaboration of the scriptural sources. On the other hand, following the line of thought maintained by the Shī'ite Imams, Shī'ite Islam located that authority in the rightful successors of the Prophet. The Shī'ite Imams maintained there was an ongoing revelatory guidance available in the

expository ability of human reason in comprehending the divine revelation. It is exemplified by the solutions offered by the Shi'ite leadership.

In general, Muslim theologian-jurists paid more attention to God's creation than God's nature per se. In addition, they discussed human beings' relation to God as the Creator, Lawgiver, and Judge. They were also interested in understanding the extent of God's power and human free will as it affected the search for a right prescription for human behavior. In view of the absence of the institutionalized religious body that could provide the necessary validation of legal-moral decisions, the problem of determining the Sacred Lawgiver's intent behind juridical-ethical rulings was not an easy task. The intellectual activity related to Islamic juridical-ethical tradition can be summed up as the attempt to relate specific moral-legal rulings to the divine purposes expressed in the form of norms and rules in revelation. Given the incomplete state of knowledge about present circumstances and future contingencies, the jurists proceeded to make ethical judgments with a cautious attitude on the basis of what seemed most likely to be the case. Such ethical judgments were normally appended with a clear, pious statement that the ruling lacked certainty. Only God was knowledgeable about the true state of affairs.¹

In due course, jurists were able to identify two methods for understanding the justification behind a legal-ethical decision. Sometimes the rationale was derived directly from the explicit statements of the Qur'an and the Tradition that set forth the purpose of legislation. At other times, human reason discovered the relationship between the ruling and the rationale. The jurists admitted and determined the substantive role of human reasoning in making valid legal or moral decisions. Moreover, human reason's role depended upon the jurists' comprehension of the nature of ethical knowledge and the means by which humans can access information about good and evil. In other words, it depended upon the way the human act was defined in terms of human ethical discernment about good and evil and the relation of the human act to God's will. Any advocacy of reason as a substantive rather than formal source for procuring moral-legal verdicts required authorization derived from revelation. All the jurist-theologians, whether Sunnī or Shi'ite, maintained that without the endorsement of revelation reason could not become an independent source of moral-legal decisions.

This attitude towards reason has its roots in the belief that God's knowledge of the circumstances and of the consequences in any situation of ethical dilemma is exhaustive and infallible. The revealed sources had provided the underlying rationale for some moral-legal rulings when declaring them obligatory or prohibited. Yet, on a number of issues, juridical rulings were expressed simply as God's commands that had to be obeyed without knowing the reasons behind them. For instance, the rationale behind the duty of seeking medical treatment is to avoid grave and irremediable harm to oneself, whereas the reason for the prohibition on taking human life is the sanctity of life as declared by the revelation. The commandments were simply part of God's prerogative as the Creator to demand unquestioning obedience. To act in a manner contrary to divine commands is to act immorally and unlawfully. The major issue in legal thought, then, was related to defining the admissibility and the parameters of human reasoning as a substantive source for legal-moral decisions.

1 The usual practice among Muslim jurists is to end their judicial opinion (*fatwā*) with a statement *allāh'ālim*, that is, "God knows best," indicating that the opinion was given on the basis of what seemed most likely to be the case, rather than claiming that this was an absolute and un rebuttable opinion, which could be derived only from the Qur'an and the Traditions.

Rationalist and Traditionalist Ethical Reasoning in the Revelation

The use of “rationalist” and “traditionalist” in this section conforms to the general identification of the two major trends in Islamic theological–ethical discourse above. Based on their cautious attitude toward reason as a substantive source for ethical–legal judgments, Mu‘tazilites and Shī‘ites fall into the rationalist group. In contrast, due to their emphasis on revelation, especially the Tradition, Ash‘arites fall into the traditionalist group. The process of formulating the methodology for deriving sound ethical–legal decisions was undertaken with a clear view of providing principles and rules for deriving predictable judgments in all matters of interpersonal relationships. Central to this discussion was the analytical treatment of the twin concepts of justice (usually defined as “putting something in its appropriate place”) and obligation (sometimes defined as “promulgation of divine command and prohibition”). The concept of justice provided a theoretical stance on the question of human obedience to divine commands and the extent of human capacity in carrying out moral–religious obligations. The concept of obligation defined the nature of divine command and provided deontological grounds for complying with it. The commandments have reasons of their own that can be explained in terms of the function they fulfill for the good of humankind.

Gradually, these two responses emerged to meet the pressing need of providing consistent and authentic guidance in the matter of social ethics. Some prominent jurists of the tenth and eleventh centuries maintained that in deciding questions on which there was no specific guidance available from the normative sources of Islamic law and ethics, judges and lawyers had to make rational judgments independent of revelation. This was certainly the case when the law did not provide for peculiar situations. This was, obviously, the rationalist group. Other jurists disapproved of this rational method as not adequately anchored in the normative sources. They insisted that no legal or moral judgment was valid if not based on the revelation. There was no way for humanity to know the meaning of justice outside the divine revelation. In fact, the traditionalists contended, justice is nothing but carrying out the requirements of the revealed law. The revealed law, the Shari‘a, provided the scales for justice in all those actions that were declared morally and legally obligatory. Eventually, the traditionalist thesis became the standard view held by the majority of Sunnī Muslims. Some Sunnī and the majority of the Shī‘ite Muslims, on the other hand, maintained the rationalist thesis with some adjustment in conformity to their doctrine about the supreme religious authority of the Imam (see Hourani 1971; Fakhry 1994a, 1994b).

This cautious and even negative evaluation of reason in traditionalist ethics had a parallel in the systematization of juridical theory among Muslim jurists. The ethical–legal problem-resolving device was in search of a fundamental principle that could function as a template for the formulation of emerging ethical–legal decisions. The expansion of Muslim political rule beyond Arabia raised questions about the application of the rulings provided by the revelation. The jurists were quick to realize that such absolute application without considering the specific social and cultural context of these rulings was not without problems. After all, the rulings provided by the revelation emphasized specific human conditions related to custom, everyday human behavior, and ordinary language used to convey moral precepts and attitudes to life in Arabian society. Even when the moral law is wholly promulgated through divine legislation in the form of the Qur‘an and the Tradition, such a law is objective because of the diversity that can be observed among human beings.

Very early on scholars of jurisprudence were led to distinguish between duties to God (ritual duties) and duties to fellow human beings (social transactions). Ritual duties were not conditioned by specific human conditions, and hence were absolutely binding. Social transactions were necessarily conditioned

by human existence in specific social and political contexts, and hence adjustable to the needs of time. It was in the latter sphere of interpersonal relations that the jurists needed to provide fresh rulings generated by changing conditions. The entire area of social ethics in Islam falls thereby under the social transaction sections of jurisprudence. However, authoritative decisions in matters of social ethics could not be derived without first determining the nature of human acts under obligation. The divine command, understood in terms of religious–moral obligation, provided the entire ethical code of conduct and a teleological view of humankind and the world. Violation of divine command, as Muslim jurists taught, is immoral on the grounds that it interferes with the pursuit of perfection that would guarantee salvation in the Hereafter. Ultimately, human salvation is directly connected with human conduct, that is, the subject matter of legal–theological ethics.

Every category of act, whether classified as incumbent, recommended, permitted, disapproved, or forbidden in the Shari'a, is founded upon explicit or implicit rules in the Qur'an or the Tradition. Thus, Shari'a, as a religious–ethical system, is theoretically able to discover the divine judgment on every category of human act in the area of "ritual duties" and "social transactions." However, Shari'a also investigates the revelatory sources, and the consensus of the learned, for their admission as evidence in deducing fresh cases occurring in different contexts. This part of juridical studies is concerned with legal principles or jurisprudence. Islamic jurisprudence is an inquiry into the principles of normative ethical judgments on external human acts. The philosophical aspects of ethics of action are concerned with fundamental questions about whether intellect on its own can rule things necessary, good, or evil (see Madkur 1960).

Categorizing Necessary, Good, and Evil Acts

To understand the impact of moral epistemology as worked out by the rationalist and traditionalist scholars, we need to see the way obligation or duty is defined and applied in practice. The derivation of ethical judgments (obligatory, recommended, and so on) is related to the ontology of good and evil in human acts. Ultimately, any valuation of divine or human acts is dependent upon the way relevant categories are constructed in theology first and then in law.

In Islamic ethics the categories of value terms resemble the categories of the Shari'a law, but their definition depends on the way human agency is perceived doctrinally. Among Ash'arite Sunnī jurists all the Shari'a categories (obligatory, recommended, permitted, disapproved, and forbidden) are defined in relation to actual divine command and prohibition, the rewards and punishments by God in the next life. In contrast, among Mu'tazilite Sunnī and Shī'ite jurists, legal–ethical categories are defined in terms of their relation to whether action is possible from the agent as a result of his power to do it or as a part of his nature that is predetermined by God.

The Ash'arī ethics roots ethical values in the commands and prohibitions of God. This was the divine command theory of ethics. An obligatory act is that which is commanded, and a prohibited act is that which is evil. The rules governing an ethical judgment are neither in the acts themselves nor in their properties. They are grounded in what God commands or prohibits. The ontological reference of an evil act is God's prohibition and not reason's intuitive judgment (Ghazzālī 1904–1907: 56–57). In contrast, Mu'tazilite ethics asserted that a command or prohibition, even by God, to do something is insufficient to make the act itself obligatory or evil. The obligatoriness or evilness is characteristic of the act as such. The ontological reference is either to an act's essence or category or to the circumstantial mode of its

occurrence. The agent is regarded morally responsible for the act as he or she caused it to come into being simply, or as knowingly and intentionally caused it to occur in a particular way. Hence, these characteristics have to be indicated by words other than just command or prohibition. Accordingly, the command or prohibition should read: “Do it, *because* it is obligatory,” and “Don’t do it, *because* it is evil.” The commands and prohibitions that are admittedly part of the Sharī’a possess ethical properties of their own over and above being commanded and forbidden by God (Ṭūsī 1980).

Muslim jurists define “necessary” or “prudentially necessary” in terms of the juridical category of the obligatory act from the standpoint of the self-interest of the agent.² An act is necessary when it is obligatory for the agent to do it if he or she is to avoid harm. It is also prudential because the act serves the practical interest of the agent. Expected harm in this life may be recognized by intellect; whereas expected harm in the next life is known only by revelation.³ The ethical character of this concept becomes evident when one considers the objective–subjective aspects of a necessary act. An act’s objective aspect is determined by the facts of the world other than the opinion of some judge or observer. This sense, this type of ethical knowledge is autonomous and self-validating, having been established by reason as necessary. On the other hand, an act’s subjective aspect is determined by the opinion of some judge or observer. Reason does not determine anything morally or religiously necessary, nor are goodness and badness generic or essential qualities of action that can be known through reason. Rather, divine command and prohibition determines an act as good or bad, respectively.

The Mu’tazilite rationalist definition of “necessary” looks at the relations of praise and blame to the agent for the act. Accordingly, “necessary” as applied to an act is that for whose omission the agent deserves blame (Muẓaffar 1966, 24). For instance, when a person suffers pain because of donating a kidney, the two steps of donating a kidney and suffering of pain are connected by a relation of praise. At the same time, while the two steps are empirical facts, the relation of praise that the donor “deserves” is not so in any obvious way. “Deserving praise” suggests the appropriateness of the two successive events. This appropriateness is objective because “deserves” introduces a fact, which is truly or falsely predicated regardless of anyone’s opinions. This was the doctrine firmly held by the Shī’ite legal–ethical theorists. The Ash’arites, conversely, denied that an obligatory act was an attribute of certain types of act in itself. God’s commanding of certain types of acts was itself the essential characteristic that made them obligatory.

The Ash’arites denied the Mu’tazilite thesis that an obligatory act had an ontological reference in human reason on the basis of the observed fact that there was a disagreement among prudent and

2 There is much disagreement among theologian–jurists in the matter of the definition of *wājib*. The difficulty stems from the way an act is attributed to the agent. Those who regard a human act to be the result of human free will define it as an act whose omission deserves punishment. The term “deserves” imputes the responsibility of the omitted act entirely to the agent. On the other hand, those who regard a human act to be the result of the divine will define the *wājib* act as the one decreed by God, for the omission of which the agent is legally (*shar’an*) censured. For these and other theological views and their analysis, see al-Juwaynī, al-Imām al-Ḥaramayn Abū al-Ma’ālī ‘Abd al-Malik b. ‘Abd Allāh, *al-Burhān fī uṣūl al-fiqh* (Cairo: Dār al-Anār, 1400 AH/1976), Vol. 1, pp. 308–10. For the Mu’tazilite and Shī’ite views and objections, see Ṭūsī (1980, 203ff.).

3 Muslims in general believe that a true understanding of any matter related to the faith in the Hereafter is impossible without divine revelation. If we are to understand anything related to God, God himself must tell us. God tells people who he is by speaking through the prophets. His words are recorded in the books of the prophets, that is, the scriptures. Hence, in understanding God and his plans for humanity, we must rely on the Qur’an as God’s revelation to humanity. As for the impending harm in the Hereafter for those who disobey God, this is known through the Qur’an.

intelligent persons regarding the obligatoriness of particular acts under varying circumstances. This observation-based rejection served as the fundamental characteristic of theistic subjectivism or voluntarism among the Sunnī jurist–theologians – more particularly, by the Sunnī law schools of Shāfi‘ī and Ibn Ḥanbal. For them, an obligatory act is that for which there is a threat of punishment. A forbidden act is one whose omission is necessary, as prescribed by the revealed law.

It is important to note that the Qur’an distinguishes objective ethical concepts from God’s acts of commanding and forbidding. Thus, when it says “be forward in good works,” the category of “good works” is clearly founded on a universally recognizable moral good. It was only through the development of Islamic jurisprudence, and more specifically the legal categories of the Shari‘a, that good was defined in terms of commanded and evil in terms of prohibition. Gradually, the Shari‘a categories, such as acts of disobedience, were widened in application. They came to replace the original ethical terms like “abominable” and “detested,” giving rise to ethical voluntarism (theistic subjectivism). This theory, as discussed above, equates the objective ethical categories of good and evil with God’s commanding and forbidding, respectively.

The thrust of the Ash‘arite argument about an obligatory act is that the conditions that control what is obligatory in the actual world are created by the will of God. These conditions include human nature, which is completely predestined, and the human’s natural ends, which are enforced by superior forces. God determines and commands the necessary acts for the natural ends of humanity. Moreover, God imposes sanctions for disobeying God’s commands, which renders performance of these acts necessary if one wants to avoid God’s punishment. There is no attribute that renders acts necessary for humans to perform in their own interest, other than that they are commanded by God. Accordingly, “necessary” means “necessary because God commands it” and because it is related in an essential way to the long-term interest of the agent.

The Mu‘tazilites contended that certain acts of God are necessary for God because of the benefit they confer on God’s creatures. For example, God must send prophets in order to inform human beings of the conditions of life to come and prepare them to do what is fundamentally right. As humans are obligated to do what is right and obligatory, so is God obligated to reward them for doing what is right and for fulfilling their moral obligations (Frank 1983, 206ff.). In contrast, the Ash‘arites did not regard as necessary that which benefits others, since there is no benefit to God in benefiting others. Since it is impossible to explain God’s command in terms of any purpose or end, no reason or purpose can be evoked to explain voluntary conformity to God’s command. The ultimate moral perfection of a human being is simply to obey without any expectation of reward in the next life.

Ḥasan, in general meaning “agreeable” or “fitting to an end,” although translated as “good” is broader than the English “good.” In relation to acts, good is “that for which the agent does not deserve blame” (Ṭūsī 1980, 207). The end or purpose of undertaking a good act may be that of the agent, other persons, or of the agent in one respect or one time, but not others. Thus, good is relative to the end specified, and what is good for John may not be so for Jack, or even for one of them in different respects or times. Thus, an irreligious person may call adultery “good” because he approves of it (Ghazzālī 1916, 100). The technical meaning of good is “whatever is fitting for any end in this life.” However, the Ash‘arites have adopted the second technical meaning, namely, what is fitting only for the ends of the *next life*. The ends and the means are determined and assigned to everyone by revelation. Good can be extended to cover anything that agents are permitted to do (Ibn Muṭahhar al-Ḥillī [n.d.], 185). The Mu‘tazilites, on the other hand, define good with reference to acts “for the performance of which the agent does not deserve blame.”

Qabīḥ, “evil,” is in many ways symmetrical with, though diametrically opposed to, good in its various meanings. Generally, the Ash‘arites view evil as whatever is repugnant or inappropriate to an end, with attention to its relative rather than absolute character. But the evilness of an act is determined by divine command and not by its inherent nature that merits blame when committed (Asadābādī 1942, 9). These definitions of good and evil resemble that of “necessary.” Instead of referring to what it is necessary to do for this life or the Hereafter, as in necessary, good refers simply to what is serviceable to an end, evil to what hinders attainment of an end.

Mu‘tazilite belief in the autonomy of the human intellect to discern good and evil led them to object that the meaning of good in common usage is not restricted to what promotes an end, nor the meaning of evil to what hinders attainment of an end. People perform some acts on their intrinsic merits, when they cannot possibly foresee any advantage to themselves. Likewise, they avoid other acts as evil even when they can see no disadvantage to themselves. As an instance of intrinsic good sought, someone gives help and comfort to a dying person with no expectation of reward; she does it simply because it is good to help others in distress. As an instance of intrinsic evil avoided, a physician without belief in religion, and thus in no fear of punishment in the Hereafter, refuses to help a terminally ill patient to commit suicide, even under threat of execution for his refusal. Such a physician regards suicide as evil, not merely in relation to ends, but as evil in itself.

The Ash‘arite belief that good and evil have no objective value offered rebuttals of these instances. They explained that the first instance could have been motivated by natural sympathy between human beings, by love of praise, or by the association of ideas which leads one to do in an abnormal situation what would serve an end in a normal one. In the case of a woman helping others in distress, one can detect a motivation based on the expectation that the patient would live and show gratitude. The second instance was explained by the agent’s love of praise for not succumbing to the pressure, or by association of ideas (i.e. taking a life, however indirectly through physician-assisted suicide, is normally followed by harmful consequences). Ash‘arites looked for self-interested or emotional causes for the acts mentioned, in order to avoid admitting attributes of good and evil intrinsic to the acts and acceptable or unacceptable to the rational mind regardless of personal ends. Their view of ethics is based on extrinsic relations of acts to good and evil. An act is good when it promotes human ends; moreover, it does so not by direct instrumental causation but because God has decided upon rewards for certain acts and punishment for others.

Such a view is coherent with the occasionalist theory of God’s relation to the world (Hourani 1985, 143). According to this theory, all activity or development in the world is the result of God’s irreversible and inscrutable decrees. A necessary connection between natural events or entities is incompatible with God’s lordship or sovereignty. Part of this theory is the belief in God’s command being good because it leads humans to attain their final reward. The end of an individual is the attainment of happiness, and happiness is to be found overwhelmingly in the next life. This is known from revelation. The primary means to this end are of two kinds: external acts of obedience to the revealed rules of conduct and internal cultivation of the virtues of the soul. External acts are helpful both because obedience is rewarded directly for its own sake and because these acts contribute to the acquisition of virtues. The inner state of the heart is more important than any external acts in the eyes of God and more conducive to reward. Yet none of the relations just described is causal. Acts do not cause virtues; they do not cause rewards in the next life. Even virtues do not cause rewards. In all cases, God through his grace bestows the rewards or moral progress. Again, God is the only cause and is under no obligation. Religious enlightenment consists

largely in understanding these revealed truths. The secondary means are principally knowledge and motivation. These are necessary for the effectiveness of the primary means to happiness. The mission of the prophets is designed to provide these aids, for scripture gives guidance and inspiration, both to acts of obedience and to the virtues. Finally, the Muslim community, when it is working properly, sustains the individual in various ways through its organization and leaders.

Corresponding to the primary and secondary means to happiness are two practical sciences: jurisprudence, which sets forth the principles to derive laws from the scriptural sources, and virtue ethics, which guides the formation of an agent's moral and spiritual character. Sunnī jurisprudence was founded upon the theory of ethical voluntarism. The core of the theory was that the value terms applied to action, such as "necessary," "good," and "evil," have no meanings in themselves. Accordingly, their application to action cannot be known by human reason. These categories acquire ethical meaning only when related to the commands and prohibitions in revelation. Knowledge about their application can be acquired exclusively by studying the revelatory sources. The opponents were, again, the Mu'tazilites and the Shī'ites with their objectivist rationalism. The objectivist position was the commonsense understanding of ethical terms in all or most cultures and languages. Most people think that when they describe someone as "just," "wicked," and so on, they are describing a real quality of that person (however hard to analyze), not merely some relation of obedience or disobedience to a social group or even to God. The presumption is that a common ethical language is being used, understood clearly and in the same way by the speaker and the addressed parties. Such a language could not depend on their prior acceptance of the particular scripture being delivered by the speaker. Mu'tazilite rationalism allows revelation an indispensable supplement position in determining important truths that reason unaided could not have discovered.

From the beginnings of Islamic theology Qur'anic references to the overwhelming power of God could not admit that human beings could ever determine on their own, without aid from scripture, what was right and what was wrong in the world, still less what was obligatory for God to do or not to do with his creation. The traditionalists naturally felt this way, since the Mu'tazilite claim undermined the utility of their collections of the traditions that were used as paradigm cases for moral-legal deliberations. More substantially, the Sunnī schools of law were inclined in this direction until voluntarism as a theory of jurisprudence was worked out with the most thoroughgoing logic by Shāfi'ī. Shāfi'ī insisted that the entire legal-ethical system could be derived from the revelation, that is, the Qur'an and the Tradition, without resorting to reason in the form of "sound opinion" of a jurist. On the side of theology, voluntarism with its theistic subjectivism found a champion in Ash'arī (873–935) and his successors. In the sphere of ethics, the conservative spokesmen of Islam, who referred to themselves as "the people of tradition and the community," continued to react against Mu'tazilite rationalism. The main reason is probably that the Mu'tazilite theory was the only articulate theory that could be set in contrast to the prevailing trend of Islamic thought on ethics in theological and juristic circles.

Concluding Remarks

Mu'tazilites and Shī'ites avoid teleology by defining an act deontologically in terms of its character without reference to consequences. Although the main terms of their ethics affirmed the human ability rationally to know which acts are good and which evil, and to attain practical certainty about the means to ends, they explain "necessary," "good," and "evil" not entirely in relation to ends. "Necessary" as an

attribute of acts is defined as “that for the omission of which the agent deserves blame,” “evil” as “that for doing of which the agent deserves blame,” and so on. The blame can be known by any person of sound reason, as in cases of suicide and infanticide, without reference to consequences. This sharp turn from teleology to deontology in Mu‘tazilite ethical theory was probably marked by the new prominence of obligation in Islamic legal–ethical thinking.

The prominence of obligation in revelation is underscored by the requirements of the Shari‘a, the sacred law. These duties, as the Shari‘a explains, must be performed by virtue of a contractual agreement between God and humanity. As God’s creatures, human beings must serve divine purposes by obeying God’s commands. In return for this obedience God promises rewards. Hence, judged on the basis of divine scales of justice provided in the Shari‘a, every human will receive what he or she deserves (Frank 1983). In such a contractual relation between God as the benefactor and human as the servant, obligation occupies a central role. The Mu‘tazilites and the Shi‘ites, thus, did not explain obligation wholly in terms of the interest of the subject and its good consequences. Rather, they were concerned to show the essence of a deontological perspective in ethics. Actions become obligatory because of the characteristic of “obligatoriness” in them (i.e. fidelity to promises, truthfulness, and justice).

Their central position on ethics is that a human being of sound mind can know in an immediate intuition that certain acts are good or evil prior to and without the aid of scripture. Ethical predicates refer to objectively real attributes and characteristics of actions they describe. However, ethical judgment should not be based merely on *prima facie* values of actions. Before arriving at a final decision, different aspects of an act should first be appraised separately, then these aspects should be weighed against each other to deduce an overall judgment. This process will lead to varying conclusions due to the varying circumstances of an act’s occurrence. Ethical deliberations in certain classes of act, despite having an invariable value character, do not necessarily lend themselves to the derivation of a clear-cut final judgment. Still, it is in principle possible to derive from these absolute characteristics of a moral act a set of universal rules such that one can know the ethical value of any act in any given situation by reflecting upon the objective facts of value.

Some Sunnī Ash‘arite theologians did not deny the feature of objectivity in Mu‘tazilite ethical concepts. They concentrated instead on opposing the partial and inessential feature of absoluteness in some of the rules. The main thrust of their attack is that ethical rules are grounded neither in the acts themselves nor in their rationally accessible properties. In other words, in moral cognition they turned attention to relativism versus absolutism, whereas for Mu‘tazilites the issue was one of subjectivism versus objectivism. While some acts are essentially good or evil and agreed on by all people of sound mind without regard to relative conditions, Ash‘arites insisted that there could be relativistic definitions of good, evil, and so on.

This debate about moral epistemology remains contested by both Sunnī and Shi‘ite scholars in their contemporary discussions about the modern project of searching for universal and absolute moral values, independent of revelation. Such a universal and autonomous claim is difficult to sustain without due emphasis on intuitive human reasoning in knowing good and evil objectively. Hence, it remains unacceptable to the majority of Sunnī jurist–theologians today. This rejection has led to epistemological crisis in juridical–ethical deliberations in matters that are beyond the scope of traditional jurisprudence. In fact, a majority of the issues related to social ethics in Muslim societies worldwide remains unresolved because of the conservative spirit that permeates juridical–ethical studies in the seminaries. Recent

scholarship to resolve this crisis (mostly undertaken by modern educated Muslims) is considered a dissident, secularist approach to social ethics in Muslim societies. Undoubtedly, nothing less than the reinstatement of reason as a substantive partner of revelation will bring back the Qur'anic ethical discourse to the center stage of religious revival among Muslims.

CHAPTER 69

Muslim Ethical Trajectories in the Contemporary Period

Frederick Mathewson Denny

The Ethical Landscape of Islam

The ethical landscape of Islam and Muslims is a combination of mostly traditional legal, ritual, sociocultural, political, and rational customs, practices, preferences, and attitudes. Although formal ethical discourses flourished in classical Islamic philosophy, they did not inform the majority of Muslims about morality. They exhibited a brilliant ongoing intellectual tradition that occurred at elite levels. Muslims have generally depended on the Qur'an, Islam's revealed scripture, and the Ḥadīth, the reports of the Prophet Muḥammad's words and acts, for their moral and ethical guidance. The Qur'an

is not a book of abstract ethics, but neither is it the legal document that Muslim lawyers have made it out to be. It is a work of moral admonition through and through ... If values and principles were to be derived from the entire Qur'an, it would be possible to build an ethical system that would be genuinely Quranic. (Rahman 1985, 8–9; see Fakhry 1994)

Historically, the Islamic imperium intervened with the great conquests and a system of law evolved. Although nominally based on the Qur'an and, increasingly, the Prophet Muḥammad's Sunna (the record of his teachings and example), it extended way beyond those sources in the interests of a complex state administrative and juridical apparatus. The early legists tended to derive their legal and ethical principles from extra-Quranic, general principles of equity and justice, which were difficult to apply in non-arbitrary ways. However, the principles also gave the imperial rulers great scope for a "state-made law that claimed to be sanctioned by Shari'a law" (Rahman 1985, 9). The early rulers seemed to have no illusions about their choice, so that the Qur'an would thenceforth function as a rectitude guide, certainly, but not as the actual juristic basis of legislation. In spite of that, the Qur'an was and continues to be of profound importance in individual, personal, and group morality apart from formal legal determinations.

The modern era has produced many Muslim thinkers and movements desiring to "go back to the Qur'an" in a general quest for the community's authentic, original faith and order in a manner reminiscent of the *sola scriptura* doctrine of the Protestant Reformation in Europe. The partnership of scripture and tradition has been at least as powerful a process in Islamic legal and political history as in Roman Catholicism, with the major difference being the former's emphasis on worldly governance and law

rather than the maintenance of a clerical hierarchy with a sacramental–penitential system of dispensing or withholding grace to adherents.

The classical sources of Islamic jurisprudence, at least in the majority Sunnī tradition, have been Qur’anic revelation, Prophetic Sunna as preserved in the ḥadīth literature, analogical reasoning (known as *qiyās*), and legal consensus, or *ijmā’*. Although the Qur’an is the supreme authority, closely followed by the Prophet’s Sunna, analogical reasoning and consensus exerted great influence in defining, interpreting, and applying (or not) the contents of the two basic sources of teaching. Add to this the problem that so many of the ḥadīths attributed to the Prophet were either outright forgeries or extremely weak as to provenance. This has been known since the science of ḥadīth came into being in order to evaluate and certify or dismiss candidate texts for the heritage of the Sunna in its literary form.

The Qur’an itself declares “in the Messenger of Allāh you have a beautiful pattern of conduct” (Qur’an 33:21). “Believe in Allāh and His Messenger, the unlettered Prophet” (Qur’an 7:158). Such passages raised Muḥammad to a level such that his own charisma was perceived as having revelatory power, even though he did not claim such for himself. As the generations passed in the establishment of Islamic legal, political, and military sovereignty that was propagated through an extensive civilization, so too did the influence and prestige of Muḥammad, whether in law, spirituality, ethics, or popular piety. The range of material contained in the hundreds of thousands of ḥadīth reports that eventually accumulated is vastly wider and more detailed than the contents of the Qur’an. They reflect not so much the life and teaching of a morally upright religious visionary and reformer from the traditional tribally ruled regions of Mecca and Medina, as the complex and diverse problems and attempted remedies of a multicultural empire on a civilization-building development path. In time, Muslim political authority and religious–legal institutions extended from Arabia and the Fertile Crescent to the Atlantic in the west, India and Central Asia in the east, as well as far north and south. The figure of the Prophet Muḥammad assumed symbolic and mythical qualities far beyond the ways in which the early Muslim community regarded their revered spiritual and political hero.

In a manner similar to the ways modern Christian thought has distinguished the Jesus of history from the Christ of faith, so also Muslims have raised Muḥammad to a nearly supernatural level in popular piety. If many Christians are stirred to ask themselves when in need of moral advice, “What would Jesus do?” many more Muslims would raise a parallel query and even repair to their ḥadīth sources to discover what in fact the Prophet, as the perfect example for humankind, is reported to have done or said. Muḥammad continues perhaps to be the most frequently consulted source for practical and ethical questions that Muslims need to address.

Islam teaches that humankind is equipped with a sound constitution, called *fitra*. Although Adam and Eve sinned, God later forgave them, and by no means did they introduce a universal disability of original sin as a condition requiring redemption. Muslims are fully aware of the challenges and uncertainties of the moral life, which they believe is humankind’s responsibility as servants of God. Humans are free agents under a just God; but on the Last Day, God holds them accountable for a moral and faith-centered justification of their deeds. In today’s complex and closely connected world, Muslims are struggling to sustain their traditional faith and values while seeking ways to cope with the problems, perceived threats, and paradoxes of modernity, secularism, and interreligious relations. This entry focuses on three evolving ethical trajectories among Muslims today: human rights, Muslim women’s rights, and progressivist initiatives in a tradition largely dominated by patriarchalist, fundamentalist, and cultural relativist attitudes, habits, and institutions.

Islam and Human Rights

Human rights are one of the most active contexts for practical ethical discourse among Muslims in the current era of globalization. It is often observed by Muslims that under Islam humans have no rights, only duties. One of the characterizations of a true Muslim is *'abd*, a “servant” or “slave” in relation to God. The best name that a parent can bestow upon a child, according to tradition, is *'Abd Allah*, “Servant of Allah,” or *'Abd al-Rahman*, “Servant of the All-Merciful.” The same Arabic root produces *'ibāda*, “service” in the sense of worship services. Like the Christian notion of *opus Dei*, “the work of God,” and the Jewish *avodah* (a Semitic cognate of *'ibāda*), there is a strong sense of work, of labor in the service of God (cf. liturgy, “the work of the people”). Although the Qur'an describes the Muslim as God's “slave,” it also bestows the title and privilege of being God's caliph (from Arb. *Khalifa*) or vicegerent on earth. Humankind has a very broad scope in which to act. But there are no freedoms, let alone rights, for Muslims, apart from obligations.

There does not appear to be any basis in traditional, orthodox/orthoprax Islam – the dominant form today in this age of fundamentalist activism – for human rights in the modern Western sense, based on the individual person in a secular setting. There are, to be sure, legal rights for certain classes of persons within the Islamic system. Majid Khadduri, a leading specialist on justice in Islam (from Iraq, originally, but not a Muslim himself), has listed five important rights of Muslims. The rights are those “that Islam had recognized in the past and those which Muslim states have accepted after the United Nations Declaration of Human Rights was issued” (Khadduri 1984, 235–237; see Arzt 1990). They are (1) dignity and brotherhood; (2) equality among members of the (Muslim) community regardless of race, color, and class [but not sex]; (3) respect for the honor, reputation, and family of each individual; (4) the right of each individual to be “presumed innocent until proven guilty according to law” (Article 11 of UDHR); and (5) individual freedom [in some sense, but this is a debated matter].

Concerning rights in comparison with obligations, one contemporary Muslim international relations specialist has written:

Human rights exist only in relation to human obligations. Individuals possess certain obligations toward God, fellow humans, and nature, all of which are defined by the Shariah. When individuals meet these obligations they acquire certain rights and freedoms which are again prescribed by the Shariah. Those who do not accept these obligations have no rights, and any claims of freedom that they make upon society lack justification. (Said 1979, 92)

The differences between Islam and the West on the issue of human freedom are emphasized in Islam's position of viewing freedom as belonging to the community rather than the “anarchy of liberal individualism.” Far from being opposed to the quest for workable global human rights standards and norms, “the concept of human rights must incorporate Islamic and other Third World traditions or it will continue to provoke irreconcilable quarrels” (Said 1979, 93, 96). The author has characterized the dominant Muslim view of the matter. It is a view strongly shaped by cultural relativism rather than the acceptance of universal values in a pluralistic, global context. There is clearly an urgent need for the development of mediating discourses, both heuristic and applied, in order to alleviate both cultural relativism and a widely perceived non-Muslim, secular mindset that does not respect religion in general, and particularly Islam.

Islam has always valued the collective community more than the individual person and views the latter as subordinate to the former. Individualism, in the modern Western sense and as related to human rights, is rejected by most Muslims. Bassam Tibi, an Arab Muslim scholar, writes that “rights are entitlements and are different from duties. In Islam, Muslims, as believers, have duties/*farā'id* vis-à-vis the community/*umma*, but no individual rights in the sense of entitlements” (1994, 289). Tibi asserts a radical transformation in Islam will be necessary to endorse human rights for individuals. He sees Muslim efforts at defining human rights as biased in favor of the rights of Muslims, “in the meaning of the duties of believers,” and questionable in their commitment to freedom of religion. “In their schemes Islamic authors provide a concept devoid of the substance of individual human rights.” Cultural modernity, not cultural relativism, is what Tibi prescribes.

There are several notable initiatives among Muslims to specify human rights in response to the Universal Declaration of Human Rights of 1948. Yet these can be disquieting concerning protections for freedom of religion. This area is perhaps the most sensitive one from the Islamic standpoint. Islamic law prohibits conversion away from the religion and views it as a capital offense. Moreover, Islam views itself as the primordial religion of humankind, the “religion of unspoiled nature,” according to Article 10 of the 1990 Cairo Declaration on Human Rights in Islam (1993, 6). Although Islamic legal prosecution of apostasy is as rare as it is unpleasant, it has some staunch proponents in extremist Muslim fundamentalism. A trend has developed whereby zealous Muslims declare a fellow Muslim to be an apostate and thus consider it lawful to take the accused’s life. One Egyptian Muslim, Shaykh Muḥammad al-Ghazālī, who is widely regarded as “*the Islamic authority on human rights* ... issued a *Fatwā* (religious decree) in which he authorizes killing every Muslim who publicly subscribes to suspending the *sharī'a*” (Tibi 1994, 290, n. 49; Tibi’s emphasis). That decree was later used by Algerian fundamentalist fanatics to justify the killing of intellectuals.

Muslim discourses in recent years have sometimes skirted the concept of rights and instead focused on the basic “dignity” of human beings.

All human beings form one family whose members are united by submission to God and descent from Adam. All men are equal in terms of *basic human dignity* and *basic obligations and responsibilities*, without any discrimination on the grounds of race, color, language, sex, religious belief, political affiliation, social status or other considerations. True faith is the guarantee for enhancing such dignity along the path to human perfection. (Cairo Declaration 1993, 3–4, Art. 1a; emphasis added)

Rights are abundantly referred to in the Cairo Declaration, but in every case they are linked to the *Sharī'a* (i.e. God’s revealed way for humankind) as the context for their interpretation and application. Regarding freedom of thought: “Everyone shall have the right to express his opinion freely in such manner as would not be contrary to the *principles of the Sharī'ah*” (10, Art. 22a; emphasis added). Or, regarding political participation: “Everyone shall have the right to participate, directly or indirectly, in the administration of his country’s public affairs. He shall also have the right to assume public office *in accordance with the provisions of the Sharī'ah*” (10: Art. 23b; emphasis added). A final article states: “All the rights and freedoms stipulated in this Declaration are subject to the Islamic *Sharī'ah*” (10: Art. 24). The Cairo Declaration’s preface affirms “fundamental rights and universal freedoms ... are an integral part of the Islamic religion ... [amounting to] binding divine commandment” (3). However, “relying on

the shari'a to limit or dilute human rights means that the rights that are established under international law are being qualified by standards that are not recognized in international law as legitimate bases for curtailing rights" (Mayer 1998, 66).

The production of human rights declarations by international Muslim bodies is due, in part, to the perceived need for Muslim countries and organizations to get on board a global discourse in a manner that does not surrender their interests. Such activity in Muslim contexts also indicates a serious interest in universal human rights. In some cases there would be no declarations at all were it not for the language of Shari'a referral cited above in several articles of the Cairo Declaration. The whole question of what the Shari'a's authority, scope, and application will be in the future is somewhat open nowadays, in light of modernist reforming thought and Muslim feminist discourses. The politics of human rights, for Muslims, whether as an internal process requiring proper regard for the Shari'a in the framing of declarations, or in universal terms where religion does not dictate – although it may agree – is a delicate, complex matter. How will Muslim majority countries provide for protection of human rights for all if the Islamic declarations they ratify leave non-Muslims and Muslim women under the ultimate regulative authority of Shari'a law?

Muslim Women's Rights

Modern Muslim feminist reformers bent on changing the traditional patriarchal character of Islamic jurisprudence and male chauvinist cultural attitudes and practices have called for a return to the Qur'an. They see in the revealed text a much more balanced sex and gender discourse than in the later, developed legal system that relied heavily on prophetic ḥadīth of all sorts, as well as a male dominated cultural tradition of legal and ethical priorities. In other words, they view the traditionally prevailing patriarchalism as a repressive form of cultural relativism. There are significant feminist developments in Muslim countries today, although they have nothing like the power and range of such developments in the West. One problem is the perception among traditionalist Muslims – and their number is enormous – that feminist discourses in Islamic contexts amount to an invasion of godless Western ideas that will corrupt Islam and the Muslims. Muslim feminists have a rough road ahead in relation to such accusations (see Webb 2000).

A prominent Muslim feminist activist-scholar, Riffat Hassan, originally of Pakistan but now on the faculty of the University of Louisville, takes a position typical of pious Muslims who harbor suspicions concerning Western sincerity about human rights. Hassan is somewhat skeptical about universal human rights, but keeps her mind open to the possibility. She feels that the Universal Declaration of Human Rights' failure to acknowledge religion as in any way a source of human rights is a "critical flaw" (Hassan 1996, 365). She also frankly acknowledges the failings and errors in the Islamic legal and theological traditions of the past that continue to haunt and hinder Muslims today. Hassan attributes these failings to patriarchalism in a manner paralleled by Jewish and Christian feminist discourses. The original, pure source of Islam – by which she means the Qur'an – is free of patriarchalism. The cumulative tradition of theology, law, and custom has been utterly dominated by males of a patriarchal mentality. Hassan discerns a number of human rights guaranteed by the Qur'an: Right to Life (6:151); Right to Respect (17:70); Right to Justice (5:8); Right to Freedom, including of religion (3:79); Right to Privacy (24:27–8, 58); Right to Protection from Slander, Backbiting, and Ridicule (49:11–12); Right to Acquire Knowledge (96:1–5); Right to Leave One's Homeland Under Oppressive Conditions (4:97–100); Right to Develop One's

Aesthetic Sensibilities and Enjoy the Bounties Created by God (7:32); Right to Sustenance (11:6); Right to Work (4:32); Right to “The Good Life” (2:229; 5:1; 17:34 et al.), and others (371–80).

Hassan acknowledges that the rights she finds in the Qur’an are not routinely honored by Muslims. She seeks to return to the Qur’an as the primary authority for Muslims in all dimensions of life. This approach she shares with most Muslim feminists. They see in the Qur’an the last best hope for change and improvement for women and all Muslims, as well. She laments the loss of freedoms that women in early Muslim times enjoyed. Hassan goes on to list egregious violations of women’s human rights: murder of women by their husbands (e.g. in Pakistan) defended as “honor killings”; the expressions of sadness and disappointment at the birth of a daughter rather than a son; the marrying off of minor girls, often to much older males; the often extreme difficulty of divorce for women; the requirement that divorced women give up their sons at age 7 and their daughters at age 12 (generally); the extreme anxiety and fear caused by the constant threat of divorce; discrimination in inheritance; the putting away of women in veils and shrouds and behind “locked doors on the pretext of protecting their chastity, forgetting that according to the Qur’an confinement to their homes was not a normal way of life for chaste women but a punishment for ‘unchastity’” (Hassan 1996, 363).

Riffat Hassan is a courageous woman who is faithful to her religion to the point of fighting for the restoration of what she believes to be its fundamental ethical principles, free of cultural relativism, particularly regarding human rights for all. It is questionable how free she would be to express herself in her native Pakistan. But her words and writings make their way across the globe, as she is an oft-quoted thinker.

If substantial numbers of Muslims returned to the Qur’an’s admittedly more balanced and egalitarian teachings on relations between the sexes and their more nearly equal roles in public life, the conditions for women could substantially improve. But some thinkers who sympathize with Muslim feminists express reservations about the possibility of purely Quranically based reform, because the juristic traditions are so entrenched and authoritative. Clearly, the question of women’s rights remains a pressing trajectory in Islamic thought and life.

From Fundamentalist to Progressivist Muslim Ethical Trajectories

This entry has not included a survey of conservative, let alone fundamentalist, Muslim thinking on ethics or theology in the contemporary era. If it had, such influential figures as Hasan al-Bannā’ (d. 1949), the founder of the Muslim Brotherhood; the Egyptian literary scholar and extremist fundamentalist reformer Sayyid Qutb (d. 1966); the Pakistani journalist Mawlana Abu-l-A’la al-Mawdudi (d. 1979); and the charismatic Iranian Shi’ite revolutionary leader Ayatollah Khomeini (d. 1989), among others, would have been included. Sayyid Qutb, for example, characterized most of contemporary humanity, Muslim and non-Muslim alike, as steeped in *jāhiliyyah*, the “ignorant barbarism” that had plagued pre-Islamic Arabia before the coming of Islam. Qutb’s views, particularly as disseminated in his polemical tract *Milestones*, continue to inspire and motivate a broad range of Muslim activists and movements, including their most extreme and violent fringes. Qutb called for a revival of Islam by having a “vanguard ... set out with this determination [of bringing total submission to Allāh] and then keep going, marching through the vast ocean of *jāhiliyyah* which encompasses the entire world” (Qutb 1990, 8–9). His words were prophetic. Sayyid Qutb has arguably been the most forceful articulator of extremist political Islam of the past half century.

Progressive and modernist thinkers in Islamic religious, ethical, and cultural discourse have also appeared, although they have attracted widespread media attention only recently. One of the leading exponents of what many Muslims increasingly prefer to characterize as a progressivist (rather than “modernist” or “liberal”) approach to understanding Islamic religion and behavior is the Iranian philosopher and scientist Abdolkarim Soroush. He has sparked considerable controversy in his country through his criticism of a government run by clergy. He is a graduate of a respected theological school and qualified to belong to Iran’s clerical guild. Soroush was also a staunch supporter of the Iranian Islamic revolution of the late 1970s. Later, he came to view the rule of Iran by mullahs as an inherent Islamic conflict of interest on ethical grounds. He has been writing and lecturing for some years on ethics, freedom, reason’s role in responsible Islamic life, tolerance, governance, doctrine, and virtue. His views, expressed without apology for the criticism they engender, are attracting significant numbers of thoughtful Muslims who feel that their religion has for some time now been hijacked by extremists, terrorists, Wahhabi fundamentalists, and, in his native Iran, power hungry clerical government leaders and their minions.

Soroush alarms Muslim conservatives, particularly those who would subject all human rights to Shari’a standards. He claims:

A religion that is oblivious to human rights (including the need of humanity for freedom and justice) is not tenable in the modern world. In other words, religion needs to be right not only logically, but also ethically ... Simply put, we cannot evade rational, moral, and extra-religious principles and reasoning about human rights, myopically focusing on nothing but the primary texts and maxims of religion in formulating our jurisprudential edicts. (Soroush 2000, 128)

The final remark clearly sets Soroush apart from the conservative, scripturalist legal and ethical discourses that dominate Muslim religious ideologies today, whether in the Sunnī or Shi’ite worlds. Soroush’s respectable following in Iran may come as a surprise to Westerners. It is a welcome trend in a nation that wants to participate in the larger world and half of whose population was not born when the revolution occurred.

Soroush views ethics as the “groundwork of religion and life” and thus inherently “delightful.” He sees a

kind of sanctity in ethics that places it above analysis, experimentation, and reduction ... Ethics seems to entail its own “indeterminacy” theorem. As the accuracy of one side increases, the generality of the other decreases. This lack of determinacy is the enigma of enigmas. It reveals not only that ethics is not an exact science but also that it will never be. Even if we follow the lead of the Mu’tazilite school of thought in designating good and evil as natural and objective categories, deriving ought from is, and establishing commonsensical moral maxims as self-evident, *a priori* precepts devoid of cultural relativity and contingency, we still have failed to shed even a sliver of light on the problem of the “indeterminacy” of morality or on the nature of rights, justice, fairness, power, and freedom. (Soroush 2000, 105ff.)

The Mu’tazilite rationalist theologians of the golden age of Islamic civilization in Baghdad called themselves the “People of Justice and [divine] Unity.” They dominated the Abbasid caliphal court of al-Ma’mūn (d. 833) in the ninth century and headed an inquisition (*miḥna*) in defense of their doctrinal

views that lasted for fifteen years (833–848). In a manner that would be imitated by other theologians in later centuries, including Christians such as Thomas Aquinas, the Mu'tazilites averred that God can be known through reason. Where the Mu'tazilites exercised a rationalism unique to their movement was in ethical discourse (see Gimaret 1992). Reason alone enables humans to determine what is good or evil. The Qur'an confirms what reason dictates, in many cases, but it also provides guidance on what human-kind's obligations are under God. The duties of prayer, almsgiving, and so forth are indeed clearly commanded and regulated by the revealed text. There is a great deal of flexibility by which humans may determine ethically sound alternatives among the countless ambiguous and indeterminate choices that arise in life beyond ritual obligations.

Soroush operates in the general framework of ethical discourse that the Mu'tazilites developed in classical times. The Shi'ites have, in fact, continued to cultivate Mu'tazilite-style theological and ethical discourses. Soroush's rational basis as a Shi'ite thinker is not out of the ordinary. But his independence and boldness go far beyond academicism and addressing traditional theological and moral topics. He is not interested in Mu'tazilism per se, but in what Mu'tazilites and other rationally committed believers, whether Muslim or not, have been about wherever they may be found. He insists that one "may not employ reason to attest to the truth of one's opinions, without leaving the door open to its fault-finding critique. The attempt to enjoy the sweet affirmation of reason without tasting its bitter reproach is pure self-delusion" (Soroush 2000, 154).

In his essay "Tolerance and Governance: A Discourse on Religion and Democracy," Soroush argues that only free, democratic societies can provide the environment for the full exercise of reason in a synergistic relationship to faith. Here he is evidently referring to totalitarian Muslim nations and societies. "Religious despotism is most intransigent because a religious despot views his rule not only as his right but as his duty. Only a religious democracy that secures and shelters faith can be secure and sheltered from self-righteous and anti-religious rule" (Soroush 2000, 154; see also Vakilli 2002).

Conclusion

This entry has charted trajectories in Islamic ethics from fundamentalist to progressive, and through debates about human rights, cultural relativism, and feminism in Islam. These trajectories are obvious forces in the current world. Yet we should conclude this discussion by pointing to an important insight. Soroush contends that much of what is awry in contemporary Islamic theological, ethical, social, and political discourse relates to the mistaken sense that being a Muslim essentially means adopting and defending a particular identity.

I think one of the greatest theoretical plagues of the Islamic world, in general, is that people are gradually coming to understand Islam as an identity rather than a truth ... So, I believe that the Islam of identity should yield to the Islam of truth. The latter can coexist with other truths; the former, however, is, by its very nature, belligerent and bellicose. It is the Islam of war, not the Islam of peace. Two identities would fight each other, while two truths would cooperate. (Soroush 2000, 24)

Were Abdolkarim Soroush simply an academic voice speaking from the ivory tower, his views would perhaps be noticed, but essentially disregarded, by most Muslims. The fact that he is also a Muslim

public intellectual, however controversial, in Iran and beyond in the Islamic world, suggests that progressivist Islamic theological and ethical discourses are on a rising trajectory.

4 Buddhism

CHAPTER 70

Buddhist Ethics?

John Ross Carter[†]

Situation Prior to System

Ethics, as a discipline in Western philosophy, is a second order reflection on morals. “Buddhist ethics” would refer to a second order reflection on issues of morality, which issues have to do with first order questions and circumstances. Yet first order questions arise from a kind of *zero level* of intuitive awareness, that is, an immediate apprehension of the circumstance of a particular moral case, and one’s response mindful of living well, of religious living. The zero level is intuitive awareness, the starting point for subsequent reflection. It is more non-reflective or less deliberate than first order questions about what to do.

A quest for an understanding of this zero level of intuitive awareness is basic to any adequate account of what might be called Buddhist ethics. I will return to the notion of zero level later by introducing two important contributions made by Theravāda Buddhists – a profound notion of awareness and a complementary sense of self-censure together with a corporate sense of mutual respect – and a contribution from Jōdo-Shinshū involving salvific awareness and a sense of indebtedness. Scholars have drawn attention to “systems building” in ethical considerations within the philosophical heritage of the West. Such systems building might appear, on the one hand, to comprehend a disparate subject, covering centuries and cultures. On the other hand, finding a conceptual system of sorts might be the result of projecting a pattern, a network, schematized grid, upon the subject. The point of a persuasive ethical theory is its applicability in providing rational norms, for ethical decision making, to an evermore inclusive group of people. And the cogency of the rational system is that it provides for commonality in moral discourses relevant for all moral agents regardless of soteriological orientations, ultimates, or engagement with transcendence.

Buddhists have developed systems, too, but of a different order. Any heritage presented to posterity as a path to enlightenment will have its guideposts. A tradition perpetuated through chanted texts in verse and prose will tend to develop mnemonic systems. And in a large textual tradition considered basic for determining the intention of the Buddha, commentarial and exegetical systems for structuring the teachings variously will arise. One thinks of the impressive Abhidhamma literature. One of the oldest continuing religious institutions known to us today, the Sangha, would be expected to have developed systems of rules and regulations for appropriate and supportive communal religious living. So, Buddhists are not unfamiliar with systems. But these systems were built and maintained in order to indicate a life pattern proclaimed to be soteriologically efficacious. They have been formulated and maintained in

[†] Deceased.

order to provide orientation for one's response in becoming engaged with transcendence. Generally, throughout Buddhist history, the systems that have appeared are founded on a fundamental affirmation: the human mind, having become freed from confusion infused by ego assertion, can achieve clarity in perception and knowledge of proper action, entirely attuned to what is fitting, and grounded on the abiding presence of salvific truth.

All of the above suggests the need for an approach, even perspective, that would lead one to consider Buddhist ethics without searching for a general normatively governing first principle or a systematic rational theory. How might one do so? We might look to virtuous persons as models for how to live. A person who seeks to pattern his or her life either directly upon, or by analogy with, persons whose virtue is determined by the cumulative experience and wisdom of the tradition, can provide us with an example of how that tradition coheres, how manners become supportive, and how analogy can be morally instructive. And we learn this without reflecting on a coherent general system of ethics. But when we turn to a study of persons living in another religious tradition, in another culture, or in another time, we become aware, quickly, that an enormous shifting complex of ideas, habits, customs, outlooks, orientations, manners, local histories, and the like, confront us. How does one spot in another person a virtuous quality worthy of emulation?

"Virtue ethics" stemming from Aristotle and his notion of *eudaimon*, which has rightly become interpreted as "human flourishing" rather than "happiness" and is best understood to mean "becoming genuinely human," did not hinge on rational argumentation deduced from a system, but was the result of watching and observing, learning from a virtuous person. If Aristotle had known Sanskrit, surely he would have utilized, in this context, *kalyāṇamitra*.¹ The constructive and supportive assistance provided for one by another person of noble bearing is also communicated in the Theravāda tradition by a standard compound, "voice of another" (*parataghosa*), a timely and well warranted word which helps one to live well (Hardy 1962, 8). There is something of a pattern here, of course, a kind of system, but in a secondary sense. Articulating the position requires systematic construction. Living it requires sensitive receptivity, engaged attentiveness, awareness of what one might call the moral moment, as well as awareness of what one can become. This, in the case of Aristotle and in the Buddhist, too, is at the foundation of the religious life.²

From among many strands in this magnificent Buddhist tradition I will consider two that are rarely addressed together: the Theravāda and the Jōdo-Shinshū. There is a theoretical model that arises from this consideration that best fits Buddhist thought and practice, the individual components of which are not entirely unknown in current discussions of ethics in the West. We can call this an *intuitionist particularistic virtue ethic*. The "particularism" involved in this account reflects the inadequate applicability of uniform rationalistic "systems" and maintains the distinctiveness of moral situations. The "intuitionist" addition indicates attention to that zero level mentioned above. The "virtue ethic" component suggests a commitment to cultivate an enhanced character.

1 A person of impressively alluring qualities, such as having faith, being well-learned, generous, virtuous, and wise, who becomes one's friend, leading one into an enhanced quality of life through rebuke, or admonition, or instruction while consistently maintaining the quality of being a marvelous exemplar.

2 The Japanese have distinguished *dōtoku*, "morality, morals," better "virtue" or "excellence" (*toku*) of the way (*dō* [cf. *tao/dao*]), and *rinri*, "ethics, morals, a code of conduct." The former is religious; the latter, more recent, more like current Anglo-American notions of "ethics."

Awareness

Intuitional particularism is not merely subjective in the sense of originating from an individual's whimsical opinion or off-hand reaction. It is generated by and grounded in a much broader context of salvific truth: dharma/dhamma in its highest and most comprehensive sense. We can now trace this kind of intuitional particularistic virtue ethic in two traditions.

Theravāda

The Theravāda tradition has preserved a magnificent account of a salvific transformation involving a cluster of interrelated concepts concerning one's coming to know, to understand, to realize, to perceive, to "come upon," to attain, to awaken, to be aware, to have discriminative knowledge, to apprehend.³ And there is that great salvific realization translated roughly as "salvific insight-wisdom" in both the customary (*lokiyapaññā*) and world-transcending (*lokuttarapaññā*) dimensions. We have here an *intuitional particularism* that is grounded in a soteriological worldview: be aware of the way things have come to be. One reads, in the Chapter on Awareness (*appamāda-vaggo*) of the *Dhammapada*, "The path to the Deathless is awareness; Unawareness, the path of death ... Having known this distinctly, Those who are wise in awareness, Rejoice in awareness" (*Dhammapada*, vv. 21–22). The Commentary (*Dhammapadaṭṭhakathā*) provides a significant gloss, "'Awareness [*appamādo*]' Now this [awareness] illumines a massive meaning, spans a massive content; for the entire Word of the Buddha included in the three *piṭakas* taken up and given articulation, boils down to the word 'awareness' only." And, further, the Commentary says, "Now this [awareness] is in essence 'not being bereft of mindfulness [*sati*]'; it is [just another] name for constantly occurring mindfulness [*nīccam upaṭṭihitāya satiyā*]" (pp. 109–110). "The Old Commentary of the *Dhammapada* (with Glossary)" (*Dhammapada pūrāṇa sannaya granthipada [vivaraṇa sahita]* fourteenth century), adds, "Awareness, which is 'not being bereft of mindfulness,' with regard to the sphere of qualities of good conduct, is the fundamental cause for all wholesome dharmas and for the benefit of oneself and the benefit of others, pertaining to this world and the next" (p. 431).

This focus on awareness or mindfulness (*appamāda* and *sati*) reflects a dimension of the dynamic core of Theravāda Buddhist thought. It is entirely applicable to human activities ranging from social interaction to quiet meditation, from resolving conflicts between persons to calming the flurry of one's mental activities. Given a moral situation demanding a response, being aware of what has been done and is going on, both generally and particularly, responding in a way that is beneficial for one and for others, and also understanding the causal sequences that have given rise to this or that particular situation, puts one in a position to reflect with insight on the proper course of action. This reflection is not in a conceptual vacuum, devoid of supportive or informative structures provided by a particular cultural context. It is not uninfluenced by the wisdom of a cumulative religious tradition and the example of persons of noble bearing. The importance of the reliability of cognitive processes is emphasized by the prevalence of the key Pali terms already noted. One is not cut adrift, as it were, or left to one's own wits to come up with an appropriate response in a given circumstance.

3 Consider our terms above: *yonisomanasikāra*, *yathābhutañāna*, and also *avabujati*, *avabodha*, *avabodhati*, *avagacchati*, *adhigacchati*, *viñānati*, *bujjhati*; indeed, *buddha*, *bodhi*, *appamāda*, and *sati*, to mention but a few.

Closely associated with this notion of awareness (*appamāda*) or mindfulness (*sati*) and providing a central dimension of human self-understanding at the core of Buddhist sensitivities about how to act, arising from the zero level, are notions which are considered “two truly supportive qualities that are guardians of the world” (*dve dhammā lokapālakā*). The two are a sense of “shame” (*hiri*) and a sense of “blame” (*ottappa*). The “shame” in this case has to do with modesty based on a natural valuing of oneself, one’s basic sense of self-worth, even respect for oneself (*attagāra*). One would refrain from what is detrimental (*pāpa*) because such behavior is embarrassing, leads to one’s being ashamed, is self-incriminating, is simply that which one would not bring oneself to do. The sense of “blame” arises from an awareness of others, a valuing of others, respecting others (*paraṅgāra*) in the sense that their opinions matter. Both of these dimensions, personal-and-also-social, alive dynamically, cooperate in leading one not to do what is detrimental (Warren 1950, ch. 4, para. 142, p. 393).

So one discerns “ethical” parameters, if not quite a formal systematic pattern. One notes the importance of recognizing interdependency (*paṭiccasamuppāda*) and the life setting which is impermanent (*anicca*), awry (*dukkha*), without enduring substantiality (*anattā*). Knowing what persons have done for one (*kataññu*) is an important variable. The perception of how matters have come to be as they are (*yathābhutañāna*) and thinking carefully about the given circumstance (*yonisomanasikāra*) provide sure foundations for acting with insight. Appropriating the admirable dispositions (*brahmavihāra*) of friendliness (*mettā*), compassion (*karuṇā*), sympathetic joy (*muditā*), and equanimity (*upekkhā*) which have arisen in the contemplative life, one contributes to one’s own quality of life and benefits others. And these parameters, as well as the paradigms provided by noble persons (*kalyaṇamitta*), are available for one in the context of cultural mores and manners, of one’s own sense of what is personally and socially appropriate (*hiri* and *ottappa*). Uppermost and foundational for all of this are unobtrusive awareness (*appamāda*) and mindfulness (*sati*). Insofar as one’s actions are in accord with those parameters, one acts morally. The response is intuitive *within* the scope of these parameters. Combining some or all of these parameters with the almost limitless particular circumstances that might arise leads to a multiplicity of possibilities and a variety of analytic interpretations. Yet an act is right to the degree that it is in accord with dharma/dhamma in the deepest and widest and highest sense: from what is fitting, as culturally determined, to what is righteous, in the sense of just, and to what is explicitly taught in the religious tradition, to salvific truth.

Jōdo-Shinshū

We turn now to Jōdo-Shinshū, in Japan, and Shinran (1173–1262). It should be kept in mind that this movement is, so to speak, on the other side of China from India and the Theravāda. The Buddhist cumulative tradition moved from North India, through Central Asia, through China, with all the associated vicissitudes of history, cultural inter-impingements, and creative intellectual responses, and subsequently into Japan’s cultural matrix. It did so centuries before Shinran was enabled to grace humanity with profound insights.

Jōdo-Shinshū notions might be more adequately understood in light of parallel Theravāda ideas. For example, there is the great Jōdo-Shinshū term *shinjin*, which the majority of English-writing interpreters have unhappily translated as “faith.” The term actually means the arising of a pure, genuine, authentic heart/mind. It is the mind of Amida Buddha given to one in a salvific instance when the utterance of praise for Amida (*nembutsu*) arises without any calculation (*hakarai*) whatsoever in a person of faith.

The soteriological force of this notion seems entirely similar to what Theravāda Buddhists have known in “world-transcending insight-wisdom” (*lokuttarapaññā*) upon the arising of the soteriological path (*magga*) (Carter 1987). Shinran urged that one avoid calculation (*hakarai*), wondering all the while whether such was possible. Surely, he maintained, overcoming calculation could not be the result of one’s own deliberate effort. We always have some ulterior motive, some subtle self-oriented agenda determining our actions. So, of course, the arising of *shinjin* is not the immediate result of *our* actions. A Theravāda Buddhist might begin to understand the qualities of a person who lives and acts without “calculation,” in a manner the older tradition knew as without “self-estimation” (*mana*).

Shinjin, an awareness suggestive of zero-level immediate consciousness, is a very difficult notion to try to put into ethical analysis. But inferring that the notion is much too subjective to provide a basis for understanding the way things are would be amiss. Nothing is more personal, it seems, than *shinjin*; yet because *shinjin* is the mind of Amida Buddha, nothing is more expressive of the truth of the way things really are. Persons in whom *shinjin* has not arisen would turn again to the notion of analogy for a procedure by means of which to determine how to act well. The presence of *shinjin* yields a quality of character entirely admirable and symbolizes a spontaneity of compassion in the life of a person completely consonant with the order of compassionate reality in the world. Acting in consonance with this personal quality and salvific reality is moral.

Another near zero-level category among Jōdo-Shinshū Buddhists is *button*. It means standing in a relationship of indebtedness to Amida Buddha and also to Shakyamuni Buddha for what has been done for one by them (compare *kataññu*). The sense of indebtedness, communicated in the notion of *on*, is also at the core of Japanese sensibilities about what is involved in human relationships. There are other key terms indicating contextuality of interpretation of one’s life setting in particular circumstances: that one has taken refuge (*kimyō*, *kie*; compare the Theravāda notion of *saraṇa*), that one has entrusted one’s life (*tanomu*, *makaseru*) to compassionate reality, and that one is capable of authentically understanding, really hearing, the salvific efficacy in the order of reality, metaphorically communicated as the call of Amida. All of these notions are integral in the key concept of *shinjin*. In Japan the Buddhist tradition has not forgotten the twin dimensions of becoming engaged with the fundamentally real and of humanity at its comprehensive best; of wisdom (*hannya* and also *chie*, compare *prajñā*, *pañña*) and compassion (*jihi*, compare *karuṇā*).

In What Sense “Buddhist Ethics”?

Where does this bring us in our consideration of “Buddhist ethics”? There appears to be no clear-cut system gaining prominence. Within the cumulative tradition one can infer a deontological (from the Greek, *dēon*, what is necessary, proper, right) scheme, that is, acting in accord with what is fitting, proper, and right, acting from a sense of duty. One surely could so interpret actions in light of dharma/dhamma, that is, acting both from and in accord with dharma/dhamma. This deontological dimension can be seen in the monastic community and the commitment to obey rules of the discipline (*vinaya*). One can also readily find themes that indicate a teleological structure, a focus on the consequences of one’s actions (*kammavipāka/kammaphala*) or in the soteriological efficacy of dharma/dhamma yielding to the arising of Nirvāṇa/Nibbāna. In a given circumstance, a Buddhist might well lean toward one or the other of these orientations in determining how to act, or might find his or her motivation arising from varying degrees of awareness of these orientations. Further, the quality of cultivating virtue, becoming fully

human, is also present for Buddhists as a framework for moral action. One is to act in such a way as to become a virtuous person imaged by the paradigm of the Buddha, leading saintly figures of the past, and persons of virtuous quality living today (*kalyāṇamitra*). All these orientations (duties, consequences, awareness, and paradigms of virtue) can be present at the moment of decision, and each to varying degrees. And there can be occasions, surely, when these categories of ethical analysis do not clearly arise.

It is at this point that terms addressing the importance of being aware, of having the capacity of analyzing the situation at hand, lead one to insist on the significance of *intuitional particularism* in “Buddhist ethics.” The emphasis placed on understanding the particular context, how it has come to be, in what sense it has arisen with ramifications for other issues, not in subjective isolationism but in the supportive context of a person engaged with a received tradition, enables one to explore moral responses without subscribing to a normative general theory or system, to respond to the particular case with moral integrity. Key in a consideration of Buddhist ethics is a recognition of the priority of a person’s capacity to apprehend the given situation, the causal processes giving rise to a particular circumstance, and, simultaneously, to sense a grounding in a received tradition, both religious and cultural. This *capacity* and this *sense* do not at all bind the person into a scheme or system or theoretical rubric primarily so that he or she can know how to act in a morally praiseworthy way, but to enable that person to live freely and well as a genuine human being, that is, to live religiously.

Comparative religious ethics needs somehow to move to an understanding of a zero level as the ground from which persons begin their reflection on responses in circumstances that can then be considered moral. Care must be taken not to separate a study of ethics from an understanding of religious living. When we focus on categories developed in an intellectual heritage not arising from the religious worldview of the persons whose actions are being considered, we run the risk of developing systems while not understanding persons. Stated more strongly, “ethics” itself must begin with awareness of the forces from which it arises, the lives of religious persons.

The zero level, the area of presuppositions, assumptions, and basic frames of reference, is the level at which one would want to work. At that level, Buddhists offer a view of humanity that is at ease with an intuitional response to the wisdom of the cumulative religious tradition and the cultural context at large. One finds an ideal orientation to living well that is founded on awareness and leads to the formation of persons. This clarifies the importance of intuitional particularism in describing Buddhist ethics. But our focus on the zero level has also led us further – and deeper – to foundational thinking about who we are as moral human beings. Some thinkers stress human freedom and the importance of autonomy in decision making as the crucial foundation of ethics. We have seen how Buddhists propose a foundation for moral action – awareness – that allows for the exercise of freedom, even the necessity for autonomy, but that offers an orientation in which autonomy is neither primary nor an end in itself. A decision-making orientation that seeks rational and defensible foundations for ethical choices seems to stress the formation of systems. When awareness is foundational, emphasis is placed on the formation of the person, and hence our emphasis on the presence of a component of virtue ethics. In the former case, the check on human behavior is rational consistency. In the latter case, a pointer is provided by the wisdom of tradition and the example of noble persons.

Persons have averred, remarkably, that when one is truly aware, when awareness or mindfulness fully arises, one *will* act well. From this point of view, one acts best when one acts with the wisdom and compassion that reflect reality, when one does not calculate or engage in the kind of self-estimation that centripetally focuses on ego-centeredness, when one acts with awareness of propriety and of what is

fitting in community, when one avoids “clinging to views” (*diṭṭhupādāna*), or seeking defensible rationales, or being driven by adherence to a system of thought. Awareness is foundational and dynamic. The fundamental affirmation is not primarily that human beings are autonomous. Rather, human beings are capable of this awareness, ever immediate, ever in process.

CHAPTER 71

Origins of Buddhist Ethics

Damien Keown

Buddhism was founded in northeast India by Siddhārtha Gautama (ca. 490–ca. 410 BCE), who gained enlightenment at the age of 35 and was thereafter known by the honorific title of Buddha (“awakened one”). Buddhism spread rapidly from India to other parts of Asia, but this entry is concerned only with the first few centuries of Buddhism in India, a period extending down to about 250 BCE. The form of Buddhism which most resembles this early period is Theravāda Buddhism, which is today predominant in South Asia, particularly in Sri Lanka, Burma, and Thailand. The Theravāda school regards itself as the orthodox custodian of the Buddha’s teachings preserved intact from ancient times.

In Buddhism there is no central authority on matters of doctrine and ethics. The order of monks (*sangha*) instituted by the Buddha is regarded by most Buddhists as the legitimate interpreter of the Buddha’s teachings. Although there are national organizations there is no one body which represents the many different monastic communities worldwide. The question of whether a common moral core can be found among the diverse Buddhist schools of Asia is a question upon which scholars are presently divided. Buddhists of all schools, however, seek the same goal – nirvāna – a state of spiritual and moral perfection which it is claimed can be attained by any human being who lives in accordance with Buddhist teachings.

Buddhism does not believe in a Supreme Being or creator god and its precepts and ethical teachings are seen not as divine commands, but as rational principles which, if followed, will promote the welfare of oneself and others. It may therefore be regarded as a form of virtue ethics sharing many features with Aristotle’s notion of the good life as one devoted to the cultivation of virtue and culminating in a condition of happiness or flourishing (*eudaimonia*) (see Keown 2001).

The Buddha

In one sense the origin of Buddhist moral teachings is easy to define. In common with all other beliefs and practices characterized as “Buddhist,” they stem from the oral teachings of a single historical individual, Siddhārtha Gautama. According to the traditional accounts of his life, Siddhārtha, the Buddha-to-be, was a prince who renounced his kingdom at the age of 29 to become a religious mendicant. His quest was for a solution to the suffering (*dukkha*) inherent in human life, and six years after leaving home, at the age of 35, he declared that he had attained the goal of spiritual awakening known as nirvāna. From that time he devoted the remaining 35 years of his life to traveling around the towns

and villages of northeast India disseminating his teachings. A large mendicant community grew up around him, and semi-permanent residences in the form of monastic institutions (*vihāras*) became established. The Buddha died at the age of 80, and appointed no successor, stating that his followers should rely on his teachings as their guide. Without their leader, the Buddha's followers did not remain united for long, and in the centuries following the Buddha's death many sects and schools arose. Several of these preserved their own records of the Buddha's teachings, such that variant canons came into being. The only one of these canons to have survived intact is the canon of the Theravāda school, composed in the Pali language and known accordingly as the Pali canon. This canon was originally transmitted orally, but was reduced to writing around 70 BCE in Sri Lanka.

The Pali canon consists of three divisions, the most important of which contains the Discourses (*sutta*) of the Buddha. The second is the Monastic Rule (*vinaya*), which is a code of behavior for those who have taken monastic vows. It is likely that this reached its final form about a century after the Buddha's enlightenment, or around 350 BCE. The third division, the Scholastic Treatises (*abhidhamma*), contains material of interest for ethics, mainly from a psychological perspective, although its relevance is sometimes disguised by a terse analytical style. This is the latest portion of the canon and can be dated to approximately 250 BCE. The discussion of ethics in this entry is based primarily upon the material contained in the first division of this canon, the Discourses.

The Indian Religious Background

Although stemming from a single historical individual, Buddhist moral teachings were not formulated in a vacuum. The Buddha lived towards the end of the Vedic period, the name given to the first phase of Indian religion, encompassing the period of a thousand years or so down to 500 BCE. At this time the prevailing religious orthodoxy was brahmanism, the ancestor of what is commonly known in the West as Hinduism. The brahmanical phase of Vedic religion takes its name from the dominance enjoyed by the brahman or hereditary priestly caste. It was characterized by the performance of lavish and complex rituals, often sponsored by the king or wealthy patrons. In parallel with this, however, other less formal and more individualistic religious practices – notably those involving ascetic and yogic techniques – were being explored. Further influences on Buddhism came by way of unorthodox religious movements such as Jainism, and the teachings of numerous itinerant philosophers (*samaṇas*), including skeptics, determinists, and nihilists, many of whom denied the reality of moral choice. Such teachings were criticized by the Buddha, believing as he did in free will and holding that individuals inevitably suffer the consequences of their moral acts.

Dharma

A concept of fundamental importance deriving from the pan-Indian pre-Buddhist heritage is dharma. The word has many meanings and nuances, but the underlying idea is of a universal law which determines both the material and moral evolution of the universe. Every aspect of life is regulated by dharma: the physical laws which regulate the rising of the sun, the succession of the seasons, the movement of the constellations; and also the moral laws which regulate the operation of karma or moral retribution (see below), define what is right and wrong, and determine the duties and responsibilities of every

member of society. By extension, dharma also means the corpus of Buddhist teachings (since they are thought to be grounded in the nature of things), the practice of the Buddhist Path, and the spiritual realization made possible by the practice of the Path. Living in accordance with dharma and implementing its requirements is said to lead to happiness, fulfillment, and salvation; neglecting or transgressing against it is said to lead to endless suffering in the cycle of rebirth (*saṃsāra*).

Dharma is neither caused by nor under the control of a supreme being. Even the gods (who may be thought of as akin to the angels of Christianity) are subject to its laws. Dharma may be translated as “natural law,” a term which captures both its important meanings, namely as the principle of order and regularity seen in the behavior of natural phenomena, and also the idea of a universal moral law whose requirements have been discovered (not invented) by enlightened beings such as the Buddha. In Buddhist thought morality is woven into the very fabric of reality and moral goodness is seen as a natural quality which must be progressively cultivated by each individual if he or she is to achieve the *summum bonum* of nirvāna. In the Buddhist view, ethics and metaphysics dovetail to form a single whole, and morality forms part of the nature of things in a way that cannot be accounted for by ethical theories such as subjectivism, relativism, or consequentialism.

Karma

Common to Buddhism and all major Indian traditions is the belief in karma, the doctrine that moral actions inevitably have repercussions on the one who performs them. Moral action is a unique class of action in that it has two distinctive effects: first, it is soteriologically transformative and modifies the spiritual status of the one who performs it; and second, it determines the good and bad fortune which a person experiences in life. Although a number of the Buddha's contemporaries denied that moral action in itself had any intrinsic significance, the Buddha rejected this idea and emphasized that the moral life was integral to the quest for salvation. The saints of early Buddhism display the highest standards of moral conduct in their lives, as did the Buddha himself, and the goal of nirvāna is inconceivable for one whose behavior is not morally perfect.

Rebirth

Closely associated with the doctrine of karma is belief in rebirth. In terms of this belief, which appears in the later Vedic period several centuries before the Buddha, the higher forms of life (such as gods, human beings, and animals) migrate from one existence to another in accordance with their moral behavior in each existence. Good conduct is rewarded by rebirth in more auspicious circumstances. The long course of an individual existence might be visualized as an upwards or downwards spiral extending over eons of time. The fact that the same living being might appear at one time as a human being and at another as an animal means that Buddhism is much more ready than Western traditions to accord moral status to non-human life forms.

In this formative period Buddhism thus refined its moral teachings by including and rejecting elements from both the orthodox and unorthodox branches of Indian religion. Continuity with the orthodox tradition can be seen in the common notion of a cosmic moral order (dharma) and belief in moral retribution and rebirth (karma). A new direction was taken by (1) the rejection of animal sacrifice, which was contrary to the ideal of non-violence or respect for life (*ahiṃsā*) emphasized in Buddhism and other

non-orthodox traditions (especially Jainism); (2) Buddhism's rejection of the complex and pervasive web of brahmanical ritual which it regarded as stultifying and mechanical; and (3) the Buddha's dislike of the caste system, which he saw as elevating birth over personal moral integrity. These factors establish the broad parameters within which early Buddhist ethical teachings were developed.

Early Texts on Ethics

In the Discourses (the first of the three divisions of the Pali canon), the Buddha's moral teachings are set out in a straightforward way. The Buddha is reported as teaching (S.v.353f), for example, that you should not inflict on another what you yourself find unpleasant (the Buddhist version of the "Golden Rule"); that wrong actions are those which intend harm to any being; that one should repay the kindness of beings who in the past may have been relatives or friends (S.ii. 189f); and that one should be mindful at all times of the effect one's actions might have on others. The style is a cross between the Christian gospels and the Socratic dialogues. Parables and metaphors are often used to get the point across. Ethical themes appear repeatedly throughout the Discourses, yet certain Discourses are particularly significant for their moral content. The *Discourse on Brahmā's Net* (*Brahmajāla Sutta*) contains long lists of moral precepts and points of etiquette, and may be regarded as the source of many subsequent preceptual codes. Part of this discourse takes the form of a eulogy of the Buddha's conduct in which individual aspects of his behavior are assembled into lists which collectively define the conduct of a perfect mendicant, and by extension that of the perfect human being.

A text which accords well with the Western belief in individualism is the *Kālāma Sutta* (A.i.188). The Buddha counsels against accepting doctrines purely on the authority of tradition. Each individual is advised to consider carefully what he hears and test it against his own experience, not being afraid to reject any teachings found deficient in practice. We can imagine the Buddha doing the same thing, founding the new religion of Buddhism as a result of his rejection of the rigidity of brahmanical orthodoxy. It should not be thought, however, that the Buddha is commending a "free for all" approach to ethics or promoting autonomy to the position of supreme moral principle. On the contrary, it is clear he believes that all who reflect rightly will come to the very same conclusions about right and wrong. The Buddha is not here saying "Make your own truth" but "Make the truth your own" (Collins, quoted in Gombrich 1987, 72).

The *Discourse to Sigāla* (*Sigālaka Sutta*) is of special importance for lay ethics, and is often described as a Monastic Rule for householders. This text explains the duties of a lay householder towards six groups of people: parents, teachers, wives and children, friends, employees and servants, and religious practitioners. Important for its emphasis on the cultivation of a loving attitude (*mettā*) is the *Discourse on Loving-kindness* (*Metta Sutta*). There is also a very popular and well-known Buddhist text known as the *Dhammapada* which in a single verse sums up the whole of Buddhism. This verse reads: "To avoid all evil, to cultivate good, and to purify one's mind – this is the teaching of the Buddhas" (*Dhammapada* v.183). This verse makes clear the central place of morality in Buddhism. Buddhist teachings are essentially about living a virtuous life and purifying one's mind, by which is meant developing the intellectual virtue of understanding. Another early text, the *Soṇadaṇḍa Sutta*, similarly compares morality and wisdom to two hands that wash one another, indicating that these two qualities go together and are indispensable in the quest for enlightenment.

Basic Themes

The Four Noble Truths

As well as giving general moral guidance of this kind, the Buddha formulated doctrine systematically in four propositions known as the Four Noble Truths:

- 1 Suffering (*dukkha*) is inherent in life.
- 2 Suffering is caused by craving (*taṇhā*).
- 3 There can be an end to suffering (this is the state known as *nirvāṇa*).
- 4 The way to attain *nirvāṇa* is through a structured plan of life known as the Noble Eightfold Path.

The Four Noble Truths are sometimes compared to the diagnosis and remedy provided by a physician. The first step is to diagnose the condition; the next is to investigate the causes of the complaint; the third step is to determine whether a cure is available; and fourth and finally comes the question of deciding on the appropriate treatment. Sometimes medical treatment just involves taking a pill, but increasingly physicians are becoming aware that many of the problems from which their patients suffer cannot be cured by repeated prescriptions. They are due more to lifestyle problems than anything else. In these cases the cure involves the patient taking action to change his way of life; for example, by taking more exercise, avoiding stressful situations, giving up smoking, making changes to diet, and so forth. This is the kind of lifestyle change required by the Fourth Noble Truth. It does not offer a quick fix or instant cure, but calls upon people to live well, in the sense of leading a saner, more moderate and balanced life. This approach to life is what is known in Buddhism as the Middle Way.

The Middle Way

The Middle Way (which only superficially resembles Aristotle's Doctrine of the Mean) is essentially the principle of neither too much, nor too little. Neither total indulgence on the one hand, nor complete abstinence on the other. This principle derives from the Buddha's own experience in his life, first as a pampered prince, and later, as a homeless mendicant practicing austerities in the forest for six years. Neither of these extremes worked. He eventually renounced them in favor of a more moderate and balanced way of life. Once he did this he attained enlightenment. This *via media* is given specific content in the Fourth Noble Truth.

The Fourth Noble Truth shows the way to happiness, fulfillment, and human flourishing in the form of a path with eight components, known as the Noble Eightfold Path. The eight factors of the Path are:

- 1 Right View (*sammā-diṭṭhi*)
- 2 Right Resolve (*sammā-sankappa*)
- 3 Right Speech (*sammā-vācā*)
- 4 Right Action (*sammā-kammanta*)
- 5 Right Livelihood (*sammā-ājīva*)
- 6 Right Effort (*sammā-vāyāma*)
- 7 Right Mindfulness (*sammā-sati*)
- 8 Right Meditation (*sammā-samādhi*)

Right View means first the acceptance of Buddhist teachings and later their experiential confirmation. Right Resolve means making a serious commitment to developing right attitudes. Right Speech means telling the truth and speaking in a thoughtful and sensitive way at the appropriate time. Right Action means abstaining from wrongful bodily behavior such as killing, stealing, inappropriate sexual conduct, telling lies, and taking alcohol or drugs. Right Livelihood means not engaging in an occupation which causes harm to others. Right Effort means gaining control of one's thoughts and cultivating positive and wholesome states of mind. Right Meditation means developing deep levels of mental calm through various techniques which concentrate the mind and integrate the personality.

The eight factors of the path fall into three categories: Morality (*Sīla*), Meditation (*Samādhi*), and Wisdom (*Paññā*). The first two items (Right View and Right Resolve) promote Wisdom. The last three (Right Effort, Right Mindfulness, and Right Meditation) cultivate mental calm. The middle three (Right Speech, Right Action, and Right Livelihood) ensure correct moral conduct. This threefold categorization gives us a quick sense of the shape of the “good life” from a Buddhist perspective. It tells us that the life of virtue involves personal development in these three areas. First, one must be moral and live in accordance with Buddhist ethical precepts. A moral person, according to Buddhism, will be calm, confident, trustworthy, and open, with nothing to fear and without guilty secrets to hide. This condition is conducive to the next phase of the path which is Meditation. Buddhists see meditation as a technique which can be harnessed to accelerate spiritual progress. It has the effect of changing moral sentiments, for example by making one more compassionate and sensitive to the needs of others, and also of concentrating the mind. The final area for development is the faculty of understanding, usually translated as “wisdom.” This involves a deep and penetrating insight into the true nature of the human condition, into human nature and its potential for fulfillment in the state of nirvāṇa.

Precepts

Morality (*Sīla*) in the Eightfold Path and elsewhere includes the notion of things to be done, and things to be avoided. The things to be avoided are enumerated in various lists of precepts, of which there are five main sets:

- 1 The Five Precepts (*pañca-sīla*)
- 2 The Eight Precepts (*aṭṭhaṅga-sīla*)
- 3 The Ten Precepts (*dasa-sīla*)
- 4 The Ten Good Paths of Action (*dasa-kusala-kamma-patha*)
- 5 The Monastic Disciplinary Code (*pātimokkha*)

The best known of these codes is the Five Precepts for laymen. The Five Precepts, mentioned earlier as the fourth component of the Noble Eightfold Path, prohibit (1) killing, (2) stealing, (3) sexual immorality, (4) lying, and (5) taking intoxicants. The nucleus of Buddhist morality may be found in the first four (which Buddhism shares with Jainism). These are then supplemented by more rigorous precepts according to the status of the practitioner or to suit particular ceremonial occasions. The precept against taking intoxicants, for example, is thought to be particularly applicable to layfolk, and the Eight and Ten precepts, which supplement the basic five with additional restrictions such as on the time when meals may be taken (as well as requiring complete abstention from sexual relations), are commonly adopted as additional commitments on holy days (*uposatha*). The Monastic Disciplinary Code (*pātimokkha*) is a set of 227 rules (the exact number varies between schools) which set out in detail the regulations governing

the monastic life of monks. Nuns were obliged to follow a greater number of rules, reflecting the Buddha's initial reluctance to allow women to be ordained.

The various formulations of precepts may be regarded as a combination of moral precepts with additional practices designed to cultivate restraint and self-discipline. The large number of monastic rules requires vigilance and mindfulness at all times, as well as ensuring standardization and conformity within monastic communities. Disputes and disagreements are thereby kept to a minimum and the Order presents itself as a moral microcosm for the world at large. Early Buddhist society was conceived of as an integrated fourfold group comprising monks (*bhikkhu*), nuns (*bhikkhunī*), and pious laymen (*upāsaka*) and laywomen (*upāsikā*). The lay and monastic “wings” of this community ideally serve one another: the laity provide material support to the monastics (*bhikkhu-sangha*), and the latter in return provide religious teachings and guidance (see Chakravarti 1987).

Virtues

Although the precepts are of great importance in Buddhist morality, there is more to the Buddhist moral life than following rules. Rules must also be followed for the right reasons and with the correct motivation. It is here that the role of the virtues becomes important. Buddhist morality as a whole may be likened to a coin with two faces: on one side are the precepts and on the other the virtues. The precepts, in fact, may be thought of simply as a list of things which a virtuous person will never do.

Early sources emphasize the importance of cultivating correct dispositions and habits so that moral conduct is the natural and spontaneous manifestation of internalized and properly integrated beliefs and values, rather than simple conformity to external rules. Many formulations of the precepts make this perfectly clear. The precept against taking life, for example, is sometimes found in the following form: “Laying aside the club and the sword he dwells compassionate and kind to all living things” (D.i.4). Abstention from taking life is the natural result of a compassionate identification with living things. It is a constraint imposed contrary to natural inclination. To arrive at such an integrated state is not easy, and involves a profound transformation of an intellectual and moral kind. To observe the first precept perfectly requires a profound understanding of the metaphysical relationship between living things coupled with an unswerving disposition of universal benevolence and compassion. Few people are capable of either of these things. Yet by respecting the precept they habituate themselves to the condition of one who is, and in so doing take a step closer to enlightenment.

The virtues, as Aristotle points out, are about what is difficult for people. The task of the virtues is to counteract negative dispositions (or vices) such as pride and selfishness. The lengthy lists of virtues and vices which appear in later literature are extrapolated from a key cluster of three virtues and their opposing vices. The three Buddhist Cardinal Virtues are Unselfishness (*alobha*), Benevolence (*adosa*), and Understanding (*amoha*). Benevolence is an attitude of good will to all living creatures. Unselfishness means the absence of that selfish desire which taints all moral behavior by allocating a privileged status to one's own needs. Understanding is knowledge of human nature and human good as expressed in basic doctrines such as the Four Noble Truths.

Meditation

As we have seen, meditation (*Samādhi*) is the second component of the Eightfold Path, and it plays an important role in the cultivation of the virtues. Of particular importance is a group of four meditational

dispositions known as the four Sublime States (*Brahmā-vihāra*): Love (*mettā*), Compassion (*karuṇā*), Gladness for Others (*muditā*), and Equanimity (*upekkhā*). Detailed guidance is provided in Buddhist literature as to the way in which these dispositions can be cultivated and deepened. In the cultivation of love, for instance, after first of all developing positive feelings towards oneself, the disposition is slowly extended to an ever-increasing circle of friends and relations, the local community, and finally the world at large. Through this practice the mind becomes free of anger, hostility, and resentment and other negative traits which are common sources of immoral action.

The same method is applied to the second and third Sublime States. Compassion is directed towards all who are experiencing misfortune, with the aspiration that their suffering may soon cease. Gladness is for those in good fortune with the wish that their good fortune should remain and increase. When the first three have been developed, the practice of equanimity can begin. The importance of equanimity is that it ensures that none of the other dispositions are allowed to predominate. There is a danger for the moral life in allowing any disposition, however virtuous in itself, to become dominant. It is sometimes claimed, for example, that so long as one acts with a compassionate motive no wrong can be done. This is not the Buddhist view. The role of equanimity is to ensure that moral judgments are not distorted by an imbalance between dispositions leading to an overemphasis on any one of them.

Nirvāna

As noted, the aim of all Buddhists is to attain nirvāna. There are different views as to what nirvāna means. The tradition recognizes two kinds of nirvāna: (1) the kind attained in the course of a lifetime and (2) the kind attained by an enlightened person at death. In this discussion we are concerned only with the former.

There has been a tendency to understand nirvāna primarily in intellectual terms as the gaining of mystical knowledge. On this view it has sometimes been thought that in the experience of awakening (*bodhi*) an enlightened being “transcends” moral values and passes “beyond good and evil.” It can be seen from the Buddha’s conduct, however, that he personally did no such thing, nor did he anywhere express the view that it would be appropriate for others to do so. The only sense in which the Buddha passed “beyond good and evil” was in not having to pause to deliberate between them: he instinctively knew the right course. Nevertheless, the well-known Parable of the Raft (M.i.134f) is often read as supporting the view that morality is of a temporary and provisional nature. It is supposedly a “means to an end” and something ultimately to be discarded like a raft after one has crossed the stream.

This overly intellectualized view of nirvāna results from misunderstanding the relationship between the three components of the Eightfold Path – Morality, Meditation, and Wisdom – and seeing the Path to Enlightenment as a kind of ladder or staircase that one ascends step by step. The problem with the ladder metaphor is that it implies that as one makes progress towards nirvāna, the lower rungs are passed over and left behind. Certain parts of the Path are deemed higher and therefore more important than others. In fact, this is not the case. There is no point at which morality is left behind. On the contrary, one becomes increasingly moral the closer one comes to nirvāna. It is more helpful to picture Morality, Meditation, and Wisdom as forming three sides of a triangle, wherein each side is connected to the others. The three together brace and mutually support one another. This conveys better the sense that morality forms an intrinsic part of the architecture of the enlightened consciousness. If the Buddhist understanding of nirvāna incorporates moral perfection in the way suggested, ethics becomes integral to

the final goal. Understood in this way, nirvāna as *sumum bonum* is an inclusive final end. The path that leads to it is nothing other than the gradual cultivation and manifestation of the virtues which constitute the end.

Summary

We may summarize the key features of Buddhist ethics in the earliest period as follows:

- 1 The arrival of Buddhism is characterized by both continuity and change. Buddhism takes from brahmanism the concepts of dharma and karma, but rejects ritual sacrifice and the caste system.
- 2 The Buddha taught a humanistic ethics emphasizing non-violence (*ahiṃsā*), benevolence, and the search for self-perfection (nirvāna) in the three areas of Morality (*Sīla*), Meditation (*Samādhi*), and Wisdom (*Paññā*).
- 3 Moderation in the form of the concept of the Middle Way becomes an important action-guiding principle.
- 4 Buddhism has no central authority competent to pronounce on moral issues. Individuals must decide for themselves after consulting the scriptures, seeking the advice of teachers, and meditating on all aspects of the matter in question. However, the precepts are at all times to be respected.

CHAPTER 72

Cultural Differentiation in Buddhist Ethics

Thomas P. Kasulis

This entry explores differentiations in “Buddhist ethics.” In using the term “Buddhist ethics,” we are speaking of the ethics not of *Buddhism*, but of *Buddhists*. It is not as if Buddhism were an abstract entity transcending both culture and the people who identify themselves as Buddhist. Without Buddhist people, there would be no Buddhism, not to mention Buddhist ethics. This idea – that there are no “religions,” only “religious peoples” – may seem obvious, but its implications are critical for understanding both the nature of religious ethics in general and the character of Buddhist ethics in particular. Seldom (if ever) is ethics the domain of religion alone. Buddhism is part, but only part, of the ethical lives of people from radically different cultures, languages, and ethnicities. The dynamic between cultural identity and religious identity in the Buddhist moral agent is the main concern of this entry.

Given the premise that persons negotiate both their religious and cultural identities in developing their ethical positions, three corollaries will affect our ensuing discussion. First, moral agency, however much it might be imbued with religious or cultural ideologies, always lies in human choice. People – not “-isms” – decide not only *whether* to live a life religiously or ethically, but also *how* to do so within the parameters of tradition. Second, in analyzing Buddhists rather than Buddhism, it is obvious that Buddhist ethics is articulated in a multitude of languages today, not just the “canonical” languages of ancient Buddhist texts: Sanskrit, Pali, Tibetan, and Chinese. The “Buddhist tradition” is more than what Buddhism was in the past. Tradition involves a way of living in the present with attention to the way the religious life has been lived previously. In such an understanding, tradition is always being lived and negotiated in the *present*. The third corollary relates to what makes a person a “Buddhist.” For simplicity’s sake, we can stipulate that people are “Buddhist” when they say without deception, at least in some contexts, “I am a Buddhist.” Yet, being a Buddhist is never *exhaustive* of anyone’s self-attributed identity. In other contexts, those same people might identify themselves differently: “I am Chinese” or “I am Sinhalese”; “I am a woman” or “I am a man”; “I am a teacher” or “I am a carpenter”; and so forth. Those cultural identities are lived out alongside Buddhist identities. And they often interact in influencing the character of Buddhist ethics in any local context.

Our analysis of Buddhist ethics across traditions proceeds in two stages. First, we will consider a general orientation Buddhism brings to the understanding of self and agency that differs from common Western assumptions, and therefore needs special treatment if we are to understand Buddhist ethics on its own terms. The second stage of our analysis will consider some cultural differences in how Buddhist ethics has been conceived and practiced over time in four global regions. Such a sampling, however limited, will shed some light on the variety in Buddhist ethics and how that variety might have a bearing on the project of comparative ethics.

Buddhism on Self and Agency

Allowing for some cultural variations, all Buddhist traditions accept the basic tenet of “no-I” (*anātman*). The doctrine originated, as the name suggests, in opposition to a traditional Indian (Hindu) idea of *ātman*. The latter holds that behind the ordinary world – the world of change and diversity (*māyā*) – lies the true ground of reality: eternal, distinctionless, and absolute (*brahman*). This *brahman* was often identified with the true self, a persisting, changeless soul (*ātman*) that is never the object of experience, but makes experience possible (“that which sees but is never seen” or “that which knows but is never known,” and so forth) (see Kasulis 1997). The crucial point for ethics is how the Buddhist view differs not only from Hindu assumptions, but from many modern Western assumptions as well.

Perhaps the easiest way to distinguish the Buddhist model of self from the dominant Western one is to discuss the two in terms of an “intimacy” model built on internal relations, as contrasted with an “external integrity” model built on external relations. An external integrity orientation understands moral agency

Figure 72.1 The self of external integrity

Figure 72.2 The self of intimacy

in terms of how the self autonomously forms external relations to “others,” whether the others are people or things. (See Figure 72.1, wherein *a* is the self and *b–i* various “others.”) Such ethical systems commonly develop rules or principles for how “I” should develop the external relational ties (the *R*s in the diagram). External integrity orientations often universalize those principles, generalizing how *R* should be constituted regardless of who the self or other may be: the situation’s uniqueness is subordinated to the nature of the relation. For example, an ethics might state “I” should treat the “others” as if I were they. Because of its tendency to universalize, external integrity requires respect for the “rights” of others.

Buddhism, in contrast, favors intimacy over such external integrity by analyzing the self as internally related to others: others are *inherently* part of me. I do not connect with them by forging ethical relations. Ethics derives from my understanding the relations that are *already* part of me (see Figure 72.2). Because I (the *a* in the diagram) am internally connected with others, there is no principle or rule necessary for connecting with them.

Buddhism takes the intimacy orientation further. According to the *anātman* doctrine, there is *no* aspect of “I” (not even the unshaded small part preserved in Figure 72.2) that is not conditioned or not interconnected with at least something else (see Figure 72.3). My “self” is completely interdependent and in no way independent. “I” do not exist, even theoretically, as an isolated agent choosing my connections to the world (as both Figures 72.1 and 72.2 allow). Ethics for Buddhism is not a matter of establishing external relations, but instead of recognizing inherent interrelations. This difference leads to a distinctive interpretation of agency.

In an external integrity orientation, the agent autonomously formulates and performs relations with others. To be moral, the agent must analyze the circumstances (a factual or “is” determination) and make a response according to some value (a normative or “ought” decision). That normative decision may be made in various ways and may involve, to cite three common options, a calculus of benefits and harms (as in utilitarianism), an imaginative act of putting oneself in the other’s shoes (as in the Golden Rule), or a more legalistic analysis of applying a general rule of goodness or fairness to the particular case (as in Kant’s categorical imperative).

The idea of agency derived from Buddhism’s not-I theory is less intuitive to many modern Westerners. In the Buddhist model, what is to be known and what ought to be done are much less sharply distinguished. For Buddhists, knowing the other and knowing myself are not fully discrete activities. If I know who I truly am (an “is” issue), I will realize my interdependent relations with others as they “should” be (an “ought” issue). That is, I will articulate myself as part of an interdependent responsive system, instead of as an independent agent creating moral connections with others.

Let us summarize these two contrasting ideas of agency. The external integrity orientation says I am moral when I transcend myself by tempering self-interest, whereas Buddhist’s intimacy orientation says I am moral when I am most truly my self. The two positions are not as opposed as they might at first seem, however. For external integrity, the self is independent of circumstances and stands alone and independent. In effect, without forming any external relations, the self is just an isolated “I,” an “ego.” Moral responsibility transcends this ego, taking one beyond the individual to the collective. Through moral education I can learn to form relations making me “more than myself” or becoming capable of “thinking about something or someone other than myself.” In contrast, the Buddhist model starts with a view of self that is *anātman*, a no-I. This no-I must be fathomed for moral responsiveness to arise. To know and be myself – in the fullest Buddhist sense – is to recognize the interdependencies constituting all I am.

Because of the difference in how “self” is understood, Buddhist moral education is aimed not at getting beyond self-interest, but at delving more deeply into oneself. As the thirteenth-century Japanese Zen Master Dōgen expressed it:

To learn by modeling yourself after the way of the buddhas is to learn by modeling yourself after yourself. To learn by modeling yourself after yourself is to forget yourself. To forget yourself is to be authenticated by all phenomena. (From *Shōbōgenzō*, “*Genjōkōan*”)

Dōgen suggests the Buddhist acts as a moral agent by being responsive within the conflux of conditioning factors. Importantly, some of those phenomena are cultural. To be yourself and to be a morally responsive agent, you must recognize that you are inherently part of a cultural system. This takes us into the issue of cultural difference. How do the specifics of cultural conditions affect Buddhist ethical thinking and behavior?

Figure 72.3 The Buddhist self

Cultural Variety in Buddhist Ethics

For the comparative purposes of this entry, we will look at four geographical areas in relation to the development of Buddhist ethics: India (especially as home to early Buddhism), Southeast Asia (as the center of Theravāda Buddhism), Northeast Asia (especially Chinese and Japanese Mahāyāna Buddhism), and the United States (especially the communities with membership drawing mainly from people without ethnic ties to Buddhist cultures). With such a broad sweep, we will have little opportunity for detailed analysis, but our focus is to compare and contrast the interplay between Buddhist and cultural identities in the way Buddhist ethical issues have been addressed.

Since we will be analyzing the role of cultural conditions in the formation of Buddhist ethics, let us begin with how Buddhists generally understand the relation between conditionedness and ethics. With the dominance of the external integrity view of agency in the modern West, the tendency there is to think of conditions as external factors operating on the self: “I am conditioned by my culture or society,” for example. The main Western question is whether there is any autonomous aspect of the self *not* so conditioned (hence, the debate between behavioral determinism and freedom of choice). This set of issues is quite alien to Buddhism, wherein conditions are understood to be *within* the system of interrelations defining me. Hence, conditioning is both self-conditioning and being conditioned by surrounding factors.

As an analogy, think of an athlete in training. To succeed, the athlete must be willing to be conditioned (must be “coachable”) and must have a coach who can create the right environment for learning. Similarly, Buddhist moral training involves an openness to changing one’s own negative habits in response to the mentor’s guidance. It is significant that the normative term in early Buddhism literally means “skillful” (*kuśala*) rather than “good.” Buddhist moral development is, then, a matter of retraining that deepens one’s awareness of interdependence and conditionedness. Then the improvement of conditions may be directed either inwardly or outwardly. For example, suppose I am in a noisy environment where I find it difficult to concentrate. It would be “skillful” for me either (a) to train myself to focus better or (b) to change the environment so it is not as noisy. If I do either, the environment becomes less distracting. From the Buddhist standpoint, one can become more skillful (more “moral”) by transforming either one’s psychological or one’s environmental conditions. In this light, let us turn to how Buddhists in different cultural contexts developed variations in ethics.

Buddhist Ethics in India

For its personal training methods, Indian Buddhism borrowed extensively from (Hindu-related) practices prominent in the culture 25 centuries ago: meditation, dietary control, abstention from harming others, control of sexual activity, avoidance of intoxicants, and so forth. There were two key areas in which Buddhists diverged, however.

First, Buddhists generally rejected the common Upanishadic idea that reality is illusory (*māyā*). For Buddhism, the human predicament derives from delusion, not illusion. Reality shows itself as it is (Buddhists designated it with terms like “suchness” or “thatness”), but unenlightened persons add to that appearance delusions arising from their desires for how they would prefer reality to be (something unchanging belonging to an eternal “me”). Buddhism consequently reconstrued the purpose of religious praxis from seeing *through* or *beyond* the world of flux, to seeing *into* it without the addition of any

delusional projections about permanence. The Buddhist strategy for discovering the true nature of self and things was, therefore, to examine coolly the arising and decaying of phenomena. Only then can one discover there is no entity free from flux. Rather than emphasizing meditative practices leading to trance experiences of oneness, early Buddhist meditation emphasized attentiveness to processes of change (the flow of one's own breathing, the visualization of bodily decay, the awareness of the psychological patterns supporting ideas of "mine" or "ego," etc.). The goal was an introspective sensitivity to the formation of attachments and a therapeutic for eradicating the cravings behind them. The therapeutic was originally formulated in terms of the Noble Eightfold Path and involved the effort to reprogram the three domains of human activity: thought, word, and deed. From this standpoint, personal ethics amounted to the reform of one's own character, the deprogramming of unskillful, delusional tendencies in behavior or attitude. If one could eradicate ego-centered desire, morality (in the Western sense as defined above) would take care of itself.

The second divergence from common Indian assumptions of the era relates to social ethics. By the Buddha's time, Indian society increasingly exemplified a social stratification according to caste or class. The society supported a hierarchical system in which an elite brahmanic or priestly caste had oversight of both scholarship and religious ritual. People were born into their castes and social mobility was very limited or impossible. As suggested by texts like the *Bhagavad Gītā* it was assumed that the dharma (at this point primarily meaning moral or social "duty") varied according to caste and gender. Because of their belief in karma and rebirth, Indians assumed that a person was born into a caste because of proclivities carried over from previous lifetimes. Social improvement was often construed as living this lifetime properly and being reborn into a higher caste in one's next lifetime.

Indian Buddhism rejected the caste system. In developing its theory of praxis, the early Buddhists maintained that since the causes of delusion are the same in everyone, the praxis to eliminate them should be essentially the same as well. Class and gender should not matter. Yet the early Buddhists recognized that the conditions leading to delusions are not only fixed within personal habitualized psychological patterns of behavior, but also reinforced in institutionalized forms throughout society. Thus, social conditions have to be addressed as well.

The early Buddhists responded not by trying to change Indian society as much as by trying to form an alternative, utopian community within India. Thus was born Buddhist monasticism. Monks and nuns had separate communities. (They were separate, but not really equal – patriarchal cultural assumptions still subordinated the order of nuns to that of monks.) Many monastics remained itinerant (following the tradition of holy seekers in pre-Buddhist India), but the long monsoon seasons were a time for even them to live together in larger communities. Eventually, some of these became centers of study as well as meditative practice. As a society separate from secular laws, the monastic communities developed their own system of moral guidelines and internal laws. This added a layer of social behavior and sanctions that went beyond the basic precepts and guidelines for personal training contained in such formulations as the Noble Eightfold Path. Within the monasteries and nunneries, one could follow a strict regimen for self-examination and training aimed at eliminating ego-centered attitudes and behavior.

As Buddhism grew in popularity, the role of the laity needed clarification. The monastic centers typically depended on local villagers for material support and the question arose about the responsibility of religious orders toward those lay patrons. Different models developed in India as Buddhist clergy assumed an increasing role in educating and training the laity in the fundamentals of doctrine and practice. The two major branches of Buddhism that emerged – Theravāda and Mahāyāna – had somewhat

different approaches to the clergy–laity interface. Those differences sometimes affected the tenor of Buddhist ethics in different locales. Since the Theravāda traditions tended to dominate in Southeast Asia and the Mahāyāna in Northeast Asia, we discuss those differences within those cultural contexts. Before leaving the discussion of India, though, one further development is noteworthy. It is an example of a Buddhist social ethic at work in modern times.

Buddhism became a major religious presence in India (to the point of becoming the state religion under King Aśoka in the third century BCE). Yet it eventually died out after the incursion of Islam in the early centuries of the second millennium CE. Buddhism has enjoyed a small revival since India's independence in 1947, however. In particular, many Dalit (“untouchables” in the classical Hindu caste system) converted to Buddhism. The major figure in this movement was himself a Dalit, Bhimrao Ramji Ambedkar, an Indian government leader and attorney with doctorates from both Columbia University and the University of London. Ambedkar believed that to improve the plight of the Dalit, two kinds of changes were needed. First, the legal system had to prohibit all forms of discrimination against them. Under his legal and legislative leadership, that was accomplished rather soon after national independence. He came to realize by the mid-1950s, however, that a psychological problem remained. The Dalit needed to develop a sense of self-esteem, something difficult to do as long as they identified themselves vis-à-vis the traditional Hindu caste system. So, he converted to Buddhism and led a movement resulting in the conversion of millions of others. This exemplifies a typically Buddhist analysis of the link between spirituality and social action.

Theravāda Buddhist Ethics in Southeast Asia

With the exception of Vietnam, which was influenced more by Buddhism from China, the Southeast Asian countries (including Sri Lanka) were introduced to Buddhism via India, starting mainly around the time of the Indian Buddhist King Aśoka. Most Buddhist doctrines and institutional monastic structures found in India were carried over into these other countries and developed further there within the eventually dominant Theravāda branch of Buddhism. In terms of personal moral development, the goal was, once again, disengaging the habitual responses arising from desire and egocentrism. The needed therapeutic was considered so extensive, however, that it would take a multitude of lifetimes before one could complete the program. Until then one had to settle for gradual karmic progress from one lifetime to the next. Given this belief, it was assumed that those who come into this world with proclivities leading them to pursue the monastic life were more advanced on the path than those who chose a layperson's life. (Since the institutions for nuns eventually died out, this also meant that women could not become monastics and that, by definition, no woman could be as spiritually advanced as a male monk.) This system of beliefs resulted in a rather sharp bifurcation between monks and laity corresponding to a different set of behavioral norms for the two groups.

As compared with East Asian Mahāyāna clergy, the monks from Theravāda countries take upon themselves a more restrictive rule of life (strict celibacy, a dietary restriction forbidding eating after noontime, a vow of complete poverty). Monks leave their families and become monastics in hopes of making best use of their excellent conditions within this rebirth. The underlying goal of their precepts, rules, and vows is to bring about detachment – the proof of *anātman* and the prelude to *nirvāṇa*. The monks depend on the generosity of the laypeople for their sustenance and the laity's charity brings them merit toward their own future rebirths. In gratitude, the monks take care of the laypeople's basic spiritual

needs: preaching the basic doctrines of the Buddha, performing rituals in the villages, and supervising lay retreats during the monsoon season (even the king of Thailand has participated in such retreats). The purpose is to influence society by aiding in the spiritual development of the laity. Although laypersons may lack the monks' opportunity to develop to their fullest spiritually, they can begin to understand the nature of desire or attachment and thereby make progress. Although no one but an enlightened being can be perfectly "moral" or "skillful," the Theravādin assumption is that by creating the right kind of interdependencies between monks and laity, both groups will grow spiritually and set the basis for a moral society.

In practice the dual-layered social structure runs the peril of becoming elitist in a way comparable to the caste system Buddhism originally rejected. The Theravādin institutions may reinforce patriarchy (women by birth *must* be laypersons because there is no longer a monastic option) and the idea that the majority of society's members (the laity) should do physical labor so that the minority (the clergy) do not have to. The emphasis on detachment, understandable within the Buddhist account of the dangers of desire, can also disconnect the monks from the plight of the disadvantaged. Detachment can become a way of ignoring social interdependencies. In the past few decades, responding in part to the change in conditions brought by the influence of communism, Christianity, and the Buddhist conversions of the Dalit in India, a new social ethic called "Engaged Buddhism" has developed in Theravāda countries. Clergy and laity cooperate in programs to help the needy in society and to preserve the natural environment. As an example of the latter, Thai monks sometimes "ordain" trees in the rainforest as fellow monks. Because killing a monk is one of the most heinous offenses in Buddhism, the hope is that this ritual action will cause the timber workers to desist and the rainforest will be spared.

In one sense, Engaged Buddhism is a new modality for social action in Southeast Asia. Yet its rationale is consistent with the ancient principle that Buddhists – clergy and laity alike – need to change external as well as psychological conditions that arise from and support unskillful patterns of behavior.

East Asian Buddhist Ethics

Buddhism's rival in China was not Hinduism, but Confucianism and Daoism. The two indigenous Chinese religions emphasized harmony as the primary spiritual value. Confucianism tended to focus most on social harmony and Daoism on harmony with nature. Neither held to a theory of rebirth or the karmic carry-over from one lifetime to the next. Nor was there in China a religious-based caste system determined by birth. Chinese Confucianism did advocate a kind of social hierarchy, but it was based in the basic relations such as parent–child, elder–younger, and ruler–subject. Furthermore, elite positions in the government bureaucracy were, at least in theory, related not to aristocratic birth, but to performance in a civil service exam. When Buddhism entered China there was no immediate need to change the social order or pose an alternative to the status quo as there had been vis-à-vis India's caste system. The assumption was that a social system conditioned by Confucian values need not obstruct skillful Buddhist praxis on the personal level. Even the monastic establishments in East Asia were not as separated from the secular communities as they had been in India. East Asian Buddhist institutions often openly sought imperial support and monks sometimes served as court officials.

Given these conditions, it is not surprising that Mahāyāna Buddhism took hold most firmly in China and in the surrounding regions like Korea, Japan, and Vietnam. The differences between Mahāyāna and Theravāda are numerous, but here the focus is only on the relevance to ethics. In this regard, three

contrasts are most important. First, Mahāyāna deemphasizes the sharp distinction between clergy and laity. According to most Mahāyāna schools, every person – clergy or laity, male or female, educated or uneducated – has the capacity to become fully enlightened in this lifetime. Second, following on the idea that reality appears as it is without illusion, Mahāyānists emphasized that the only difference between the real world and the delusional world is how we look at it. Ignorance arises not from being tricked by false appearances, but from making distorting human projections. Therefore, reasoned the Mahāyānists, the ordinary world (*sa sāra*) and the world of enlightenment (*nirvāṇa*) are fundamentally the same. Whereas the early and Theravāda Buddhist formulations understood enlightenment as the movement from *sa sāra* to *nirvāṇa*, the Mahāyānists claimed there was no place to go to or to move from. For East Asians, steeped in Confucian and Daoist ideas, it was reassuring that Mahāyāna Buddhism presented an ideal of enlightenment that could be lived in the world of ordinary social and natural phenomena.

Third, Mahāyāna Buddhism emphasizes a more collective, rather than individual, understanding of the process of enlightenment. Along with a (somewhat less stringent) set of vows and precepts resembling those used by Theravāda monks and laity, the Mahāyānists added a new one, giving it special prominence – the bodhisattva vow. This vow promises to put the ultimate spiritual progress of others ahead of one's own. One will not allow oneself to achieve full enlightenment until everyone else is also ready to do so. In contrast with Theravādins, Mahāyānists envision a situation in which people achieve full enlightenment not one by one over many eons, but rather all at once at some future moment. In this respect, the external conditions supporting delusion took on a special focus in Mahāyāna Buddhism. The traditional Mahāyāna formulation is that the wisdom of enlightenment cannot be separated from the compassion of enlightenment. To know the anguish of others is to feel that anguish as one's own. Alternatively, to have wisdom is to engage, not escape, the suffering of ordinary existence. Here we see a clear application of the Buddhist notion of agency based in internal relations.

Given Confucian and Daoist cultural influences, the Chinese Buddhists understood the *saṃsāra*–*nirvāṇa* dynamic as a call to use compassion and wisdom to harmonize ordinary and enlightened activity. The Indian Buddhist assumption was that impermanence is the nature of reality and because it runs counter to our desires for permanence, we delude ourselves into thinking of it as other than it is. The Buddha's message was understood to be the resigned acceptance of that impermanence through the elimination of all attachments. The East Asian Buddhist understanding was different. The East Asians (reflecting Confucian and Daoist assumptions) generally understood the Buddha's message as not being detached from the world of flux, but instead as being in *harmony* with it. In fact, in Japan, the idea of “impermanence” (*mujō*) assumed a positive aesthetic value as the *appreciation* of evanescence. According to this interpretation, the sadness at, say, the passing of the short-lived cherry blossoms was considered an enlightened sensitivity as long as it was not accompanied by a *desire* for permanence, a wish that the cherry blossoms would never die.

Because the East Asian Buddhist goal was now to be more fully in touch with the world, enlightenment came to be viewed as living fully in the everyday. The East Asian Buddhists placed special emphasis on Mahāyāna metaphors for seeing the whole in the individual thing (“all worlds in one moment of thought”; “each jewel at each nexus in Indra's net of reality reflects every other”). This blended with an indigenous valorization of spontaneity and naturalness associated mainly with Daoism. In the development of personal ethics, the shift was away from detachment to “openness” (the Mahāyāna Buddhist idea of “emptiness” as filtered through the Daoist emphasis on “non-being” as the source of being). Ethically, this meant an emphasis on responsiveness rather than following fixed rules of behavior.

The Mahāyāna precepts tended more toward a minimal set of self-imposed restrictions that would generate the compassion–wisdom necessary to change how one sees and behaves in the world.

Following the Mahāyānist inclination, East Asian Buddhists generally assumed no significant spiritual difference between monastics and laity. All people are inherently enlightened insofar as *saṃsāra* is *nirvāṇa*. The problem is that people do not realize this fact and act accordingly. The vows and precepts for clergy and laity were quite close (outside special rules related to harmonious living within monastic confines). Although the monastic communities still looked to the laity and the court for patronage and support, they became more self-sufficient than their Southeast Asian counterparts. The goal of Buddhism remained the same – the realization of *anātman* – but in East Asia this tended to be glossed as a harmonization with the impermanent world, instead of a cool detachment from it.

Many forms of East Asian Buddhism (Zen being the clearest example) thereby developed a situational approach to ethics. Because *saṃsāra* and *nirvāṇa* were considered indistinguishable on some level, the emphasis became not so much what one did or did not do, but *how* one did it. The same act done by one person in one situation might be “unskillful,” but by another in a different situation “skillful.” The “heart-and-mind” of the agent is the determining factor. In a famous Zen story the master finds his disciples squabbling over the ownership of a cat. So he challenges the students in a Zen dialogue. Dismayed at their response, he kills the cat to shock his students out of their petty possessiveness. By ordinary Buddhist standards, the master’s action would be criticized as harming a sentient being. In this case, however, the Zen tradition focuses on the master’s enlightened intent. Given such examples, it is not surprising that even the martial arts sometimes flourished within the confines of East Asian Buddhist temples. In Japan especially, any activity – arranging flowers, wielding a sword, shooting an arrow, writing calligraphically, or preparing and serving tea – could be a way to show one’s harmony with the world as it is and engaging it with a “buddha mind-heart.” To sum up this contrast: whereas early and Theravāda Buddhism often saw a close connection between ethics and epistemology, in many cases East Asian Buddhism related ethics to aesthetics instead.

Because of its emphasis on compassion, a socially “engaged Buddhism” has appeared within the Mahāyāna East Asian tradition at various points in its history. During the 1960s many Vietnamese monks actively opposed the war. Some even self-immolated themselves as a form of protest. The act of suicide was understood to have negative karmic effects on their personal rebirths. Yet the monks believed the social conditions for spiritual development were so endangered by warfare that they made the sacrifice as an expression of their bodhisattva vow. In China during the sixth and seventh centuries, the Third Period School of Buddhism developed a treasury of funds to help the needy. In seventh-century Japan one of the first major temples, Shitennō-ji, included a public hospital as part of its complex. In the early ninth century Kūkai’s temple in Kyoto operated a public school for children of all classes, girls as well as boys.

In recent decades, however, there has been criticism in East Asia about the actual practices of Mahāyāna Buddhism, especially in light of the new social conscience developing around the Engaged Buddhism movement. In Japan, for example, there is an originally scholarly movement called “Critical Buddhism.” The Critical Buddhists note that despite the emphasis on compassion in Mahāyāna Buddhism, its overall record of social ethics has been quite poor. They criticize the Mahāyāna perspective as heretical because it places its moral emphasis on *how* something is done instead of *what* is done. They also claim that in saying that the world-as-it-is is already *nirvāṇa* (or that everyone is already somehow enlightened), Mahāyāna Buddhists have tolerated the status quo even when including conditions of social injustice.

The Critical Buddhism movement in Japan is in some ways also a response to what is happening in our fourth region for this study: contemporary North America.

Buddhist Ethics in the United States

Buddhist communities in the United States can be divided into two groups that have had (at least until recently) relatively little interaction with each other. The first group originated from Asian immigrants who came to the United States from Buddhist countries. One such group is the Buddhist Churches of America, established on the west coast of North America about a century ago by Shin Buddhist immigrants from Japan. In general, the immigrational groups brought Buddhism to the United States as part of their members' ethnic identities. They became for the most part cultural-religious enclaves within a pluralistic American society, reflecting the general range of educational and class backgrounds as other US ethnic groups. In this respect they functioned much like European immigrants such as Russian Americans who brought Russian Orthodox Christianity to the United States. The immigrant Asian Buddhists did little to convert Americans of different ethnicities.

The second kind of American Buddhist, our primary focus in this discussion, originated with Americans of non-Asian ancestry who "converted" to Buddhism. Typically, the groups coalesced around a Buddhist missionary teacher. The most popular of these groups belong to the Zen, Theravāda, and Tibetan traditions. The members come from a diversity of ethnic backgrounds. We can call these groups "adoptive" rather than "immigrational." Two striking characteristics of the adoptive Buddhist groups are relevant to the development of American Buddhist ethics. First, because of their educational background and the way they (or their parents) first encountered Buddhism, they often have a comparative religious perspective. Aware of the strong tradition of social ethics in the Abrahamic religious traditions dominant in US culture, they have looked for a parallel in Buddhism. Often disappointed in their search, the question arose for them of "how can our Buddhist perspective inform our moral position vis-à-vis the social and environmental issues of today?" In many cases, they brought this question to their teachers from Asia, and, in so doing, stirred within them a heightened urgency to answer the same question. For example, American Zen communities (with the support of American adoptive Zen Buddhists like the poet Gary Snyder) built on the Japanese religio-aesthetic views of nature to foster ecological concerns. In turn, some ideas and projects from American Zen Buddhism began to influence Zen Buddhist scholars and teachers in Japan. This process resulted in the founding of centers for environmental studies within some Zen Buddhist universities. Meanwhile, engaged Buddhist practices from Asia (in part influenced by issues of modernization, including an awareness of Christian and communist ideals of social justice and responsibility) became a focus for scholarship and ethical thinking among Buddhists in the United States. Because so many issues of social and environmental ethics are global in nature and because of the rapid exchange of information through technology, this cross-fertilization across Buddhist communities is becoming the rule rather than the exception.

This brings us to the second striking feature related to Buddhist ethics in the United States. Buddhism's identity as a single religion with global manifestations was in part a construction by the West. Two centuries ago, for example, Buddhists in Thailand felt no strong connection to Buddhists in, say, Japan. It was partly the nineteenth-century Westerners' attempt to understand Buddhism that led to the historical and philological studies revealing how the various Buddhist traditions evolved out of each other. Only since the mid-twentieth century do we find pan-Buddhist associations such as the World Fellowship of

Buddhists and the World Buddhist Sangha Council. In the United States, though, collaboration among adoptive Buddhist groups (unlike immigration groups, at least until recently) has occurred on a regular basis for some time. The assumption seems to be that since all the groups are “Buddhist,” they share basic values. This is perhaps more obvious to the adoptive rather than immigration Buddhists because their Buddhism is not as intermixed with ethnic and cultural differences. This situation encourages within the United States the possible development of a generic Buddhist ethics, one that crosses the lines among the varied traditions.

An interesting result of this generic Buddhist ethic arising within the United States is that it interfaces with American cultural expectations about what religious ethics or social ethics is supposed to accomplish. As suggested earlier, those expectations often derive more from an external integrity orientation that uses concepts like “autonomy,” “rights,” “moral responsibility,” and so forth. For the most part Buddhism has historically used concepts derived more from a cultural orientation of intimacy, however. Will American Buddhist ethics successfully formulate Buddhism anew, using external integrity terms? Or will it try to change the dominant American conceptual map of ethics by shifting it to an intimacy orientation in tune with classical Buddhist terminology? American Buddhists have multiple identities – they are both Buddhist and American. How they negotiate that dual identity will be a new chapter in the interface between culture and Buddhist ethics.

Buddhist Ethics as the Ethics of Buddhists

In summarizing, it is tempting to think of Buddhism as adapting its ethics to local cultural conditions, maintaining along the way certain core values. This phrasing is not, however, a particularly *Buddhist* one. The wording reifies and essentializes “Buddhism” into a discrete system that adapts to its external environment. It makes Buddhism seem an independent agent, as if Buddhism were acted upon by culture and responds to it in return. Such an interpretation makes the relation between culture and Buddhism external rather than internal.

As suggested at the outset, Buddhists not Buddhism are what differ from one culture to the next. This is not because Buddhists are the effects of their social, cultural, and physical conditions, but rather because they *are* those conditions. Yet those conditions do not constitute some mindless mechanism. Rather, the interdependent processes are more like a conscious self-regulating, even self-healing system. The Buddha’s Four Noble Truths were formulated in the medical progression of symptom, diagnosis, prognosis, therapy. He apparently understood his message as a kind of self-awareness leading to self-healing. Let us pursue this analogy between Buddhism and medicine a bit further.

Medical research suggests that the self-healing processes of the human body work best if the person is sensitive to somatic experience. If a person thinks about a particular part of the body, for example, the blood flow and temperature of that area shifts slightly. This can aid healing. The interdependent somatic processes signal injury or malfunction through tingling, pain, burning, itching, and so forth. If people are aware of these signals, they can respond to them while the problems are mild. If they repress or ignore the information, however, the conditions will often worsen. Where is the agency here? It is the body, but the body as including self-consciousness. The more the whole body (including the mind) is self-aware, the better it self-heals.

Let us apply this medical analogy to the Buddhist person as a system of interdependent, self-aware, and self-regulating processes. Viewed in this light, the point of Buddhist ethics is to make one more self-aware and self-responsive – more “skillful.” Buddhists try to be aware of the “signals” of distress indicating the need for healing. Some may seem internal (the persistence of attachments, the desire for permanence, the preservation of a sense of ego) and some may seem external (the problems inherent in the caste system, economic inequality, gender prejudice, ecological degeneration). By being alert to the signals, the complex of conditions has a better chance to heal itself. To heighten this sensitivity, Buddhists have developed various techniques of praxis, principles of self-discipline, and reminders for how to keep the spiritual therapy on track.

Spiritual illnesses arise within certain conditions: cultural, social, personal, physical. Like physical illnesses, though, they often differ from one locale to another. So we should not expect Sri Lankan Buddhism to be any more like Mongolian Buddhism than we would expect Sri Lankan medicine to be like Mongolian medicine. The conditions are different and so different therapies develop. If we focus on the difference in the illness, we will find great variety. But if we focus on the goal of health, the differences tend to disappear. If in India Buddhist therapy connected more with epistemology and in Japan more with aesthetics, we can see those as different therapeutic strategies to treat the distress signals of different environments. But the goal of the therapies – the basic insight of self, world, and “skillful” agency – remains basically consistent across the variations.

CHAPTER 73

Buddhist Ethics: Trajectories

Charles Hallisey

Varied Trajectories

Over the past centuries, Buddhists have both been caught in and embraced the global processes of colonialism, modernity, and globalization. Each of these processes has changed how Buddhists apprehend the world. As a result, each has left a profound imprint on Buddhist moral experience, values, and practice. Moreover, each process sets in motion relatively novel trajectories that continue to shape Buddhist moral thought and practice, from metaethics to normative ethics to applied ethics. A critical appreciation of the generative presence of these trajectories is essential to any understanding of modern Buddhist ethics as a form of religious ethics. Put differently, these generative forces provoke new and different conceptions of “ethics” and human persons from traditional Buddhist ethics. They also enable thinkers to reclaim aspects of past teaching in novel ways. A range of responses to these large-scale dynamics has given rise to versions of ethics now seen in the Buddhist world. Understanding these responses is the subject of this entry.

Some of these new trajectories are relatively easy to spot. They are the result of Buddhist encounters with ideas and values whose origins lie historically outside of the Buddhist world. This is the case with Buddhist acceptance of the modern concept of historicity and the notion of human rights. It is also true of Buddhist responses to contemporary challenges that are without precedent in history, as is the case with global environmental degradation. Other new trajectories are harder to perceive. These are shaped by shared assumptions and institutions that broadly structure otherwise diverse understandings of human life and our place in the world: assumptions of historicity, culture, and society; institutions like courts, state-supported education, and markets.

These trajectories come together to form what are seemingly ethical creoles in which the moral vocabulary may be Buddhist but the ethical syntax stems from the increasingly common habitus of the modern world. Conversely, the moral vocabulary of an “ethical creole” may be modern but the ethical syntax stems from traditional Buddhist values and practices. Prawet Wasi, a Thai Buddhist activist, gives an example of the first kind of ethical creole. Buddhism, he insists, must have a centrally visible role in development. The traditional Buddhist notions of *sīla* (self-discipline of behavior through morality), *samādhi* (the cultivation of mental self-discipline in meditation), and *paññā* (a wise understanding of the nature of human nature and the world) are central to human development. Yet on closer examination his understanding of perfect development is inflected more by middle-class and urban values than by the Buddhist ideas and

ideals found in Thai villages, the ostensible object of national development (van Esterik 2000, 81). Payutto, a Thai monk and among the most significant contemporary Buddhist thinkers, gives an example of the second kind of ethical creole. His reflections on political and social freedom, celebrated in Thailand as much as anywhere else in the world, are embedded in a moral framework that culminates in a freedom from oneself, from one's own desires and ignorance. This freedom from oneself is, for Payutto, *nirvāna*, the *summum bonum* of Buddhism. *Nirvāna*, as ultimate freedom, is the standard by which all other instances of human freedom are to be judged. Unlike much modern Western ethics, where freedom is a given *sine qua non* of morality, freedom here is a condition to be striven for. "The process by which to achieve freedom (and peace and happiness) is called development (*bhāvanā*) [a traditional Buddhist term for meditation and other forms of mental culture], and in Buddhism, as far as man is concerned, development is synonymous with education (*sikkhā*) [a traditional Buddhist term for training in discipline, particularly used for monastic precepts]" (Payutto 1990, 37).

This entry explores the "trajectories" in Buddhist ethics attentive to the complex interaction of these large-scale processes and mindful of the emergence of ethical creoles in varied contexts. It is important to grasp just how "modern" current Buddhist ethics has become. Hopefully, in this way, something of the vitality as well as the moral challenges facing "Buddhists" around the world will become evident.

Large-Scale Processes

When we try to bring large-scale processes like colonialism, modernity, and globalization into view and consider their significance for the understanding of modern Buddhist ethics, it is critical to avoid the common tendency to delimit their presence only to particular spheres of thought and practice in particular times and places. The importance of avoiding this tendency can be illustrated by considering, first, the continuing impact of colonialism on Buddhist ethics.

Colonialism

Colonialism affected the whole world – colonizers, colonized, and those who were neither – not just in different ways, but in unequal ways as well. Even those communities that were outside any specific colonial political economy were shaped by colonialism's way of ordering the world and its justification of that world order by emphasizing human difference and structures of value based on that difference. Modern colonialism cannot be delimited to a period that is now firmly in the past. Its values, possibilities, and constraints continue to shape the moral thought and practice of all humans, even while the political economy of colonialism has overtly given way to a world order constituted with the foundational notion of the nation. All of these generalizations apply to every part of the Buddhist world, from Central Asia to Southeast Asia to East Asia, just as much as they apply to any other part of the world.

Of course, for some Buddhists who were colonized, like those in Sri Lanka and Cambodia, the general legacy of colonialism makes them part of the "third world." But Buddhists were not only colonized. Some Buddhists colonized others (like the Japanese in Korea), some were "independent" (like the Thai) throughout the colonial period, and these have their own specific legacies of colonialism just as much as those Buddhist communities which were colonized. Whatever their colonial status historically, Buddhist communities all share a common heritage from colonialism. The various modes in which contemporary Buddhists

apprehend themselves as *Buddhist* generally stem from the global processes of colonialism that began in the sixteenth century. Indeed, some argue persuasively that the very notion of Buddhism is primarily a colonial product. It goes without saying that Buddhists did have a range of indigenous terms for self-ascription in precolonial times. Yet the cultural syntax that ordered human difference in colonial times was vastly different from anything before and left an indelible mark on all Buddhist terms of self-ascription.

It is only in the colonial period that Buddhists became capable of distinguishing themselves from other humans using the categories of culture and religion. Neither the modern notion of culture nor religion was known in precolonial Asia. One aspect of this colonial legacy that makes “religion” one of the primary ways of “othering” humans is the still-common impulse to define Buddhism by what makes it *different* from other religions rather than by what constitutes Buddhism. Students of religion too often assume that difference itself is the key rationale for the study of anything Buddhist. They are on the lookout for what is uniquely “Buddhist.” This is an academic issue, but it is not only that. The colonial assumptions of human difference remain a key element of nationalisms in the postcolonial world. “The most powerful as well as the most creative results of the nationalist imagination in Asia and Africa are posited not on an identity, but rather on a *difference* with the ‘modular’ forms of the national society propagated by the modern West” (Chatterjee 1993, 5). Religion loomed large in Asian nationalisms precisely because “the European criticism of Indian [or Chinese or Khmer, or whatever] tradition as barbaric had focused to a large extent on religious beliefs and practices, especially those relating to the treatment of women” (Chatterjee 1993, 9).

Colonialism, modernity, and globalization are big words with even bigger referents. The large-scale processes named by these terms appear increasingly complex as they are investigated more concretely and theorized more adequately. They seem to elude adequate definition. Only the simplest delineation can be stipulated for each of these processes. The definitions provided must necessarily be suggestive and open-ended. Moreover, these delineations are focused on the topics of morality and ethics, understanding the distinction between the two to be that between first and second order phenomena. “Ethics” is thinking and talking about the values, ideas, and practices of morality.

Modernity

Modernity occupies the central place among the three, since colonialism and globalization are defined in conjunction to modernity. Although our understanding of the origins, history, and future of modernity is becoming increasingly open to doubt and tentativeness, the general contours of modernity remain sufficiently conventionalized. By “modernity” is meant a theoretical vision of human nature determined by a constellation of ideas about the individual as a free and discrete agent who, in cooperation with others, is able to transcend the constraints of inherited conditions (especially “culture,” “society,” and “religion”) and is able to construct new “life-worlds” of meaning and well-being.

This constellation of ideas is everywhere apparent in the Buddhist world today. One sees them clearly even in the references to Prawet Wasi and Payutto above. We can also see them in the comments of Daisaku Ikeda, president of Soka Gakkai International, a new Buddhist movement that emerged in postwar Japan, about anecdotes from the biographies of the Buddha. These anecdotes “illustrate an important point in Buddhism, the fact that it does not seek to create any fixed image of the ideal man or demand that everyone attempt to conform to one particular stereotype. Rather it encourages its adherents, while embracing a certain sense of mission, to give full play to their individual abilities and characteristics” (Ikeda 1996, 97).

In modernity, a human being is a self-creating and self-governing individual, and this gives ethics a special pride of place in modernity's vision of a person. Ethics was the primal site of human freedom: a person chooses to be responsible for the kind of life she chooses to lead; a "moral agent" takes responsibility for guiding and regulating her own behavior. Everywhere in the contemporary Buddhist world there is a routine acceptance of modernity's vision of the human, and especially its vision of the importance of ethics. Comparison with the Buddhist past makes this clear, especially in so far as major strands of premodern Buddhist ethics often included starkly probative visions of human capacities: ignorant and riven with desires, we can never be other than beings of "blind passion and karmic evil" (a self-ascription of Shinran's, the great Pure Land thinker from thirteenth-century Japan). On this more classical vision, human beings are constitutionally incapable of constructing life-worlds of meaning and well-being for themselves. The "modern" idea about persons and moral agents, arising out of a large-scale process, is then the condition for the kind of ethical creole seen in the words of Ikeda and others, as well as the very importance of "ethics" in contemporary Buddhist thought and practice.

The inflections of modernity in contemporary Buddhist ethics are partially obscured by the legacy of colonialism. This obscuration occurs in many ways, but generally all to the same effect. Buddhism is posited as apart from the modern, making the manner in which Buddhists articulate a modern ethics more problematic. For example, Prawet Wasi's advocacy of development is an acceptance of the universal vision of modernity that leaves the Thai Buddhist community outside modernity. "Development" is the process by which men and women in certain communities become capable of the ethical self-creation and self-regulation so central to modernity's vision of the moral agent. When Buddhism is constructed as apart from the modern, then the Buddhist past, with all of its ethical and cultural resources, must be measured by the standards of modernity and sometimes transcended en route to the modern. This is seen in the contemporary Tibetan poet Dhondup Gyal's poem, "Waterfall of Youth":

The thousand brilliant accomplishments of the past
cannot serve today's purpose,
yesterday's salty water cannot quench today's thirsts,
the withered body of history is lifeless
without the soul of today,
the pulse of progress will not beat,
the blood of progress will not flow. (Gyal 2000)

Communities which are "not yet modern" were defined as such in the world-ordering vision of colonialism as part of its justification of the inevitability of colonial regimes and their beneficence in initiating the processes of technological, social, and cultural development.

Colonial critiques of Buddhist communities were often couched in moral terms. These were deeply felt – they stung – and their force was often internalized, sometimes emerging in advocacy for new forms of morality among Buddhists. The early twentieth-century Sri Lankan Buddhist activist Anagarika Dharmapala wrote a handbook of moral behavior for Buddhist laypeople that became quite popular and influential. Actually, it was a condemnation of what was accepted in the moral communities of rural Buddhists in colonial Sri Lanka.

In some instances [in Dharmapala's handbook] Western norms are directly advocated as, for example, eating with fork and spoon and using toilet paper before water during ablutions ... Some

points do not conflict with tradition, but by and large Protestant and Western norms have been assimilated as pure and ideal Buddhist norms. Sociologically viewed, Dharmapala's social reform provided a value system to a new class, an emerging bourgeoisie. In many non-Western nations, nineteenth-century Western values, generally Victorian, have been assimilated into the fabric of indigenous bourgeois society ...

The Sri Lanka case is especially striking since the new value system was articulated into a powerful ethic of this-worldly asceticism. (Gombrich and Obeyesekere 1988, 12)

The example of Dharmapala makes it clear that colonialism's manner of establishing differences among communities changed the way in which Buddhists imagined themselves. This is true to the degree that they were always aware of the condemnatory gaze of Europeans. Buddhist life-worlds and moral communities have been created since the time of colonialism by Buddhists and non-Buddhists as they encountered each other in contexts of critique, governance, and resistance.

One important trajectory of modern Buddhist thought stemming from colonialism is deeply defensive. It is part of an inherited response to colonial accusations of the inherent inadequacy of Buddhist thought, practice, and experience in the context of modernity. The shadow of this defensiveness is pervasive, and helps one to understand many features of contemporary Buddhist ethics, such as the routine contrast between Buddhist ethics and vaguely theistic ethics. This contrast is obviously apologetic. It is a way of aligning Buddhist ethics more closely with the secular ethics of the modern West and thereby making Buddhist ethics less susceptible to anticipated criticism of "religion."

This apologetic can be seen in comments by Payutto. One should note especially the claims for systematic rationality, heroic autonomy, freedom, objectivity, and universality in Buddhist ethics. All of these ideas are cardinal features of the self-understanding of modernity, and they are supposedly absent in theistic forms of ethics. Payutto's comments clearly resonate with standard critiques, and also the oversights, of theistically grounded ethics made by European Enlightenment thinkers.

The moral code of Buddhism must be understood as a rational, integrated system of ethics so that the Buddhist practitioner can correctly proceed along the Path. In general, the code of ethics for theistic religions amounts to divine commandments or expressions of divine purpose, which are all separate and different ... *Sīla*, or the Buddhist system of ethics, is a universal set of objective principles established in accordance with natural truths ... Good and bad, right and wrong, blame and blamelessness all exist; you must be willing to accept these for what they are depending on your actions. You must be brave enough to accept that you are right or wrong according to the facts present, not according to your own inclinations.

There are several good things about the commandments of theistic religions. And yet problems remain that render theistic ethics untenable in the contemporary world.

The determination of what is right and wrong, true and untrue has been clearly designated so that if a person believes and is loyal, the positive results of proper behavior are quick and effective. But a problem subsequently arises: in a rationalistic and positivistic age, what can be done to maintain people's beliefs in these commandments? And in the long run, how will people adhering to different faiths be able to live together? And if belief depends on loyalty to commandments, how will people achieve the freedom necessary to attain true wisdom? (Payutto 1995, 249–250)

Colonialism set in motion a dynamic set of images of communities and cultures and thereby helped to spread the “modern” vision of the human. These were used by individuals to establish their own identity as members of a community (e.g. “I am Thai, and as such, I am a free man, because Thailand was never colonized”). The conjunction of modern ideas and colonial processes helps to back “creole” moral identities that characterize much of contemporary Buddhist ethics as “different” than Western religious ethics, but also surprisingly compatible with “modern” ethics.

Globalization

Globalization, the accelerated flow of goods, peoples, images, and ideologies through circuits of economic and cultural interdependence, has intensified the dynamism of the colonial system of images. It has also generated new images that circulate in advertising, tourism, and university classrooms. In other words, globalization has intensified the impact of the “gaze of others,” knowledge through images, setting in motion a “process of doubling” in the Buddhist world (Lopez 1998, 200). This process of doubling builds on but goes beyond the assimilation of European moral values and practices in the colonial world. It is a process of internal self-critique fostered not by defensiveness towards the anticipated critiques of non-Buddhists. Here, self-critique is fostered by measuring oneself against an image of “Buddhism,” an image that is free-floating and thus apparently true. So, for example, “young lay Tibetans growing up in India ... criticize Tibetan monks for not living up to the image of Tibetan Buddhism they have read about in English” (Lopez 1998, 201). The process of doubling does not only occur with images created by non-Buddhists, as one might be inclined to suppose from this Tibetan instance. We see in Thailand and Japan, for example, shifting presentations of images for local consumption that claim to find and display the essence of Thainess (*khwampen Thai*) or Japaneseness (*Nihonji*) (see van Esterik 2000; Morris 2000; Ivy 1995).

The process of doubling is particularly powerful in Buddhist morality and ethics. Globalization consistently spreads an image of Buddhism as a religion grounded in compassion, one which is “above all a religion of reason dedicated to bringing an end to suffering. [A religion which] is strongly ethical and is devoted to non-violence, and as such is a vehicle for social reform” (Lopez 1998, 185). In Buddhist communities shaped by globalization, ethics inevitably becomes second order reflection on Buddhist morality as mediated by these images, not on the values and moral practices of actual Buddhist communities. Common aspects of Buddhist moral life that remain outside these images, such as relations between teachers and students, relations between parents and children, sorcery, and exorcism are thus frequently omitted from consideration in contemporary Buddhist ethics. In this way, globalization continues modern and colonial processes with greater scope, spread, and speed, thereby shaping trajectories in contemporary Buddhist ethics.

The sets of images about particular Buddhist communities (e.g. Thailand as “the land of smiles,” victimized Tibet), about Buddhism in general (e.g. an advertisement that promises that “you can reach business nirvāna” if you use a certain computer program), and about modern ethical ideas (e.g. human rights) that circulate globally are far more fluid and malleable than those systems of ideas, values, and practices that are generally denoted with notions of culture or systematic religious thought. The significance of these sets of images cannot be overemphasized for any understanding of contemporary Buddhist ethics. Accounts of contemporary Buddhist ethics that turn only to culture or systematic thought cannot adequately account

for the cacophony of contemporary Buddhist ethical discourse. It is a cacophony because statements are sometimes made in particular ways more to gain the sympathetic attention of those far away, much like the placards in English that can be routinely seen on television reports of demonstrations in places like Beijing or Baghdad, than as an articulation of a systematic and stable ethical position.

Vincanne Adams has noted this in accounts of imprisonment and torture made by Tibetan nuns in a film by Ellen Bruno, *Satya: A Prayer for the Enemy*:

Heard by activists outside of Tibet, these accounts [of imprisonment and torture] are interpreted as utterances of suffering, not simply of the sort that can bring spiritual salvation, but of the sort that can bring about a political revolution. Suffering in this latter sense is about creating a space of shared meaning between Buddhist and non-Buddhist, Tibetan and Tibetan refugee, Tibetan and foreign activist, Tibetan refugee and foreign activist. Suffering has to be made into something that for non-Tibetans and Tibetans alike can transform the religious into the political by the fact that it results from a presumed universally shared understanding. Suffering is asked to speak in the language of the one who is perceived as being able to alleviate it. Thus the nuns respond to the Western filmmaker, and in their voices we perceive both something that is produced by the Western gaze and some things that may be contrary to it. (Adams 2002, 389)

What “is produced by the Western gaze” and what “may be contrary to it” are equally Buddhist in contemporary Buddhist ethics, even if they are not equally Buddhist in terms of the history of Buddhist ethical thought. It is also important to take note of the ethical resonance of the notion of suffering. *Dukkha* (suffering, dis-ease, dissatisfaction) is a generative element in the Buddhist moral vision. Finally, it is important to take note of the site of moral discourse. Bruno’s film was made for viewing in non-Tibetan communities. All of this is related to the impact of global processes on Buddhist ethics. This takes one deeper into the kind of “creole ethics” presently found among contemporary Buddhist communities and thinkers and thereby clarifies the important changes that virtually define various trajectories in “Buddhist ethics.”

Defining Changes

One of the biggest changes in contemporary Buddhist ethics is the shift to new sites for the production of moral and ethical discourse. In the premodern Buddhist world, ethics was a product of monastic culture. It bore the imprint of the particular disciplinary and pedagogical practices that structured monastic life in different Buddhist communities. Like other areas of intellectual life, ethical thought was pursued and embedded in social patterns organized around person-to-person relationships of spiritual guidance with particular teachers. The practices of devotion and respect that displayed these relationships contextualized and organized a thinker’s relationship with the intellectual and systematic content of the *dharma*, including ethics.

In the modern world, the site of ethics is no longer exclusively monastic. Ethics are taught and studied in state-sponsored schools and universities, disseminated in books, newspapers, and pamphlets, and in the mission statements of NGOs. This expansion of the sites in which Buddhist ethics are encountered and appropriated has introduced a marked ethical change. The mechanisms of print culture encourage

an experience of horizontal anonymity between individuals, on the model of the experience of citizens of a nation, rather than the more personalized but more hierarchical dependence that is typical of pre-modern relationships between monastic teachers and students. In short, the practices of modern print culture require and reinforce the “modern” ethical understanding of a person as an autonomous and capable individual agent. And this shapes, as we have seen, trajectories in contemporary Buddhism about the very subject of ethical discourse and the importance of “ethics” in Buddhist life.

Aside from shifts in how to understand the human person, there is one other change that helps to define the ethics of contemporary Buddhism. It is a shift in the “cosmological” frameworks for understanding the status of moral practices. In general, contemporary Buddhist ethics has made a turn to embracing a thin form of moral realism that is more foundational than what was seen in premodern Buddhist ethics. In the latter, the cosmological framework for morality was located in the structures of *karma* and rebirth. These structures were “real” in a significant way. It was generally thought that denial of *karma* and its fruits in various realms of rebirth (heavens, titans, humans, animals, ghosts, and hells) would put one outside the Buddhist fold. Insofar as the structures of rebirth could be said to represent “real” features of the world, premodern Buddhist ethics represented a form of moral realism. Yet this kind of moral realism was both more robust and more tempered than presently found. That was due to the importance in traditional Buddhist thought of the common notion of “two truths.” One angle of vision on the world represents the way things really are, an ultimate truth. The other offers conventional truth, based on practical efficacy and shared assumptions between the users of accepted categories of thought, discourse, and evaluation. For example, a person from the perspective of ultimate truth is insubstantial and impermanent, best described as an aggregate of impersonal elements and forces. This “person” is profoundly unlike the modern Western idea. And yet, a person from the perspective of conventional truth is a discrete entity that exists and acts in space and across time. This “person” is much more like the modern vision of a moral agent. The difference between the two perspectives on a “person” is close to the difference between saying “I am hungry” (which would be a conventional description) and “There is an abundance of acids irritating the lining of the stomach” (a description from the perspective of ultimate truth). Both statements describe the same state of affairs, yet they can warrant very different ethical judgments. In premodern Buddhist thought, “morality” and “ethics” in the modern sense, along with a modern vision of persons, were within the realm of conventional truth. It was explicitly denied that moral claims could be persuasive or even understandable if expressed in ultimate rather than conventional terms.

Not surprisingly, accounts of rebirth in various realms, while the very stuff of premodern Buddhist ethics, were vulnerable to modern critiques of religion. They represented a bid for a robust but tempered moral realism that could not be sustained in the face of scientific accounts of the world. Buddhist ethics were quickly “demythologized” in response to these critiques of Buddhist cosmology. The bid for moral realism was now made by a turn to accounts of the world that use the categories of ultimate truth. This had the effect of truncating the Buddhist vision while seemingly extending its insights into the modern world. In particular, the concept of “co-dependent origination” was made to sustain a “realistic” ethics. Traditionally, this doctrine was used in relatively limited ways to explain the presence of a person in time and space using strictly impersonal categories. In contemporary Buddhism it has assumed “seemingly magnetic” powers that affect all areas of Buddhist ethics (Keown 2000, 78, n. 46).

For example, the Dalai Lama makes it clear in his *Ethics for the New Millennium* that the moral realism of co-dependent origination gives a prudential moral imperative. It is in our own interests to be moral and this moral realism gives guidance on how we should live.

When we come to see that everything we perceive and experience arises as a result of an indefinite series of interrelated causes and conditions, our whole perspective changes. We begin to see that the universe we inhabit can be understood in terms of a living organism where each cell works in balanced cooperation with every other cell to sustain the whole. If then, just one of these cells is harmed, as when disease strikes, that balance is harmed and there is danger to the whole. This, in turn, suggests, that our individual well-being is intimately connected both with that of all others and with the environment within which we live ... Such an understanding of reality as suggested by this concept of dependent origination also presents us with a significant challenge. It presents us to see things and events less in terms of black and white and more in terms of complex inter-linking of relationships, which are hard to pin down. (Dalai Lama 1999, 4)

The change in cosmological outlook, and so the kind of moral realism endorsed, when linked to shifts in ideas about persons arising within new sites of moral discourse, goes a long way in helping us understand trajectories in Buddhist ethics. It enables us to see the possibility of Buddhists constructing differing creole identities that continue and yet also revise traditional Buddhist beliefs, practices, and outlooks.

Realism and Situationalism

We see in the comments of the Dalai Lama a final feature of contemporary Buddhist ethics, at once traditional and also modern. The principles of normative ethics are theoretically obvious (they include the well-being of others in relationship with oneself), but they are particularly hard to discern in practical terms. The (ultimate) nature of the human and natural world makes it impossible to specify particular moral norms that would be universally applicable in all instances. Interestingly enough, the moral realism of traditional Buddhist metaethics as the real backing for a contemporary ethics yields an acceptance of situational ethics in the area of normative ethics. It reduplicates in a novel way some of the same insights as the classical “two truths.” And, further, this move also allows contemporary Buddhist ethicists to accept the insights of historical and cultural relativism in describing morality without rejecting the objectivity and universalism of moral realism as seen in the Buddha’s teachings. In this respect, we see Buddhist ethicists finding a way to allow for moral disagreements without insisting that one point of view must be wrong, as is often the case in ethical positions that are morally realistic. We also see how a classical tradition can locate within its own resources means to respond to the large-scale processes now shaping human life on this planet.

5 Indian Religions

CHAPTER 74

Hindu Ethics?

Roy W. Perrett

Is There Hindu Moral Theory?

Is there such a thing as Hindu ethics? Is the category of ethics appropriate to the moral thought of the Hindu religious tradition? Obviously enough, the answers to these questions depend very much on what we mean by “ethics”. One very broad characterization might be something like this: ethics is a set of substantive proposals concerning how to live, how to act, or what sort of person to be. In this sense there certainly is Hindu ethics, with a large variety of texts in Sanskrit and other Indian languages setting forth various such proposals (see Holdrege 1991).

But ethics is also often taken to be a branch of philosophy, and hence a body of theoretical discourse centrally concerned with analysis and justification. There certainly exists a highly articulated Hindu philosophical tradition, but is there Hindu ethics in the philosophical sense of that term (i.e. a body of developed moral theory)? The answer is not so clear, for although classical Indian philosophy is incredibly rich in rigorous and extended discussions of topics in epistemology, logics, and metaphysics, comparable discussions in philosophical ethics do not abound. Hence, too, the relative paucity of extended contemporary studies of Hindu moral philosophy (see Maitra 1956; Hiriyanna 1975; Perrett 1998).

Some have seen this lacuna in the otherwise enormous Indian philosophical literature as implying that “morality, its origins and its expression in various commands and interdictions, was taken too much for granted to be discussed” (Hopkins 1924, 88). But this is not quite right. The classical Indian philosophers obviously had a great deal to say about ethics insofar as they vigorously discussed topics like the ends of life and the relation of virtuous action to those ends.

Others have suggested the gap in the literature does not point to the Indians’ indifference to ethics, but just to their indifference to ethical theory of a certain universalistic sort. Max Weber’s views have been influential in this connection:

There was no universally valid ethic, but only a strict status compartmentalization of private and social ethic, disregarding the few absolute and general ritualistic prohibitions (particularly the killing of cows). This was of great moment. The doctrine of *karma* deduced from the principle of compensation for previous deeds of the world, not only explained the caste organization but the rank order of divine, human and animal beings of all degrees. Hence it provided for the coexistence of different ethical codes for different status groups which not only differed widely but were often in sharp conflict ... [Men] were as unlike as man and animal. (Weber 1958, 144)

More recently, A. K. Ramanujan has often been cited as claiming such particularism to be a characteristic “Indian way of thinking”:

One has only to read Manu after a bit of Kant to be struck by the former’s extraordinary lack of universality. He seems to have no clear notion of a universal *human* nature from which one can deduce ethical decrees like “Man shall not kill,” or “Man shall not tell an untruth.” One is aware of no notion of a “state,” no unitary law of all men ... To be moral, for Manu, is to particularize ... I think cultures (may be said to) have overall tendencies ... to *idealize*, and think in terms of, either the context-free or the context-sensitive kind of rules ... In cultures like India’s, the context-sensitive kind of rule is the preferred formulation. (Ramanujan 1989, 45–7)

All of this might too hastily suggest a picture of Hindu ethics as a variety of anti-theoretical particularism, prefiguring certain trends in contemporary Western ethics. On such a view, the absence of a developed Hindu moral theory not only fails to show that there is no Hindu ethics, but it may very well also show that the Hindu ethicists deliberately eschewed universalistic theory because they better understood the radically particularistic nature of ethics than have most Western ethicists.

Such a picture of Hindu ethics as particularistic anti-theory, however, is unconvincing. First, if the Indian philosophers really were anti-theorists about ethics, this clearly had nothing to do with any principled general objection to the construction of universalistic philosophical theories: witness the growth of the intricate edifice of classical Indian epistemological theory (*pramāṇavāda*). Second, the classical Hindu ethicists did recognize the existence of some kinds of universal moral rules: the *dharmaśāstrins* explicitly distinguished the particular duties of one’s caste and stage in life (*varṇāśrama-dharma*) from the universal duties (*sādhāraṇa-dharma*) incumbent on all, regardless of age or occupation. Third, the classification of Hindu ethics as particularist unhappily saddles Hindu moral philosophers with the problem of how to make coherent the often inconsistent deliverances of commonsense moral judgments on particular cases – especially since in other domains Indian philosophers have been just as reluctant to accept contradictions as have their Western counterparts.

A third position is that Hindu thinking on *dharma* does indeed provide a moral theory, but one of a uniquely pluralistic sort:

Part of it is a theory of moral rules, part of it a theory of virtues, another part communitarian, and added to all these, there is a layer of Kantian-like duty for duty’s sake sub-serving a transcendent goal of *mokṣa*, where ethics transcends itself. (Mohanty 2000, 122)

There are difficulties, however, with this way of representing Hindu moral theory. First, it can all too readily be taken to suggest that Hindu moral theory is just an uneasy – and probably unstable – patchwork of parts of various more familiar Western moral theories. Second, it is exegetically implausible to represent the corpus of Indian writings on ethics, scattered over a variety of sources and genres, as constituting a single synthetic moral theory.

Is there a better picture of Hindu ethics available, one that does justice to its special theoretical character while also acknowledging the relative thinness of the moral theory actually developed by the Indians – its thinness, that is, when compared to paradigms like Western moral theory or classical Indian *pramāṇavāda*? I think so, but providing it requires the use of a rather different map of the territory of ethics than that which has become the standard one.

Two Maps of Ethics

A familiar Western map of ethics divides the territory up into two basic approaches: non-normative and normative. Non-normative approaches, on the one hand, include both descriptive ethics and metaethics. Metaethical theories are either cognitivist or non-cognitivist. Cognitivist theories are either naturalist or non-naturalist. Normative approaches, on the other hand, divide into normative ethics and applied ethics. Normative ethics then divides into teleological and deontological theories. The main teleological theories are egoism, consequentialism (including utilitarianism), and virtue ethics.

Such a map would not have the currency it does if it failed to capture any of the territory. Hence, it is at least *prima facie* embarrassing to find that there exists nothing identifiable as Hindu ethics which can be located comfortably on this map. Nor is it enough just to plead that Hindu ethics is *sui generis*, for then we still need to supply a better map of the territory of ethics: one on which Hindu ethics can be located, together with all the other theories already captured on the standard map. Fortunately for the cause of Hindu ethics, however, some recent work in Western moral theory not only supports the claim that the standard map of ethics is inadequate as a complete representation of the logical space of the possible theories, but also offers a more promising rival map (see Kagan 1992, 1998; Donagan 1977).

First, the rival map suggests that the distinction between metaethics, normative ethics, and applied ethics is arguably better understood as roughly marking positions on a continuum, rather than sharp lines of division. Just as we cannot articulate substantive moral claims in applied ethics without reference to the sorts of more fundamental claims about the content of morality traditionally counted as part of normative ethics, so too we cannot articulate these more fundamental normative claims without reference to second order claims about the very nature of morality. Metaethics and normative ethics, then, are not as independent of each other as is often claimed.

Second, the new map of ethics suggests that when we consider the structure of normative ethics it is fruitful to distinguish between normative *factors* and normative *foundations*. For example, when considering a particular act, we typically seek to articulate both the various factors relevant to determining the moral status of that act and the foundational devices that generate and explain the favored list of normatively relevant factors.

A normative factor is one relevant to determining moral status and most moral theorists favor admitting a variety of them – including outcomes, constraints, special obligations, options, and so on. More controversial is exactly how these various factors interact and how they are to be weighted relative to each other in the event of conflict. To get a grip on the notion of a normative factor, imagine a situation where I take a boat to rescue someone who is drowning. Clearly, saving a life is a good outcome and this factor is relevant to the moral evaluation of my deed. But many think this may not be the only morally relevant factor here. Suppose, for instance, the boat belongs to someone else and so to rescue the drowning person I have to steal the boat. Should someone else's property rights constrain my rescue attempt? Or suppose the drowning person is my daughter. Do I then have a special obligation, stronger than my obligation to save a stranger? And so on. In both Western and Indian ethics there are a number of alternative theories about the morally relevant factors and their interaction.

The foundational theories are supposed to help us with these issues by offering mechanisms that purport to generate and thus explain the list of normatively relevant factors. Of course, some ethicists are *non-foundationalists*, holding that there is no further explanation possible at the foundational level of

the normative factors and their interaction principles. *Foundationalists*, on the other hand, deny this and offer competing theories that seek to justify their choice of a factorial list. (Note, however, that the ethical foundationalist is not necessarily committed to the thesis that the foundational level theories are *epistemically* prior to, or more basic than, the factorial level theories. Epistemically speaking, it might well be that neither level is more fundamental than the other.)

Foundational theories may be either teleological or deontological. Teleological theories explain the significance of the factors in terms of their significance for the good, either the individual good or the overall good. Examples of such teleological foundational theories include egoism, virtue ethics, and consequentialism. Deontological theories deny that the ultimate basis of ethics lies in terms of some central good or goods, except for that agreement they differ about the details of their positive foundational accounts. Examples of deontological foundational theories include contractarianism, universalizability theory, ideal observer theory, and reflection theories.

It is important to realize that the choice of a theory about the morally relevant factors can be relatively independent of the choice of a foundational theory. This point is not always well appreciated. Two people might well agree, for instance, about the list of normative factors, but disagree about the correct foundational theory. Whereas it is too often assumed that a foundational theory uniquely generates a particular list of factors, in fact two rival foundational theories might well generate the same list of factors. For example, admitting the moral relevance of factors in addition to outcomes does not preclude all of these factors being given a purely consequentialist explanation at the foundational level. On the other hand, two people might well agree on the correctness of a given foundational theory and yet disagree about which factors are generated by that theory. For example, many consequentialists have too hastily assumed that consequentialism as a foundational theory commits us to the (relatively unpopular) view that outcomes are the only morally relevant factors. But in fact one can quite consistently be a consequentialist at the foundational level without being a consequentialist at the factorial level.

The distinction between theories of normative factors and foundational theories, then, fruitfully enriches the logical space that ethical theories occupy: there are far more theoretical possibilities than has usually been thought. But there are still two further foundational issues a complete normative theory has to address.

The first issue is the problem of whether to embrace *monism* or *pluralism* at the foundational level. A pluralist at the factorial level holds that more than one normative factor has weight in its own right. This does not, however, preclude there being a single foundational theory that justifies and explains this plurality of factors. Someone who believes there is such a single foundational theory is a foundational monist. In contrast, a pluralist at the foundational level holds that the different factors are grounded in different foundational devices.

There are two ways this might be done. One is right to insist that there is an ultimate and irreducible pluralism at the foundations of normative ethics. The other is a bit more exotic: a foundational pluralism which also admits of the possibility of *multilayering*. The idea here is that there may be at a deeper foundational level still some single foundational theory that grounds and explains the plurality of more superficial foundational theories. There are many structural possibilities along these lines that are still to be explored fully. For example, egoism might be invoked to support contractarianism, which in turn might generate the factorial level; or the ideal observer might support universalizability. Nor is there any obvious reason why we must stop with a single deeper foundational layer: perhaps the multilayering goes much deeper than that. Indeed, using this notion of multilayering, perhaps we can combine

elements of both monism and pluralism at the foundational level and construct a foundational theory which has several layers containing more than one component account, with pluralism at one level grounded in monism at a deeper level. The theoretical possibilities in this area are surely much richer than has usually been appreciated.

Second, a complete foundational theory needs to address the issue of *evaluative focal points*. Rival theories in normative ethics have often disagreed as to what kinds of objects provide the *primary* evaluative focal point. Thus the familiar debate between act- and rule-consequentialists: are acts to be the primary evaluative focal point, with rules evaluated in a secondary or derivative way, or should it be the other way around. But acts and rules do not exhaust the list of plausible primary evaluative focal points. Other possibilities include motives, institutions, norms, character traits, and intentions. Taking each of these we can construct a variant of any given foundational approach. The choice of focal point will then significantly influence what is generated at the factorial level. Once again, ethicists have done relatively little independent investigation of the evaluative focal points, as opposed to promoting rival foundational theories which already incorporate choices about focal points. An exception is recent work by virtue theorists, where significant intramural differences of opinion at the foundational and factorial levels have not been able to obscure a fundamental point of agreement: that it is virtues, rather than acts or rules, that ought to be our primary evaluative focal point.

To sum up then. On this new map of ethics we can think of normative ethics as having two major levels: the foundational and the factorial. At the foundational level we can then further subdivide the concerns of ethical theory into two: the choice of foundational devices and the choice of focal points. Taken together, these latter two generate the favored list of normative factors. Ideally, a complete moral theory will include all three components and give an account of their interconnections. It will also take a stand on the foundational monism/pluralism issue.

Implications

Suppose that a complete moral theory ought to include all of these components. Is there such a fully developed Hindu moral theory? The answer is clear: there exists no credible Indian candidate for such an exalted role. But equally there is no credible Western candidate for such an exalted role. Even the most fully articulated Western moral theories fail to address all of the ethical territory represented on the new map of ethics. Of course, some Western moral theorists have explored some parts of that territory in considerably more systematic detail than have any of their Indian counterparts: this is what gave rise to the impression that there was no Hindu moral theory. But arguably most Western ethical theories effectively confine themselves to less than the three areas a complete theory is supposed to discuss.

Thinking of the usual standard Western normative theories as incomplete moral theories from which there is nevertheless something to be learned helps us to understand better the limits and achievements of Hindu moral theory. It is not that the Hindus have developed a uniquely pluralistic, synthetic moral theory, scattered over a variety of sources and genres. Rather, what the Hindu moralists have done is much like what their Western counterparts have done: they have investigated different regions of the moral map, with their different sorts of normative investigations often proceeding independently of one another, and they have managed at best to develop only significantly incomplete normative theories (notwithstanding the interest of these fragments).

Of course, sometimes the Indian theories happen to be weak in precisely the areas that the Western theories are strongest: hence the Western valorization of Western foundational theory and metaethics. In reality the Hindu moral theorists have done some very good work centered on factoral and focal issues: see, for instance, the rich discussions of the normative factors, foci, and their interactions to be found in the *dharmaśāstra* and *arthaśāstra* texts, or in the epic narratives of the *Mahābhārata* and *Rāmāyaṇa*. Moreover, in some areas the Hindus have arguably done pioneering work as yet unmatched by their Western counterparts: for instance, whereas the issue of multilayered foundational pluralism has been largely unexplored in Western ethics, the Hindu discussions of the nature of the *puruṣārthas* and their relationships to one another are remarkably suggestive in this respect.

On this theoretical map of the territory of ethics, much of the fine-grained detail has yet to be filled in. Using this map, however, we can successfully capture what both Western and Hindu ethicists have done and what they have as yet failed to do. In other words, we have an attractive representation of ethics which allows us to view both Western and Indian moral philosophers as importantly engaged in common activity aimed at the same regulative goal: contributing to the construction of an ideally complete moral theory. In this sense, then, there most definitely is Hindu ethics.

CHAPTER 75

Origins of Hindu Ethics

Anne E. Monius[†]

Focusing on the classical model of the ideal human life as it emerges from the texts of Hinduism's religious elites by the turn of the common era, this entry examines the origins and fundamentals of Hindu ethics, phrased here as the inquiry into the nature of dharma, a moral, social, and cosmological "order" that lies at the heart of traditional Hindu thinking about the moral life. In the complex of Hindu religious traditions that tend to emphasize orthopraxy over orthodoxy, where "what a Hindu does in relation to his or her social standing and context is far more important than what a Hindu thinks" (Flood 1994, 69), dharma suggests something other than an ethics of general and abstract principle, of rationally derived universal law and application.

The Ritual Beginnings

For those accustomed to the Euro-American discipline of moral philosophy, the effort to understand Hindu ethics begins in an unlikely place: with the sacrificial ritual traditions of the most ancient and authoritative of Hindu texts, the Vedas. The Vedas, literally texts of "knowledge," combine myth, poetry, and sacrificial injunction. They are complex and voluminous works whose oral composition spans more than a millennium, from the hymns of the Rig Veda, composed perhaps in the second millennium BCE, to the more speculative sections known as the Upaniṣads, datable roughly to the eighth through sixth centuries BCE. Hindu tradition assumes the Vedas to be eternal and authorless. It refers to the entire textual corpus as *śruti*, "that which has been heard": truths about the nature of reality received by great sages of a far distant age. Composed in a religious language known as Sanskrit (literally "perfected" language), the Vedas have remained, until the advent of modern Euro-American Indology, the provenance of a class of religious specialists known as the brahmins. Recognition of the supreme authority of the Vedas has served as one of the strongest measures of Hindu identity in the great diversity of Indian religiosity.

The Vedas – and all texts to be considered in this entry on origins – represent only the perspectives of an elite priestly class. The voices of women, the lowest social classes, and other marginal groups are largely silent until the modern period. Although the full practice of Vedic sacrifice survives only in a few isolated communities in modern India, and generations of non-brahmins and non-Hindus have arisen to challenge the brahmanic model of the ideal human life, the traditions of moral inquiry to be discussed below remain central to all Hindu moral reflection to the present day.

[†] Deceased.

In the Vedic world of *yajña*, “sacrifice,” performed by brahmins for their wealthy patrons, dharma, derived from a verbal root meaning “to uphold,” significantly occurs most often in the plural. Found more than sixty times in the Rig Veda alone, dharma and its derivatives signal ritual acts properly performed by brahmin virtuosos to rejuvenate and reinvigorate universal order. Correctly enacted sacrificial rites are critical to the well-being of the cosmos, for the world is not an independent or objective reality. Universal order is *constructed* by the ritual performance (Halbfass 1988, 314–316). As the “Hymn to the Primeval Man” (Rig Veda X.90) demonstrates, dharmas as rites of sacrifice serve to create and order the entire world, from the heavens above to the very fabric of Hindu society: the social classes or castes, elsewhere termed *varṇas* or “colors”:

The Primeval Man had a thousand heads, a thousand eyes, a thousand feet ...
 When the gods performed a sacrifice with the Primeval Man as the oblation, spring was the clarified
 butter, summer the fuel, and autumn the offering ...
 From that sacrifice, offered entirely, the drops of clarified butter came together; [that] made all
 the animals: those of the air, those of the forest, and those of the village ...
 His mouth was the brahmin; his arms made the ruler; that which was his thigh was the mer-
 chant; the servant was born from his feet ...
 With [this] sacrifice, the gods sacrificed to the sacrifice; these were the first sacrificial acts
 [dharmas] ...

As these primordial rites of sacrifice first constitute cosmic order, so, in turn, must the members of the priestly caste maintain that order: “these were the first sacrificial acts [dharmas]” to be enacted again and again by the priestly community.

The vision of the moral life that emerges from the large and complex body of the Vedas is thus highly performative, tied to the structured ritual actions of the sacrifices that fashion and maintain the world. The human being’s moral challenge – particularly that of the brahmin male – is to conform to one’s place in that tightly woven, hierarchical world. To find one’s place and so conform to the obligations and rhythms of the planets, the forces of nature, the world of animals and plants, and the intricate web of society is to participate actively in an aesthetic whole, enacting the sacrifice that both sustains that whole and ties one to a specific position therein. In the Vedic conception of dharma, the “intermeshing of natural and normative is taken for granted” (Chatterjee 1986, 178). The proper ordering of the universe and human society emerges both from the raw stuff of the world itself (the body of the Primeval Man) and from the human ritual activity that shapes and sustains that matter. To be moral, to act rightly, is to realize actively one’s place in the ritually constituted cosmos.

The cult of ritual sacrifice dominated by brahmin officiants no longer survives apart from a few isolated instances, and perhaps has not existed in any significant way since the demise of royal patronage by powerful medieval Hindu kings. Yet these most ancient views on dharma remain central to later developments in Hindu ethics. In the voluminous Vedic texts that incorporate many centuries of gradual change in practice and thought, dharma also emerges as an important term in the singular. If the plural signifies the multiplicity of ritual acts necessary to constructing and maintaining universal order, the more abstract singular term implies the result of such ritually creative activity, the established norm to which the individual should conform to the best of his ability: the brahmin to perform sacrifice; the warrior to rule; the merchant to trade and till the soil; the servant class to labor wherever necessary.

While dharma as a “totality of binding norms” (Halbfass 1988, 314) becomes increasingly the focus of ethical inquiry, the creative activity of the ritual is never fully lost in Hindu understandings of the term. Dharma is not a natural law or objective truth but the result of human activities, denoting a “reciprocity” between cosmogony and ethics, human action and natural events (Halbfass 1988, 318). Just as the ritual-performative aspects of Vedic dharma remain constant, so, too, does the notion of multiple dharmas. In the classic model of ideal human behavior discussed below, dharma is constituted by an emphatically plural set of behavioral codes. While moral order is singular and cosmic, its constituent parts are plural and particular.

An Alternative Vedic Ethics of Withdrawal and Transcendence

Before turning directly to the development of the classic orthodox model of Hindu dharma, brief mention of diversity within the Vedic tradition itself must first be made. There exists within the Vedic corpus, in the latter portions known collectively as the Upaniṣads, a rejection of ritual that will be taken seriously by all brahmanical moral theorists to come. Where this turn from ritual to more philosophical speculation on the nature of reality originates is unclear. Whatever their source, the teachings of the Upaniṣads discard the world of ritual in favor of a new goal: *mokṣa*, literally “release,” an ultimate freedom from a vision of human life in which the soul suffers endless rebirths and redeaths (termed *saṃsāra*). *Mokṣa* is to be achieved, according to the Upaniṣads, not by the performance of highly patterned ritual activities, but by withdrawing from the world of ritual, and from the world of human activity in general, to contemplate the true nature of self and world through meditation. “For dangerous are these boats of sacrifice ... / The foolish who praise [them as] the highest / indeed go again to old age and death” (*Muṇḍaka Upaniṣad* 1.2.7).

This vision of the human condition mired in the miseries of endless reincarnation demands a reworking of a number of earlier Vedic concepts, stripping them of their original ritual connotations and imbuing each with a new sensibility. One such lexical transformation lies in the redefinition of karma. While karma (from a verb meaning “to do”), in the ritual injunctions of the Vedas, refers to the performance of the ritual act, karma acquires a more abstract, ethicized set of meanings in the Upaniṣads, signaling not just action but the ongoing, cumulative moral fruits of that action across many lifetimes. Reconceived as the ethical repercussions of human deeds, karma guides the human soul through its succession of rebirths: “As one does, as one conducts oneself, thus he becomes ... One becomes virtuous through virtuous action, wicked by wrong action” (*Bṛhadāraṇyaka Upaniṣad* 4.4.5). Since it is karmic activity that keeps human beings trapped in the realm of rebirth, the path to liberation lies in the complete cessation of all such activity, accompanied by meditative austerities meant to generate the Upaniṣadic equivalent of the heat of the sacrificial fire, *tapas*, an internal “heat” that is powerfully transformative. The quest for liberating knowledge replaces sacrificial ritual as the central activity of human beings. It lies not in the realm of the gods or the heavens, but in the experiential awareness of the underlying ontological unity of the world, expressed in terms of the identity of Self (Ātman) and highest Reality (Brahman).

The moral life is to be found in the pursuit of the knowledge of Brahman and Ātman, superseding the life of ritual performance embraced in other parts of the scriptural corpus. The paradigmatic life of the sage – restrained in activity, detached from sensory participation in the world, meditating on an object of

knowledge that lies beyond the human capacities for language and description – embraces an ethics of restraint and austerity. As the *Kaṭha Upaniṣad* (3.3.9) declares:

Know that the Self is the owner of a chariot, and the body is the chariot itself; know that reason is the charioteer and that mind, indeed, is the reins ...
The man whose charioteer is discernment and who reins in his mind, he reaches the end of [his] journey ...

The Upaniṣadic focus on the individual's quest for liberating knowledge of the ultimate identity of Self and Reality survives in the form envisioned by the ancients no more than do the sacrificial traditions embraced by the more ritually oriented portions of the Vedic corpus. Yet, like the performative ethics described above, this ethics of renunciation and transcendence plays a critical role in all Hindu formulations of the ideal life. It is the intertwining of these two Vedic moral visions – that of ritual activity and that of renunciation – that generates the most powerful and enduring orthodox Hindu model of the ideal human life.

An Ethics of Human Particularity

The two models of human behavior outlined in the Vedas do not remain forever at odds. Among the earliest layers of brahmanic commentary on the Vedas, the *Dharmasūtras*, literally “Short Texts on the Nature of Dharma,” focus on the ideal life of the priestly householder, one in which “the ritual, the moral, and the social constitute ... a continuum” (Olivelle 1999, xxxviii). Citing the ritual injunctions of the Vedas as the primary source of dharma, the *sūtra* literature applies the performance of public rituals to the everyday activities of the brahman householder. While the texts repeatedly sing the praises of the householder, the possibility also exists of living one's life in service to the guru or teacher of Vedic tradition, in forest retreat, or in the state of full renunciation (see Olivelle 1993). There also emerges from the *sūtras* a clear vision of distinct pursuits suitable to human life, the *puruṣārthas* or “goals of man.” These include not only dharma or moral behavior but also *artha*, the pursuit of wealth and power, and *kāma*, literally “lust,” the pursuit of the pleasures of love and family (later authors will add *mokṣa* as a fourth and final goal of human life).

The *sūtra* literature expresses a vision of the moral life firmly rooted in the brahman householder's ritual activities directed toward the gods, the ancestors, and the cosmos writ large. Yet here dharma also begins to grow into a vision of the moral life that is both performative and intentional, an ethic of worldly works and inner cultivation of a particular frame of mind and heart. Dharma implies not only ritual propriety, but also morality in a wider sense, the cultivation of virtues deemed generally beneficial.

The older Vedic notion of rites done for worldly – or even universal – gain is superseded in the *sūtras* by a focus on cultivating proper intention, proper frame of mind, while at work in the world as a brahman householder. As Āpastamba notes, “Let him not follow the Laws for the sake of worldly benefits, for then the Laws produce no fruit at harvest time” (1.20.1–2, in Olivelle 1999, 31). While dharma remains rooted in the ultimate authority of the Vedas, Āpastamba and other *sūtra* authors also cite commentaries on the Vedas (*smṛti*, literally “that which is remembered”), the conduct of those learned in the Vedas, and accepted custom. The uncertainty of dharma, the difficulties in determining the proper path of conduct

for the brahman male householder amid the messiness of human life, obviously weigh heavily on the minds of the *sūtra* authors as each struggles to discern a wider system of human ethics amid a contested array of opinions and customs.

These *sūtra* themes are consolidated and elaborated upon in the large body of important texts known as *Dharmaśāstras*, extended treatises on the nature of moral life. The most important of these in Hindu history is the *Manusmṛti* or *Mānavadharmasāstra*, often translated into English as “The Laws of Manu” (Doniger and Smith 1991). Manu attempts to claim a certain universality absent in the individual *sūtras* that remain tied to specific Vedic schools and to expand the themes outlined above to include not only rules of conduct (*ācāra*) and expiatory rites (*prāyaścitta*) but the administration of law, both criminal and civil (*vyavahāra*). Attributed to a figure, Manu, about whom nothing is known, and datable roughly to the turn of the common era or earlier (Doniger and Smith 1991, xvii), the Laws of Manu are comprised of 2,685 Sanskrit metrical verses, composed by and for the members of the brahman priestly elite. The focus of the text lies in constructing an all-encompassing model for human moral behavior: *varṇāśramadharma*, literally an “ethics of life stage and social caste,” a moral vision based on innate differences among human beings. Beginning with large metaphysical claims about the authority of his vision of dharma, Manu then focuses on the specific duties and obligations of the three upper or “twice-born” castes, with occasional references to lower social groups, including women. Particular attention is paid to the conducting of life-cycle rituals known as the *saṃskāras*, rites of transformation meant to create and shape the moral human being. The four life choices of the male Brahmin found in the *sūtra* literature, now significantly rearranged as successive life “stages” (*āśrama*), organize the central portion of the text. Manu then moves on to discuss the duties of kings and the administration of justice.

The Laws of Manu consist of long and often mind-numbing lists of prohibitions and exhortations to eat certain foods, mix with certain people, and avoid all others. Such lists, to the modern Western eye, seem random, confusing, and completely confining. Consider, for example, what Manu has to say about urination:

He should not urinate on a path, on ashes, in a cowshed, on ploughed [land], in water, on a funeral pyre, and not on a mountain ...

He should never discharge urine or feces while facing the wind, fire, a priest, the sun, or water ...

In the daytime he should discharge urine and feces facing north, at night facing south, and during morning and evening twilight as during the day.

[Urination] on fire, at the sun, or at the moon ... destroys [one's] intelligence (4.45–52)

Despite such impossible lists of rules, the Laws of Manu also betray a quintessentially realistic view of human fallibility. In the context above, Manu recognizes that one cannot always control the circumstances of nature's call. As in nearly every situation, he provides an escape clause of sorts, a statement about the possibilities of violating all the carefully articulated laws “in extremity” (*āpad*): “The twice-born [male], when fearing injury, should do it facing whichever way, / whether it be in shade or darkness, at night or during the day” (4.51). Manu also builds on the rites of expiation outlined in the earlier *Dharmaśūtra* literature, allowing for the ritual correction of any mistakes.

Keeping in mind these escape clauses of expiatory rite and extremity, we now turn to the central focus of Manu's work. The model of *varṇāśramadharma*, the morality of social class and life-stage, brings

together those two competing Vedic visions of morality: the life of active ritual participation in, no less construction of, the world and that of complete renunciation of ritual and society. The model of *varṇāśramadharma* rests on the assumption of qualitative human difference, of particularities of substance, space, time, and circumstance. In Manu's world of class and life-stage, there can be no concept of universal human nature or rights; Manu refers repeatedly to the innate tendencies and activities of each social class. The hallmark of social and moral order for Manu lies in the ever-vigilant separation of distinct groups of people and earthly things. There is a general appreciation in the *Laws of Manu* for universal values such as non-injury to living beings (*ahiṃsā*): "non-injury, truth, not stealing, purity, and control of the senses ... is the concise dharma of the four classes" (10.63). Yet the substance of ethical discussion focuses on the particular duties of those specifically located in the social and universal order. Dharma is sensitive to context: "to be moral, for Manu, is to particularize" (Ramanujan 1989, 45).

The particularities of human nature, as well as the moral codes of behavior that govern each, are arranged not horizontally in the dharma of caste and life-stage, but vertically. In this text written by and for brahman priests, the brahmans enjoy the preeminent position over the warrior, the merchant, and the servant. This hierarchy of particularity and the separation among peoples and things is marked in Manu by what he terms "purity" (*śuddha*) and "impurity" or "pollution" (*asuddha*). These are almost substantive qualities that are contagious, transmitted through contact or close proximity. All things in the world possess a purity factor that is both fixed and relative. Brahman is pure, warriors less so, merchants even less so. Yet what is polluting for the brahman – a particular food, contact with a particular person – might be quite purifying for the lowly servant. The priestly caste's presence at the apex of the social order is due to its collective purity. The bulk of Manu's text aims to maintain that very purity from the polluting dangers of the world and of other social classes that surround the brahman. Purity is not an entirely natural state, however. It is carefully constructed and maintained through a lifetime of ritual observances. The brahman's capacity for purification rests in Manu's cosmogony, in the fact that priests issue forth from the mouth, the purest part of the Primeval Man who gave birth to the universe (1.92–94). Manu's rites of expiation are essentially rites of purification, cleansing the self of moral "dirt" accrued through contact with the substantively/ethically "unclean."

Yet this ethics of particularity, of difference and hierarchy, does not necessarily imply inter-class hatred or distrust. Manu's treatment of women is a good case in point. On the one hand, women of any class are dangerously impure and polluting, largely because their bodies are prone to excreting more polluting liquids than their male counterparts. Women are also dangerous to the brahman male in search of sensual restraint. Due to the dangers they pose to men seeking lives of self-control, women must never be allowed independence of thought or circumstance: "[Her] father protects [her] in childhood; [her] husband protects [her] in youth; / and [her] son protects [her] in old age" (9.3). Yet, for all the sexual dangers women pose, the horrifying impurity of their menses and the bodily excretions of childbirth, Manu is also constant in his exhortations to respect and honor women for their invaluable place in the order of the world. Although women are barred from Vedic recitation, for example, their presence is deemed critical to the success of any ritual performance: "Where women are honored, there the gods rejoice; / but where they are not honored, there all rituals are without fruit" (3.56).

In addition to the particularities of substance that govern the dharma of *varṇa* or social class, dharma is also shaped by qualities of time. In the largest, most universal of senses, the Hindu cosmos endlessly cycles through four great ages that tend toward moral entropy. In the first, dharma as order both moral and cosmic stands complete; *adharma*, disorder, is entirely unknown. Through each successive stage, dharma grows increasingly diminished (Manu 1.79–86). The dharmic duties of men are different in each

age, and human beings now live in the most morally decrepit of eras, when perfect morality, perfect sacrifice, perfect anything is utterly impossible. Not only is dharma difficult to discern, but, even when located in this most amoral and blackest of cosmic eras, it can be but partially revealed.

The individual – at least of the three upper or “twice-born” classes – is also subject to temporal particularity. The stages of one’s life demand that different moral codes be followed. In a brilliant interpretive move that weaves together the world-embracing and world-renouncing strands of Vedic thought, Manu presents the ideal human life as one of four discrete stages or *āśramas*. An upper-class male’s life ideally begins with the stage of celibate studenthood, serving his teacher while learning the Vedic texts and traditions of ritual performance. Following mastery of the Vedas, the student ritually departs from his teacher, marries, and enters into what remains for Manu the most important of the life-stages. The householder actively performs Vedic rites and meets his three debts to the Vedic sages, the deities, and the ancestors. In the life of the brahman householder, one pursues the first three of the human goals: dharma, power, and sensual happiness. This emphasis on the life of the actively engaged householder, accounting for the bulk of Manu’s text, implies a moral vision focused not only on acting correctly but also on living well, in the bosom of family, prosperity, and meaningful daily activity.

After the priestly householder has fulfilled his ritual and reproductive debts to ancestors, gods, and sages, he may turn over all his property to his sons and retreat from the world. There, “alone, he should contemplate continually in solitude on what is beneficial to the Self; / for alone, [so] contemplating, he approaches the highest good” (Manu 4.258). By making the life of ritual dharma a prerequisite for pursuit of the fourth human goal of ultimate liberation, Manu incorporates the Upaniṣadic quest for *mokṣa* into the final two stages of human life: the forest-dweller who gradually withdraws from society and severs all social ties, and the full renunciant who single-mindedly pursues self-knowledge. By realizing the ultimate identity of Self and Reality, Manu writes, “he who sees the Self in all living beings through the Self / achieves equanimity toward all and approaches Reality, the highest step” (12.125). The call for the householder to engage actively in his world, maintaining the course of the planets and the order of society through ritual performance, becomes repugnant to the man who seeks release in the final stages of his life. The dharma of a single man at one point in his life utterly contradicts his dharma at another.

Manu’s incorporation of the Upaniṣadic call to reject the life of ritual activity that earlier portions of the Vedas enjoin does not stop with his arrangement of the *āśramas* or life stages. The Laws of Manu also use the Upaniṣadic language of *tapas* or “inner heat” generated by self-restraint and austerities to describe the attitude with which a priestly householder ought to approach Vedic recitation and rite. An ethic of self-restraint and sensory control should guide the priestly householder, long before he heads for the forest in search of spiritual liberation. Inner heat, sustained through single-minded focus upon the Vedas, ensures both the success of the rites and placement on the path to liberation.

While the Laws of Manu attend consistently to the karmic principles of future reward or debt based on the moral seeds sown in this life, emphasis is repeatedly placed on the cultivation of proper moral attitude while carrying out the behaviors appropriate to one’s particular place in space and time. The necessity of seeking to do what is right – even if failing to fulfill each and every rule of conduct – seems, in fact, to govern much of what Manu has to say about dharma. The virtues of self-restraint, sensory control, and concern for the well-being of others constitute the good intentions necessary for the life of ritual and meditative contemplation to bear its desired fruit. In a cosmic age in which dharma is broken, the intention to act according to social position and life-stage serves as a moral compass point by which all behavior should be guided.

According to Manu's model of *varṇāśramadharmā* and its ethics of particularity, the moral life lies first of all in realizing the specifics of one's existence in terms of social class and life-stage and of the innate capabilities and tendencies that each implies, as well as one's place vis-à-vis specific qualities of space and time. One must act in accordance with moral and cosmic order, pursuing and preserving a state of purity as far as is humanly possible, performing rituals if one is a priest, ruling wisely if one is a king, and so on. Yet this "acting in accordance" is difficult to determine, much less maintain, in the face of ever-changing human and natural circumstances. The measure of a man's moral aptitude lies in his ability to maneuver productively in the complex web of human relationships that constitute the social order and in the ever-changing facets of the cosmos that constitute the universal order. In the often tangled mess that is human life, the struggle lies in meeting the demands of one's own position, rather than attempting to live according to another's (Manu 10.97). Important throughout is the cultivation of moral intention. Most significant is the intention to act in preservation of the social/human order, for even dharma remains subservient to preserving the intricate web of relations that constitute human society: "[one should abandon] even dharma if it ends in unhappiness and causes people anger" (Manu 4.176). This ethics of particularity is, on the one hand, fixed. The brahman priest should not do the work of the servant, at least not while the sun is shining, peace reigns in the land, and there exists no circumstance in extremity. On the other hand, it is also thoroughly relational, thoroughly flexible, speaking to the particularities of space, time, and specific context. When those particularities are not clear, one must, at the very least, intend to do that which conforms to the overall cosmic, social, and moral order.

The Standard Moral Vision

Since the Laws of Manu assume such a humble assessment of human capabilities, providing so many escape clauses of exception and extreme possibility, the question must be raised as to whether or not the text is actually meant to be read as prescriptive code. Why provide such lengthy and confining rules of behavior if, in fact, intention is what really matters? Why does Manu acknowledge that no one can actually live fully in accordance with his moral vision? For all their length and tediousness, Manu's lists simply do not cover all possible human situations on any single topic. What, for example, counts as "in extremity"? What if a man truly believes his life to be in danger, but realizes only after urinating in an inappropriate place that he mistook a menacing shadow for a homicidal maniac? Must he do an expiatory rite to cleanse himself? The text's many nods to the sheer impossibility of living up to the exact letter of the law perhaps suggest that Manu is not meant to be read as prescriptive code. Rather, it is a study in pattern, in conditioning the brahman student to see the world in a certain way: as a universe defined by innate human differences, as a cosmos in which the substance of those differences is easily transferred and must be avoided, a world in which every activity, particularly the performance of Vedic rites, must be done by the proper persons in accordance with the proper alignment of the planets, in the proper season, and at the proper time of day. For while the Vedas may serve as the ultimate source of the moral life for Manu, dharma can also be learned from the lowest of people, including women, children, and servants (2.239). Rather than creating a literal code to be enforced by the letter, Manu throughout suggests a spirit of the law in which one trains oneself to see the patterns of moral order in the world. One is to realize the webs of connection among people and cosmos and to act accordingly, even in extremity. Less precepts to be memorized than intricate series of patterns and relationships to be internalized,

Manu's text envisions a morally mature human being who ultimately requires no behavioral code to feel the fragile moral order that surrounds him and to respond to life, appropriately and creatively, in order to sustain that order.

Resources for Challenge and Change

Manu's model of *varṇāśramadharmā*, with its focus on human situatedness, rapidly becomes the standard moral vision for upper-caste orthodox Hinduism. In this model of the ideal human life tightly woven into the fabric of a cosmic order perpetuated by the ritual performances of a priestly class, there would seem to be little tolerance for challenge or change from within. Those who arise to question or undermine this vision hail primarily from castes other than the brahman: the Buddha and Jina Mahāvīra, for example, both remembered by their respective communities as members of the warrior or ruling caste; the epic *Mahābhārata*, whose warrior-oriented ethos challenges at every turn the efficacy of Vedic ritualism in the current cosmic age of moral darkness; and the saints of the *bhakti* or devotional traditions, many from among the lowest social classes, whose poetry reorients the moral cosmos around a personal and loving deity who demands but single-minded devotion from his followers.

Even the devotional orientation of the great medieval saints – that so clearly attempts to steer human activity away from both ritual performance and Manu's commitment to human particularity toward an ideal life of selfless devotion and service – bears witness to the enduring influence of the classical *varṇāśramadharmā* model. The exemplary lives of the great north Indian saints both champion love for the lord and its attendant virtues and “accomplish ... the ends of dharma” (Hawley 1987, 69). Dharma, even Manu's model of caste and life-stage, is “not ultimately abandoned but transformed” (68). In overturning brahmanic norms, the narratives of Hindu devotional hagiography are stories of everything turning out all right in the end, of kings acting royally, of merchants engaging prosperously in business, of brahmans performing their rituals. Yet all of this is accomplished with new or transformed intentions focused on serving a personal and accessible lord. Indeed, the very rite at the heart of Hindu devotional life – *pūjā*, ritual offerings to an image of the deity – “simultaneously replaces the *yajña* while it incorporates within itself many rites from the Vedic sacrifice” (Smith 1998, 214). From the eschewing of purity as a moral ideal by the medieval practitioners of tantra and the championing of a single intention of worth (love for a personal lord) by the great poet-saints, to the political activism of the lowest social classes in modern India, *varṇāśramadharmā* – embraced, despised, or modified – provides the cornerstone for all subsequent Hindu thinking about the nature of the moral life.

CHAPTER 76

Differentiations in Hindu Ethics

Maria Heim

In its three millennia of recorded history, South Asian civilization has produced diverse traditions of ethical reflection. Perhaps more than the other world religions considered in this volume, Hinduism presents a rich plurality of moral and religious systems. Hinduism itself can hardly be said to be a single religion. The term “Hinduism” embraces several interlocking yet distinctive religions. These in turn have developed divergent responses to questions of human nature and the moral life. In addition, dialogue with non-Hindu traditions, in premodern times Buddhism and Jainism, and, more recently, Islam and the modern West, has stimulated Hindu modes of moral discourse and their range of concerns. An accurate portrait of Hindu ethics, then, keeps the complexity and divergences ever in view, even while it delineates patterns and continuities where they emerge.

Indians did not devote a single branch of philosophical thought to what is called ethics. Instead, they incorporated moral considerations into various philosophical, literary, and theological genres in Sanskrit and the vernaculars. The chief sources of moral reflection from the Sanskrit intellectual traditions are brahmanical, that is, texts composed by and reflecting the ideologies of, the elite classes of literati learned in Sanskrit and in Vedic revelation. Of particular importance for morality is a branch of prescriptive brahmanical knowledge called Dharmaśāstra. Hindus have also employed literature – folktales, epic narratives, and poetry – to pose moral inquiry and as itself a means to stimulate moral response. Narratives create a shared moral past and cultural terrain. They explore the morality of social obligation, not through rules and categories like Dharmaśāstra discourse, but through life stories of particular epic figures. In addition, Indian literati have much to offer on how they understand literature’s capacity for stimulating the moral imagination. Finally, religious treatises which seek soteriological aims through either renunciation or theistic devotion offer a range of perspectives on the relationship between spiritual attainments and moral duty. This entry explores these diverse forms of moral discourse found in the Indian context.

Normative Discourse

At one time far distant in human memory the natural and moral order (dharma) of the world stood firmly and securely like a bull planted on four legs. Over time, as the gradual decadence and decay in the cosmic order set in, dharma was reduced to standing on three legs, and then, precariously, on two. We now find ourselves in an era, called the Dark Age, where dharma teeters on one leg only and threatens to topple.

Dharma

These vast cosmic eras in which dharma is brought down foot by foot provide the backdrop for the drama of human moral activity and reflection. Moral activity becomes rarer and more difficult to accomplish, yet ever more urgent and necessary to sustain and uphold the cosmic order. Moral reflection is oriented towards the past; moral knowledge was established and complete in previous eras and so moral inquiry takes the form of preservation and recovery of that distant knowledge.

Since dharma is a natural order, sources whereby humans come to know about it, and thus learn to reflect upon how human beings should act, do not necessarily include reason. Dharma is not described as the *rational* ordering of human or natural affairs, but rather simply as the way things are. While reason is not denigrated as a useful tool for intellectual work in this tradition, it is pre-empted by the authority of revelation and memory as sources for learning about dharma. Revelation and memory are vested in the textual tradition, in particular, in a genre of textual knowledge known as *śāstra*. *Śāstra*, according to the eighth-century Mīmāṃsā theorist, Kumārilabhaṭṭa, is “that which teaches people what they should and should not do” (see Pollock 1985, 501). Broadly conceived, *śāstra* includes revelation (the Vedas) and recollections and inferences, derived from revelation, about human conduct. *Śāstras* codify nearly every branch of learning and human practice, from the mores of statecraft to the regulations of ritual activity. The *śāstra* that concerns moral behavior is called Dharmaśāstra.

While Dharmaśāstra articulates the rules and customs governing human social conventions, including law and religious practices, our concern is the category that regulates moral behavior (*ācāra*). The term *ācāra* means right conduct, customs, and conventions. The conflation of custom or convention with moral practice is consistent with the tradition’s orientation to the past as a source of moral guidance. Customs are conservative and are thought to enshrine practices established when dharma was more secure in the world. One knows correct *ācāra* by three sources, in descending order of authority: revelation, texts composed by the learned who have inferred what is not explicitly stated in revelation, and the practices of learned people. The best guides for right behavior are passed down from previous generations and the correct customs carry weight in large part because of their antiquity. Sometimes personal conscience is admitted as a further source of dharma, though it carries the least authority (Manu 2.6). Reason does not secure moral guidance except when it is employed to discern what to do when moral codes in the ancient texts appear to conflict.

Just as dharma is not evenly spread out over time, it also varies from place to place. Hindus are sensitive to the geography of moral difference. Morality’s close link to custom, and the variation of local customs, suggest both tolerance for differentiation as well as classifying and ranking places, customs, and peoples. Traditionally, the heartland of India, between the Himalayas and the Vindhya mountains “where the black antelope ranges by nature,” is the country in which dharma is most fully established. One should endeavor to live there (Manu 2.21–3).

Dharma’s structural unevenness in space and time resists the application of categorical or universal laws. That is not to say that there are no attempts to delineate general duties or virtues common to all good people. Rather, it means that most normative deliberations on dharma are highly particularist in forming principles or regulations for behavior. While modern Western ethical systems often presume and emphasize human sameness and equality as the very foundations for ethical reasoning and justice, the brahmanical traditions assume that what is morally relevant about human beings resides in their

differences. Human beings differ from one another in a variety of ways, most of which are considered relevant for understanding their moral responsibilities. Since no single homogenous moral subject is presumed, establishing moral codes is not conceived to be a quest for universal principles or laws to govern human behavior in all times and all places.

In what ways are human beings different from one another? How are these differences morally relevant? Human beings vary with regard to their locations within the social order. Since the social order is highly differentiated, moral obligations are also highly differentiated, contextual, and particularized. Since morality is not easily separated from social structure, moral obligations coincide with the fulfillment of social roles and expectations. Moreover, the social structure is conceived to be just, with one's place within the hierarchy determined by previous moral actions via the mechanisms of karma. All moral actions have consequences that will be reaped in either this life or a future life, determining one's future condition. Not only does past moral action determine one's location in the social order, but also where one fits determines a large part of present moral obligation. As a result, brahmanical moral discourse aims to establish the nature of different human social roles and the duties incumbent upon them with regard to their place in the natural order of things.

Nevertheless, sometimes lists are formulated to name virtues of common appeal that can cut across human difference. The Dharmaśāstra authority Yājñavalkya lists nine duties common to all: non-violence, truth, refraining from theft, purity, control of senses, generosity, self-control, compassion, and patience (1.122). Manu says that non-violence, honesty, abjuring theft, purification, and restraint of the senses are the duties shared in common by all social classes (10.63). In the third century BCE the great emperor King Aśoka inscribed in stone throughout his empire these universal virtues: compassion, liberality, truth, purity, gentleness, peace, joyousness, saintliness, and self-control (Kane 1974 V, 10). The *Mahābhārata* also lists freedom from anger, truthfulness, sharing one's wealth, forbearance, procreation only with one's own wife, purity, absence of enmity, straight-forwardness, and maintaining one's dependents (12.60 in Roy 1955, 134–135).

Apart from such general attempts to describe virtues with widespread application, the bulk of this discourse recognizes that dharma “has many doors” and is concerned with specific duties and obligations for the different classes in society (*Mahābhārata* 12.174 in Roy 1955, 1). To encapsulate the range of duties of the social body composed of individuals in different roles, brahmanical authors articulated the ideological system of *varṇāśramadharma*, the duties of social class and stage of life. Each social class – the elite priestly class (brahman), kings and warriors (*kṣatriya*), commoners (*vaiśya*), and servants (*śūdra*) – has particular duties prescribed for it, specific to its function and stature in the social order. In addition, the course of human life is regulated by duties prescribed for each stage of it: studentship, householder life, retirement, and final renunciation. Distinctions between the sexes are also significant. The *śāstras* generally assume a male moral subject and delineate a special class of duties enjoined for women (*strīdharmā*).

This tidy conception of the ideal social body was conceived and glorified by brahmanical elites as the proper way for human beings to uphold the natural order of dharma. The dharma of social class and stage of life provides each individual with his or her own duties (*svadharma*). Morality resides in conforming to the mandates of one's station and function in the social body. This is not an ideology that prizes social mobility or individual autonomy. Straying from one's own duties (*svadharma*) is censured. Brahmanical ideology depicts a moral agent that is not autonomous and unmediated by social norms, but rather is constituted by them.

Despite the śāstric impulse to regulate nearly every aspect of human activity, there remains within Dharmaśāstra ideology a nod to local custom and difference. This results in a curious blend of authoritarianism and flexibility. The Dharmaśāstra writers are sometimes inclined to recognize and even defer to the law of the land or the family, enjoining adherence to family or local customs where śāstric norms conflict or when their application is unclear. An early Dharmasūtra author, Āpastamba, acknowledges the weight of local custom, which is often known and preserved best by the women in the family. He prescribes that in some cases people should understand from women what laws to follow (2.15.9; 2.29.11, 15, in Olivelle 1999, 59, 72–73).

Although some Dharmaśāstric discourse prescribes social rules and customs with little apparent critique and reflection, there are topics and treatises within this genre that evince second order reflection on moral behavior. Such discourses do not merely pattern moral behavior. They stand back from prescribed social practices and theorize them. One example is the development of Dharmaśāstra attention to the ethics of giving (*dāna*), a social practice that comes to be highly articulated and systematized in the medieval commentaries and compendia (*dāna-nibandhas*). These comprise extensive books given over to the rules and values of gift giving, with sustained scrutiny of the virtues and qualities of the donor and the recipient, and the etiquette of the face-to-face hospitality encounter. In some of their discussions, the authors shift from expounding duties to analyzing motivations and intentions. In these discourses, the authors set forth their social practices as objects for reflection and analysis.

That giving should come to be a chief category of moral investigation is entirely consistent with the advance of the Dark Age. In each of the four eras of time, a single duty is emphasized: in the first eon of perfection humans practiced *meditation* as the highest virtue, followed by the pursuit of *knowledge* in the next eon, then *sacrifice*, and now, in the last age, *gift giving*. It is significant that in the last and most decadent time we turn to social relationships and exchanges, rather than individual religious pursuits, to preserve what remains of the moral order in the world.

Human Nature

The mandates of *svadharma* – one’s own particular duty – though binding in terms of the constraints of gender, social class, and age, are not conceived to be arbitrarily imposed from without. Through karma one is born into a station of life to which one is by nature suited. Previous action, or karma, not only creates consequences and effects that will be experienced in future lives, but it also determines one’s present character. It is not only the conditions in which moral subjects act that are highly particularist and differentiated, but also human nature itself. No one enters the world as a “blank slate”; the character of one’s present nature is the result of activities performed and dispositions developed in previous births.

While many of the earliest Vedic ritual texts and later Mīmāṃsā expositions of them were concerned less with internal disposition than with correct external ritual form, the Upaniṣads turned to questions of character in their interpretation of the workings of karma. Here, karma is not simply ritual action resulting in future benefit, but rather moral activity that conditions one’s future nature. The logic of action and rebirth is that “like produces like,” as the following passage suggests:

Now, people here whose behavior is pleasant can expect to enter a pleasant womb, like that of a woman of the Brahmin, the Kṣatriya, or the Vaiśya class. But people of foul behavior can expect to enter a foul womb, like that of a dog, a pig, or an outcaste woman. (Chāndogya Upaniṣad 5.10.7, in Olivelle 1996, 142)

Injunctions that require one to perform one's own duty rather than another's appeal not only to the dictates of maintaining social order with everyone in his or her place. They also appeal to convictions about the formation of human nature and character across births.

Hindu thinkers have much to contribute to reflections about how moral and ritual activity is related to internal disposition. For some, moral action is generated out of human nature or disposition. The *Mahābhārata* says "all propensities for action that exist in the universe may be seen to flow from the very natures of the creatures (to which they inhere)" (12.179, in Roy 1955, 16). One ancient schema for classifying human nature depicts three psychic and moral conditions which drive all activity in the material world. These qualities are *sattva* (goodness, purity, brightness, intelligence), *rajas* (passion, lust, anger, activity), and *tamas* (darkness, inertia, gloom, ignorance). Each is present in everything and everyone, but in different and changing proportions. Human beings can be characterized by which of these three qualities predominates in their characters and actions. The elements that make up moral disposition and character are deeply rooted yet constantly changing and developing. The means of developing correct moral behavior is cultivating certain internal states and natures.

In other conceptions quite the reverse is true. Action is considered to be prior to character and human nature. Sometimes moral behavior is simply conflated with conformity to rules and any internal dimension in correct behavior is irrelevant. A Mīmāṃsā definition of dharma is simply "rule-boundedness" (*PūrMīmSū*.1.1.2, in Pollock 1985, 511). Concerned with external form, much Mīmāṃsā ritual discourse prescribes the following of rules rather than the development of virtue. In this view, dharma is exhaustively described by human activity, without reference to character or disposition.

Other reflections on ritual practice see external adherence to rules as conducive to the development of inner virtue. Theories of karma assume that human nature is pliable and unfixed. One is always in a state of becoming rather than being, and action itself generates disposition. Theoretical reflections on the ritual sacraments or *saṃskāras* (life-cycle rites such as birth ceremonies, investiture with the sacred thread, marriage rites, etc.) are a further instance where external ritual is thought to cultivate internal transformation. The *saṃskāras* are said to be actions and rites which "impart fitness." Fitness arises from the removal of moral taints and by the generation of new virtues (Śabara's commentary on Jaimini III.1.3 in Kane 1974 V, 190–191). Bringing a person into fitness or eligibility is a moral transformation. The more advanced *saṃskāras* introduce a person to new relationships with self and others, with new responsibilities and statuses. Additionally, the *saṃskāras* are thought to be external actions that leave an imprint or trace on the memory and personality that develops character and disposition. Here, *saṃskāra*, like karma, is conceived to be external action that molds internal moral character through patterning and habit. This movement from the gross to the subtle finds expression in multiple traditions of Indian thought. Purification and self-mastery often begin with bodily actions and advance to inner and subjective states once the outer forms are disciplined.

The Contributions of Narrative

Where Hindus have used Dharmaśāstra texts to delineate the ideal moral life framed within the context of given social roles, they have often turned to literature to test and challenge the limits of such roles. The great epics of India, the *Mahābhārata* and the *Rāmāyaṇa*, study social and political life within embedded contexts of collective memory and history. In an intriguing way they reaffirm brahmanical norms while providing the contexts and opportunities for critiquing them.

The *Mahābhārata* presents itself as the story that tells all stories and all that can be known: “what is found here may be found somewhere else, but what is not found here is found nowhere” (1.56.34, in van Buitenen 1973 I, xxiii). Indeed, the sheer bulk of the text gives initial credence to this assertion. The *Mahābhārata* is perhaps the longest book from the ancient world, and its contents range considerably beyond its frame story concerning the ancient dynasty of the Bhāratas. The epic tells the story of the great fratricidal war between the Pāṇḍavas and the Kauravas. Along the way it also incorporates other stories, as well as entire books given over to moral, philosophical, and religious instruction, including the *Bhagavad Gītā* and long chapters on *Dharmaśāstra*.

The claim that the text exhaustively describes what human beings can know is more than a statement about its length and comprehensiveness. It is also a claim that sees in these stories and in the instruction given by its characters an inheritance, a repository of cultural memory and precedent. The epics furnish the historical memory that situates Hindus in the world and provides an awareness of themselves as moral agents against a moral background. The epics provide a moral compass by showing where others have walked before, and suggest a further instance of deriving a moral present from the memory of a moral past. Describing itself as “brimming with wisdom” (1.2.33, in van Buitenen 1973 I, 33), the *Mahābhārata* says “no story is found on earth that does not rest on this epic – nobody endures without living off its food” (1.2.240, in van Buitenen 1973 I, 43). This story to end all stories is the very nourishment of human endurance.

At the same time, the text’s claim to its own exhaustiveness of knowledge is authoritarian, refusing to allow outside critique, reason, or new knowledge to enter into the great questions and answers it raises about the human condition. Such an assertion, like other brahmanical claims to all-encompassing authority, elevates the text’s own status and import in the world by its claims to completing what can be known. Despite the potential of narrative to explore moral dilemmas in greater complexity than normative discourse, the epics still anchor moral knowledge on events and norms from the past.

Within its own parameters, however, the *Mahābhārata* does provide the resources to critique nearly every social norm and value it considers. It depicts a cast of heroes, who, in the critical moments of the epic, are faced with moral conundrums where duties conflict and the right course is unclear. Such moments portray widely held cultural presuppositions as well as conscious moral choices. Dharma is tested at every turn. The apocalyptic ending of the epic in which the Pāṇḍava brothers are victorious, but nearly the entire world has been destroyed in battle, preserves the tensions in righteous victory to the very end.

Perhaps nowhere are the ambiguities regarding social roles more perplexing than in the tragic circumstances concerning the figure of Karna. The elder brother of the Pāṇḍavas, Karna is conceived out of wedlock and abandoned at birth, and is thus deprived of his noble status and kinship. He befriends and allies himself with the Pāṇḍavas’ enemy, Duryodhana, who fights an arrogant, unrighteous, and ultimately unsuccessful war at great cost to all involved. Even upon learning of his true birth, Karna rejects the social status of which he was originally deprived and refuses to join the Pāṇḍavas. He honors the genuine and constant bonds of affection and loyalty offered to him by his low caste adopted family and Duryodhana. He is aware he will ultimately battle his brothers and fail. His death is the result of a dishonorable breach in the rules of warfare, when he is struck by Arjuna while unarmed. Though he is not entirely blameless, Karna is nevertheless a deeply sympathetic character. He has been wronged by strict social codes that privilege status and birth. His character posits an ethics of friendship that may slip past the grasp of the social roles and rules of dharma.

Of equal importance as this literature's capacity to pose and wrestle with moral dilemmas is its capacity to refine and cultivate those who come to know it in ways that are morally significant. The epics describe how knowledge of them creates moral agency. By incorporating the very telling of its story into the narrative as the bard Vaiśampāyana, prompted and queried by Janamejaya, relates the tale, we learn the effect of the story on the reader. Janamejaya repeatedly pleads for more of the story to unfold, for he "cannot hear enough of the great deeds of the ancient" (1.56.4, in van Buitenen 1973 I, 129). He interrogates the bard on the intricacies of dharma. Moreover, the text specifies the nature of the audience's reaction to the story: "sons become obedient and servants compliant, the evil done with body, words, or thought vanishes at once for a man who listens to it ... if a man in his ignorance chances to do evil in his day, it will vanish as soon as he has heard the story of the *Mahābhārata*" (1.56.23–30, in van Buitenen 1973 I, 130). The text attributes to itself moral agency and efficacy in its capacity to shape and refine human moral sensibilities.

The *Rāmāyaṇa* describes itself as born of sorrow. Its author Vālmīki witnessed a pair of birds in love shot down by a hunter's arrow and blurted out the world's first verse, thereby giving birth to the first poem. The *Rāmāyaṇa*, and by extension all literature, is the product and the producer of sensitivity in human beings. That its origins arise from a witness to violence and injustice is significant in terms of its deliberations on morality. It is itself formulated out of a response to unrighteousness. The *Rāmāyaṇa* describes the effect it in turn should have on its hearers. Rāma's story "confers righteousness, worldly prosperity and delight on the reader ... [it] does not degrade the mind and grants release from sorrow, that story which charms the heart" (1.3, in Shastri 1952 I, 12).

The *Rāmāyaṇa* is the tale of the wrongful exclusion from succession to kingship and the exile of Rāma, followed by the kidnapping of his wife Sītā, and the eventual restoration of both. Along the way it offers sustained examination of the conditions of social life: the nature of righteous kingship; the complexities of social and sexual relationships; and the role and place of violence in the social and political order. The characters of the epic are considerably less conflicted than those in the *Mahābhārata*. They are held up as paradigms of model behavior. Rāma is less of a hero in the Greek sense – that is, engaged in valiant and noble efforts despite facing certain defeat – than an ideal to be emulated. He is the righteous king whose convictions about proper conduct remain unruffled despite the many forces attempting to undermine him.

Rāma's only possible fault may be an overweening preoccupation with his honor and public opinion about him. This in turn is revealing about what is important. A large part of moral duty is fulfilling the expectations of one's social role without invoking censure and disapproval of others. Rāma is constantly aware that the eyes of the world are upon him. This "most truthful of men" offers reflections on his role of exemplifying dharma to others by not disobeying his father's command to go into exile. Implicit in Rāma's fixation with honor and shame is a sense that the moral order of the world rests on him, and on his capacity to attract the esteem and emulation of the world. This is cast in terms of selflessness. The world needs an icon of correct dharma to esteem and revere. The other characters in the story are no less paradigmatic in exemplifying models of behavior. They provide examples in two capacities: models appropriate to their particular social locations, as well as models of esteem and reverence for Rāma. Sītā provides a model of a faithful and loyal wife, Lakṣmaṇa, of dutiful brotherly affection and loyalty, and Hanumān, of unwavering service and devotion. Throughout the epic is the overarching theme that moral duty consists in "obedience and the suppression of the individual will" which is realized in part through recognition and esteem for honored others (Pollock 1986, 33).

Narratives are understood in this tradition as communicating not just erudition and the wisdom of past lore, nor simply as providing the models for virtuous behavior, but also allowing for intimacy and association with noble people critical for moral development. The *Rāmcaritmānas*, a Hindi telling of the *Rāmāyaṇa*, claims that hearing its tale provides association with the virtuous. It is only through association with holy men that human aspirations may be realized: “Through contact with the virtuous even the wicked get reformed, just as base metal is transmuted by the touch of the philosopher’s stone” (Tulsidas 1976, 21–22). The text also sees itself as bringing one closer to God by celebrating the exploits of Lord Rāma, who is considered an incarnation of the great god Viṣṇu. Exalting virtuous people and God fosters devotion and humility, which the text sees as producing pious and worthy persons. Hindus from all ages have cherished stories of saints and gurus, of holy men and women, and of gods and goddesses, that bring them into contact with what is noble and good. Recognition and reverence of virtues in others is the mark of a cultivated and moral person.

In addition to the epics, other stories serve as sources of moral reflection and allow for inquiry that tends in a different direction than the epics’ concern with the fulfillment of social roles. Popular collections of folktales such as the *Pañcatantra* and the *Hitopadeśa* are regarded as morally edifying stories full of practical wisdom for everyday life. In addition to offering general good counsel, these collections of mostly animal fables allow for a particular mode of moral reflection not always possible in stories and reflections about human beings. Animal stories can be free of the usual human social categories and hierarchies. Consideration of character and virtue can be carried out independently of the determining factors of class, caste, and social location that mark human social structures. Animal tales require their audience to divert the moral imagination away from social roles to consider generic moral virtues. Such stories can explore the intricacies of friendship, loyalty, and wise policy without correlating them to fixed social roles. Intriguingly, it is in a world of greedy jackals, clever monkeys, prudent mice, fickle crows, and courageous lions that the baseness and the nobility of human character may be most fully explored.

Morality and Religious Practice

Hindu traditions recognize four distinct values or goals of human life: love and physical pleasure (*kāma*), the acquisition of material well-being (*artha*), morality and the good (*dharma*), and spiritual liberation (*mokṣa*). Hindu thinkers have differed over the precise relationship of these different aims, especially when they conflict with one another. However, they tend to agree that each aim is a distinct and legitimate human end valued for its own good, rather than a means to something else.

Some interpreters of Indian ethics have identified what they regard as a tension between the last two aims, *dharma* and *mokṣa*, which distinguish between moral claims and spiritual aspirations. In this view, the ultimate spiritual aim of *mokṣa*, which by definition transcends the *saṃsāric* world of moral consequence and karma, is regarded as so beyond our realm of ordinary experience and its duties that it is seen to bear little relationship to them. If *mokṣa* utterly transcends the social world of worldly obligations it may appear to have nothing to do with ethics. In this view, ultimate spiritual aims radically relativize or trivialize moral codes. Another charge against some forms of Indian spirituality is that they would seem to articulate antisocial as well as potentially antinomian tendencies. The pursuit of human perfection pursued by renunciators – in which one is to leave behind home and hearth and take up the life of a wandering mendicant free of all social ties – does not seem to describe a morally significant life lived with and for others.

These critiques can be investigated further in terms of the different forms of Hindu spiritual practices. The tradition of introspective discipline and self-mastery (*yoga*) articulated in Patañjali's *Yoga-sūtra* describes eight stages of the religious path of the spiritual seeker (*yogin*). The eight stages are: moral principles, religious observances, posture, breath control, withdrawal of the senses, concentration, meditation, and pure contemplation. The path begins with moral practices (*yama*), which Patañjali defines as five "universal moral principles, unrestricted by conditions of birth, place, time, or circumstance": non-violence, truthfulness, abjuration of stealing, celibacy, and lack of greed (2.31, 35–9, in Miller 1998, 53–54). In this schema, the foundation of religious discipline and the contemplative life is moral practice. Far from being opposed to the spiritual life, moral practice is conceived as a necessary prerequisite for it. It is noteworthy that the term for moral practice, *yama*, also means self-control. Moral practice can best be seen as contiguous with the yogic life of discipline, because morality is itself viewed as a kind of self-restraint. Reigning in one's damaging effect upon others by curbing one's capacity for harm, deceit, theft, sexual activity, and avarice is part of what it means to gain mastery of self. Care of the self is necessarily morally significant, since through self-mastery the moral life is made possible. The discipline of renunciation requires the examination of the interior life which includes purifying moral disposition.

We might also consider the aims of the discipline and try to conceive of what the fully realized and self-controlled individual would be like. Patañjali says that perfect discipline (*samyama*) results in extraordinary cognitive abilities that include sensitivity to and knowledge of others' thoughts. One can hear "the cries of all creatures" (3.17, 19, in Miller 1998, 64). Among other strengths and powers, the *yogin* gains the strengths of discipline of friendship, compassion, joy, and impartiality (3.23). Moral heroism is the effect of self-mastery and discipline. When perfected, it leads the practitioner out of self toward a new and heightened sensitivity to others.

Theistic systems of religious practice also attempt to meet the charge of antinomianism in a variety of creative ways. The theistic system developed in the religious classic the *Bhagavad Gītā* articulates a novel approach to moral issues. Competing religious movements articulate compelling doctrines of retreat from social and moral activity in favor of a life lived for spiritual attainments alone. The *Bhagavad Gītā* attempts to buttress moral duty in the world by framing the individual human life within a larger divine plan.

The teachings of the *Bhagavad Gītā* emerge as a response to one of the most famous war protests ever registered. The hero Arjuna refuses to do battle against his kinsmen in the great war of the *Mahābhārata*. Arjuna, a *kṣatriya* or warrior, is required by duty to fight in battle. He balks, however, at the prospect of killing his family and teachers in what has climaxed in a devastating fratricidal war. He questions the ultimate value of dutiful action that requires such bloodshed. In response, the *Bhagavad Gītā* argues that human action is unavoidable. The proper response is to divest one's self of personal agency and desire for reward by dedicating one's action to God. The divine plan is glimpsed in a theophany in which Lord Kṛṣṇa displays at once both his impersonal supremacy as well as his personal intimacy with human life. The fulfillment of moral duties, including the violence of righteous warfare, is to be interpreted as sacrificed and surrendered to the service of God. The *Bhagavad Gītā* affirms the different duties imposed on the fourfold class system, which require Arjuna to uphold the moral order by vanquishing those who threaten justice and righteousness. True moral conduct is the performance of one's particular dharma, done without personal desire for ends and dedicated to God.

The *Bhagavad Gītā* articulates various complementary but distinct paths of spiritual and moral practice. These are appropriate to different human capacities and natures, which are, again, an acknowledgment

of differentiation in the moral life. The text describes three paths: the path of correct social and ritual action (*karmayoga*), the path of discriminating wisdom (*jñānayoga*), and the path of devotion to God (*bhaktiyoga*). The merits of these differing but complementary approaches to religious and ethical perfection are elaborated in great detail in the *Bhagavad Gītā*, providing later commentators with material rich with interpretive possibilities for their own theological systems.

The best known and successful of later commentators are the eighth-century Śāṅkara and the eleventh-century Rāmānuja. Both thinkers developed theistic religions that have had great influence on Indian religiosity since. They emerged from their readings of the *Bhagavad Gītā*, the Upaniṣads, and other scriptures with very different interpretations of the value and nature of the moral life. Śāṅkara's emphasis is on union with the divine as a result of cultivating spiritual knowledge and insight. Ultimate spiritual liberation (*mokṣa*) is the realization that the individual human soul is not different from the ultimate reality, Brahman, the ground of all existence and the goal of all experience. The human condition is analyzed in terms of cognitive error, that is, failure to realize this unity. Correct knowledge (*jñāna*) is the only way to obtain absolute freedom that realizing this unity yields. This absolute freedom is beyond moral distinctions of good and evil. Śāṅkara's thought explicitly denies that moral practice is sufficient for *mokṣa* – since *mokṣa* is unconditioned, it cannot be brought about by actions. One realizes it through understanding the true nature of the self's relationship to the divine. Morality is something one transcends in perfect wisdom, though once one has obtained *mokṣa* one is free of selfishness and corruption.

The eleventh-century theologian Rāmānuja took a very different approach to the question of morality. Rāmānuja agreed with Śāṅkara that ultimately there is no distinction between absolute Brahman and the human soul. Yet, in the context of ethics, Brahman is best understood as the eminent and sinless ruler or controller of creation. The proper human response to divine transcendence is reverence, devotion, and self-surrender. Human beings best display their reverence for God by devotion and the performance of religious and moral obligations.

Many of the *bhakti* or devotional traditions, with their single-minded faithfulness to God and emphasis on grace, though not altogether amoral systems, cannot be seen as privileging either moral duty or ethical reflection. They draw from passages in the *Bhagavad Gītā* which emphasize devotion to God above all else. In this interpretation, while the *Bhagavad Gītā* endorses dharma by making it an instrument for spiritual pursuits, in the end it suggests that love of God is all that matters. This profoundly theistic turn affirms the importance of moral action, but still holds out for the final preeminence of pure love of God. The humdrum world of everyday social intercourse pales in comparison to the yearning for God. In addition, the doctrine of divine grace in some of these traditions undermines the importance of works and the human capacity for moral and spiritual effort (Ramanujan 1973, 30–31).

While devotional traditions generally were not engaged in systematic exploration of moral action, nor with reforming the injustices of brahmanical ideology, some of them did offer a critique of and alternative to brahmanical claims to predominance. With the religious value of pure and heartfelt devotion to God regarded as the chief axis of value, social norms based on ritual purity, Vedic and śāstric learning, and caste regulations could be dismissed or trivialized. The *Basava Purāṇa*, a twelfth-century religious text of the Vīraśaivas, a cult devoted to Lord Śiva, ridicules uppity brahmans. It states that “ten million brahmans, even if they were scholars in the Vedas, *purāṇas*, and *śāstras*, would not be equal to a single devotee” (*Basava Purāṇa* in Rao 1990, 235). The Vaiṣṇavas also subverted brahmanical systems of value by making devotion to God the primary consideration of religious and social status, though they did not entirely nor consistently dismantle rules pertaining to *varṇāśramadharma*.

Though sometimes critical of duty and works, the devotional poets also expound an ethic of love and care for fellow creatures. Basavaṇṇa explicitly links religion to ethics in asking, “where is religion without loving-kindness?” (Ramanujan 1973, 54). A later nineteenth-century reformer, Bankim Chandra Chatterji, explicitly conflates devotion to God with love of humankind and allows for no distinction between them (Chatterji 1977, 138). In addition, some of the medieval *bhakti* poets find in their love for God a profound humility, which they link to a gentleness and concern for God’s creatures. One saint’s poem reads:

Knowing one’s lowliness
in every word;
the spray of insects in the air
in every gesture of the hand;
things living, things moving
come sprung from the earth
under every footfall;
and when holding a plant
or joining it to another
or in the letting it go
to be all mercy
to be light
as a dusting brush
of peacock feathers:
such moving, such awareness
is love that makes us one
with the Lord
Dasarēśwara
(translated from the Kannada by Ramanujan 1973, 54–55)

Religious sentiment is paired with tenderness and moral sensitivity. This heightened awareness of the condition of other creatures might be compared with the advanced *yogin*’s capacity to hear “the cries of all creatures.” The devotee attains such moral sensitivity through submissiveness and devotion to God, while the *yogin* reaches it through self-mastery and discipline.

Conclusion

In Hindu thought, normative discourses pattern or condition moral behavior, inscribing the natural moral order on persons and behavior. The rules of Dharmaśāstra provide not only detailed specifications on how to live. They also communicate that the social and natural world is rule governed, and that each person has duties and obligations within it. Yet even as Hindus have acknowledged the constraints of the dharmic order, they have also sought ways to glimpse human moral capacity independently of it. The epic poet sets out to test the very limits and foundations of dharma. The *yogin* embarks on a quest of self-discovery by renouncing social norms. The religious devotee seeks out alternative axes of value to replace brahmanical structures of purity.

Moral discourses in India not only dictate and theorize moral practice, but they also contribute to moral agency. Hindus find themselves living in a storied world, where narratives link them to past moral ideals. We find in these narratives not only practical moral instruction, but also the means to expand and stimulate the moral imagination. Literature – epic, folk, or poetic – cultivates moral persons by prefiguring the moral imagination in multiple ways: either by providing models of ideal behavior within the social structure, or by suggesting exemplary behavior outside of it. One of Hinduism’s key contributions to the study of religious ethics is its recognition of the capacity of literary language to stimulate sensitivity and refine those who come into contact with it.

CHAPTER 77

Trajectories of Hindu Ethics

Joseph Prabhu

It is impossible within one entry to cover a 5,000-year tradition in any depth. In this context it is also unnecessary given the accompanying entries that describe and analyze features of Hindu ethics. What follows is a set of commentarial remarks on four aspects of this tradition: (1) the ambiguity of a *Hindu* ethics, (2) whether there is a Hindu *ethics*, (3) the tension between tradition and modernity in the Indian context generally and in Gandhi's ethics in particular, and (4) the prospects and challenges facing Hindu ethics in the future. One of the purposes herein is to highlight what is distinctive about Hindu ethics and also what it shares with other religio-cultural traditions.

The Ambiguity of *Hindu* Ethics

The term "Hindu" does not unproblematically pick out a singular religion in the modern Western sense of the term, signifying homogeneity of belief or creed under the aegis of some controlling authority. There is no such homogeneity or controlling authority in the Hindu case. For much of its history, "Hindu" was as much a cultural as a religious designation. Even such a self-consciously secular individual as Jawaharlal Nehru, India's first prime minister, or an avowed atheist like J. N. Mohanty, the prominent Indian philosopher, consider(ed) themselves Hindus in a cultural sense.

The term closest in the Hindu system to religion is "dharma," which connotes a variety of different things falling under the broad rubric of a way of life. Dharma, however, carries different connotations than the term religion, something examined below. Consider the example of the medieval Indian poet Kabir, who regarded himself and was regarded by others as both Muslim and Hindu. Likewise, there are many Christians in India today who call themselves Hindu-Christian. Multiple religious belonging is not seen as a problem. "In pre-modern India ... the term 'Hindu' ... was essentially a racial, cultural expression and Buddhists, Sikhs, Jains, and those we refer to as Hindus now, all shared the same multifaceted ethnicity of the subcontinent. They perceived themselves as all belonging to the same extended cultural family" (Lipner 1998, 14–15). "Hinduism" and "Hindu" in the modern sense were largely Western creations, the legacy of British colonialism. It was part of the political and intellectual project of providing for administrative and other purposes a homogeneity and a rigid classification which were quite foreign to the spirit of this family of culturally similar traditions. Hinduism evolved as a fluid and open ended reality which was free to seek truth in, and to adapt to, different circumstances, all the while maintaining a continuity, but not a sameness, with the past.

What counts as Hindu today is a product of interactions among groups who now would be classified as non-Hindu. This indicates a philosophical difference between India and the West which has ethical repercussions. The Western logical imagination from Aristotle onwards articulates identity in terms of difference, whereas premodern India, as often as not, saw identity in terms of continuity rather than difference and in terms of adaptation rather than differentiation. Hence the relative ease with which Hindu figures like Gandhi or Ramakrishna were able to identify themselves with “non-Hindu” faiths. Their example points to the non-dogmatic temper of the Hindu sensibility at its best, open to truth wherever it is to be found, and tolerant, indeed receptive to, differences.

Unfortunately, that is not the whole story. Quite often tolerance changed to inclusiveness or assimilation and often to hostility, as the fate of Buddhism, which was essentially driven out from the country of its birth, attests. The famous *Advaita* philosopher Śaṅkara, for example, often called a crypto-Buddhist, displayed features of an “anxiety of influence” in seeking to denigrate and vanquish his Buddhist opponents. Nor is this just an academic question. Hindus who for centuries were happy to operate with porous boundaries and to move freely across them, have in recent times sought to politicize their religion. Some have called this development the “Westernization” of Hinduism, as it has tried to codify its beliefs and practices and to exclude those who fall outside essentialist definitions. Present day Hinduism displays an intolerance and a separatism strikingly at odds with an earlier pluralism and open mindedness. When writing on Hindu ethics, it is appropriate to ask which Hinduism we are considering, because as already indicated, there are shifts of tone as between premodern and modern Hinduism.

In order to sketch current “trajectories,” the next section will focus on the background of classical brahmanic Hinduism. There were many challenges to Brahman authority, both within the mainstream and on the margins. The sway of Sanskrit Brahman culture was such, however, that even the challenges had to be articulated within its framework. At the same time, this framework accommodated an extraordinary internal heterogeneity of beliefs and practices held together by some unifying concepts.

Is There a Hindu *Ethics*?

There is an apparent paradox at the heart of Hindu ethics. On the one hand, it is claimed that ethics was not a prominent branch of Indian thought. Bimal Matilal, one of India’s most eminent philosophers, complained:

Certainly, there exists a lacuna in the tradition of Indian philosophy. Professional philosophers of India over the last two thousand years have been consistently concerned with the problems of logic and epistemology, metaphysics and soteriology, and sometimes they have made very important contributions to the global heritage of philosophy. But, except [for] some cursory comments and some insightful observations, the professional philosophers of India very seldom discussed what we call moral philosophy today. (Matilal 1999, 21)

On the other hand, much of the Indian philosophical tradition has a definite value orientation and is centrally concerned with the practical ideals of *dharma* (morality loosely defined), and *mokṣa* (spiritual liberation), and with spelling out how other values stand in relation to them. One of the distinguishing features of Indian thought is this strong practical emphasis. Theory exists for the sake, and as part, of

practice. At this level, there is much written not only about values but also about conflicts and dilemmas and the challenges of practical wisdom.

The appearance of paradox depends on a hidden assumption. Much of Western moral philosophy is preoccupied with the search for universal moral principles, which can serve as the legitimizing ground for moral belief and actions. In that sense of the term, there is perhaps an absence of “ethics” in Indian thought. But is that the normative sense of the concept? As is well known, this abstract theoretical conceptualization of ethics has recently come under fire. With the rehabilitation of virtue theory, the emphasis in current literature seems to have shifted to descriptive analyses of human excellences and action. This change in Western moral philosophy sits well with the Indian situation. A large part of Indian thought deals with an elaborate articulation of different values and human ends or goals designed primarily to guide the individual along a path of spiritual liberation. There is also a codified system of social duties and obligations nuanced according to class, caste, and the stages of a life-cycle (*varṇāśrama dharmas*).

The concept in Western ethics that might from a theoretical perspective best capture the spirit, if not the letter, of Indian moral reflection would be Hegel’s notion of *Sittlichkeit*. *Sittlichkeit* refers to the actual set of norms, duties, values, and goods that a community valorizes. It also includes the habits, practices, laws, and customs that constitute the ethical life of a society and that actualize these values and norms. All these sustain and in turn have to be sustained by an ongoing community. In the Hindu tradition, dharma constitutes the handed-down rules of morality and practice that provide the content of social ethics. These are grounded in custom and convention, no further moral justification being deemed necessary because they have met the pragmatic test of “workability.”

There is, however, a feature of Hindu ethics that distinguishes it even from this strand of Western moral theory. There is a close kinship between humans and other manifestations of nature in Hindu ethics. The scope of human responsibility extends not only to other humans, but also to the whole cosmos. Thus, the *Bṛhadāraṇyaka Upaniṣad* says: “This Atman [breath or vital essence] is the same in the ant, the same in the gnat, the same in the elephant, the same in these three worlds, the same in the universe” (1, 3, 22). This range of ethical reference is mirrored in the crucial term of Hindu moral discourse, namely the idea of *dharma*, as it figures in classical discussion. *Dharma* is the fixed position of duty and of right, in the sense of what is proper and normative. It is not restricted to personal ethics, but also designates religious observance and secular law, prescribing the individual’s social and legal standing within the wider domains of community, caste, class, and station. Expanding its range even further, *dharma* connotes a cosmic contract to which the individual is bound, both in the sense that she derives support from it (Sanskrit, *dhar*) and the corresponding obligation to support it. This, as universal order, assigns to each entity, personal or impersonal, its specific place in the cosmic, social, and personal orders.

This notion of *dharma* is at once metaphysical and ethical. The problem becomes what the precise connection is between the two. It would be incorrect to suggest that the ethical is deduced from the metaphysical. The logic is rather one of analogy and isomorphism, with custom and tradition playing the mediating role of providing the specific rights and duties attached to the individual. They are obviously able to play this mediating role more easily in a closed and highly structured setting rather than in a mobile, fluid, and pluralistic society. This fact will form one of the trajectories of Hindu ethics explored below.

Importantly, *dharma* is only one of four human ends discussed in the classical view, which might be said to have intrinsic value. The others are *artha*, or material interests, *kāma*, pleasure and emotional

fulfillment, and *mokṣa*, or spiritual liberation. Even though *artha* and *kāma* have ethical dimensions, conceptually they belong to the fields of political economy (*artha*) and aesthetics and psychology (*kāma*), and so fall outside the scope of our discussion. What is of interest for ethics is the connection between *dharma* and *mokṣa*. While it is generally agreed that the ideal of *mokṣa* trumps the claims of *dharma*, the exact relationship between the two ideals and the validity of *dharma* when seen from the perspective of *mokṣa* have been subjects of debate. On the one hand, *dharma* is seen as a means to the attainment of *mokṣa*, but from the perspective of *mokṣa*, *dharma* with its rigid clan/caste/family structure is often regarded as an obstacle to *mokṣa*. Orthodoxy often held that *dharma* had absolute validity even for the person who had attained *mokṣa*; but there were – and are – many influential views that question this assertion. After all, *mokṣa* is a state of consciousness consequent upon the knowledge of the true nature of things, while *dharma* belongs to the realm of action and will. Put otherwise, *dharma* upholds the established social–ethical order, whereas *mokṣa* is “release” from this order in order to achieve self-realization, a free spiritual individuality that transcends the “ethical” realm.

This has given rise to the common, and somewhat tedious, Western reproach of the purported amorality and the alleged life-negating quality of Hindu spirituality (Schweitzer 1955). Even long-time students of Indian religions like R. C. Zaehner, analyzing the ritual murders of Charles Manson and his followers, argue that the killings may well have derived their moral justification from the teachings of the Upaniṣads, according to which the enlightened individual lives “beyond good and evil” and transcends the conventional morality of right and wrong (Zaehner 1974, 97–98). This interpretation is based on a strange mistranslation of the relevant Upaniṣadic texts (see Lipner 1998). It is, however, a sufficiently widespread view to warrant rebuttal.

First, the very definition of the enlightened sage is one who has developmentally advanced beyond his empirical self and its interests, and is established in a “transcendental” wisdom. To ascribe egoistic acts like murder to such an individual is to misunderstand what enlightenment means and entails. Second, while *dharma* strictly speaking is neither a necessary nor a sufficient means for *mokṣa*, in actual fact, *dharma* is often presupposed as a condition for *mokṣa*. Even though *mokṣa* lies beyond *dharma* the means of achieving both are not vastly different. In the *Bhagavad Gītā*, one of the central ethical texts of the tradition, Arjuna, the protagonist, is instructed in the path of *dharma* as a precondition for enlightenment. The *Bhagavad Gītā* attempts to synthesize two moral ideals, the outer one of social obligation and the inner one of renunciation and detachment. It is made clear to Arjuna that this goal of renunciation *in*, but not *of*, action requires, among other disciplines, that of *karma yoga*, the path of selfless service. Third, there are texts that challenge this harmonizing interpretation, like Śaṅkara’s *Advaita Vedānta*. Yet nowhere is it suggested that the enlightened person can disregard everyday morality with impunity. Spiritual liberation is a progression beyond, not a regression from, the strictures of *dharma*.

Nonetheless, viewing morality from this developmental perspective results in a shift of meaning and emphasis compared to some Western understandings of the term. The life-cycle is seen as progressing through four stages, each with its appropriate code of conduct. Studentship (*brahmacarya*) requires habits of studiousness, sobriety, and reverence for one’s teachers; the householder (*gṛhastha*) stage entails the responsibilities of marriage, family, career, money, and power; the forest-dweller (*vānaprastha*) stage brings with it a gradual withdrawal from worldly pursuits and interests; while finally the stage of renunciation (*saṃnyāsa*) calls for complete withdrawal from society so as to have freedom for spiritual contemplation. To these social stations and their duties are fused the four life goals mentioned earlier. At each stage of life there is a basis in custom and convention for one’s responsibilities. Individuals operate

on the basis of a moral appropriateness that seems fitting in the circumstances. This is not “situation ethics” calling for ad hoc responses. Rather, the understanding of “morality” is subtly different. It is neither the application of abstract moral rules, nor the invocation of general principles that is deemed important. More vital is the unfolding journey of self-realization and the demands which this journey imposes at each stage. There is a close relation between ethics and religion in the Hindu tradition. Still, there is no doubt that questions of “ultimacy” and of spiritual liberation relativize morality and render it ultimately subordinate to spiritual goals.

The Dialogue of Tradition and Modernity: The Case of Gandhi

This entry has emphasized so far the classical moral tradition articulated in the long interval from the Vedas (before 1500 BCE) to the working out of philosophical systems and commentaries on scriptures culminating with the dualist *Vedantin* Madhva in the fourteenth century CE. What comes after that period are the Moghul and British invasions. These caused great disruptions in Hindu thought, at least in its philosophical aspects, until the modern period heralded by Rammohan Roy and the Bengal Renaissance in the early nineteenth century. As this is not a historical inquiry, what will be perhaps of greatest interest is how modern Hindu thinkers received and appropriated their traditions.

Much of classical moral thought took shape within a highly structured and traditional society, where custom and convention, though by no means static, were able to specify moral roles and responsibilities. Modernity, with its scientific temper, technological innovation, economic and social mobility, and democratic ethos, issues a quite different set of moral demands. The question arises how well the traditions are able to adapt to modern conditions. Custom, by definition, remains local and defies universal application. In a modern society like India's, with more than a billion people, it should not be surprising that forces besides custom take on the role of moral arbiters. Increasingly, constitutional, legal, and parliamentary debates assume greater importance than social conventions and habits. It is important in this light to distinguish between orthodoxy and tradition. Orthodoxy hypostatizes tradition rendering it static and unchanging, whereas tradition, from its very etymology, suggests that which is carried forward, as it seeks to preserve significations and create new meanings in changed circumstances. The real issue for ethics outside the strictures of orthodoxy is, then, that tradition and modernity, ideally speaking, are caught up in an ongoing dialogue, each challenging and questioning the other.

In recent Indian religious ethics, the most consequential dialogue of tradition and modernity was conducted by Gandhi. Two considerations motivate the focus on Gandhi. First, without any question Gandhi is the modern Indian who has most caught the world's imagination. His ethics of non-violence, though not particularly original in its theoretical underpinnings, is striking in its practical applications. It represents the most significant development of Hindu ethics in the twentieth century. Second, his successes and failures point to some of the challenges now facing Hindu ethics in the twenty-first century, as noted below.

Gandhi is a moralist through and through and yet it is difficult to write philosophically about his ethics (Prabhu 2001, 2004). This is because Gandhi is concerned with practice rather than with theory or abstract thought, and such philosophy as he used was meant to reveal its “truth” in the crucible of experience. Hence the subtitle of his *Autobiography*: “the story of my experiments in truth.” The truth

of concepts, values, and ideals is fulfilled only in practice. Prior to that practical fulfillment they remain spectral and abstract. Furthermore, Gandhi's ethics are inextricably tied up with his religion, which itself is unconventional. Though an avowed Hindu, he was a Hindu in a philosophical rather than a sectarian sense. There was much Hindu ritual and practice that he subjected to critique. His religion could be described as the life of the self attempting to realize itself as Self, thus achieving *mokṣa* or spiritual liberation. *Karmayogi* that he was, self-realization had to be expressed through work in the world and the details of daily life rather than through renunciation of the world. Gandhi's own ethics have a decidedly spiritual cast, but because he takes pains to express them in a neutral philosophical manner, he intends them to have general validity. When he switches from affirming that God is Truth to saying that Truth is God, his rationale is that the latter is a more general statement which has resonance even for unbelievers. This is a testament to Gandhi's innate sense of tolerance and inclusiveness, in that he believes that his ideals of truth and non-violence are accessible even to those who do not share his religious metaphysics.

Truth for Gandhi is not merely, or even primarily, the property of statements. He does not deny the importance of factual truth or the correspondence between propositions and states of affairs in the world that either confirm or refute them. Rather, his multifaceted notion of truth emphasizes ontological, moral, and existential aspects. Ontologically, *satya* is derived from *Sat*, the self-existent essence, both the Is and the Ought of reality. It was this derivation that led Gandhi often to say, "Nothing exists in reality except Truth, everything else is illusion." Beyond the illusory temporal flux of phenomena lies the eternal Truth, what Gandhi also called Absolute Truth. We humans, with our finite capacities, can have access however only to relative truth, an assertion Gandhi uses to justify epistemological humility and tolerance. All our perceptions of truth are inevitably partial and therefore claims of cognitive absoluteness are unwarranted and dangerous.

While the ontological aspect of truth points to a more objective notion, the moral and existential aspects move in the direction of a more subjective dimension, the deeply personal intuition of truth which can be experienced only through action. "Gandhi could not regard truth either as solely the object of reason or as simply the product of human decision. For him ... truth is nothing less than the splendor of reality and cannot be gained without an understanding of the Eternal Law of Nature, but when it is perceived and seized it must be acted upon" (Iyer 1973, 154). Truth for Gandhi found its fullest expression in the field of politics, which in accordance with his moral outlook he regarded as the arena for doing good on the largest possible scale. The idea used to encapsulate this moral conception of politics was *satyāgraha*. This was conceived as a practical experiment to introduce truth and non-violence into the political field. Gandhi adopted this idea early in his political career when he chose *satyāgraha* as the name for his resistance movement against the repressive South African government. Gandhi wrote, "Truth [*satya*] implies love and firmness [*agraha*] and therefore serves as a synonym for force. I thus began to call the Indian movement *satyāgraha*, that is to say, the force which is born of truth and love of non-violence" (Gandhi 1938, 172).

The forceful and activist character of *satyāgraha* should correct a common misperception, namely, that it denotes a passivity of resistance, a mere turning of the other cheek. Although Gandhi insisted that violence be met with love and understanding, the non-violent means chosen should not obscure the powerful end of establishing justice and truth. He is on record as saying that if the choice were between the passive acceptance of injustice and violent resistance to it, he would choose the latter. He was convinced, however, that non-violent resistance was superior to both alternatives.

Satyāgraha begins with reasoning with one's opponent or adversary in an attempt to arrive at a just solution, recognizing that no party has a monopoly on the truth, or is wholly in the right. The purpose is to work out a rational compromise that will be agreeable to both sides. It is only when such processes of reasoning, persuasion, and compromise have been tried and have proved unsuccessful that one adopts the direct action techniques of *satyāgraha*. *Satyāgraha* involves performing actions such as noncooperation (strikes, boycotts, lockouts, fasts); civil disobedience (non-payment of taxes, disregard of specific laws or injunctions); publicizing one's cause through marches, rallies, picketing, and other forms of peaceful protest; and constructive programs (low-cost housing, education, health facilities, cooperative banks for the poor). A big part of non-violent resistance is *tapas* or the willingness to suffer for one's cause. "It is the assumption of *satyāgraha* that when reasoning fails to move the head, the argument of suffering by the *satyāgrahis* helps move the heart of the oppressor or opponent. Self-suffering, moreover, is the truth-serving alternative to the truth-denying method of inflicting violence on others" (Pantham 1987, 292–310). Contained in this idea of *satyāgraha* is the question of means and ends. Gandhi disagrees with the common political idea that the ends justify the means. To the contrary, he held that immoral means taint and distort potentially good ends and to that extent he placed at least as much, if not more, emphasis on the means, which he described as ends in actions. "The means may be likened to a seed, the end to a tree; and there is just the same inviolable connection between the means and the end as there is between the seed and the tree" (Gandhi 1956–1994, X, 431).

The forceful and activist character of *satyāgraha* leads naturally to the idea of non-violence. Gandhi invokes the Jain precept of *ahiṃsā*, or not causing deliberate injury or harm to any being. He takes the precept beyond its merely negative formulation to mean the largest love, the greatest charity. "If I am a follower of *ahiṃsā*, I must love my enemy or a stranger as I would love my wrong-doing father or son. This *ahiṃsā* necessarily includes truth and fearlessness" (Gandhi 1916, in Iyer 1973, 180). *Ahiṃsā* is the deployment of moral force to persuade one's opponent or adversary. It differs from violence in that it respects the autonomy and dignity of the other, whereas violence does not. *Ahiṃsā* differs from violence in the perpetual willingness to dialogue and negotiate with the other and, as far as is consistent with rightness, to come to a compromise. Given that one's grasp of the truth is at best partial, it is imperative to see and appreciate the truth in the position of the other and to try and achieve a higher or dialectical reconciliation of conflicting ends. This negotiated compromise has the opposite effect of violence, which involves vanquishing and putting down one's opponent that inevitably sets up a cycle of resentment, ill will, and further violence. The search for truth becomes a shared quest based on epistemological humility and mutual respect, notwithstanding the differences that still remain after the effort at understanding.

Gandhi was not so naive as to think that such moral persuasion would come easily. He was aware that people who exercise power over others are not likely to give it up without some pressure being exerted. All the means of *satyāgraha* should then be adopted as a way of morally coercing one's opponent to negotiate. It is true that coercion is being exerted, but it is a coercion that still respects the moral agency and dignity of the other, not least by the willingness to undergo self-suffering. The strategy presupposes that the opponent does have a minimal openness to such moral appeal, a trait that Gandhi was willing to grant to most people. However, he also recognized that there are madmen and tyrants, rapists and aggressors who would not fall within that category. In those extreme cases Gandhi was willing to use physical force for the purpose of self-defense. For example, he sanctioned the use of military force to drive back the Pakistani Army in what he considered to be the invasion of Kashmir in 1947–1948.

The three concepts discussed, *satya*, *satyāgraha*, and *ahimsā*, might give some idea of the texture of Gandhi's ethical thought. The ideas of truth and non-violence are certainly to be found in the Jain, Buddhist, and Hindu traditions, but there is a difference between Gandhi's conceptualization of these ideas and traditional ones. The high standards of moral and spiritual discipline that Gandhi invokes were traditionally part of the *sādhana* of monks and saints, but decidedly not of people in political life. To the contrary, political thinkers like Manu and Kautilya sanctioned the use of physical force both for self-defense and for purposes of political order. Gandhi, by contrast, considerably softens the traditional dualism between religion and politics. Instead, he attempts to forge a non-dual relationship between the two, where religion, seen as reverence for and service to Life, necessarily leads to politics, the arena for the greatest potential public service. Politics in turn is saved from power mongering and the conflict of factional interests by the moral purification involved in religion at its best. It is important to distinguish Gandhi's highly moral notions of religion and politics from the ideological conceptions of them all too common in our time. Certainly, the rise of religious fundamentalism and right-wing religious groups would make any peace-loving person nervous about the marriage of religion and politics. It should be clear, however, that the moral checks and balances that Gandhi exercised over religion and politics purified both domains and offered the world a different and more noble conception of them that we have yet to live out.

These principles of Gandhi represent only one aspect of his ethics – his ethics of love. Love, for Gandhi, was not a simple sentimental matter, or just a benevolence towards all, demanding as that ethic might be. Love in the full sense incorporates justice, treating people fairly, if not always equally. It was these elements of love and truth, on the one hand, and justice and fairness on the other, that constitute his comprehensive philosophy of peace. What warrants its claim to comprehensiveness is that it tackles overt and structural violence, the violence that is all too visible, and the more subtle and less visible violence contained in unjust practices and institutions. Peace, for Gandhi, was not simply a narrowly conceived moral and spiritual matter. It encompassed a holistic way of life that includes economic and social concerns.

As early as 1909 Gandhi wrote *Hind Swarāj*, a book that was in many ways the foundation for his subsequent thinking. In it he criticizes the Western path of modernization as unstable and alienating. It is materialistic, exploitative of nature and human beings, unrestrained, and lacking a sense of direction of moral purpose. The key factor responsible for this state of affairs is the conception of human beings and of human nature that underlies it. Instead of seeing humans as essentially moral and spiritual beings, Western modernity regards them fundamentally as consumers driven by greed and self-indulgence. The goal of the modern economic system is endlessly to produce goods in response to the ever-increasing demand of consumers, continually driven and inflamed by advertising. Modernity confuses material production for progress, restlessness for vitality, acceleration for efficiency, and consumer satisfaction for an improved quality of life.

From his critique of Western modernity, we can infer the character of Gandhi's alternative modernity in dialogue with tradition. It is based on a picture of human beings as moral, spiritual, and culturally creative. From this basic conception of human nature, Gandhi derives some regulative principles that should govern a good society. First, it should be informed by a reverence for life. Because human beings are not the masters or owners, but are instead the caretakers and trustees of creation, they should organize their affairs in such a way that they respect nature's integrity, diversity, and rhythm, and adjust their demands accordingly. Second, because human beings are interdependent, a sound social system should

discourage all forms of exploitation, domination, and inequality, and instead promote the values of love, truthfulness, cooperation, and solidarity. Third, because human beings are creative and spiritual in nature, a good society should encourage them to develop these capacities, and in particular, their capacity for *swarāj* (moral self-rule). When Gandhi applied these principles to the social and economic spheres, the ideas he emphasized are those of decentralization, regional development, local self-sufficiency, and the creation of a technology adapted to the needs and resources of a particular area and to the creativity of people. He insisted that economic growth should proceed in harmony with nature and between people, even if such growth is slower and more gradual than that brought about by heavy industry and high technology. Gandhi had nothing against wealth or productivity as such. His point was that the production of wealth should be regulated by a set of moral values rather than being an end in itself.

Gandhi's critique of modernity by no means implied a complete rejection of modernization. He greatly valued the scientific temper of modernity and its emphasis on investigation and experimentation. Gandhi also valued the spirit of the Enlightenment with its valorization of independence, critical thinking, and moral autonomy. Conversely, there were many aspects of his tradition that Gandhi criticized, from caste and untouchability to the oppression of women. By the same token, modernity for Gandhi did not imply a wholesale rejection of tradition and an embrace of the new for its own sake. Rather, he sought to assimilate the best of tradition and modernity, as measured by his own evolving standards. To that extent, we can justify Gandhi's vision as being in tune with the spirit of openness and independence of thought betokened by modernity.

The Prospects and Challenges Facing Hindu Ethics

Gandhi was assassinated by a fellow Hindu – a rabid nationalist who feared that he was betraying Hinduism – in 1948. The dialogue that he initiated between tradition and modernity is one that has continued since his time. India today, as a full-fledged nation-state, grapples internally with a range of ethical problems, from questions of distributive justice and minority rights to a uniform civil code for the diverse social and religious groups. At the same time, operating within the community of nations, and being the largest democracy in the world, it is faced with its share of transnational challenges, from the impact of globalization and global ecology to problems of war and peace.

In meeting these challenges, Hinduism has a rich ethical tradition to draw on, with moral ideas that are complex enough to allow for reinterpretation in new settings. These resources for contemporary trajectories in ethics are rooted in the past forms of thought noted above. Consider a few examples. The idea of dharma, with its cosmic, holistic, and ecologically sensitive perspectives, provides a counter-weight to the possessive individualism, acquisitiveness, and nature-dominating features of modern and postmodern society. The ethic of the *Bhagavad Gītā* of doing one's duty selflessly and with inner-detachment is one that has wide resonance. Gandhi's ethic of non-violence has long attracted the attention of groups in civil society working for peace, human rights, transnational distributive justice, and ecological harmony. In an age of globalization, it is heartening to read the praise of a renowned scholar of comparative legal systems: "The genius of India ... is peaceful coexistence between groups, creative co-prosperity. India has harnessed the concepts of religion not to *activity*, nor to a meditative and self-absorbed *stagnation*, but to the creative co-prosperity of groups each recognizing the other's right to contribute to the whole. A balance of forces is still needed and because it favors it, Hinduism still dominates" (Derrett, in Smith 2003, 202).

However, any dispassionate student of Hindu ethics will readily admit that there are urgent tasks ahead that any use of traditional resources must address. The future trajectories of Hindu ethics will be along the lines of these urgent tasks. In this way, contemporary Hindu ethics will enact in its own way the dialogue of tradition and modernity.

First, in relation to the paradox about Hindu ethics isolated above, it still remains true that the lacuna of a *systematic ethics*, though often remarked on, has still not been filled or even adequately addressed (but see Bilimoria, Prabhu, and Sharma 2004; Gupta 2002; Perrett 1998). Granted the distinctive features of Hindu ethics, there still remains a puzzle as to the paucity of good accounts of the subject that meet modern canons of rigor and thoroughness. The few that do exist are largely descriptive treatments detailing the ethical features of various philosophical systems and texts, but displaying relatively little analytical acumen (Hopkins 1924; Dasgupta 1965; Jhingran 1989). If one considers another tradition quite different from the West – the Chinese, for example – one would have to concede that studies of Indian ethics fare poorly in comparison. It is possible that as scholars face the challenges of contemporary moral problems more resolutely, they will also examine the traditions more carefully.

Beyond this academic trajectory, however, there is a set of practical ethical challenges that India faces. One challenge surrounds *toleration and pluralism*. The peaceful coexistence of many different beliefs, practices, and institutions within Hinduism, and its tolerant attitude towards non-Hindu traditions, has been a hallmark from earliest times. There is at least a threefold basis for this tolerance: religious, philosophical, and psychological. The Vedic maxim “Truth is one, though sages call it by different names” (*ekam sat viprā bahudhā vadanti*) captures the pervasive sense of religious pluralism that Hinduism often espouses. The Jain doctrine of *Anekāntavāda*, the many-sidedness of truth, referring to the perspectival quality of truth in general, signals the philosophical open-mindedness and rejection of dogma of Hinduism at its best. Psychologically, the idea of karma (moral cause and effect), together with the recognition of differences in personality, social station, aptitude, etc., points towards a latitude of lifestyle and conduct. While there are indeed basic moral rules and norms (*sādhāraṇadharmas*), these get applied differently to caste and one’s stage of life (*varṇāśramadharmas*). This tolerance has gone together with a general disposition in favor of non-violence. It is both wrong and wrong-headed to coerce someone into agreement with one’s particular moral standards, because that involves a violation of her or his moral integrity. This is a relativistic position, but one (a systematic ethics would show) that stops well short of a self-defeating relativism. There *are* appropriate standards which can be justified, but the appropriateness is nuanced according to caste, class, stage of life, etc.

All this is theoretical and like many theoretical pronouncements does not always translate into practice. Indian Muslims and Christians, in recent times, have tested the limits of Hindu tolerance, and one cannot say that the results have been encouraging. Hindu–Muslim and Hindu–Christian tensions, alas, are now fairly common and on the rise. This is a complex topic and the many causes of this development cannot be explored. Suffice it so say that there is fault on all sides; suffice it also to say that many Hindus regret the chauvinism and fundamentalism that seem to be conspicuous features of their religion today. It is important for the future of Hindu ethics to distinguish the pluralism and genuine tolerance of Gandhi and Ramakrishna from inclusivism, which has often been mistaken for them. Inclusivism is the position in which one’s particular tradition is taken to represent the final or ultimate truth, and other traditions are seen either as aspects of, or stages leading up to, such final truth. It easily absorbs or assimilates or subordinates other traditions. The difference between pluralism and inclusivism comes at the point where they deal with difference. Where inclusivism tends to neutralize difference and reduce it to

the same, pluralism either celebrates difference as part of the infinite plenitude of being, or when differences harden into oppositions and celebration is not possible, tries to live with such oppositions. Some, but by no means all, of Hindu tolerance has been of this inclusivist kind. Even that is an improvement on the exclusivism and marked intolerance that recent Hindu fundamentalism often displays. But the question of *toleration* requires more reflection.

If religious violence points to a dimming of the great ideals of tolerance and spiritual unity that once animated India, there is another area of ethics which has never been strongly addressed. This is the theme of *social justice* treated systematically in ethics; its relative absence in the literature is a troubling lacuna in the tradition. While the classical tradition espoused the idea of impartiality (Doniger and Smith 1991), this is counterbalanced by the belief of inequality among castes and between genders. The caste system was not always the hierarchical and inegalitarian institution it has become. At its inception, it was a functional system based on a division of labor, talent, and disposition and one could argue that it may not then have been *prima facie* unjust. That argument cannot be sustained today. It is impossible to examine here the details of something as complicated as the caste system. Caste poses serious questions for the democracy and egalitarianism that post-independence India has espoused. In this egalitarian ethos, all sorts of oppressed groups, from tribal peoples and “untouchables” to women and landless laborers, demand justice in a system that has not adequately thematized it.

The problem generally expressed is how to fashion a just social order out of a hierarchical system that embodies inequalities of rank, status, and power. Gandhi thought he could retain the caste system by interpreting it as a functional order expressing differentiation, though not necessarily inequality. In this judgment, he was naive at best, and self-deluded at worst. B. R. Ambedkar, the father of the Indian constitution and an “untouchable” himself, in his exchange with Gandhi exposed the latter’s wishful thinking. Ambedkar organized a mass conversion of his fellow “untouchables” to Buddhism as a mark of protest against Hindu caste oppression (Zelliott 1996). It is not surprising that the burden of trying to meet some of these demands for social justice has fallen disproportionately on the law courts without much ethical reflection to draw on (Larson 2002). Here, too, the lack of a *systematic ethical reflection* is linked to grave practical matters.

This selective treatment highlights a few of the challenges that Hindu ethics faces in the future: to develop *modes of moral reflection*, to clarify features of *toleration*, and to address basic issues of *social justice*. Modern India has opted for a democratic and egalitarian society. While it has a rich ethical legacy to draw on, it nevertheless faces a daunting task as it seeks to revise its hierarchical social system and the beliefs that support it to meet these urgent demands.

6 Chinese Religions

CHAPTER 78

Chinese Ethics?

Eske Møllgaard

The main concern of traditional Chinese thinkers has been what we call ethics, and not epistemology, logic, or theology, to name a few other important European interests. For a Western reader, the rich field of Chinese ethical thought is difficult to approach. The discourse of “ethics” does not easily map onto the Chinese tradition. First, the field of knowledge was structured differently in China than in the West. Second, we must consider the question of the difference in conceptual schemes between Western and Chinese thought. The third difficulty is the pervasive authoritarianism in the Chinese tradition. This is particularly important to highlight when Chinese thought is read within a Western liberal and post-modern context.

Fields of Knowledge

The fields of knowledge in traditional China are not divided according to the familiar Western academic disciplines: ethics, politics, history, literature, and so on. Traditionally, Chinese learning was divided into the “six arts” (*liuyi*): *shu* (history), *shi* (poetry), *yi* (changes), *li* (ritual), the *chunqiu* (the Spring and Autumn Annals), and *yue* (music). During the Han dynasty (206 BCE–220 CE) this division was codified in the study of the *Five Classics* (*wujing*): *Book of History*, *Book of Poetry*, *Book of Changes*, *Book of Rites*, *Spring and Autumn Annals* (a *Book of Music* either never existed or was lost). It may be tempting to take the Chinese categories roughly to correspond to what we call history, poetry, metaphysics, and the socio-ethical domain. But in translating the Chinese terms we find no strict equivalencies: *shu* (history) does not historicize in the way modern history does; *shi* (poetry) is not poetic in the way of modern poetry; the book on *yi* (*changes*) is concerned with divination of changes rather than with our familiar metaphysics of being; and the *li* (rituals) cover the whole field of civilized behavior from bowing to an elder to conducting animal sacrifices.

The point to grasp is that in traditional China the ethical is not a separate category but pervades all the fields of knowledge. Traditional Chinese “learning” (*xue*) has no separate discipline of ethics. To be sure, the works of the early “Masters” (*zi*) and later the “collected works” (*wenji*) of scholar-officials have much to say about “humanity and righteousness” (*renyi*) and “moral conduct” (*dexing*). There are also works that catalogue and explain ethical terms, yet no philosophical ethics is found in traditional China. (The Mohists made a beginning, but their theories had no impact on the tradition.) There never was in China an Aristotle, who defined practical wisdom in relation to scientific knowledge, craft knowledge,

and sagely wisdom. It was only with the encounter with the West that the Chinese came to see ethics as a separate domain and coined terms for it: *lunlixue* or *daodexue*. What we call “Chinese ethics” is therefore an object constructed according to the logic of Western science.

The tradition of Chinese ethics does not have our familiar landmarks, in particular the division between ancient and modern ethics. Chinese ethics may seem at once premodern and postmodern, or it may impress us, as Confucius did Elias Canetti, as being thoroughly modern. But if we do not find in traditional China a theory of moral autonomy, we have in the various traditional Chinese schools of thought not only a great deal of moralism but also more importantly an invaluable range of ethics not as theory but as spiritual exercise. Like in ancient philosophy in the West, we find in the Chinese tradition examples of ways of forming oneself as an ethical subject that are of universal significance. In the Greek tradition the ideal is the philosopher who is a lover of wisdom but does not possess wisdom, and is a true lover precisely because the consummation is denied. In China the ideal is the sage, who embodies wisdom – at the price, perhaps, of giving up the *eros* of the philosopher (expressed in irony, dialectics, speculative propositions, and so on). Most Chinese schools of thought justify themselves by referring back to “sages” (*shengren*) of the past and the “sage knowledge” (*shengzhi*) they possessed. Most schools promote a particular “way” (*dao*) of “learning to become a sage” (*shengxue*), and in many of the schools the politico-ethical ideal culminates in the “sage king” (*shengwang*).

This dominance of the figure of the sage in the Chinese tradition poses difficulties for the Western interpreter. In the modern West the image of the sage has lost its force and has become largely irrelevant for speculative thought. By default Western interpreters treat Chinese thinkers as “philosophers.” But for the Chinese the point is to *embody* wisdom, not to contemplate it. Here we may be tempted to say that the Chinese value practice rather than theory. But this reversal of the Western valuation remains inscribed in the Western dichotomy; it does not quite capture what is at stake in Chinese thought. Perhaps we should say that for the ancient Chinese, practice was theoretical (or metaphysical) – as if one could see with the hand.

In regard to religious ethics, it is decisive that whereas the philosopher is situated somewhere in-between human opinion and human wisdom, the sage is situated somewhere in-between human wisdom and the divine. The Confucian sage is closer to the wise human being; the Daoist sage is closer to the divine. It appears that in China the ethical and the religious are split between the two indigenous traditions: Confucianism and Daoism. Everyone agrees that Confucianism has an ethics, but it is controversial if Confucianism is a religion. The prestigious Chinese Academy of Social Sciences, for instance, does not include Confucianism among the World Religions. On the other hand, everyone agrees that Daoism is a religion, but many scholars, in traditional China as well as in the modern West, emphatically deny that Daoism has any ethics at all. (By “Daoism” I mean the *Laozi* and the *Zhuangzi* and not later Daoist schools and movements, which had strict ethical codes.) Concerted efforts have been made to present Confucianism as a religion. But it may not be before the profoundly ethical nature of early Daoist thought is brought to view that we are in a position to assess China’s most important contribution to religious ethics.

Conceptual Schemes

The view that Chinese thought relies on conceptual schemes that are radically different from those of Western thought has a long history in sinology. Most recently, it has been claimed the Chinese have no concepts of rationality, causal thinking, objective truth, dialectics, and definition. It is said that Europe

and China rely on opposed valuations. Whereas Europeans value being, individuality, freedom, and rights, the Chinese value becoming, relation, spontaneity, and rites. Not long ago the conceptual difference now claimed for China would have relegated Chinese ethics to the most dense substantiality without any development towards autonomy. In the present postmodern climate of Western philosophy, Chinese ethics is seen rather as an aesthetic expression liberated from all foundationalism. Yet this construction and comparison of conceptual schemes comes at the price of interpretive reductionism. The very moment we establish the difference *between* the two traditions, we homogenize differences *within* each of the traditions. Chinese thinkers are now merely representatives of underlying linguistic and conceptual formations, and the same holds true for the Western interpreter. The result of this operation is that all unique (existential) features disappear.

Against this reductionism we should emphasize that the other, just like the self, is always also an other (a stranger) to itself, and precisely this provides the possibility for mutual understanding between different cultures. Consider a well-known but under-appreciated fact of translation. We know that our best translation is not adequate, but we do not know exactly what it is we know in knowing this. For instance, we know that the English word “humanity” does not quite cover the meaning of the Chinese *ren*, but we do not know *precisely* what it is we know when we know this (if we did, the deficiency could easily be remedied). But Confucius himself was not really sure what the word *ren* meant. For him, too, the word had an uncanny excess of meaning that he could not express. Just like the modern translator, Confucius knows that he does not know the full meaning of the word, but he does not know precisely what he knows in knowing this. It is from the meeting of these two lacks of understanding (Confucius’ and ours) that the universal emerges (Žižek 1997, 49–50).

The differences in conceptual schemes are important, but most often it is not conceptual differences but a certain chinoiserie that prevents the Western reader from seeing what is at stake in Chinese ethics. This has led to the prevalent view that Chinese ethics is a kind of aestheticism. According to F. S. C. Northrop, for instance, Chinese ethics has to do with “warm, vivid, personal experiences filled with aesthetic content, such as the crunching of bamboo sprouts between one’s teeth, the enjoyment of the flavor of sharks’ fins, or the quiet aesthetic intuition of the fragrance and flavor of a cup of tea” (Saussy 2002, 105). This aesthetic interpretation of Chinese ethics is also found in recent postmodern celebrations of Chinese thought. The claim is that because the Chinese sage is not hampered by universal rules, he correctly assesses the ethical flavor of a particular situation – much like a connoisseur appreciates a bowl of sharks’ fins soup. This may be a pleasant view, but the real substance of Chinese ethics lies elsewhere: in authoritarianism and strategic thinking.

Authoritarianism

Kinship and bureaucracy are the two fundamental factors of traditional Chinese culture. Society was viewed in terms of the hierarchical structure of the family, and there was a continuum reaching from the family to the scholar-officials (the “father–mother official”), all the way to the earthly emperor (the “son of Heaven”) and further into the realm of ancestors and divine bureaucrats that serve the Jade Emperor in Heaven. This continuum may seem to preclude any notion of transcendence, but the power invested in the king (or the emperor) is the one transcending power in China. Whereas everyone in the continuum of hierarchical relations had to bend to their superior (and so lost their moral autonomy), the king was the only one who in principle could act without any regard for such strictures.

This king's transcendent power was absolutely necessary to maintain the traditional system. The power that circulated in the continuum of hierarchical relationships was not bound by a transcending principle (such as God or justice), but was maintained rather through constant strategic manipulation. The ideal (and the ideology) was that the system of hierarchical relations could be strategically manipulated in such a way that it functioned harmoniously as second nature. On two occasions the intervention of a power that transcends the system was necessary. First, the power that circulates within the system cannot itself found the system. Therefore, at the founding of a new dynasty the "mandate of Heaven" (*tianming*) had to intervene. The system had to be recharged, as it were, by investing the new ruler with transcendent power. Second, once the system is operating there is always the danger that it may crash. The harmony may be so seriously disturbed that it cannot be restored by strategic manipulation. Again, in this state of exception, to borrow Carl Schmitt's term, the transcending power must intervene, and the one who rules over the exception is the king.

In early China the philosophers and the kings compete over the right to rule over the exception. Competition with the ruler for command of the state is the distinguishing characteristic of the early Chinese schools. The early Chinese "Masters" (*zi*) (Mozi, Mengzi, Hanfeizi, Xunzi, etc.), says Mark Edward Lewis (1999, ch. 2), create in their texts "parallel realities" or "an imaginary counterstate" to the actually existing polity. In this imaginary realm the Master or the sage (who himself was a textual creation) is put in a position that parallels that of the king in the actual polity. In this way the king and the sage (or, rather, the Master as the sage's representative) are in competition with each other, yet they are also identified in the figure of the sage-king, or the ruler who embodies the "wisdom" (*zhi*) provided by the Master.

If Greek philosophy originated in the competition between citizens and friends and implies a certain equality, the Chinese Masters competed with the king for a power that produces a fundamental split between the ruler (the regulator) and the ruled (the regulated). The Masters claim that they possess a higher order strategic competence: a flexible wisdom that transcends the set responses of particular skills and arts. The philosophical schools present themselves, says Lewis, "as exponents of a generalist, regulatory intelligence comparable to that of the monarch, in contrast to the particular, technical skills of other text-based traditions" (1999, 96). It is precisely as regulators of regulation that the sage and the king coincide. Both are exceptional in that they can act without regard to the strictures that hold for everyone else in the continuum of hierarchical relations. This is well illustrated, for instance, in the idea that Confucius transcends the dichotomy between what is "allowable" (*ke*) and "not allowable" (*buke*) and simply "falls in with what is right" (*yizhi yubi*). This type of sagely "wisdom" (*zhi*) has been compared to Western forms of practical wisdom (*phronesis* or *prudentia*), or to a kind of aesthetic perception. It is should be understood in terms of the attempt to put oneself in the exceptional position of ruling over the exception, and so control the entire system of hierarchical relations.

In their own imaginary textual world, the Masters may have won the competition with the kings. In the real world, of course, the kings and emperors remained in power. They did, however, adopt a combination of Confucian moralism and Legalist authoritarianism as state ideology. The exercise of state power in China consists in distributing rewards (honor and favors) and punishments (mutilation and death) in a strategic balancing of powers, where the center of power remains obscure or "empty," that is to say, in no particular position and therefore impossible to attack. Confucian "sage knowledge" (*shengzhi*) provided important ideological support for this particular configuration of power, which proved to be one of the most enduring in human history. It is remarkable that the ancient Chinese not only developed

a bureaucratic form of government that is comparable to that of modern Europe, but also conceived of a totalitarian regime that in its intention is similar to the totalitarian states of the twentieth century. The first Western counterpart to this concept of power may be Bentham's panopticon, sometimes seen as characteristic of modernity. But, as François Jullien points out, in China it had already been invented in antiquity, "and not simply on the cautious, modest scale of a prison but on a scale that controlled the whole of humanity" (1995, 57).

The profoundly authoritarian character of Chinese culture had decisive consequences for Chinese ethics and religious ethics in particular. If state power, the exceptional power to rule over the exception, is sacralized as the "empty" space beyond any determination, then it can tolerate no competition. Any claim to a competing transcendence must be immediately suppressed. This explains why the Chinese state and its scholar-officials viewed religion with such suspicion and fear. In traditional China it was the responsibility of the county magistrate to collect taxes, employ clerks, sheriffs, and jailers, give lectures on morality, and make offerings at the officially recognized temples. But the magistrate also "kept close watch over all religious activities, especially those involving voluntary organizations of people outside the family and locality groups, whose actions might threaten the sovereignty and religious prerogative of the state" (Teiser 1999, 115). Many have wondered why the present regime in Beijing so brutally suppresses the Falun gong religious movement, not to mention the incarceration, torture, and murder of so many Buddhists and Christians. The response seems out of proportion to the threat. But the regime in Beijing is well aware that the foundation of its power – which is entirely traditional – can tolerate no competition. As a transcendent power, state power must remain one and undivided. This notion of power is the main impediment for China's transition to modernity. One may expect that the most pressing concern of Chinese scholars today would be to formulate an ethics that, unlike the traditional ethics, is not inextricably bound to the notion of a transcendent (sacred) state power.

CHAPTER 79

Origins of Chinese Ethics

Philip J. Ivanhoe

Any account of the “origin of ethics” will be to some degree speculative, for it attempts to explain not only what we know about the written records of another time and place, but also to reconstruct what the authors of these texts were trying to achieve by writing them. For ethics is the attempt to explain oneself to others, to offer a story that one believes other reasonable people will take as in some sense justifying why one acts, believes, and feels as one does. In this brief account of the origin of Chinese ethics, I will introduce some of the religious and philosophical concepts and orientations that informed the early development of Chinese thought. I will begin with material from the Bronze Age culture of the twelfth century BCE, and then focus on what many regard as the “classic period” of Chinese philosophy, roughly the period between the sixth and third centuries BCE.

The Bronze Age and Early Chinese Ethics

The rulers of twelfth-century BCE China, the latter part of a period known as the Shang Dynasty, relied upon divination to consult a variety of spirits concerning what actions and policies they should pursue. One method involved the use of shell and bone. Questions would be posed to various ancestral and nature spirits and specially prepared shells or bones would then be cracked by applying the tip of some type of hot implement. The resulting fissures would then be “read” by a diviner – often the king himself – and an answer to the inquiry determined. The questions and often the responses as well would then be carved onto the bone or shell and stored away, perhaps for future reference.

Oracular divination of this period was an important feature of Chinese society, for it enabled the ruling elite to discern and influence events in the spirit world. The early Chinese thought that spirits in general were quite capricious, often hostile or at best indifferent to human well-being. Oracular consultation and sacrifice were ways to understand and influence the powerful spirits who were thought to control many important events, both on the personal and larger social and political levels. Ancestral spirits were especially important in this regard as they retained some of the concern for their posterity that they felt while alive. Hence they were important allies for their living descendants.

The goal of divination was to understand and influence the spiritual world in order to comprehend and control events in the human realm. Successful divination required two primary abilities. On the one hand, the diviner needed to be a master of and be aided by those who could prepare and conduct the physical acts which constituted the divination. Regardless of the type of divination being performed,

special *technical* skills and knowledge were needed simply to move through the process. On the other hand, the diviner also needed to be a certain kind of person and to have a certain *character* in order for the divination to succeed. Among other things, he needed to show the proper reverence for the spirits whose aid he sought. Even the most technically flawless divination or sacrifice would prove ineffective if the person performing it was not properly oriented and attuned to the spiritual world. Only a properly sensitive diviner could discern the true meaning of the cracks produced on shell and bone. These three features of early oracular practice – its general goal of understanding “Heaven” in order to facilitate human well-being and the combination of technical knowledge and personal character needed for success – played critical roles in the development of Chinese ethics.

In certain oracular inscriptions, we encounter early forms of a Chinese character which in the modern Mandarin dialect is pronounced *de* (“virtue”). In these early Shang contexts, *de* was a kind of power which accrued to and resided within an individual who had acted favorably toward a spirit or another person. The favor shown could be some common act of kindness or in the case of a spirit the proper presentation of an appropriate sacrificial offering. It was believed that the recipients of such favorable treatment would feel a psychic debt toward their benefactor and this feeling would, in turn, engender a desire to “respond to” or “repay” the kindness. In this early period, the notion of *de* is almost always found in contexts concerning rulers and had the sense of that virtue particular to a good ruler. A king with “royal virtue” had the endorsement of ancestral spirits, and such support was thought necessary for him to gain and maintain his rule.

With the emergence of a new ruling line, known as the Zhou Dynasty, around the eleventh century BCE, the notion of “virtue” began to change, particularly in regard to the person of the king. A king’s ability to rule and the legitimacy of his rule came to be seen as something he could earn or forfeit. An improper ruler, one who neglected his ritual duties, dissipated his *de*, which in turn led to the collapse of his rule. Such a king would lose *tianming* (“Heaven’s Mandate”) to rule. A ruler who was scrupulous in his conduct, preserved and could even augment his personal power. Rulers were thought to have a role-specific obligation to “take reverential care of” their virtue. They did this primarily by paying strict attention to their ritual obligations as king. These obligations were numerous and varied but underlying them all was the idea that the king must put the good of the people before the satisfaction of his personal desires. At times, the king might even be called upon to put himself at risk in order to benefit his people. A king who failed to revere his virtue, by indulging personal desires at the expense of his royal obligations, would dissipate his virtue and weaken his rule.

The fall of the Western Zhou, in 771 BCE, is traditionally explained in terms of the last king’s lack of virtue. It seems that King Yu was deeply enamored of his concubine Bao Si and indulged himself by amusing her. Bao Si was fond of having the king light the series of beacon fires that were supposed to be used to summon his vassals from surrounding territories in times of attack. Even though there was no danger of attack, King Yu would have the fires lit for her amusement. Vassals would gather their forces and rush to the capital, only to find that it was a false alarm. After a number of such false alarms, they stopped coming and hence were not there when the real attack came and toppled his regime.

The story illustrates the belief that self-indulgence weakens the power of a ruler and that eventually this will result in the loss of Heaven’s Mandate to rule. Political failure was strongly correlated with moral decay and the latter was understood primarily in terms of sacrificing proper role-specific duties by indulging personal pleasure and advantage. The duties incumbent upon a good king – one who reveres his Heavenly virtue – were for the most part defined by a set of ceremonies and social practices known

collectively as the *li* (“rites”). These included high religious ceremonies of state, the regular administration of the government, personal deportment and behavior, and what we would call matters of etiquette. Since everything the ruler did contributed, in some small measure, to the character of his virtue, almost everything he did took on great significance. One sees how the trajectory of this style of thinking leads to a concern with self-cultivation, namely, the attempt, through concerted effort and reflection, to transform one’s basic inclinations and dispositions.

Along with and to some extent as consequences of these changes in the concept of “virtue,” two related shifts in the Chinese religious and philosophical paradigm were important for the emerging ethical consciousness. First, an appeal to kinship was no longer seen as sufficient grounds to legitimate one’s rule. Heaven’s Mandate was no longer simply viewed as a hereditary right or a question of fate. The right to rule was thought to depend upon the ritual propriety of the ruler. Second, what mattered in cases of ritual propriety was not simply acting or behaving in a certain way; more important was acting out of proper motivations. One had to perform one’s ritual obligations with the appropriate feelings and these were defined largely in terms of self-restraint and other-regarding, ethical qualities.

One can see in this constellation of concerns the influence of the “general goal” and “two primary abilities” needed for divination that were described above. A good king sought to serve and gain the favor of Heaven in order to control important events in the human realm. In order to do this, he needed to master an impressive body of technical knowledge concerning the rites, while at the same time working to cultivate the personal character required to carry them out effectively.

The Classic Period of Chinese Philosophy

Kongzi (551–479 BCE) or “Confucius” and his early followers preserved all three of these central features of early Chinese oracular culture and in this respect they show a conservative tendency. However, they also transformed these ideas into more distinctively ethical concepts. For example, while they believed that properly performed ritual actions had the power to influence events in the world, they tended to believe that this occurred as a result of the force of the ethical example that a practitioner displayed rather than as a manifestation of spiritual powers. In the case of Xunzi (310–219 BCE), a sophisticated and influential follower of Kongzi’s teachings, there is an explicit rejection of magical understandings of ritual. He argues for the critical importance of ritual, but in terms that a modern sociologist could easily embrace.

The Confucians are distinctive among early Chinese philosophers for the great emphasis they placed upon rituals and culture in general. They believed that the influence one receives through the practice of certain rituals and the appreciation of certain cultural pursuits such as archery, charioteering, poetry, and music were necessary for the development of moral character. In this set of beliefs, we hear clear echoes of the two “primary abilities” discussed above. In order to realize the Confucian ideal, one needed to master a substantial body of technical knowledge regarding the rites, while at the same time learning how to perform them with the attitudes and sensibilities needed for efficacious performance. While remarkably influential throughout later Chinese history, this characteristically Confucian approach to ethics was rejected by two important competitors: the Mohists and Daoists.

While Mozi (ca. 480–390 BCE) and his followers sought to understand Heaven and control the spirits in order to benefit human beings, they explicitly rejected and ridiculed the Confucian concern with ritual and culture in general and the related emphasis on self-cultivation. Mohists rejected the need for ritual

and culture because they did not believe these things in fact helped to shape people's character. They saw Confucian ritual and advocacy of culture as a wasteful extravagance which served as a source of oppression for the common people.

Mohists also strenuously objected to the way that Confucians tended to deemphasize overt faith in and direct appeal to Heaven and the spirits. In contrast, they advocated a literal belief in spirits as the agents of Heaven who regularly acted in the world to ensure that Heaven's will was obeyed. They also believed that certain well-formed arguments proved the truth of their teachings and would convince anyone who was able to follow their arguments to adopt their beliefs. For example, they argued that Heaven cares for and seeks to benefit the people and shows no favorites, supporting only those who are righteous. Those who want to follow Heaven should therefore directly emulate these qualities and act toward all with "impartial care." These and other Mohist teachings gave rise to a kind of state-centered consequentialism. They believed that if people rejected Confucian teachings regarding the importance of ritual and cultural pursuits, as well as the central importance of familial ties, and instead acted with impartial care to increase the basic common goods of wealth, population, and order within the state, everyone would be better off.

Daoist texts such as the *Daodejing*, purportedly the work of the legendary Laozi, and *Zhuangzi*, the "Inner Chapters" of which at least seem to express the views of a historical individual named Zhuangzi, date from the fourth to third centuries BCE. Both texts emphasize the need to follow *tian* ("Heaven") and develop *de* ("virtue"), but understand these ideals in distinctive ways. The *Daodejing* offers a vision of a pristine and innocent stage of human existence, when people enjoyed simple yet satisfying lives in a primitive village-based utopia. Such conditions offered people a way to preserve and strengthen their natural "virtue," "power," or "vitality." They also offered an opportunity to live in peace and harmony, avoiding the dire consequences that are described as the inevitable consequence of more "developed" societies.

The *Daodejing* offers a mystical teaching that purportedly enables one to pre-reflectively understand and move in harmony with natural, Heavenly patterns and processes, thereby avoiding harm and attaining various benefits. In this way, it preserves the "goal" of early oracular approaches. However, it strenuously denies the efficacy or value of ritual and high culture. The *Daodejing* claims instead that such pursuits obscure and deform one's original *de*. The text describes a form of self-cultivation, but one that is designed to pare away and eliminate cultural embellishment and return one to a spontaneous, natural state of understanding and action.

The *Zhuangzi* also seeks to find a way to live in harmony with Heaven or Nature. It is distinctive among the texts discussed in that it does not link the ethical vision it advocates with any particular social or political philosophy. Rather than insisting on the need to reform or reconstitute society, the author describes a way to live in the social world but not be fettered and ruined by it. The *Zhuangzi* notes the importance of *de* ("virtue"). The Confucians tended to regard virtue as a power to attract people and inspire them to greater ethical heights. Zhuangzi sees it as an ability to put others at ease and help relieve them of the debilitating posturing that is seen as characteristic of normal human society. Like the *Daodejing* and the Mohists, Zhuangzi holds ritual and culture as sources of a great deal of human deceit, hypocrisy, and suffering. However, unlike the Mohists, who place great faith in reason, these Daoist thinkers believe that human nature is fundamentally benign and simply needs to be liberated from social practices and norms. Like the *Daodejing*, the *Zhuangzi* advocates a form of self-cultivation that aims at eliminating the pernicious effects of socialization. The author advocates practices like "fasting the heart

and mind” and “sitting in forgetfulness” as ways to return to the natural state that is his ideal. Zhuangzi is unique among the thinkers discussed above in explicitly arguing that our natural, authentic state of being is compatible with a wide variety of equally good and proper human lives. He is more than a pluralist; he is ethically promiscuous. He believes that the remarkable variety of good lives the Way engenders offers a valuable lesson. It can make us aware of the vast, open-ended diversity of good lives and help us avoid the common failing of taking our particular point of view as the definitive standard for what is good.

Early Chinese concerns about the power of the spiritual world and the need to understand and control it played a central role in the development of Chinese ethics. Later thinkers retained these concerns and worked to devise ways to comprehend and tap into Heavenly powers, to flow along with the stream of Heaven. In significant contrast to the Mohists, Confucians as well as Daoists of the classical period tended to naturalize earlier, explicitly anthropocentric conceptions of Heaven and the spirits. Yet all three of these schools sought to understand and accord with the Heavenly in a way that would enable human beings to avoid harm and to flourish.

The thinkers we have discussed offered different views about the need for and relationship between the “technical knowledge” and “personal character” that were described as the “primary abilities” for successful divination. Confucians insisted on the importance of both and saw the ethical life as arising from the reflective interplay of ritual, traditional culture, and personal character. Mohists rejected the need for self-cultivation and the value of tradition. They advocated a more rational understanding of the nature and function of both the Heavenly and human realms. Daoists were opposed to Confucian ritual and tradition as well as Mohist rationality. They believed in a spontaneous, pre-reflective style of understanding and action.

The Mohist school died out around the time of the Qin unification in 221 BCE and their demise saw the end of explicitly rational approaches to ethics in China. Confucianism and Daoism continued to flourish and mutually influence one another and were joined by Buddhism, which arrived in China sometime during the first century CE, to constitute the three “Great Traditions” of later Chinese culture.

Subsequent Developments

Throughout the subsequent course of Chinese history, Confucian, Daoist, and Buddhist thinkers continued to elaborate new variations on the ancient themes. The aim of understanding and tapping into the power of Heaven remained a central concern, especially for Confucians and Daoists. The interplay between the mastery of technical knowledge and the cultivation of personal character proved to be a productive tension for thinkers in all three traditions. It can be seen at work across a range of very different cultural activities. This is one reason why ethical concerns often are not sharply distinguished from other cultural practices within the Chinese tradition. Whether one was consulting the *Yijing*, compiling a history, writing calligraphy, composing a poem, or producing a painting, one was relying on the mastery of technical knowledge that enabled one to cultivate and to express one’s personal character. Many of the debates between these three traditions and within each of them about the nature and practice of ethics turned on the relative importance of technical knowledge – often conceived of primarily in terms of traditional methods and standards – versus personal character – often described in terms of innate

intuitions or spontaneous tendencies. Regardless of the value attached to these related concerns, they were aimed at cultivating an understanding of Heaven or Nature that would enable human beings to avoid harm and fare well. In this, we see the distinctive orientation of Chinese ethics.

CHAPTER 80

Differentiations in Chinese Ethics

Mark Csikszentmihalyi

“Learning from moral models” is what China’s President Jiang Zemin prescribed to combat materialism and corruption in a July 2001 speech promoting a combination of law and morality. In 2014, his successor, Xi Jinping, used the occasion of Confucius’s birthday to argue that the Communist Party was composed of “faithful inheritors” of the Confucian tradition and used a scientific approach to the tradition in developing the country. In doing so, Jiang and Xi were continuing a longstanding practice of redesigning socialism to make it compatible with the structures of traditional Chinese ethics. At the height of the Cultural Revolution, when Confucius was criticized as a reactionary who upheld the ideals of a slave society, his model was replaced by “the untroubled image of Mao as the fountainhead of all morality, standing high above all laws and institutions.” Ethical behavior was promoted by broadly publicizing the exemplary behaviors of socialist paragons “capable of heroic acts of self-transcendence” and who drew their inspiration from Mao himself (Schwartz 1970, 168). Viewed against the backdrop of traditional China, accommodations to Marx, Lenin, and the ideology of the “market” are the latest in a series of variations resulting from internal conflicts and encounters with foreign religious traditions. While grounded in a set of canonical texts, and in a set of virtues and the mythic figures that exemplify these virtues, Chinese traditions have constantly varied the elements of these sets in response to such external challenges.

This entry will proceed chronologically through the major stages in the development of China’s ethical and political traditions. The subjects of the sections that follow are:

- 1 The three major strands of ethical thinking that were woven together by the historical figure of Kongzi (Kong Qiu, i.e. Confucius), traditionally said to have lived from 551 to 479 BCE.
- 2 The legacy of Kongzi, his disciples, and the two major Warring States period works that developed systematic accounts of human nature based on the example of Kongzi.
- 3 Responses to the different traditions labeled as “Daoism” (i.e. Taoism): a naturalization of ethics into a unified theory of the cosmos under the rubric of Way (*Dao*) in the synthetic atmosphere of the early imperial period, and, on the popular level, the developing role of superhuman entities as arbiters of morality and fate in organized Daoism.
- 4 The response to Buddhism in the Six Dynasties and Tang periods, as well as its influence on canon formation in the Song Dynasty.
- 5 The development of scholasticism in the “Study of Principle” (*Lixue*) school associated with Zhu Xi and the “Study of Mind” (*Xinxue*) school associated with Liu Jiuyuan and Wang Yangming in the late imperial period from the Song through the Qing dynasties.

The encounter with the West led to attempts at fusion with non-Chinese traditions and transformed ethical thinking in significant ways while preserving important structures of ethical learning and behavior. Throughout, special attention will be paid to the interplay between the three earliest strands of ethics that were combined to form Kongzi's model of self-cultivation of the virtues.

Three Strands of Ethical Thinking Before Kongzi

The view that Kongzi was “the fountainhead of all morality” in China is not only an artifact of the tradition of moral paragons, but runs counter to the words attributed to Kongzi in the *Analects* (*Lunyu*): “I am a transmitter, not a creator” (7.1). Kongzi's avowed project was not specifically ethical, but rather the recreation of the cultural patterns of the Zhou (trad. 1027–221 BCE): “If there was someone who would make use of me, could I not make a Zhou in the East?” (17.5). Kongzi is not simply being modest: his didactic use of the Zhou *Classic of Odes* (*Shijing*, hereafter *Odes*) and elements of its ritual code are only the most explicit instances of his appropriation of Zhou cultural standards. In particular, three strands of ethical thought appear to have been well developed prior to Kongzi: a political morality, a ritual blueprint for society, and a theory of self-formation based in part on internalizing classic texts. Their common recourse to the ancient sage kings was perhaps the most significant shared characteristic of the three strands prior to their being woven together by the *Analects* and by subsequent attempts to synthesize the heritage of the moral models of the past.

The assertion that Kongzi's religious ethics was in part *political* risks obscuring the more important point that, at least until the time of the early empire in the third century BCE, ruling authority had always been both political and religious. The clearest illustration of this identity was the concept of “Heaven's Mandate” (*tianming*), the fulcrum of many of the proclamations that make up the *Classic of Documents* (*Shujing*, hereafter *Documents*), also known as the *Books of the Predecessors* (*Shangshu*). Heaven's Mandate was the command issued to the Zhou founders, King Wen and King Wu, to overthrow the last corrupt ruler of the Shang in the eleventh century BCE. More generally, it refers to an endorsement by divine authority that both good rulers and virtuous rebels received. Although often viewed as a heterogeneous set of historical works, the texts in the earliest stratum of the *Documents* are orations that repeatedly champion the political authority of the speakers, justifying events such as the Zhou conquest of the Shang and the forced move of the Shang capital to Anyang. These early chapters, thought to date to the reign of Wen's son King Cheng of Zhou, illustrate the way in which the ruler's link with Heaven was the source of his personal morality and of his political authority. The “Announcement of Kang” (*Kanggao*) illustrates the way in which morality and authority are granted by Heaven, albeit conditionally. The tension in the *Documents* between a picture of the ruler as simply a conduit for the divine and the volitional ruler subject to Heaven's sanction becomes an important theme in later discussions of the “mandate” (*ming*), a term that came to connote a limited concept of “fate” in the context of individual lives. These narratives of political justification, first centered on the Zhou, were later retold about sage rulers of greater and greater antiquity, whose privileged connection with Heaven was identified as the source of their morality.

A separate set of standards of behavior grew out of the multiple contexts of Zhou *ritual performance*. In areas of intense ritual attention such as sacrifice and funerals, normative attitudes and behaviors were abstracted into general ritual scripts, and then into virtues whose cultivation signaled an acceptance of those roles. Both the *Odes* and the *Documents* preserve early Zhou liturgical formulas that illuminate the degree to which gesture, expression, and appearance were seen as both formative and expressive of ethical dispositions. The *Rituals of Zhou* (*Zhouli*), *Ceremonials and Rituals* (*Yili*), and *Records of Ritual* (*Liji*), three compendia that purported to reconstruct the ritual system of the Zhou, contain elaborate descriptions of the proper attitudes of reverence in sacrifice and grief in mourning. A quotation of Kongzi preserved in the early third century BCE *Mengzi* (Master Meng) explains how when a king dies, the exemplary crown prince's face turns a deep inky black. Other mourners are reassured by this proof of his heartfelt reaction: "When it comes time for the burial, people come from all directions to see it. The devastation on his countenance and the sorrow of his crying (leave) the mourners greatly satisfied."

In writings that post-date Kongzi, a view developed that saw ritual participation as both process and end of self-cultivation practice. In the fourth and third centuries BCE, theorists went to great lengths to explain mechanisms behind the correlation between external signs (e.g. demeanor, gait, and bearing) in ritual contexts, and the internal virtues that they evidenced. Just as the sage kings exemplified an ideal political morality, they were also associated with the construction of the ideal ritual framework.

Bound with these two strands of ethics was a third grounded in a *pedagogical method* based on the interpretation of sacred texts. While it is difficult to reconstruct the social context of the early transmission of the *Odes* and *Documents*, archeological evidence supports the conclusion that sophisticated exegesis of early texts was a central aspect of the early community associated with Kongzi. In the *Analects* and in excavated texts like the late fourth-century "Kongzi discusses the *Odes*" (*kongzi shilum* among the tomb texts purchased by the Shanghai Museum in 1994), Kongzi offers didactic readings of ancient texts, and twice praises a disciple by saying: "only with you can I discuss the *Odes*!" (*Analects* 1.16 and 3.8). The hermeneutic assumption of exegetes was that the classics expressed the aims (*zhi*) of the early sage kings. As one commentary held, "the *Odes* articulate aims," and so the study and performance of their compositions provided direct religious inspiration. Teaching the proper understanding of these texts led to the development of distinctive modes of exegesis and was a central means of the transmission of the tradition (Van Zoeren 1991). In the second century BCE the Five Classics (*Wujing*, including the *Classic of Changes* – *Yijing* – and *Spring and Autumn* – *Chunqiu* – in addition to the *Odes*, *Documents*, and *Ritual*) became the curriculum associated with the imperial civil service examinations. This began the long process of state sponsorship and institutionalization of their interpretation. In contrast to the other two strands, the actual practice of interpreting the message of the sage kings was attached much more immediately to a fixed set of texts.

These three strands were interwoven from a very early time. For example, the performance of mantic arts by the Zhou rulers as a means of divining Heaven's Mandate was a ritual event that demanded the proper attitude of awe, and which was then memorialized in the *Documents*. However, in context, these three strands appear to have often been separate in terms of social practice, specific sources of authority, and the texts they generated. What they shared was their common perception that they were all part of the bequest of the sage kings of the past.

The Legacy of Kongzi

The diverse teachings of the sage kings were systematized in writings that have come to be identified with the pivotal figure of Kongzi. One of the most controversial scholarly questions today is when that identification began to be made. Chinese writing is usually thought to have originated with official records of communication with the divine inscribed on media of divination, inscriptions commemorating noble individuals or events inscribed on sumptuary vessels, and records of the speeches and edicts of early rulers. Even in the case of new genres of the kinds identified with Kongzi, archeology reveals that texts rarely circulated with authorship explicitly identified. The biographies of the putative authors of many early Chinese texts appear to be little more than later projections of voices found in the texts themselves. Despite centuries of attempts to discover the authentic Kongzi, this problem and a related one imperils any claim to authoritative biography: there are too many texts and so too many possible Kongzis to definitively select one as authoritative.

Despite the lack of an authoritative biography, there are common tropes and concerns in many of the earliest attributed materials. Descriptions of Kongzi differ from that of the celebrated sage kings in one major detail: Kongzi, despite his intention to revive the ritual and political system of Zhou, was unable to attain the political influence to do so. The earliest biography of Kongzi, dating to the *Grand Scribe's Records* (*Shiji*) at the end of the second century BCE, narrates his life as a circuit of feudal states during which Kongzi was by turns slandered, overlooked, or treated in a ritually improper way. Though he occupied minor offices, he suffered the fate that the age never recognized his talents. As a result, narratives about Kongzi's deeds were less important than his recorded advice to rulers and disciples aspiring to hold official positions.

Several canonical sources draw from a body of diverse sayings and anecdotes written on bamboo slips and circulated in the late Spring and Autumn and Warring States periods, but do so based on different principles of selection. The *Transmission of Zuo* (*Zuozhuan*), a commentary to the terse chronicle *Spring and Autumn*, transmits quotations that are loosely concerned with historical episodes, issues of fate and contingency, and, occasionally, a form of historically informed observation that resembles the reading of omens. The *Analects* (*Lunyu*, literally "Considered discussions"), by contrast, appears to have been assembled in the early imperial period, probably in the second century BCE. The conversations in the work represent the sage's advice to rulers and disciples. They are concerned with self-cultivation practices that result in reliable stewardship of state or office. Early imperial collections like the *Records of Ritual* and the *Lineage sayings of Kongzi* (*Kongzi jiayu*) preserve large amounts of Kongzi's recorded speech, but are generally more diverse and thought to mix material from Kongzi's time, Warring States period inventions, and genealogies and prophecies from the early dynastic period.

It is the *Analects* that has long been the basis for the later reception of Kongzi's ethics. The work as a whole incorporates all three strands outlined above into an ideal of moral perfection based on the internalization of a set of behaviors designed to qualify one for the performance of official duties. The process of self-transformation in the *Analects* focuses on developing benevolence (*ren*), righteousness (*yi*), wisdom (*zhi*), and trustworthiness (*xin*). *Benevolence* entails acting with awareness of the personhood of others, entailing both kindness and compassion. *Righteousness* is an obligation to act fairly, especially in official contexts. *Wisdom* is often discussed in the context of discerning the character of others or

evaluating the appropriateness of actions in particular circumstances. *Trustworthiness* is acting in a manner consistent with one's words.

In the system of the *Analects*, ethical action was also role-specific. Self-transformation consisted of locating oneself correctly with respect to one's family through filial piety (*xiao*) and to one's community through ritual propriety (*li*). Speech and demeanor proper to one's status in the family and society were not seen as "surface" requirements, but as transparent and spontaneous signs of developed ethical dispositions. The *Records of Ritual* make this connection: "This is the same reason that the gentleman is ashamed of wearing suitable clothes but having the incorrect deportment, of having the correct deportment but saying the wrong things, of saying the right things but lacking the appropriate virtue, of having the appropriate virtue but lacking the proper action." The progression from dress to ethical action is not a matter of etiquette. It confirms that the actor understands the way in which clothing, deportment, speech, virtue, and action are all inextricably linked, and mutually entail each other. Besides this central place of ritual self-cultivation, the *Analects* also champions the position that Heaven's Mandate, as testified to in the *Odes* and the *Documents*, had been granted to the ancient sage kings on account of their virtue.

In the centuries after Kongzi's death, changes in society led to modifications in his system. One third-century BCE source, *Master Fei of Han* (*Han Feizi*), records that after Kongzi's death, his disciples split into eight factions, each of which emphasized different aspects of Kongzi's message. The fragmentation that was to have the most influence on the tradition dates to a third-century BCE debate on human nature. While there is no question that the major synthesis of the three strands of ethics had already occurred by the time of the fourth and third century BCE writers Mengzi (Meng Ke or Mencius, ca. 380–ca. 290 BCE) and Xunzi (Xun Qing or Hsün Tzu, ca. 310–ca. 238 BCE), they extended the legacy of Kongzi in ways that made the synthesis ethically robust. Both figures are known through the texts that bear their names, the 14-chapter *Mengzi* and the 32-chapter *Xunzi*.

The *Mengzi* argues that within each person's mind are incipient bases of the virtues. These were the "minds" of compassion (*ceyin*), shame (*xiu'wu*), yielding (*cirang*), and right and wrong (*shifei*). These "sprouts" (*duan*) of moral reactions are already present in the inner mind, and may be nurtured to become the four virtues of benevolence, righteousness, ritual propriety, and wisdom, respectively. The *Mengzi* does not really argue that human nature is good, but instead that the mind has dispositions to goodness, which need to be developed through reflection and practice (Ivanhoe 2002). The *Mengzi*'s picture is an innatist one. The moral education of Kongzi was held to be the best way of developing moral dispositions that were inherent in human physiology.

The contents of the *Xunzi* are extremely diverse, but the chapters thought to be authentically the work of Xunzi are generally concerned with ritual and music as a means to transform individuals, and thereby society. A famous catechism in its first chapter, *Quanxue* (Encouraging Learning), outlines the central role of a course of training: "In terms of its process, [learning] begins with reciting the classics and ends with reading the rites. In terms of its significance, [learning] begins with being a candidate for office, and it ends with being a sage." The reason one studies ritual is that it allows one to cultivate the virtues, which is an indirect means to promoting social order. The *Lilun* (Discussion of Ritual) chapter emphasizes how rituals and obligations (*li* and *yi*) were developed by the sage kings to "nourish the people's desires and satisfy their needs." In the *Xunzi*, society is an expression of the sages' desire for order, the only sense in which moral tendencies might be considered "innate" (Wong 2000).

The connection between ritual's radical reshaping of a person in the *Xunzi* and the development of incipient "sprouts" through reflection on the *Odes* and *Documents* in the *Mengzi* also illustrates how the program of ethical training favored in each text is consistent with its implicit moral psychology. The *Xunzi*'s focus is not on innate dispositions as in the *Mengzi*, but rather on external influences. Proper training conditions a person to have a certain set of reactions to external stimuli, in effect transforming the individual's basic nature and the affective dispositions that guide his or her reactions. The *Xunzi* explicitly and implicitly attacks the *Mengzi* and indicts the notion that anything inherent in the body will aid the process of training.

To some extent, these developments of the synthesis associated with Kongzi may be seen as a redifferentiation of the tradition in response to changes in society in the Warring States period. Li Zehou (1986) has argued that the changes in social structure allowed the *Mengzi* to go further than *Analects* in separating noble status from virtue, and promoting moral self-restraint. Hou Wailu (1947) wrote that the late third century's integration of law and ritual, as well as attempts at synthesizing diverse modes of knowledge under the rubric of the "Way," are all clear influences on the *Xunzi*. The competing pictures of human nature in these two texts, then, have been read as variations on Kongzi's synthesis resulting from contrasting social conditions. The unification of the Chinese empire in the third and second centuries BCE exerted another type of influence on these ethical traditions, one in which the "Way" played the major role.

Ethics and the Way in the Early Empire

Both the *Mengzi* and *Xunzi* continued to be read after the consolidation of the empire in the third century BCE, yet the major transformation of ethics was a result of its integration with other discourses. The Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties established a precedent for many of the structures that are now identified as essential characteristics of Chinese society. Despite its brevity, Qin structures of imperial control and its methods for unifying diverse groups were adopted by the Han. It was the sustained and unified empire of the Han that established the pattern for everything from political institutions to historical writing throughout later dynastic history. From the perspective of religion and philosophy, the introduction of Buddhism in the first century CE and the formation of organized Daoism in the late second century CE exerted profound effects on the legacy of Kongzi. The systematization of theories of natural cycles based on *yinyang* dualism, the physics of the five phases (*wuxing*, i.e. water, wood, fire, earth, and metal), and other classifications of phenomena became the basis for the growth of a plethora of technical disciplines in areas from divination to astronomy to medicine.

The political consolidation of the early empire set the tone for an attempt to integrate regional traditions and specializations that had hitherto been differentiated. The Han synthetic impulse extended to ethics, and many Han texts integrated the diverse influences on Kongzi's thinking into other frameworks, such as theories of natural cycles. In the first century BCE *Elder Dai's Records of Ritual* (*DaDai Liji*), attributed to Dai De, the ritual and obligations central to *Xunzi*'s picture of ethics are likened to the alternation of the five phases according to the seasons: "That the pattern changes is because ritual is like the five phases and obligation is like the four seasons." The fact that ritual forms depend on one's obligations reflects the progress of the five phases according to the four seasons. Often, these correlations had the effect of erasing the remaining distinctiveness of the early strands of ethics explored above. An example is the recently excavated Han commentary on a pre-imperial work on ethics called the *Five*

Kinds of Action (Wuxing). The anonymous commentary explains a verse from the *Odes* about King Wen of Zhou's reception of the mandate from Heaven by paraphrasing the *Xunzi's* account of the origins of ritual, thereby homogenizing all three strands of thinking identified above. What both these uses of the earlier writer Xunzi have in common is that they put less emphasis on the role of the sage kings in cultural creation. Instead, they imply that ritual patterns were incipient in the natural order and provide for the possibility that the patterns may change.

The increasing importance of concepts of natural order and change in the Han synthesis reflects the influence of fourth and third century works like the *Laozi* and *Zhuangzi*, often identified with Daoism or as the canonical texts of "philosophical" Daoism. These works in general rejected the ethics of virtue in favor of a call to return to the spontaneous reactions characteristic of one's original nature (*xing*). The normative or originary picture of a world in which everything follows its nature is expressed using the concept of an overarching Dao (Way), which was then picked up in the Han as a universal framework on which a synthesis of disparate ideals could be built.

The Way was used to similar purposes in the second and third centuries CE by a set of healers who combined medical and shamanistic practices with the rhetoric of the *Laozi* to create the social organization of the *tianshi* (Celestial Masters). As Qing Xitai (1988) has argued, the notion of an automatic reward for good and bad actions found in the earliest strata of the Celestial Masters tradition has much in common with the consequentialist mechanisms of the fourth century BCE *Mozi*, yet because the celestial masters used the same emblem of the Way, they are today also labeled as Daoist. An emphasis on the aid of salvific divinities, perhaps in part a response to the arrival of the forerunners of Buddhism in China, may also have led to an increasing emphasis on the role of a semi-divine Kongzi in the newly unified ethical systems. His chronicle *Spring and Autumn* acquired commentaries that read it as an encoded manual for rulership. The Han historical work *Shiji* (Grand Scribe's Records) traced the project of classical exegesis to the initial efforts of Kongzi, whose birth was accompanied by auspicious portents. Finally, the Kong family's maintenance of ritual traditions at the birthplace of Kongzi in Qufu (in modern Shandong province) became the model for the later imperial system of Kongzi temple sacrifice. In the synthetic atmosphere of the Han, the malleability of Kongzi's biography was used as a resource for unifying the diverse strands of pre-imperial ethical thought.

The Influence of Buddhism in the Six Dynasties and Tang

The Six Dynasties period (222–589 CE) was a pivot in the history of Chinese religions in that it marked the period in which the "three teachings" (*sanjiao*) of Confucianism, Daoism, and Buddhism became self-conscious traditions. The common suffix *jiao*, which meant "teaching" and later came to be used for "religion," identified them for the first time as being of the same kind, so engaged in similar projects, and potentially in competition. Imperially sponsored debates between the adherents of two or three of the "three teachings" made clear the degree to which they could be, for the first time, viewed as mutually exclusive systems of belief.

The Six Dynasties period saw a resurgence of interest in the classics *Laozi* and *Zhuangzi*, and figures like Wang Bi (226–49 CE) and Guo Xiang (d. 312 CE) read such "Daoist" works alongside works attributed to Kongzi. They also applied terms deriving from the former texts, such as "naturalness" (*ziran*), to the understanding of the latter. Guo Xiang, in his commentary to the *Zhuangzi*, explains how a person

who has stripped him or herself of the artificial trappings of morality would have no use for praise of the sage kings: “condemnation and glorification both arise from insufficiency, so those of ultimate sufficiency forget good and evil, and dispense with death and life. They become one with change and transformation, and in their vastness nothing is not proper”. This challenge to the ethics of virtue was answered by figures like Fan Ning (339–401 CE), who specifically criticized Wang Bi for allowing “benevolence and righteousness [to] sink into darkness.”

Criticisms of Daoism, however, were tempered by the fact that some of its notions were useful in anti-Buddhist polemics. The close relationship between Buddhist cosmology and ethics meant that in order to rebut the Buddhist eschatological framework, writers had to enlist aspects of indigenous cosmology that were better developed in Daoist texts. In the Six Dynasties period, Liu Jun (462–521 CE) echoed the argument of Dai Kui (330–95 CE) that natural endowments of pneumas and unpredictable environmental influences all had determining effects on people’s lives in a way that had nothing to do with notions of karma. In refuting Buddhist cosmology, Liu Jun expanded the notion of the “mandate of Heaven” to resemble the *Zhuangzi*’s notion of “naturalness.”

In the newly centralized China of the Tang Dynasty (618–906 CE), Buddhist and Daoist institutions developed and received official support, and Confucianism adopted some of their models of lineage and transmission. In particular, the notions of *Daotong* (transmission of the Way) and *Zhengtong* (transmission of good governance) developed as an attempt to define both a Confucian orthodoxy and orthopraxy that might be distinguished from doctrines and practices that had been “polluted” by Buddhism and Daoism. Official support for Confucianism was exemplified by Emperor Taizong’s commission of Yan Shigu (581–645 CE) to annotate the Five Classics. Anti-Daoist and anti-Buddhist writings rebutted the challenges of these traditions to Confucian ethics on a fundamentally different basis than the challenges to Buddhist cosmology of the Six Dynasties period.

The task of defining an authoritative “transmission of the Way” was a central element of the nascent Confucian revival of the Tang. Because the transmission was traced to pre-Buddhist China, this definition was part of an effort to legitimate Confucian traditions. Han Yu (768–824 CE), an influential and iconoclastic Tang essayist, traced the transmission of the Way from the ancient sage kings, to the rulers of the Zhou dynasty, to Kongzi and then to Mengzi. The loss of the transmission roughly coincided with the arrival of Buddhism in China. The biography of Han Yu in the *New History of the Tang* (*Xin Tangshu*) draws a comparison between Han’s critiques of Buddhism and Daoism and Mengzi’s earlier criticisms of the figures Yang Zhu and Mozi, implicitly identifying Han Yu as the next figure in the line of the *Daotong* or *Daoxue* (Learning of the Way). Han Yu attacked Buddhism on a number of counts. Foremost was a genealogical argument: Buddhist traditions did not derive from the Way of the ancient sage kings of China, and as a result lacked the proper connection between knowledge and action. At the same time, Han Yu was also implying that Han and Six Dynasties exegetes had also lost the Way. In so doing he was attempting to refocus the Confucian enterprise back to the Warring States concern with moral rulership and social engagement.

Han Yu’s contemporary Li Ao (d. ca. 844 CE) promoted a model of self-cultivation based on a concept of “returning to one’s nature” (*faxing*) that had strong overtones of the Tiantai Buddhist conception of the recovery of the “original mind” (*benxin*). For Li, the goal of Confucian practice is not simply the development of cultivated ethical dispositions. It is also to clear away desires in order to attain a sagely ideal that was described with many of the same terms used to characterize Buddhist enlightenment. While the Confucian emphasis on social engagement was held up as a major factor that differentiated it

from Buddhism, Confucian writers also began to reread their tradition to recover its idealist aspects and resuscitate its moral psychology.

In the Tang and the Song Dynasties, in part in response to such needs, the Confucian canon was gradually redefined. Those elements of indigenous traditions that could rebut Buddhist notions of the mind and enlightenment were preferentially revived. The establishment of the “Four Books” (*sishu*) in the Song Dynasty was actually the result of changes that had been underway for centuries. At that time, the *Analects* was raised to canonical status along with the *Mengzi* and two chapters of the *Record of Ritual: Great Learning* (*Daxue*) and the *Doctrine of the Mean* (*Zhongyong*). The *Mengzi*’s place in the canon may be traced back at least to Han Yu’s contention that Mengzi was the last classical representative of the Transmission of the Way. One reason the *Mengzi*, *Great Learning*, and *Doctrine of the Mean* were especially appealing in the post-Buddhist context was their development of moral psychology and of links between that psychology and a cosmology that included the magnetic power of *cheng* (sincerity) and the quasi-divine conception of the *sheng* (sage). These texts furnished a basis for constructing models of transcendence compatible with the goal of returning to an original “nature” unclouded by desires.

“Study of Principle” and “Study of Mind” in the Later Empire

The late imperial revival of the legacy of Kongzi bifurcated into two competing traditions in the Song (960–1279), Yuan (1280–1367), and Ming (1368–1643) dynasties. Both offered solutions to the problem of how to reconcile traditional practice and the imperative to social engagement with the reemergent psychologicistic and idealist orientation represented in the newly elevated “Four Books.” The solutions of the “Study of Principle” (*lixue*) school associated with Zhu Xi (Zhu Yuanhui, 1130–1200) were critiqued by Lu Jiuyuan (Lu Xiangshan, 1139–1193) and later by Wang Yangming (born Wang Shouren, or Wang Bo’an, 1472–1529). The latter critiques developed into another tradition, sometimes called “Study of the Mind” (*xinxue*).

The early “Study of Principle” school structured its theory of moral knowledge on a view of the cosmos based on the dualism between *li* “principle” and *qi* “matter”. The cosmological basis of this school is often traced back to Zhou Dunyi’s (Zhou Maoshu, 1017–1073) “Explanation of the Diagram of the Supreme Ultimate” (*Taijitu shuo*), which combines the symbolic scheme of the *Classic of Changes* with the moral language of the “Four Books.” Zhou Dunyi’s “supreme ultimate” (*taiji*) imbues all things, both animate and inanimate, but is expressed in its purest state in the nature of human beings. The basic disposition to good found in the *Mengzi* is no longer an aspect of the physiological model of incipient “sprouts” of virtue, but a reflection of the purity of this cosmic principle contained in human nature, identified with the sage’s quality of sincerity. The brothers Cheng Hao (Cheng Mingdao, 1032–1085) and Cheng Yi (Cheng Yichuan, 1033–1107), who exerted a major influence on the views of Zhu Xi, developed and elevated the notion of human nature to subsume allied notions of fate, mind, affective dispositions, the Way, and Heaven. Cheng Yi held that morality inheres in the aspect of one’s nature that is an expression of the natural pattern of principle, but is obscured by the *qi* of one’s material nature. “Settling one’s nature” (*ding xing*) and cultivating an attitude of reverence refines the neutral *qi* in the mind, making it possible to discover principle. In this way, the dualism between *li* and *qi* became the cosmological background to a new understanding of self-cultivation as the search for a transcendent order permeating the universe.

Zhu Xi's influence as a religious systematizer and a commentator on the "Four Books" exerted a defining influence on the "Study of Principle" school. His views became a reference point for future argumentation in ethical traditions. At the heart of the "Study of Principle" (also called the Cheng-Zhu school) was Zhu Xi's systematic application of the Cheng's notion of principle to his scholarly reformation of prior doctrine and practice. For this reason, some writers have applied terms like "rationalist" or "metaphysical" to what has been called Zhu Xi's "Neo-Confucian" position. It is true that human nature became entrained with a conception of principle that transcended not only the individual but also the category of human beings in general. Indeed, Zhu Xi wrote that jackals and otters carried out sacrifices, while tigers and wolves cared for their young, citing this as proof that animals could also penetrate principle. At the same time, Zhu's early exposure to Chan Buddhism translated into an appreciation of the role of institutions and practice in the maintenance of traditions, and the study of the classics was at the core of his self-cultivation practice.

Zhu Xi's synthesis centered on transcendent principle, and was tied to a program of cultivation practice directed to gaining access to that principle. Since ritual, the virtues, and social hierarchies were all expressions of this incipient pattern, Zhu Xi was able to resynthesize the strands of early Chinese ethics in a way that more closely matched the needs of a post-Buddhist age. The mind was the vehicle for understanding "principle," but this was not accomplished in isolation because principle was embodied in the works of the sages and worthies of the past. To properly engage these works, a program that combined quiet sitting (*qingzuo*) to clarify the mind and a particular method of studying the classics with was developed. Zhu Xi adopted Cheng Yi's application of the phrase "penetrating things" (*gewu*) from the *Great Learning* to his hermeneutical method. He meant to foster a resonance between the principle in the interpreter's mind and the principle of the things being interpreted. This method of mutual activation was a crucial aspect of Zhu Xi's self-cultivation program. It had the effect of restoring the ethical status of exegesis by making interpretation an active process integral to becoming a moral person.

The "Study of Mind" (*Xinxue*) school became a formal rival of the "Study of Principle" school, especially following the explicit criticism of Zhu Xi's understanding of "penetrating things" by Wang Yangming in the early Ming Dynasty. Some early Song writers, such as Zhang Zai (Zhang Hengju, 1020–1077) and to some extent even Cheng Hao, conceptualized the apprehension of principle as largely a matter of intuition. It was Zhu Xi's contemporary Lu Jiuyuan who argued that principle was discernable in the mind, and as such practice needed to be organized around the realization that, in Lu's words: "The universe and my mind are identical." Harkening back to the physiological arguments of the *Mengzi*, Lu saw the structure of the mind as being universal, and therefore held that the principle that ran through the works of the sages and worthies of the past was accessible in one's own mind.

Wang Yangming, the other major figure in the "Study of Mind" school (also called the Lu-Wang school), extended Lu's position by criticizing Zhu Xi for artificially dividing the mind and principle. Wang Yangming's critique of "Study of Principle" revolves around his view of the necessary relationship between knowledge and action, and of the inferiority of "ordinary knowledge" gained through study to experiential knowledge connected with daily action. Wang Yangming's fame rests on his reputation for swift action in his official career, and on his related emphasis on accessing an intuitive level of understanding. This has led some to label his thought "idealist." Wang adopts the phrase "true knowledge" (*liangzhi*) from the *Mengzi*, where it is explained as "the things a person knows without having to reflect" (*suo bulu er shi*), such as parental love and respect for elders. He used it to explain the way in which knowledge of principle is incipient in the mind.

While both the “Study of Principle” and the “Study of the Mind” criticized Buddhism, both their views on the mind and on specific meditative practices clearly owed much to Buddhist traditions. Lu Jiuyuan explicitly criticized Zhu Xi as advocating Chan Buddhism, yet was also criticized by Zhu Xi’s disciple Chen Chun (Chen Anqing, 1159–1223) for “sitting in silence all day, during which time even a slight idea is taken as a sign of enlightenment, and said to be an authentic secret that had not been transmitted from the time of the ancient sages.” Wang Yangming also directly criticized Buddhist practitioners for their detachment from the world. Nevertheless, modern scholars have compared his view that moral knowledge depends on clearing away the dust of the desires to reveal the mind’s inherent moral principles to Chan Buddhist notions of the “original mind.” Liu Zongzhou (Liu Qidong, 1578–1645), a revisionist “Study of the Mind” scholar, acknowledged the nature of the mutual influence when he wrote that Zhu Xi “was affected by Chan but then repudiated Chan,” Liu Jiuyuan “interacted with Chan but then shunned Chan,” and Wang Yangming “resembled Chan but then condemned Chan.”

The institutional aspects of Confucian writing in later imperial China reflect the importance of orthodoxy in its concern with the “transmission of the Way.” Zhu Xi’s redefinition of that transmission included the early Confucians connected with the composition of the “Four Books.” He located the Late Imperial resumption of the transmission with Zhou Dunyi and the Cheng brothers. Zhu Xi’s own commentaries became orthodox parts of the civil service examination system at the start of the fourteenth century. This happened despite the fact that one area in which both the “Study of Principle” and the “Study of the Mind” schools agreed was in their criticism of the examination system as encouraging people to pursue Confucian training out of a desire for self-advancement.

Conclusion

Transformations of Chinese ethics resulting from the encounter with the West may be seen in the rather syncretic moral works of the Qing (1644–1911). In the work of revisionists like Kang Youwei (1858–1927), the portrait of Confucius as a social reformer was part of an effort not only to change the corrupt system of Manchu rule, but also exert a unifying effect in the manner that Christianity was perceived to have done in the West. A more critical attitude toward many aspects of traditional culture was taken by the 1919 May Fourth Movement, an attempt to reform the post-imperial Republican government. When the 1949 Communist Revolution established the People’s Republic of China, the locus of new Confucian thinking and scholarship moved to Taiwan, Hong Kong, and the Chinese diaspora. The destruction of the connection between the state, the performance of Confucian ritual, and the mastery of traditional texts significantly changed the nature of the modern tradition. This has effectively shifted the locus of its transmission from the imperial government to the international university.

Because Kongzi’s vision of ethical self-transformation was intended to make a person worthy of stewardship, it was predicated on a particular model of familial and social relations. For this reason, ethics in the contemporary Chinese family is still predicated on preserving a connection between particular social institutions and personal morality. Perhaps this best explains why, while the understanding of both individual virtues and the optimal means of cultivating them changed significantly in response to factors like the arrival of Buddhism and changes in society, the goal of emulating a set of moral exemplars by developing ethical dispositions has remained constant.

CHAPTER 81

Trajectories of Chinese Religious Ethics

Mark Berkson

The Chinese traditions that date from the classical period (ca. sixth to second centuries BCE) – most prominently the *Rujia* (“The School of the Scholars,” or “Confucianism”) and *Daojia* (“Philosophical Daoism,” exemplified in the *Daodejing* and *Zhuangzi*) – as well as the organized Daoist religious traditions (*Daojiao*) that date from the late Han (second to third centuries CE), establish a number of essential themes, terms, and concepts that have remained significant to the present. These give Chinese religious ethics a certain coherence, albeit a remarkably plural one with numerous tensions. To this set of indigenous traditions is added Indian Buddhism around the beginning of the common era, which constitutes the first major outside cultural and religious influence on China. Throughout China’s history there has been only one example of foreign influence that rivals the Buddhist, namely the modern encounter with “the West.” This encounter – far more violent, both literally and metaphorically, than the Indian Buddhist – shook China’s foundations. It threatened China’s political and cultural integrity and posed a major intellectual challenge to the inheritors of its religious traditions. The ways in which Chinese thinkers drew on the resources of and/or critiqued Confucianism, Daoism, and Buddhism in response to the challenges of the West constitutes one of the most significant aspects of modern and contemporary Chinese thought. These efforts have resulted in the development of distinctive forms of Chinese religious ethics characterized by an engagement with Western philosophy, democracy, economics, technology, natural sciences, and more recently, ecology, feminism, and postmodern thought. This entry considers common themes and current trajectories in Chinese ethics.

Common Threads

While “Chinese religious ethics” contains multiple traditions that differ from each other in significant ways, there is also a discernible set of ethical concerns, concepts, and orientations shared by the indigenous traditions and those that are “sinicized,” such as Chinese Buddhism of the Tang Dynasty (618–907) and beyond. These themes include the following:

- 1 A prominent role for “nature” in the ethical framework. This includes the Confucian concern with the cultivation/realization of human nature; the Daoist emphasis on following the natural Dao; and the Buddhist focus on realizing Buddha Nature.

- 2 A “this-worldly” emphasis focusing on practical considerations of how to live well, how to become a “good” or “true” person. There is not the kind of emphasis on the next world or afterlife that there is in Christianity and Islam, particularly among the indigenous Chinese traditions.
- 3 An emphasis on self-cultivation and a belief in human perfectibility. The goal is the achievement of sagehood, a possibility for any human being.
- 4 Syncretism and pluralism, seen in both thinkers who are deeply informed by multiple traditions, and in organizations and movements that bring together many traditions.
- 5 A notion of order and harmony as the highest goods, involving both an inner harmony within each human being (e.g. between mind and body) and, ultimately, a harmonization of heaven, earth, and humanity.

The Challenge of the West and Modernity

The unprecedented shock that China received in the mid-nineteenth to early-twentieth centuries came from the West both in the form of political–military challenges and new intellectual currents. Beginning in the 1840s, Chinese military defeats resulted in a loss of territory and the imposition of unequal treaties, producing feelings of humiliation and powerlessness in many Chinese. On the intellectual front, works of Western thought were becoming increasingly available in China.

Chinese intellectuals focused on the question of how China should adapt to meet these challenges while retaining its own identity in the process. One prominent response came in the form of the “Self-Strengthening Movement.” It argued that China did not need to change institutions or philosophical foundations, but needed only to master Western arts like shipbuilding and weaponmaking in order to repel the “barbarians” and protect Chinese civilization.

Other thinkers, such as Kang Youwei (1858–1927), believed that China did need to make institutional changes, but that this could be done in an entirely Confucian manner. Rather than looking to a past Golden Age, Kang looked to a future utopia characterized by the Confucian virtue of *ren* (benevolence), egalitarianism (including equality of women), and universalism.

Some Chinese thinkers advocated the more radical goal of replacing traditional Chinese culture. One of the leading critics of Confucianism was Chen Duxiu (1879–1942), a founder of the Chinese Communist Party, who argued that Chinese ethics is the “ethics of a feudal age” and sharply attacked Confucianism for its patriarchy. Despite the harsh criticism often directed at Confucianism by communists, it is clear that Chinese communist ethics was influenced by Confucian thought. For example, Liu Shaoqi, a chief theoretician of the Chinese Communist Party, wrote “The Self-Cultivation of a Party Member” (the very title employs a Confucian theme), which emphasized the Confucian practice of moral self-reflection in party members.

Another radical critic of traditional Chinese thought was Hu Shi (1891–1962). Hu embraced American pragmatism, rationalism, and science, and was a harsh critic of Buddhism and Confucianism. Hu admired the restless striving toward advancement found in the West and argued that China’s “culture of contentment” was an obstacle to progress.

Varieties of New Confucianism

The Confucian thinkers of the nineteenth century and beyond are often characterized as constituting the “Third Epoch” of Confucianism. The first was the classical period of the late Zhou, during which the foundations of the tradition were laid; the second was the “Neo-Confucianism” that arose from

Confucian thinkers' engagement with Buddhist thought. The Third Epoch, known as "Contemporary Neo-Confucianism" or, more commonly, "New Confucianism," is characterized by the response to, and integration with, Western thought through the critical examination and creative renewal of the tradition.

The thinkers of this period, often working in Taiwan and Hong Kong, emphasize the "religious" or "spiritual" dimension of Confucianism grounded in a cosmic source (*tian*, "Heaven") that is both transcendent and immanent. The vision has been described as "anthropocosmic," centered on humanity, but not in an "anthropocentric" way. It recognizes the micro/macrocosm interconnection and correspondence between the human and heavenly realms. The metaphysics is grounded in the notion of a single, integrated cosmos, one ultimate reality that embraces and harmonizes all individuals. This Way can be found within the individual human heart-mind (*xin*). Embodying the Way (*Dao*) is equivalent to revealing and manifesting the moral heart-mind, the heavenly endowment within each of us. The essential nature of this heart-mind (and thus the moral cosmos) is *ren*, the overarching Confucian virtue of "benevolence" or "humanity."

Most New Confucians have advocated a form of idealism and intuitionism, particularly as articulated by the Neo-Confucian Wang Yangming (1472–1529) and the Consciousness-Only (*Yogācāra*, *Weishi*) school of Mahāyāna Buddhism. Most also exhibit a tendency toward creating syncretistic systems that combine Western and Chinese thought and feature a systematic moral metaphysics.

One feature of New Confucianism that has emerged largely as a result of the encounter with Western thought is an increased emphasis on equality (including political, economic, and gender equality) and a corresponding critique of Confucianism's traditional hierarchical worldview. In general, New Confucians have seen the value of democracy, science, human rights, and the importance of critical reason. They also caution against the excesses to which some Western ideas tend (e.g. rationalism, scientism). They want to present a reformed and revitalized tradition that they believe will be seen as at least equal to Western thought, and amenable to fruitful harmonization with it.

Xiong Shili and His Students

There are debates over the point at which a coherent "New Confucian" school coalesced and who belongs in its ranks. One common picture emphasizes the lineage of philosopher Xiong Shili and his students, "second generation" members Xu Fuguan, Tang Junyi, and Mou Zongsan. Xiong Shili (1885–1968) brought together Neo-Confucian and Buddhist thought with *Yi Jing* cosmology and Western influences, such as science and nationalism. Xiong's emphasis was on unity, and he criticized the separations of *li* (principle) and *qi* (psychophysical energy), tranquility and activity, and substance and function. All of these dualities are merely different aspects of the same reality, the "Great Ultimate," which is a fundamental unity underlying all individual things. He employed the common Buddhist metaphor of water and waves to describe a pervasive ultimate reality that gives rise to individual instantiations that are not ultimately separable from it. Human beings can apprehend this reality with intuition, through which we "awaken to our original nature," which is *ren*. Echoing earlier Neo-Confucians, he wrote: "A man of *ren* forms one body with all things." Xiong advocated a balance of activity and quietude, a full participation in social life grounded in the pure, unchanging moral mind. Xiong emphasized an aphoristic formulation which was then picked up by later New Confucians: "Sage Within, King Without." This illustrates how realizing the moral self leads to social and political action.

Xu Fuguan (1903–1982) was the least interested in metaphysical speculation among the disciples of Xiong. He emphasized the practical dimension. One of his contributions was the positing of a “sense of anxiety” as a central feature of Chinese culture. Unlike the notion of existential *angst*, original sin, or *dukkha*, Xu’s notion is a fully moral one. It describes the feeling of responsibility toward the world, arising from our conscience, that leads us to want to cultivate our moral selves and improve the world. Sages are those people who are true to their own nature by overcoming selfish desires and allowing the inner moral reality to manifest itself in virtuous action. For Xu and the others, Confucian ethics is deeply political. He argued that not only is Confucianism compatible with democracy (the people are seen as “heaven’s representatives”), but that “democracy can obtain a more supreme ground from the revival of the Confucian spirit, and Confucianism can complete its actual objective structure through the establishment of a democratic polity.”

The two other well-known students of Xiong, Tang Junyi (1909–1978) and Mou Zongsan (1909–1995), both constructed elaborate metaphysical systems to ground their ethics. Mou wrote that the trajectory of Chinese thought, unlike Western thought with its origins in Greek natural philosophy, had its origins in moral sage kings and always maintained ethics at the center. Mou’s ethics takes the moral subject as a starting point, seeing intellectual/moral intuition as the foundation for systematic philosophy. He focused on “concern consciousness,” a sense of worry and concern for other people and the world that is a source for the developing moral consciousness. Mou was profoundly influenced by Kant, whose distinction of noumena and phenomena played a central role in Mou’s thought. Mou argued that we have two kinds of intuition: a sensible intuition that allows for the apprehension of worldly phenomena, and an intellectual intuition that enables us to grasp the noumenal. He believed that the intellectual/moral consciousness is rational, and that to follow it is to realize our nature. This results in happiness, the *summum bonum* understood as a fully moral achievement. The mind is “the transcendental foundation of moral behavior and is itself absolutely and infinitely universal.”

The Third Generation and Beyond

Contemporary New Confucians are often called the “Third Generation” and share many characteristics with their predecessors. The best known among the contemporary New Confucians is Tu Weiming, who teaches at Harvard University. His work sympathetically presents the Confucian vision to a Western audience and contributes to its interpretation, reform, and modern application through commentaries and philosophical work. Tu advocates Confucian dialogue not only with other religions and Western philosophy, but also with psychoanalysis and Marxism (a departure from the strong anti-Marxist stances of most earlier New Confucians).

Tu’s prominence is one example of the lively development of Chinese thought in the West. An aspect of this trend is the growing involvement of non-Chinese scholars in both the interpretation of Chinese thought (Confucian, Daoist, and Buddhist) and active participation in constructive daological work. There are even “schools” of Chinese thought developing in the West. The most famous is the “Boston Confucians” that includes Chinese scholars living in the area and American thinkers such as Robert Cummings Neville and John Berthrong, who bring in Christian and Western philosophical perspectives to their Confucianism. Understood broadly, “Boston Confucians” can apply to all Confucians living in the West whose goal, in Neville’s words, is “bringing Confucian philosophy into the world philosophic conversation.” A related phenomenon is the growing presence of people who see themselves as having a

“multiple religious identity.” Some members of the Boston Confucian school, for example, have a deep commitment to the values and worldviews of both Confucianism and Christianity, making them “Confucian Christians.”

Another significant trend is the recent development of New Confucianism in mainland China and a growing dialogue between mainland and overseas Chinese. In the decades that followed the Communist Revolution, the Marxist–Maoist orthodoxy, enforced by the coercive power of the state, virtually silenced other forms of thought. After the ascension of Deng Xiaoping and the significant, though unpredictable, opening and reform that has occurred since, Chinese religious and philosophical traditions have enjoyed something of a renaissance. Conferences on Confucian thought have been held in China, volumes published, and a “China Confucius Foundation” established. One notable voice has been that of Fang Keli. He describes communism, liberalism, and New Confucianism as the three major streams of Chinese thought, all of which must work together for the modernization of China.

Global Confucian Philosophy

Three of the main areas in which the increasingly global Confucian philosophy is participating are ecology, feminism, and human rights. Thinkers representing Chinese traditions have pointed out that the Western “Enlightenment Mentality,” while producing many admirable achievements, has also led to serious crises. One of the most severe crises is environmental. Some thinkers suggest that the anthropocentrism that characterizes much of the Abrahamic faiths’ attitude toward the rest of creation has been at least partly responsible for the current problems. Chinese thinkers propose that the “anthropocosmic” Chinese view might provide a better foundation for a sustainable environmentalism. China’s “naturalistic cosmology” is grounded in a notion of the Dao as the natural pattern underlying all things. It is characterized by an emphasis on the interdependence of all things and an underlying psychophysical foundation of *qi*. Confucian thinkers point out that this “continuity of being,” and the possibility of attaining a harmonious triad of Heaven, Earth, and Humanity, make Confucianism a good candidate for contributing vital perspectives to the environmental movement.

Many modern Chinese thinkers have taken seriously the challenge of feminist critique and have attempted to respond with reinterpretation and reform. Confucianism’s patriarchal history might make it an unlikely candidate in terms of usability for feminist projects. Yet some scholars argue that if one strips Confucianism of its androcentrism and patriarchy, there are valuable resources for feminist thought. Confucianism emphasizes a nature that is shared by all human beings and the possibility of any human being, male or female, achieving sagehood. The primary Confucian virtue of *ren* has been compared with the feminist ethic of care. The relational Confucian self has been understood as somewhat analogous to a feminist conception of the self. Resources for a “Confucian feminism” (which might differ from, and thereby serve as a critical lens on, Western feminism) have been drawn from both classical Confucians as well as later thinkers such as the Ming Dynasty radical thinker Li Zhi (1527–1602). He believed that women, like men, can fully realize themselves through self-cultivation if their lives are not unfairly restricted.

Finally, there is a robust discourse occurring regarding Confucianism and human rights, with scholars representing a wide range of positions. Some have argued that “rights” is a concept conceived in the West and therefore inextricably tied to its culture and philosophical positions (e.g. a particular notion of the autonomous individual as rights-bearer and a law-based society). Rather than speak of

Chinese “rights,” we should look at Chinese “rites.” This provides an ethical alternative that should be explored by the West as a supplement to the discourse of rights. On the other end of the spectrum are those who argue that rights are universal, whether or not any particular culture recognizes them or has an indigenous notion of them. Some scholars point to the embrace of human rights notions by Chinese students and intellectuals during the uprising of June 1989 as evidence of their universal applicability. There are also scholars who argue that, while traditional China had no concept or term for “rights,” such a notion was implicit in Chinese ethics. There are many thinkers who are now working on ways to bring together Chinese “concept clusters” (to use Henry Rosemont’s term) involving virtues, the relational self, and role-specific obligations with Western clusters involving rights and the autonomous individual. The idea is to mutually enrich both and create a more “international philosophical language.”

Developments in Daoist and Buddhist Ethics

Throughout history, Confucians have criticized Daoist and Buddhist quietude and detachment, particularly the Daoist notion of “non-action” and avoidance of political service, and Buddhist monasticism and emphasis on sitting meditation or simple chanting. The criticisms are somewhat unfair, as there are well-developed ethical dimensions in both Daoism and Buddhism. There is also some truth to that characterization when applied to certain forms of the two traditions. This has led modern Daoists and Buddhists to work on developing more socially engaged forms of their traditions.

Daoism

“Daoism” has been used to refer to both the philosophical–daological traditions represented most commonly by the *Daodejing* and the *Zhuangzi*, and the multiple “religious”/liturgical traditions that originated in the Han Dynasty. One area in which an increasing number of Daoist thinkers and scholars are working is ecological thought. Some scholars caution against the tendency to think of Laozi and Zhuangzi as allies in environmentalism (particularly because of the dimension of non-action and noninterference in these texts, which would undermine the activist orientation that most environmentalists endorse). However, many believe that the worldview informed by “philosophical Daoism” provides a way of thinking about and acting toward the nonhuman natural realm that produces a harmonious and mutually beneficial relationship. The Dao is understood as the natural pattern that underlies all living things, and is described as a creative, nurturing force. The texts caution about interference with its processes and over-reliance on human intelligence. They advocate a way of acting that is fully in accordance with the movement of the Dao (*wu wei*, “effortless action”), rather than self-conscious striving. This would produce a tendency to “let Nature be,” so that the Dao will act as harmonizer of all things. Harmonization occurs when each thing acts *ziran*, in accordance with what is “so of itself” without artificial impositions. While there is what might be called an “ethic” involving harmonization, the guidance of nature, and the undermining of selfishness and rationalism, there is not the sense of a “moral cosmos” in the Confucian sense. The cosmos is generally seen as amoral (e.g. not characterized by benevolence) and yet harmonization with it, living in accordance with its way, can be seen as the *summum bonum*. Daoism does not share the Confucian belief that human beings occupy a higher place than other natural beings in the order of

things. Daoism holds that the very things that set human beings apart (e.g. the mind's making of distinctions and creation of categories) bring about our downfall.

Daoist "religious" traditions also provide valuable resources for ethics. From the beginning, moral codes were an essential component of Daoist communities. Many Daoists posit a link between moral action and one's spiritual and physical states (immoral action can produce illness, and can be healed through rituals of expiation). Virtue has been connected with longevity or immortality, and Daoist sages are seen as having perfected moral qualities. Altruism and compassion are common features of the sages featured in the Daoist religious traditions such as *Tianshi* (Celestial Masters), *Lingbao* (Numinous Talisman), and *Quanzhen* (Complete Perfection). Much of what can be described as "Daoist self-cultivation" involves the elimination of selfish desires to achieve harmony with the Dao.

There are two main existing Daoist religious traditions – *Zhengyi* ("Orthodox Unity") and *Quanzhen*. Members of these traditions have increasingly become involved in environmental action. For example, Zhang Jiyu, the 65th descendant of Zhang Daoling, considered to be the founding figure of religious Daoism, has written about ecological consciousness from a Daoist perspective and publicly calls upon Daoists to put these views into practice. He writes: "We shall spread the ecological teachings of Daoism, lead all Daoist followers to abide in the teachings of self-so or non-action ... and preserve and protect the harmonious relationship of all things with Nature ... We shall continue the Daoist ecological tradition by planting trees and cultivating forests."

Daoist resources have also been applied to recent work on feminism. Historically, the Daoist religious communities have featured women in leadership roles and as sages to an extent not found in the other Chinese religious traditions. For example, there are Daoist nuns in contemporary Taiwan who lead temples, and they are committed to Daoism's engagement with the modern world, particularly through environmental action. The philosophical texts, with their emphasis on either the need to harmoniously balance the *yin* (female) and *yang* (male) energies, or the primacy of the *yin* (which, seen as "yielding," "non-competitive," and "soft," has the power to ultimately overcome the "hard"), are seen as having much to offer contemporary feminists. Some feminists, who articulate a view grounded in nature, focus on the descriptions of the Dao as fertile, nurturing, and characterized by "feminine" values. Others who have a more "cultural constructivist position," emphasize the theme, found in both the *Daodejing* and the *Zhuangzi*, of the artificiality of all dualities and the complementarity and mutual dependence of all apparent opposites, including male–female.

Buddhism

While Buddhist scholarship was eclipsed by Neo-Confucian developments during the late imperial period, Buddhism in China enjoyed a revival in the late nineteenth and early twentieth centuries. However, along with the other religions, it fared very poorly from 1949 to the 1980s in mainland China, with its nadir during the Cultural Revolution. Since the 1980s, fortunes have improved in mainland China. In addition, a dramatic Buddhist revival occurred in Taiwan following the establishment of the Nationalist government in 1949.

The best-known figure of the Buddhist revival is the abbot Tai Xu (1889–1947). Beginning in the 1920s, he started a reform movement that advocated social involvement and an approach to education that taught secular subjects in addition to Buddhist studies. Tai Xu believed that the Buddhist emphasis on universal compassion could help bring together the various ethnic groups that make up the Chinese

population and thereby strengthen China. The movement connects an emphasis on the revival of monastic life with social engagement, including a central role for the monasteries in helping the poor.

Engaged Buddhists see liberation from *dukkha* (suffering, unsatisfactoriness) as something that can occur not only at the level of the individual practitioner, but also at the social, political, economic, and environmental levels. The very notion of interdependence shows that these levels cannot be separated. Engaged Buddhism often makes use of notions such as interdependence and mutual interpenetration (a theme with powerful ecological applications), no-self, Buddha Nature (a nature shared by all beings), and skillful means to ground the ethical praxis. The bodhisattva ideal, a selfless commitment to work within this world in order to relieve the suffering of others, occupies a prominent place in this religious ethics.

A noteworthy feature of the Buddhist revival in Taiwan is the prominent role of women, who constitute the majority among the thousands of monastics ordained after 1949. One example is the Buddhist nun Ven. Zheng Yan, the founder of Taiwan's largest charitable association. The foundation supports hospitals and free clinics, education and environmental protection, among other things, and Zheng Yan calls on people to "wash the earth clean and purify people's hearts." The ethical commitments are connected with a metaphysical picture. She believes that when people awaken to their original nature, the result will be a spontaneous manifestation of love for all sentient beings. When acted upon, that love produces "a Pure Land of peace and joy."

Fo Guang Shan, another significant movement, was founded by Master Xing Yun. His personal experience of war and poverty moved him to focus on social action (including the founding of medical clinics, orphanages, wildlife preserves, and educational institutions). The group, which advocates the equality of men and women, has an international scope (supporting development efforts in different parts of the world) and has been involved in intrafaith (bringing forms of Buddhism together) and interfaith dialogue.

Over the last few decades, Buddhists, more than the members of any other Asian religious tradition, have engaged in interfaith dialogue with other traditions, particularly Christians and Jews. There has been an increase in people with "dual religious citizenship" who might call themselves "Zen Christians" or "Buddhist Jews." Models of pluralism, syncretism, and multiple religious identity have long existed in much of East Asia. They are beginning to take shape increasingly in the West.

One frequently addressed theoretical issue is the relationship of ethics (often represented by the notion of *śīla* – moral practice in accordance with the precepts, including no harming, lying, stealing, abusing intoxicants or sexual misconduct) and soteriology. Nirvāṇa is sometimes portrayed as beyond ordinary moral distinctions and therefore transcending ethics. There is a division between those who believe that ethics is a preliminary step to be left behind upon enlightenment, and those who believe that an enlightened Buddha is one who manifests ethical perfection (e.g. the full realization of the Bodhisattva perfections) and thus is never "beyond good and evil." To what degree *upāya*, or skillful means aimed at liberation, can lead to a suspension of the ethical is also the subject of debate.

Popular Religion

There are countless examples of syncretic religious groups or societies in China that have flourished for periods of time. The best-known contemporary Chinese movement, Falun Gong, is a synthesis of Daoist and Buddhist elements. It involves notions of enlightenment and physical and spiritual power that can

be achieved through the psychophysical exercises of *qigong*. The group has become well known in light of the crackdown by the Chinese government. Their practice involves exercises that combine movement, breath work, and meditation. Falun Gong, as with other modern syncretic groups, has an ethical dimension, focusing on three main virtues: truth (*zhen*), goodness (*shan*), and forbearance (*ren*). The assumption is that moral cultivation must accompany the physical and contemplative exercises in order for one to achieve enlightenment. Through dedication to the practice, individuals become happy and a harmonious social environment results.

Popular Chinese religious practice focuses on earthly, life-affirming values such as happiness, longevity, and wealth (these goods being represented by deities who can help people achieve them). While much of popular religion does have an element of *quid pro quo* ethics involving gods, ghosts, and ancestors, it also serves as a source of moral education. Like China's elite daological traditions, popular religion is highly syncretic. Popular ethics is characterized by the strong role of ancestors, filial piety, education, and virtue cultivation from Confucianism. It is also informed by notions of karma and hell regions derived from Buddhism. It can be difficult to disentangle the pervasive influence of Daoist religion from that of general "folk religion" in the overall lives of most Chinese people. Chinese deities, for example, combine a bureaucratic model often seen in Daoism (with representation at the home, local, and "imperial" levels) with Buddhas and Bodhisattvas, numerous ghosts and popular gods (such as Mazu), and ancestors. These beings are to be worshipped, revered, propitiated, or petitioned as appropriate. If the deity is treated properly and not angered, one will avoid harm or enjoy benefits. Many Chinese believe that one is watched by a range of deities, both within the body (a Daoist contribution) and without. The deities keep records and decide on rewards and punishments, with consequences for one's lifespan and afterlife existence. Beyond this results-oriented relationship, people express attitudes and feelings such as gratitude, piety, and awe, through ritual, chanting, praying, etc. The "moods and motivations" connected with religious belief and practice certainly have an impact in the ethical sphere.

Conclusion

The Chinese religions' approaches to syncretism and harmonization, along with their "this-worldly" emphasis on nature, interdependence, self-cultivation, and the achievement of sagehood, make them good dialogue partners for the Abrahamic traditions and valuable participants in the global ethical conversation. Having had a profound influence on the East Asian cultural sphere for around two millennia, Chinese religious ethics has now begun to have an impact on the rest of the world. The future trajectory of Chinese religious ethics will likely involve an increasingly global character, a continuation of interfaith dialogue, and philosophical and social engagement with the vital issues of our time, such as ecology, feminism, human rights, and religious pluralism.

Developments in Chinese religious ethics over the last two centuries illustrate both the continuity provided by the core concepts and values that have characterized the Chinese traditions since the classical period, and also the transformations that have occurred as the traditions responded to the confrontations with the West and modernity. Chinese and non-Chinese thinkers alike will continue to apply, develop, and transform the rich ethical resources of China's religious traditions.

7 African Religions

CHAPTER 82

African Ethics?

Barry Hallen

Controversial Paradigms

Western scholars have tended to use the word “morality” rather than “ethics” when discussing values in the African context (Beidelman 1993). The presumed reasons for this may be hypothesized as follows. First, the articulated systematic thinking underlying these societies’ moral codes is minimal, and so it is better not to obscure this point by associating stipulated forms of moral behavior with the name of a discipline, “ethics,” that is defined primarily by articulated systematic thinking and the reasoned principles it produces. Second, morality in the African context is practically oriented, in that its primary task is to inculcate and regulate behavior that is socially acceptable or unacceptable.

African intellectuals and scholars have protested vigorously about such studies (Gbadegesin 1991; Gyekye 1995; Wiredu 1996), which falsely portray African societies as communities where individuals mindlessly submit to moral values (characterized as “traditions”) that are inherited from the distant past, that continue to be enforced virtually unchanged in the present, and that will be passed on to future generations in an uncritical manner because their ultimate justification is itself an appeal to tradition. “We believe these things are right (or wrong) because this is what we inherited from the forefathers”.

One of the earliest and still influential publications on this subject by an African scholar is John Mbiti’s *African Religions and Philosophy*. Note the plural and singular forms, respectively, of the nouns that constitute the title. This might be taken to imply that, depending upon the particular African culture, the relationship between religion and philosophy can vary. This would mean that, although there is a common philosophical core to all of Africa’s cultures (a point now subject to controversy), there are a variety of religions (“native,” “traditional” religions) that may or may not impinge upon that philosophy. “Traditional religions are not universal: they are tribal or national. Each religion is bound and limited to the people among whom it has evolved” (Mbiti 1970, 5). As far as morality is concerned, this would mean that there are cultures in Africa in which moral values derive directly from a divine source (Idowu 1962), as well as cultures in which the linkage between the religious and the ethical is less significant. “There are other societies in which people do not feel that they can offend against God ... that God has no influence on people’s moral values” (Mbiti 1970, 270). The latter would apply to a culture in which the ultimate justification for morality is humanistic – these are the chosen values because they are deemed

most likely to secure human happiness – a viewpoint about which there will be a good deal more to say in what follows (Wiredu and Gyekye 1992, 193–198).

The more controversial implication of the title is that there is a single set of philosophical (including ethical) principles that underlie all of Africa's cultures. Whether Mbiti's divergent views on religion and philosophy in the African context would themselves remain consistent becomes a point worthy of consideration, insofar as the same ethical/moral principles and values would be held common to all of Africa regardless of whether they had a divine or secular origin. Mbiti eventually comes down in a fairly one-sided manner on behalf of the divine. "Most African peoples accept or acknowledge God as the final guardian of law and order and of the moral and ethical codes" (1970, 269). He affirms that religion permeates virtually every aspect of African life, as well as viewing African society as an organic whole (he prefers the term "corporate") whereby individual immorality is also communal immorality is also divine immorality.

One unfortunate consequence of this paradigm has been to reaffirm the portrayal of African societies as places where the individual moral consciousness ("Regardless of what my community says is right, what ought I do in this situation?" – MacIntyre 1967, 84–109) was denied in an uncompromising manner. Africa again is presented as an ethical environment where behavior and compliance with rules is the praiseworthy norm, and the role of the individual consciousness in determining or evaluating "traditional" norms inherited from some virtually mythical past is of no real consequence. "Therefore, the essence of African morality is that it is more 'societary' than 'spiritual'; it is a morality of 'conduct' rather than a morality of 'being.' This is what one might call 'dynamic ethics' ... for it defines what a person *does* rather than what he *is*" (Mbiti 1970, 279).

Divinely Inspired or Humanistic Ethics?

In what follows, interest will center upon the debate among philosophers of Africa as to whether a variety of ethical principles and moral values that may be taken as truly indigenous to Africa's cultures are directly divinely inspired and sanctioned or are more properly seen as of secular origin in societies that are best typed as humanitarian in orientation. One noteworthy consequence of this debate has been the reinstatement of articulated, reasoned ethical principles as intrinsic to the justification of more specific moral values in these societies (Wiredu and Gyekye 1992, 198). Another is that the importance of moral judgments made by the individual in determining and affirming what is or is not ethical in a particular situation has been reasserted (Hallen 2000). These findings have been achieved via the research of a new generation of African scholars, as well as via a vigorous critique of Western views of how thought must be expressed in order to qualify as genuinely philosophical, and thereby ethical, in character.

Though knowledge in cultures that are significantly oral may be expressed in different forms than is conventional in the paradigmatically literate West, this does not mean the character of thought underlying those forms is different (e.g. emotive and prereflective rather than reasoned and critical). Myth, poetry, song, verse, proverb, and story, as well as such philosophical staples as language usage and discursive ideas (social or individual), can also be used to express viewpoints that are of theoretical (as well as practical) significance.

Certainly, most Africans have never felt deficient in this regard and were taken aback to find themselves being characterized as such. It was primarily Western scholars, associating such forms or

expressions of thought with relatively underdeveloped powers of ratiocination, who persevered in drawing this conclusion. But it is philosophers familiar with the intellectual contexts and content of both Western and African cultures who are challenging it as ethnocentric and insisting that the boundaries of philosophy must be redrawn if it too is not to be labeled the “traditional” beliefs of just one other “tribe” – those of the so-called “West.” This need not mean that orthodox philosophical approaches such as analytic philosophy (Hallen 2002), phenomenology/hermeneutics (Serequeberhan 1994), or Marxism (Fashina 1989) become irrelevant to the African ethical context. Rather, with the appropriate adaptations made to facilitate their working within that cultural context, they too may continue to provide insights of genuine value.

In order to place in historical context the claim that ethical principles and moral values in indigenous African cultures can be of secular origin, and therefore may be best characterized as humanitarian, it is important to recall that initially (Western) scholars and missionaries did not even consider this a possibility. The vocabulary that associated the religious with the moral was demeaning, to say the least – emphasizing such terms as “fetishes,” “idols,” “rituals,” “taboos,” “juju,” “cults,” “witchcraft,” etc. – all involving exotic beliefs about various “forces,” “spirits,” or “deities” characterized as “pagan” and unenlightened by comparison with truly “world” religions like Christianity and Islam. (There are a number of published studies that detail how Christianity and Islam are themselves being indigenized – transformed – so as to suit the African context: e.g. Peel 2000.) The image of “tribes” of “natives” bowing down to “fetishes” that were associated with rigidly enforced moral absolutes (“traditions”) was more compatible with the portrayal of societies that had been characterized as “primitive” (precursor to the supposedly less offensive “traditional”). This is why, in what follows, more attention will be devoted to recent secular, humanistic renderings of ethics in specific African cultures. Although, to do justice to the relation between indigenous religions and moral values, it will also be necessary to examine the arguments of those new generations of African scholars and intellectuals in this respect as well.

Contemporary Positions

A growing number of contemporary African philosophers maintain that the relationship between religion and morality in Africa’s indigenous cultures has been misrepresented by claims about the supposed permeation of religion into all facets of African life. The Ghanaian philosopher Kwasi Wiredu aims to counter this by maintaining: “African conceptions of morals would seem to be of a humanistic orientation” (Wiredu and Gyekye 1992, 194). Wiredu suggests this hypothesis may be confirmed via studies of the basis for morality in individual African societies. To practice what he is “preaching,” Wiredu himself has published numerous studies of morality in his native Akan culture.

In what follows, interest will center on Wiredu’s writings, as well as those of his Ghanaian colleague, the philosopher Kwame Gyekye. The case they make for the secular basis of morality in Akan culture is compelling. It arises from five specific points:

- 1 “The remarkable fact that there is no such thing as an institutional religion in Akan culture” (Wiredu and Gyekye 1992, 194). The idea that the cosmos has been created by God with various deities and quasi-physical forces within it is a given. But their primary relevance to human beings is that these deities and forces can be used for personal and/or utilitarian ends if correctly addressed and respected.

The motive for doing so is primarily to achieve some form of practical end. The idea of “worshipping” such beings because of their intrinsic holiness is foreign. On the other hand, an attitude of “unconditional reverence and absolute trust” (1992, 195) is extended to the Supreme Being (or God). This is conjoined with the belief that so perfect a Being is not in need of worship – in fact might not even welcome it – and therefore remains somehow distant from the created world (Gyekye 1995, 196).

- 2 The humanitarian origins and focus of morality (in Africa generally) are further justified and explained by Gyekye because of the absence of a prophetic religious tradition:

The doctrinal system of a religion *revealed* by God to a single person, the founder, invariably includes elaborate prescriptions to guide the ethical life of the people who can accept and practice that religion. A coherent system of ethics can be founded upon such divinely revealed commands ... It is clear, however, that traditional African religion cannot be said to be a religion whose doctrines were embodied in a revelation. (Gyekye 1995, 206)

- 3 Given points (1) and (2), the basis for morality must derive directly from humanity. It is human beings who are left to devise systems of values (“all value is derived from human interests”). Furthermore, an essential motivating factor is the consensus that “human fellowship is the most important of human needs” (Wiredu and Gyekye 1992, 194). The good is what is regarded as promoting human interests as defined by human beings themselves.
- 4 The primary source of moral instruction is the family. “Nor, relatedly, are any such institutions [“institutionalized” religion as a source of moral values] felt to be necessary for the dissemination of moral education or the reinforcement of the will to virtue. The theater of moral upbringing is the home, at parents’ feet and within range of kinsmen’s inputs. The mechanism is precept, example and correction” (Wiredu and Gyekye 1992, 195).
- 5 All of the above points mean that religion in Akan society is said to be “purely personal, being just a tenet of an individual’s voluntary metaphysic, devoid of social entanglements” (Wiredu and Gyekye 1992, 195).

What becomes of interest are the specific values espoused by such a culture to flesh out what is said to be its basic humanitarian orientation, and what are said to be the ethical principles that underlie and justify those more specific values. The fundamental ethical principles underlying the more specific moral values distinctive of Akan society and culture are two: (1) an obverse form of the Golden Rule: “Do not unto others what you would not they do unto you” (Wiredu and Gyekye 1992, 198) and its corollary (2) individual interest cannot and therefore should not be divorced from communal well-being. “In Akan moral thought the sole criterion of goodness is the welfare or well-being of the community” (Gyekye 1995, 132).

The specific values derived from these principles are “kindness,” “generosity,” “faithfulness,” “honesty,” “truthfulness,” “compassion,” “hospitality,” and whatever “brings peace, happiness, dignity and respect” (Gyekye 1995, 132). All of these are said to promote *social* well-being. This should not be taken to mean that an individual’s personal interests become totally subordinate to those of the community. Communal and individual interests are balanced so that self-interest encompasses the welfare of the community along with that of the individual (Gbadegesin 1991, 64).

Sanctions play an essential role in the *constitution* of morality in Akan society. But these sanctions, as well, are primarily social insofar as they involve the diminution of an individual’s integrity and thereby

personhood if, for example, self-interest becomes a motive that has negative consequences for communal well-being. Gyekye ridicules Western philosophers who tout the individual's moral "reason" as the sole basis for doing what one "ought" as unrealistic and impractical. It takes a social context and socially imposed sanctions for morality to become a real force on purely practical grounds (1995, 139–141).

The revised role of religion in this overall humanitarian ethical and moral schema is said to be supportive rather than foundational. In certain situations religious beliefs serve as reinforcement for moral behavior that, on logically independent humanitarian grounds, is considered improper. Both Gyekye and the Nigerian philosopher Segun Gbadegesin (1991, 67–78) regard the function of religion in this regard as pragmatic – it can serve as a further, though less direct or powerful, incentive for the individual to be moral. "It may appear puzzling that the practical aspects of a morality whose principles are not grounded in religion should [also] be animated by religion; yet this position does not involve any logical inconsistency" (Gyekye 1995, 141).

The individual person has a self-conscious sense of what is right and wrong (or conscience) in addition to these relatively external sanctions. Indeed, the role of individual moral judgments, and therefore responsibility for one's actions, are another foundational element of Akan ethics and morality. The connection between this individual moral sense and the communal is made explicit when Gyekye argues it "is not innate to man, but [is] something acquired through socialization, through habituation, through moral experience" (Gyekye 1995, 143).

A final dimension to the ethical in the Akan context is the importance attached to "character." When one is said to have a good character, one is awarded the status of being a "good person," which means that one can then be depended upon consciously to try to do the right thing in any situation. This is determined primarily on the basis of behavior and therefore socially, but such behavior is of course thought to arise from individualized and self-conscious intentions.

Among the Yoruba people in Nigeria a good character appears to have epistemological consequences as well, in that such individuals are regarded as reliable sources of information generally. If being good also involves being honest about what one truly knows (or does not know), then ethical values also involve epistemological virtues (Hallen 2000). Among the Yoruba this conjunction of the ethical with the epistemological is further reinforced by the involvement of the aesthetic, in that a person who has a moral character that can be depended upon is also said to embody the highest form of beauty. In other words, the individual who is said to have a good character embodies the highest paradigm of the beautiful, with physical beauty, by comparison, coming in a distant second (Hallen 2000).

Conclusion

Does the emphasis upon being practically relevant diminish a moral system's theoretical integrity? Does the fact that moral precepts must be seen to work in practice – to produce results that benefit both the individual and society – transform theory into dogma, precept into command? The response that seems to be coming from philosophers in and of Africa is a resounding "no." The point of the ethical and the moral is to make a difference in people's lives. This need not mean that the importance of the underlying ethical principles is diminished. What it does indicate is that the process of deriving specific moral values from those principles that promote a moral society (and individual character) is of no less importance to their justification.

CHAPTER 83

Origins of African Ethics

Segun Gbadegesin

What is African Religion?

John Mbiti's *African Religions and Philosophy* is arguably the vehicle that conveys many Westerners to the corridors of African traditional religion. It is as controversial as it is famous for some of its claims. Two of those claims have been subjected to vicious attacks by African scholars: (1) his assertion that traditional Africans have no concept of future time and (2) his claim that Africans are in all things religious (Mbiti 1989, 1).

While these claims are controversial, they do not define Mbiti's seminal contribution to African traditional religions. Indeed, there are two other claims or assertions by Mbiti that appear to me to strike at the core of African traditional religions. Unfortunately, Mbiti himself seems to have underplayed their significance or indeed may have had a negative attitude toward them. One of them (found in the same volume) is that "because traditional religions permeate all the departments of life, there is no formal distinction between the sacred and the secular, between the religious and the non-religious, between the spiritual and the material areas of life (Mbiti 1989, 2). The second is found in Mbiti's *Introduction to African Religions*, where he claims that African religions "evolved slowly through many centuries, as people responded to the situations of their life and reflected upon their experiences" (Mbiti 1991, 14; see also Masolo 1994).

Both of these claims define the core of African traditional religions. First, religion in traditional Africa is the outcome of reflection on life's circumstances, the vagaries of nature, the inexplicable splendor of the universe, the blue sky, the rugged mountains, and the deep ocean. The loneliness of humans in the midst of these wonders could be perplexing. A religious attitude is the response of the traditional African. The response of the traditional African is one of reverence and devotion, but one that is motivated by the well-being of the human. Thus, for the traditional African contemplating the universe, there is an "apprehension, awareness, or conviction of the existence of a supreme being, or more widely, of supernatural powers or influences controlling one's own, humanity's or nature's destiny," and thus religion, as Webster's dictionary defines it. Yet this manifestation of religion on the African landscape is not an abstract idea. It is purposeful; it is utilitarian. In traditional Africa, humanity is not made for religion, religion is made for humanity.

The Akan attitude to the gods is typical of most African cultures. Kwame Gyekye (1995, 137) has observed that a deity that fails to fulfill a promise would be censured and abandoned by the people. And

Busia notes that “the gods are treated with respect if they deliver the goods, and with contempt if they fail ... Attitudes to ... [the gods] depend upon their success, and vary from healthy respect to sneering contempt” (1954, 197).

The other claim makes sense in the light of the foregoing. If religion has an instrumental role, if the gods are valued for what they can deliver, then there can be no unbridgeable gulf between the sacred and the secular. Consider the case of the worker in the field. The effectiveness of the gods in his life must be felt in terms of how well his crops do, how safe he is from the wild. He would be much inclined to do his own part, make the necessary supplications to the gods, and expect the logical results. The demarcation between work and religion is eliminated and the secular and the sacred merge. But if there is no unique sacred space, can we still speak of “religion”?

One implication of this feature of religion in traditional Africa should not escape us: the gods are subject to human evaluation and assessment. This does not suggest any possibility of escape from religion as such. With the uncertainties of the stormy world around, one needs a safe anchor. One needs to shop around to identify a god that might provide that safe anchor. This does not mean that one can escape the need for a safe anchor. The religious shoreline has numerous anchors as well as the tools for choosing one. In the case of the Yoruba, the tool is Orunmila, the god of wisdom or divination. A new baby born into the world today needs to have a divination with respect to her destiny, including the god to which she would be devoted. This god will afford her protection and provision. But since it is also believed that uncertainties mark the life of humans, the expectation and advice is that an oracle should be consulted. In this case, it may well be that the baby-become-teenager needs a new or additional god for maximum protection and provision. Changing gods or having additional gods does not entail escape from religion. It is the fulfillment of religion.

The features of African traditional religion just discussed are not exhaustive, but they are the most relevant to this entry, which is mainly a discussion of the origins of ethical thought in traditional religions. To this I now move with a transitional thought. Masolo complains of African scholars (Mulago, Bahoken, and Mbiti) who “have been eager to demonstrate that African religious concepts could be explained in terms of Greek metaphysics” and then argues that their demonstration “has not been convincing. There is nothing which proves that the idea of unity is superior to that of multiplicity or pluralism, or that monotheism is superior to or develops from polytheism” (Masolo 1994, 122). I agree with this observation. However, Masolo also notes that while it is frequently stated that Africans are notoriously religious, the loose intertwining of religion with nearly all aspects of lives could be a weakness responsible for the demise of the traditional religions. “There may be attempts,” he notes, “to drag religion unnecessarily into situations requiring simple practical approaches” (Masolo 1994, 123).

The problem with this way of looking at the matter is that it takes away with the left hand the recognition of the uniqueness of African traditional religions that has previously been offered by the right hand. Scholars do not impose uniqueness on traditional African religions; rather, it is due to the conception of the worldly nature of religion by traditional Africans themselves. It is the original contribution of traditional Africans to religious theory and practice. Religion is not separable from life because it is part of life and it is for life as we live it; it is *this-worldly*. Religion is to benefit human and communal life; hence the conception of the other world in the image of this world. Religion has to be constantly there, even at beer parties, as Mbiti notes. It is not unusual that many of the rules and prohibitions of Christianity – monogamy, for instance – rightly or wrongly, are not part of the core of African traditional religion. There are prudential injunctions on matters of relationship, including monogamy and polygamy. Orunmila, the

Yoruba god of wisdom, counsels his devotees against polygamous relationships simply on account of its internal problems. Religion functions for the well-being of the people. So does morality.

The phenomena of morality comprise moral beliefs, rules, principles, and problems. The purpose of a “morality” is the furtherance of a harmonious relationship within a particular society, the control and enhancement of its other institutions and individuals, the protection of its land and its individual members, and as a result of success in that area, the survival of that society as an entity. If this is the case, all societies certainly have the incentive to develop a vibrant moral institution for the promotion of their communal existence and individual enhancement. They may adopt different strategies and/or develop different emphases. For some, the moral institution will emerge through the instrumentality of the state. For others, religion and spirituality may be the catalyst that shapes and confirms morality.

The Moral Outlook of African Religious Traditions

We should begin by addressing the question: What is morality to traditional Africans? What purpose does it serve? How do they relate to it? Indeed, how do they come about the idea of a moral institution? Like other cultural traditions, morality comes into play in African cultures as a system of rules and practices for the purpose of maintaining the social order and enhancing the individual's process of self-actualization. These two goals are not exclusive. The enhancement of the self-actualization of individuals is an important means of maintaining the social order. A community with self-respecting individuals will have no problem maintaining its social order. Conversely, maintaining the social order is an important means of enhancing the self-actualization of individuals. A community that succeeds in maintaining its social order is one in which individual members can have the peace of mind and an atmosphere conducive to the realization of their full potentials. This is the way that traditional African societies understand the matter. This is what the process of socialization is about. It is also the main goal of moral education.

How does religion come into this picture? Is there a specific set of values and morals that come out of religion and serve as ingredients in the moral menu of traditional Africans? In *Introduction to African Religions*, Mbiti discusses the parts of African religion. These include beliefs, practices, ceremonies and festivals, religious objects and places, values and morals, and religious officials and leaders (Mbiti 1991, 11–13). These are what Bolaji Idowu also refers to as the structure of African religion. We may gain a good understanding of African religion if we focus on these features or structure.

If morals and values are a part of traditional religion, in what sense should we understand this? What does it mean to discuss values and morals as part of African religion? It could mean any or all of the following: (1) religion gives birth to societal morals and values; (2) religion shapes morals and values; (3) religion serves as an enforcer of societal morals and values; (4) religion is a source or origin of some specific morals and values. Now, it is fair to say that of these possible interpretations of the claim, Mbiti has the broadest sympathy for (1), which is all-inclusive. What is the claim and what is its support?

According to Mbiti, morality comes from God to Africans. He attributes this verdict to the belief of African peoples themselves. “It is believed by African peoples that God gave moral order to people so that they might live happily and in harmony with one another. Through the moral order, customs and institutions have arisen in all societies to safeguard the life of the individual and the community of which he

is part” (Mbiti 1991, 41). This statement may be interpreted in various ways, two of which are crucial. First, it could mean simply that the moral order – the order that exists in the African moral realm – is ordained by God. So God brought the moral institution into being at the same time that God created the African universe. In this case, it would not have mattered what humans did, the moral order would be there to manifest itself and the morality that it represents.

There is a second and more adequate interpretation. Traditional Africans believe that God gives the moral sense to each person, and they use the moral sense to fashion the moral order and its structure. The moral sense includes the sense of right and wrong, the sense of decency, the sense of fittingness, appropriateness, beauty and ugliness, the sense of straightness and crookedness, etc. Understood in this way, the moral sense is contextual, spatial, and temporal. For what is appropriate in one context, in one community, may be inappropriate in another. It is not appropriate to use water recklessly in the desert region, but such a rule is unnecessary in the rain forest. It is the moral sense that helps to discern this distinction. Human beings create the moral order through the use of the moral sense given to them by God. This is the case with traditional Africans.

The foregoing position does not, by itself, suggest a severance of all connections between religion and morality. This seems clear if we focus on the other three interpretations that we have identified. First, it is true that religion shapes morality. If in fact traditional Africans believe that they receive their moral sense from God, this is a crucial way in which religion shapes morality. Second, however, the various contents of our moral norms are also influenced and shaped by religion. To see that this is the case, we only need to compare Christianity and its impact on the African moral realm with traditional religions. In traditional Yoruba religion, as in many African religions, the gods are strict with regard to punishment for particular moral infractions. Adultery, for instance, is punishable by a huge fine and forms of restitution to the aggrieved family. This is not the case in Christianity. In Yoruba religion, it is believed that whoever swears on the altar of Sango, the god of thunder and justice, and breaks his or her oath, will be punished with death. Though Christians swear on the Bible to assure others of their fidelity, there is no belief that any empirical consequences would follow should they renege on their promise. In this sense, religion shapes the morals and values of the people, and traditional African religion is no exception.

It also seems clear, third, that religion serves as an enforcer of morals and values. Many African religions have little or no conception of a heaven where punishment is given to bad or evil people. What they have is worse, namely the belief that punishment will be given here on earth towards the end of a person’s life. Such punishment may include total reversal of fortune. Since no one knows what the future holds, there is a terrifying thought that one may go from an extreme of fortune to one of misfortune. Therefore, there is an interest in pleasing the gods to avoid that kind of fate.

There are certain morals and values that are specifically religious in origin and content. They come out of religious beliefs and practices and they are mobilized for the purpose of observance and advancement of religious practices. These are found in the injunctions of particular gods through their priests for their devotees. The purposes of this class of moral injunctions are ostensibly devotional, but in reality, they are utilitarian. For instance, the devotees of Obatala, the Yoruba god of creation, are enjoined to refrain from alcohol. The purpose is supposedly devotional and referential, to make them clean and sober before the god. But it is also utilitarian and one variant of the myth of Obatala supports this interpretation. According to the Yoruba cosmogony, Obatala was the divinity that Olodumare, the Yoruba supreme being, sent to create the earth. But as he was descending from heaven, he saw a group of palm trees and he helped

himself to some of its juice. He got drunk and slept it off. Olodumare had to send Oduduwa, the progenitor of the Yoruba, to finish the job. Thus, Oduduwa took the glory for creating the earth and Obatala never forgot the embarrassment. So he instructed his devotees to avoid alcohol. The devotees, in turn, understand this as a taboo, for the simple reason that it is so enjoined by the divinity they serve. It is a norm of behavior that is clearly religious in origin. This does not mean that a secular rationale may not be found for the norm. Indeed, from the story behind it, the injunction itself has its origin in the embarrassing experience of the divinity after his consumption of alcohol. Therefore, there are both religious (injunction of a divinity) as well as secular (avoidance of embarrassment) reasons for the devotees of Obatala to follow the norm thus enjoined by the divinity (see Idowu 1962).

There are norms of behavior that traditional Africans have come to accept as regular norms without raising any question about their origin. What is crucial for them is that these norms and moral codes have been effective in the furtherance of their communal lives and have served as important guiding lights in their daily lives. Indeed, a significant aspect of the moral outlook of a number of traditional Africans is that it does not really matter to them what is the source of the norms they live by. The communal nature of their lives ensures that they accept the norms that work for the survival and prosperity of their community.

The foregoing point deserves a modification. We must distinguish between the traditional thinkers, that is, the philosophical sages on the one hand, and the priests and practitioners of traditional religion on the other. The first group looks further and deeper to identify the rationale for moral injunctions in the secular world, in terms of the consequences for human beings, though, in a minority, their existence in traditional societies cannot be doubted (Oruka 1990). The second group, the practitioners of traditional religion, is guided by the pronouncements of the gods through the priests and priestesses. They abide by the injunctions because they want to please the gods. For them, the moral norms are the injunctions of the divinities, and are thus religious norms, just as the natural is the spiritual. Their position or attitude is not significantly different than the Christian priest/parishioner in terms of where authority resides in matters of morality.

Significantly, because of the structure of traditional society, and in particular the continuity between the spiritual and the natural, this group gets enlarged insofar as the traditional political authority is its extension. The traditional ruler is the chief priest of all the religions and therefore religious, moral, and political authority are rolled up in one. When our topic is the origin of African religious traditions and their moral outlook, this group (more than the philosophical sage) has pride of place. I will conclude by identifying some examples of the moral outlooks that are characteristic of African religious traditions as seen from the vantage point of priests and practitioners.

The Essence of an African Moral Outlook

One of the enduring features of African religious traditions is the emphasis placed on good character. The development of good character is the focus of the various religions and processes of informal education. There is recognition of good character as a prerequisite for social harmony and justice, which are the mandate of the divinities on earth. The key to religious devotion in the context of the utilitarian interpretation of religion is the character of each person. The Yoruba people summarize this in a sentence, *iwa l'esin*, or "character is religion." All there is to religious devotion and sacrifice is good character. If you

claim to be a devout believer and you do not demonstrate the qualities of body and mind that even non-believers possess, your claim is empty. For the African religious tradition, a person's character is her amulet and it is her character that will judge her in the end. Therefore, one must have good character.

The Yoruba word for character is *iwa*. *Iwa*, however, has a second meaning, which is "existence." Thus we have *iwa* as character and *iwa* as existence. It has been suggested that the former is a derivative of the latter. *Iwa* as existence is primary in the sense that without existence, we cannot talk of character (Abimbola 1975a, 389–420). But we may talk of the character of a person's existence. This is just a different way of talking about the person's character, which may affect for better or for worse his or her existence. A person with bad character will spoil the means to good fortune. In this sense, *iwa* means the totality of the person's being, including habits of right conduct, right attitude, and right emotions at the right time. We can now isolate the components of *iwa* to conclude this account of African moral outlooks.

Truthfulness

In the African religious traditions, truthfulness, as a component of *iwa*, is an important injunction of the divinities. The Yoruba Ifa oracle instructs devotees of Orunmila (the divinity of wisdom) always to tell the truth because it is those who are truthful that the divinities will promote and bless. Many religious traditions have ways of detecting lying and deceit, and there are instant punishments for such waywardness. In the Yoruba tradition, Sango, the divinity of justice, is summoned whenever there is a suspicion of wayward dealings, and the culprit is punished along with his or her household.

Industry

All divinities of the African pantheon are shining examples of industry. Many of the myths of creation depict the divinities as engaged in one activity or the other. They may clear the bush that leads from heaven to the earth; they may plant the first seeds on earth; they may be skilled hunters. The value of work is the theme of many religious poems. Thus, Yoruba children learn from the cradle a poem that sings the praise of work as a means to avoid poverty. Work is taken seriously as a moral requirement because people who do not work cannot carry out their responsibilities to their families and are likely to become parasites on communal resources.

Moderation

Moderation in food, drink, and bodily pleasure is an important component of character that African religions emphasize. Lack of moderation may result in squandering of resources. It may lead to weakness of the body, mind, and spirit. It may lead to loss of dignity. This is one reason, noted before, that the arch divinity Obatala prohibits devotees from indulgence in alcoholic beverages.

Generosity

The generous person is appreciated by the gods, according to African religious traditions. It is incumbent on devotees of many of the religions to make provision for those in need, no matter how small their own fortunes may be. There is a sense in which sacrifice is understood as a lesson in generosity. When a

divination oracle instructs a supplicant to offer a sacrifice of palm oil or used clothes, the idea behind this is to make provision for those in need so that the divinities may look favorably on one and provide for one's specific needs.

Patience

In the Yoruba religious tradition, patience (*suru*) is depicted as the son of Olodumare (supreme being) and father of *iwa* (character). They say “patience, the father or lord of character” (*suru baba iwa*). A person with patience has all she needs for good character. A patient person would have no cause to be immoderate, or to be lazy, or to be dishonest, or to insult the elders. A patient person will not run before she is ready to walk. The story is told of how Orunmila, the divinity of wisdom, lacked patience. His wife was Iwa. She was a dutiful wife, but she had some defects. Orunmila could not stand these defects and he maltreated his wife until she left him. Orunmila had to look for her all over the earth without success. Then after some sacrifice, Esu, the trickster god, led him to where Iwa was in the world beyond. But Iwa refused to go back with Orunmila to the world. Here in this story, the priests depict their own divinity as lacking some important character trait, and because of this, the divinity suffered the consequence, the loss of his precious wife, Iwa. If a divinity could thus suffer for lack of such a trait, the reasoning is that humans should watch out.

Respect for elders

In traditional African cultures old age is held in esteem. With experience of life comes wisdom, which is necessary to avoid falling into the same mistake. Therefore, even if an elder is poor in material wealth, he or she will be rich in wisdom. It is said that if a young one has as many cloth outfits as an old person, there can be no comparison to their stock of rags. Having lived longer, that is, the older person must have more rags. It is therefore incumbent on a young one to respect the elder in order to tap his or her wisdom. Since one expects to grow old too, and since one good turn deserves another, one ought to respect elders so one may be respected in one's old age. Furthermore, there is a strong belief that elders have a mystic power that clings to their spoken word. One would not want to be on the receiving end of a curse from the elders, and surely this may be the case if one shows disrespect to them. Here is another moral injunction that is sanctioned by religion but which has a this-worldly justification.

Respect for community

The community is the source of a person's being in the African understanding. Religion itself is a collective endowment of the community. The particular divinities are communal divinities in the sense that the majority of them are identified with certain peculiarities of the community: its mountains, its rivers, its weather, etc. The community gives existence and validation to religion. The young child is born into the community and is brought up as a community member. He or she experiences the ups and downs of the community and grows up seeing him or herself as nothing outside of the community. This is the meaning of the saying credited to traditional Africa: I am because we are. In this context, the religious injunction of respect for the community only reinforces the recognition of the community's role in

one's life. In concrete terms, the injunction requires a devotee to refrain from polluting the land through acts of murder, adulterous relationships, defacement of and defecation on community altars and landscape, and violent acts of robbery. Respect for the gods of the community and for the rules and procedures of the community are religious injunctions that individuals have incentives to obey if they think of the community's role in their own origin, growth, and prosperity.

Conclusion

I have argued that the moral outlook of African religions is essentially this-worldly. Its emphasis is on the promotion of harmonious relationships within communities with a view to enhancing the self-actualization of individual human beings. The specific moral injunctions from the divinities and the supreme being are meant to serve this same purpose. In the final analysis, character is religion, and it is on one's character that one is judged. There is no escape from such judgment at the end of life by appeal to the saving grace of "God." There is reward and punishment in this world and at the end of life for whatever a person does, and there is no intercession from anyone, human or divine.

CHAPTER 84

Differentiations in African Ethics

Bénézet Bujo

This entry considers the historical aspect of African traditions' origins and the differences among them. From the outset, we must state, together with most African scientists, that it is inappropriate to talk in the plural about ethics or religion in sub-Saharan Africa. Except for a few non-African researchers and scientists, most tend to agree on the unity of religion – and ethics – in Black Africa (Mulago 1965, 1980; Magesa 1998; Mugambi 2001, 7–26; Mbiti 1996). Mugambi notes a great affinity of religious thought throughout all of Africa. This pronounced affinity led the first Western researchers to believe that the only possibility was that Africans had copied their religious conceptions from the Jewish people (see, for instance, research on the Masai in Merker 1910; Hollis 1969). Mugambi rightly refuses to accept this thesis. The differences we can observe among African ethnic groups do not concern the substance of the African conception itself, but the way that conception is translated and put into practice (costumes, rites, etc.). It is inappropriate to look for the kind of divergence in African religion we find, for instance, within the various Christian denominations (Catholicism, Protestantism, Orthodoxy) or the various Buddhist, Muslim, and other traditions. The African conception centers on life. Life articulates itself thanks to and through the community of the living, the dead, and the not-yet-born, and it never forgets to refer to God, the actual foundation of this three-dimensional community.

To begin with, we will examine the foundation of African ethics before dealing with the problem of the invention and the articulation of norms. We will conclude our journey by showing, based on a few examples, the relevance of African ethics in the modern world.

The Foundation of African Ethics

In order to understand the ethical conception and articulation in Black Africa, we must apply ourselves to its main anthropological basis. Many theologians and philosophers, as well as ethnologists of all tendencies, have already made this kind of study. However, it seems that until now no one has undertaken any systematic elaboration of its ethics. The emphasis of our study lies in systematic ethical reflection.

The Three-Dimensional Community

If, in moral conduct, African thought puts a special emphasis on interhuman relations, this does by no means obliterate God or exclude the role of God in morality. In the traditional African conception, God is an unquestioned postulate, even though God is rarely mentioned. One knows once and for all that God is first and that without God nothing comes about and nothing survives. Myths, legends, tales, etc. evidence that God is not absent from the individual's life. Many African names incorporate without ambiguity God's action. The most obvious examples are in Rwanda and Burundi, where theophorous names are particularly frequent: *Habyarimana*, *Nzeimana*, *Ndikumana*, etc.

By way of illustration, *Imana* indicates God and *Habyarimana* means "God alone begets." When given to a child, this name signifies that life originates in God alone, not in human strength. Similarly, among the Bahema of Congo-Kinshasa, there are children called "Byaruhanga," which means "God's property." This name may be given to a child born after its parents had come to believe they would be deprived of the blessing of children; but precisely at that moment God intervened (Bujo 1992, 19; 1998a, 75). The idea of God as the originator of life and thus of everything humans do is so fundamental that among the traditional Banyarwanda and the Barundi parents will never go to bed in the evening without leaving a little water in a jug. This water is commonly called "Utuzi tw'Imana," "God-Imana's little water." God creates life at night, and after this work of creation, God washes God's hands in this water specially set aside (Mulago 1965, 109–110).

Most of the time in everyday life African morality takes place without necessary and constant mention of God, though God is by no means absent. African ethics concentrates its attention in a very special fashion on the individual and the community. Africans know that humans are indebted to God for all their undertakings and that, by attempting to articulate their morality within an interpersonal relation with fellow humans and the cosmos as a whole, they ultimately praise the same God (Bujo 2001, 1–71). Insofar as one promotes life in this world, one does God's will as one's ancestors have handed it down to one. The tradition received from them is that to please God and the ancestors is to take into account the three-dimensional community: the living, the dead, and the not-yet-born. This community with its threefold dimension constitutes the anthropological foundation of ethics as a whole. According to this conception, the community, unlike society, is an organic whole. It is not based on some kind of contract, but it is a bond rooted in a covenant. This covenant generally implements a reality grounded either in a natural or symbolic common origin. This alludes to the fact that beyond the "natural" blood relation it is possible in Africa to become a member of a family or a community by acts other than birth. For instance, a blood pact does not necessarily mean the material exchange of blood, but it can also take on symbolic forms.

Beyond this last consideration, however, it must be strongly emphasized that, in general, African tradition does not forget the common origin of all humans, which precisely grounds a common membership. Consequently, there is the obligation to see every person as a member of a universal human community in which every individual moves and attempts to be moral. This is what the Baluba of Kasayi in Congo-Kinshasa bring to light through their expression "Muntu-wa-Bende-wa-Mulopo," which means "Human from Bende from God." In other words, every human being comes from Bende, who comes from God. *Bende* here becomes synonymous with the common origin of humans and of the cosmos, an origin that makes sense only with reference to God (Tshiamalenga-Ntumba 1995). The consequence of this affirmation is that the community based on this kind of thinking is not only three-dimensional but four-dimensional as well, since it includes God as ultimate foundation.

However, let us underscore once more that in its everyday life African morality does not thematize this dimension one can call “theandric”: its full attention goes to the community of the living, the dead, and the not-yet-born, as if God did not exist (*etsi Deus non daretur!*). The foundation of the morality in this “tripartite” community does not have as its starting point a Cartesian or Kantian philosophical concept. Reason with its *cogito ergo sum* is not what defines human beings and their moral action. Interpersonal relations shape the three-dimensional community as well as the individual and constitute as such a base for ethics itself. The Cartesian principle *cogito ergo sum* falters. Another principle supplants it right away: *cognatus sum, ergo sumus*, because I am related to the others, not only I, but also we, together, exist. The individual as a human being is not a monad but exists in openness to the other.

Beside the three-dimensional community, in daily terrestrial life human beings as persons can only live within a bipolarity implying a tri-polarity. In other words, masculinity necessarily relates to femininity, and both imply in turn a third dimension, the child. The human being, as human, is whole only as man and woman summoned by the child, who is the representative of the world of the not-yet-born and at the same time the messenger of the community of the ancestors. Here to some extent is the relevance of the African conception for determining concrete norms; we will come back to this issue in the last part of the entry. For now, we must underscore another important dimension in African anthropology, namely the problem of the relation between humans and the cosmos.

Cosmic Unity or the Human as a Relation to the Surrounding World

In African religion and ethics, everything in the world is intimately connected. For this reason, humans and the rest of creation have a dialectic relation. All the elements in the universe imply each other and interlock. One cannot touch one of them without causing the whole to vibrate. Humans are not only part of the cosmos, but they are also the summary of its totality, so to speak. “At the same time earth and sky, spirits and cosmic forces, past, present, and future, the human really is a miniature version of the universe, a microcosm within the macrocosm” (Mveng 1985, 12). In Black Africa humans belong at the same time to the world of the living, the dead, and the not-yet-born. They can identify with spirits, animals, plants, minerals. They know that between them and the cosmos there is a vital flux making up the solidarity of creation as a whole and ultimately connecting them to the supreme being, God, the source of all life.

Thus, in the traditional rites and in African medicine, one cannot simply talk of symbolic acts. They are much more about an encounter between life and life: on the one hand, human life, and, on the other, “cosmic” life (plants, minerals, etc.). In this encounter, humans attempt to decipher and to master the tension opposing life and death. If they wish to secure life’s victory over death, they must secure allies in the cosmos and identify their opponents. In this sense, for instance, the cosmic elements used in traditional medicine, even if they are minerals, dry wood, animal bones, etc., are not impersonal or inanimate realities. They contain and convey life to the one who utilizes them (Mveng 1985, 11–13). The transmission of vital energy, however, does not only concern the strictly medicinal realm; it is also about nature as a whole in relation to the abundance of life in all its ramifications. This explains the respect the African manifests towards earth, plants, water, etc.

As an illustration, there is a widespread practice in Africa concerning sacred trees. The Bahema of Congo-Kinshasa, for example, have the practice of the *figus*, which they plant on the tomb of the head of the family. This tree is sacred and represents the one who is buried there. Its branches symbolize the

deceased's many descendants. Thus, it represents the life of the family in the African sense. Consequently, it is strictly forbidden to desecrate the tree by cutting it down or by removing any of its branches, twigs, and leaves (Bujo 1996a, 77ff.).

There are many more examples of the importance of certain trees in the lives of African peoples. People's attitudes towards these trees prompt them to cultivate respect towards nature and to strengthen their vital ties with it. Such respect is not limited to one category of trees alone, as such trees are only the representatives of the cosmos in general. For a casual observer, this is primitive, irrational thought that perhaps goes against modernity and development, since for the Western rationalist world the cosmos no longer contains any secret and mystery. Those, however, attempting to penetrate African culture will marvel at its ancestral wisdom. The life–death tension is predominant in the world, and cosmic nature is a companion one has to associate with in order for life to triumph over death.

With this in mind, we must now tackle the issue of the invention and the articulation of ethical norms.

Elaboration and Articulation of Norms

Since community is of the utmost importance for African moral action, the elaboration of norms and their application can only unfold within the community's frame. In what follows, we will not be able to present at full length the way ethical norms come into being and unfold in Africa. We will be content to indicate what we take to be essential in order to understand moral action in Africa. To do so, we will begin with *palaver* (the African traditional council dealing with community matters) as an institution where norms are born and brought to bear. We will then examine the relation between communal action and personal life. This will imply a brief presentation of the concepts of person, freedom, and individual conscience.

Palaver as the Locus Where Norms Are Born

In order to understand palaver's role, one has to keep in mind the function of words in African communities. The word is powerful, and it contains highly explosive elements in Black Africa. A word can be medicine just as it can be poison; it has a life-giving power just as it is capable of bringing forth death. Words are something drinkable or edible; one chews and digests them. Badly chewed and digested, they can destroy the individual and a whole community, whereas in the opposite case they bring life (Bujo 1996a, 25ff.).

In this context, palaver functions as a time during which people reexamine the chewing and digestion of received words. First, there is therapeutic palaver, which is a dialogue between the traditional healer and the patient or his or her circle. As noted, the community is a collection of relations where everything holds and influences everything else. Therapeutic palaver aims at detecting the causes of illness or malaise in general, based on the articulation of the relations experienced in the community. Thus, therapy will not consist in administering medicines without taking into account the patient's life context, but the aim will be to return life to him or her above all by recreating a collection of more life-nurturing relations. To do so, the sick person, the doctor, and the community as a whole must hold a palaver where one manages together to digest the badly chewed and undigested bad words in order to deprive them of their

deadly venom and to give them vital and life-nurturing force. The administered medicines will be able to take effect only after good relations are restored.

Besides this therapeutic palaver, one ought to mention, second, family palaver, where people deal behind closed doors with the problems pertaining to the family in the African sense, that is, in its three-fold dimension of the living, the dead, and the not-yet-born. This form of palaver, just like the one concerning “supra-family” and administrative life (we will talk about this later) can be irenic or agonistic depending on whether it deals with non-contentious or contentious cases (Bidima 1997, 10). Family palaver is the foremost place where domestic ethics elaborates, grounds, reinforces, and develops. Family palaver covers a wide variety of topics because it seeks to contribute to the growth of the life of the family in all its dimensions. The problems it deals with can therefore be about sharing property, reflecting on which attitude to adopt in view of the future, appointing or removing a person responsible for a given area, tackling family feuds of all kinds – the list could go on endlessly. Even apart from contentious cases, family palaver aims at helping to maintain or restore healthy and harmonious relations within the community. In other words, it is about bringing together again the antagonists where there is strife in order for them to learn to listen to each other, and thus it is about managing to develop a new lifestyle where people are ready to support each other in the harshness of life.

Seen from this perspective, palaver also takes on the role of therapeutic and medicinal authority besides its ethical function: while it concerns itself with establishing or abolishing or strengthening ethical norms, palaver takes the individual in his or her dimension of totality and attends to his or her moral and physical health. No wonder, therefore, that most palavers, even the ones that are not related to family, end with a celebration of reconciliation around a meal, for instance, where everybody finds their way back to the initial fellowship.

If a family palaver fails to solve a problem, particularly in the case of a feud, the community can appeal to an extra-family or even an administrative palaver. This palaver is not just a kind of appeals court dealing only with cases beyond family authority. The supra-family and administrative palaver also takes up totally new cases concerning the good beyond isolated families. This palaver has a more political character and even applies to several clan communities. Here, too, we are not dealing exclusively with agonistic palavers but also irenic palavers, as defined above.

While the traditional doctor (male or female healer) and the family’s sage (the elder in general) are in charge, respectively, of therapeutic and family palavers, the situation is different with extra-family and administrative palavers. Here, the chief or the king, but also a member of the counsel of elders, can be the one who is in charge of the session when the palaver takes place. It is important to underline that at no time is the person who presides over the palaver allowed to be arrogant and authoritarian so as to humiliate or silence participants, male and female. On the contrary, he has to be attentive and ready to listen to everyone in order to discover the sapiential aspect of what they have to say. “Sapiential” also means that a palaver’s discourse uses poetic language, symbolism, proverbs, parables, stories, etc. What takes place in a palaver refers to life’s existential foundations, which these various kinds of language must translate.

One cannot help noticing a well-known difference from Western styles of argument. We have already seen how the African conception differs from Cartesian philosophy and its *cogito ergo sum*. It is *cognatus sum, ergo sumus* that is decisive in African ethics: “I am related, therefore we are.” This ultimately means that African ethics is not based on the concept of Western natural or moral law, but in the framework of the community. The community is actually the place where norms take shape. In all of this, life in its

widest sense is what functions as the hinge for the elaboration of ethical norms. Everything that contributes to maintaining, strengthening, and perfecting individual as well as communal life is good and right. Whether it is an ethical judgment on property, marriage, or sexuality, etc., palaver will determine if it is appropriate for life in abundance for all.

It is interesting to note the differences in argumentation that lead to the grounding and securing of norms in comparison with certain Western models. If, as an example, we take the discourse ethics of Habermas (1983, 99), anyone able to express themselves and to act is entitled to participate in the discussion. In discourse ethics, one can only have a discussion with people able to argue at a rational level. Concerning, for instance, the interests of children and of the generation to come (one can also add the dead and the cosmos), one could argue only in an advocative fashion, that is, speak on behalf of those unable to “reason.” African ethics based on palaver follows another procedure because it is not conditioned by rational argumentation so defined. If among Ghana’s Ashanti the rule is to exclude no one from palaver, this goes beyond the rule applying to discourse ethics. Even if discourse ethics talks of the unlimited communication community, in fact it is about a community of individuals endowed with intellectual capacities and able to speak (Ndjimbi-Tshiende 1992, 247). By contrast, the rule of the Ashanti (a rule similar to those of several other African ethnic groups) really embraces everybody, including the handicapped, even if they cannot express themselves at the level of language. They can, however, communicate and make themselves understood through symbolic actions and gestures, for instance. Such actions and gestures are of no importance for discourse ethics, whereas they can be decisive for palaver.

Another difference from discourse ethics concerns palaver’s religious dimension. God and the world of the ancestors are an integral part of palaver, whereas the argumentation of discourse ethics excludes them. Integrating God and the world of the ancestors does not deprive the palaver’s participants of their ability to be critical, but reason must not be turned into an instrument of oppression and omnipotence. In a world where the life–death tension prevails, truth can only be analyzed in an existential and sapiential manner; rational malice cannot manipulate it. Along the same lines, not only God and the ancestors are actively involved in palaver, but people also go so far as to include in it the cosmos as a whole. The Ashanti explicitly state that government agents and any behavior in the community must be consistent with the law of nature as well as with the ancestors. In palaver, one has to ensure that this rule is observed (Ndjimbi-Tshiende 1992, 246–247). For the Ashanti and for Black African communities in general, humans are really the synthesis of the whole universe (Mveng 1979, 234).

In addition, discourse ethics is content with grounding ethical norms, keeping them at the “formal” level without caring about their concrete application. In other words, it is more concerned with macro-ethical problems, and it is vague about micro-ethical questions that deal precisely with the applicability of “formal” principles to concrete cases of daily moral action (Bujo 1993, 33). By contrast, African ethics does not stay at the level of formal principles, but is concerned at the same time with the applicability and the application of the norms proposed in the course of palaver.

The dimension of sin is another characteristic radically setting apart palaver from discourse ethics. In an ethics where religious matters, God, and the ancestors play a predominant role, it is normal to ask about interpersonal relations involving faults, sin, and sanction. One will easily understand, therefore, that particularly agonistic palaver will usually end with a celebration of reconciliation between all the members. This is often the case with therapeutic palavers, too. In fact, the medicines the traditional doctor administers can only demonstrate their efficiency and restore health if there are good relationships

and harmony in the patient's community. Diseases often arise from tensions of all kinds between a community's members, who eat up each other's vital energy. Reconciliation contributes in a decisive way to restoring health to the sick and, by way of prophylactic measures, preventing other ills among still-healthy members (Bujo 1996b, 9–25).

So far, we have described only one type of Western ethics, namely discourse ethics. Another kind, however, is closer to African ethics. It is called communitarianism. Even though communitarianism is represented by several trends, it is nevertheless possible to bring out their common characteristics. Overall, communitarianism strongly opposes the kind of individualism that liberalism advocates. The criticism of liberalism by communitarianism's major representatives is that it has an atomistic conception of the individual: it does not place individuals in their original communities, that is, the context of their life environments (Reese-Schäfer 1994). An individual without ties to other humans, however, does not exist; this determines every human's way of thinking and moral behavior. One of the important consequences of this thesis is that one cannot formulate abstract ethical principles applicable to all humans of all nations and at all times. There is no *single* ethics; rather, there are several, according to the different communities that exist. Unlike discourse ethics, communitarianism emphasizes the ethics of "the good" (*bonum*, *euzèn*), which does not stay at a purely formal level, but tries to fill ethical principles with substantial content capable of orienting active subjects' daily lives.

If we compare communitarianism with African ethics, we find commonalities but also differences. Both models underscore the contextuality of the individual, who is always to be understood based on the community in which he or she lives and acts. Communitarianism and African ethics also merge with respect to *bonum*: they do not expound it only at the level of principle and without giving it a content applicable in concrete life. In Africa, this *bonum* revolves around the fullness of life.

These commonalities, however, do not erase important differences. Even if both models talk of community, one gets the impression that for communitarians the concept does not sufficiently set itself apart from that of society. Community is more organic than society, and society has a composite and artificial character because it proceeds from the will of individuals seeking a unity.

Western anthropology leaves a fundamental mark on communitarian thinking. It is true that communitarians strongly oppose the atomization of the individual and that they stress the bond between individual and community. Nevertheless, if one compares their conception of community with the African conception, it appears that, as far as moral action is concerned, the individual, though bound to environment and group, is not bound in his or her personal decisions to the extent of referring to his or her community. In other words, the community can shape the individual, but it does not accompany them in their personal dealings: ultimately, decisions belong to the private sphere, in which the community must not meddle. By contrast, in African ethics community is so important that one goes so far as to involve its deceased members in a decision to be made: this is not a passive attitude but, rather, an *active* participation of the whole community which must help the individual before, during, and after a decision in order to put it into practice – always as a community.

At the same time, the communal character of African ethics does not necessarily turn it into a kind of fiction and dogmatism but provides leeway for innovations and creativity: traditions that no longer encourage abundant life must be abolished and new ones must replace them. That is what palaver is all about. In addition, African communitarianism knows how to avoid ethnocentric paralysis in the sense that the various communities are not shut off from each other, they are not atomized entities, but they remain open to other cultural approaches and spheres. The best illustration of this is the *luba* conception

of Kasayi in the Democratic Republic of Congo, but it is easily applicable to other ethnic groups. As mentioned above, for the Baluba, every person is a “Muntu-wa-Bende-Wa-Mulopo,” a “human being from Bende who himself is from God.” Therefore, every human is from God and entitled to respect no matter his or her clan, ethnicity, or nation.

With regard to ethical questions, this means that norms have a universal character while remaining plural. Every human as an individual is required to encourage the abundance of life, but also to take into account each community’s characteristics and realities. This is precisely what African ethics attempts to do by using palaver in order to secure norms and put them into practice. This ethics, which has a sapiential character, cannot be confined to a narrow focus on particularity. By dealing with confined, contextual, and singular cases, it knows how to find rules with a universal dimension. The predominant approach does not consist in moving down from the universal to the particular. It is just the opposite. The universal is thus the result of a concrete and particular experience. In studying African proverbs, for instance, one realizes that what a sentence puts into words is the result of several concrete experiences which ultimately make it possible to reach generalizations applicable to everyone.

Although African ethics has some characteristics in common with Western models such as natural law ethics, discourse ethics, and communitarianism, it clearly differs from them in other respects. Above all, its relational character, in all its aspects – notably God, the spirits, the world of the living, the dead, and the not-yet-born, and even the cosmos as a whole – gives it its own originality.

However, another question arises. If community shapes so much of African ethics and if every decision and every implementation cannot take place without it, to what extent can one still talk of individual responsibility?

The Concepts of Person and Freedom

It is not uncommon to hear criticism of the influence that the group exerts on the individual. Some consider it to be inadmissible oppression that runs counter to human rights because of its failure to respect individual freedom.

Undoubtedly, unfortunate and deplorable events have tarnished African tradition. However, this tradition’s ideal should not be confused with such breaches, which must ultimately be corrected in the light of the ideal itself. Again, African morality is essentially based on interpersonal relationships. This means that there is no atomized activity removed from other humans who constitute a life community even beyond death. In this context, it is impossible to talk of freedom in the sense in which modern Western philosophy conceives it. Western philosophy sees the essence of freedom in each individual’s highly personal self-determination. This is the whole issue of Kantian morality and its keen sense of autonomy. This is also the central topic concerning individual conscience in Roman Catholic morality based on natural law. It is, finally, the whole concern of human rights activists who want to protect individuals from the tyranny of groups.

As for Black African ethics, since the individual can only exist within the “us,” it is impossible for them to fulfill their potential outside, beside, or against the community. In order to understand this conception, one must examine the notion of person in Africa. This notion is based neither on the philosophy of being (*naturae rationalis individua substantia*) nor on cognition (*cogito ergo sum*), but on a process that unfolds through the interdependence between the individual and the community, which comprises not only the dead and the not-yet-born but also the cosmos and God itself (Bujo 2001, 85–89).

This is what the principle of “cognatio” (*cognatus sum, ergo sumus*) expresses. What is peculiar to this principle is that the reality it expresses does not depend on the community’s consent or recognition in relation to the individual. It is something so existential and so fundamental that *not* abiding by it can only lead to the destruction of the individual and the community. The interdependence of both parties concerns more than the biological continuity and the spiritual heritage that relate us to each other or one generation to another. In the Black African conception, it is especially important to stress the uninterrupted interaction between all of a community’s members (alive, dead, and not-yet-born). Thus, to be called a “person” does not require an ontological membership but an active participation, not in the Western sense of “performance” but in the sense of mutual, interpersonal relations (“being-with”). In other words, individuals become persons provided and to the extent that they do not isolate themselves in their actions, but act together with all the community’s members.

Participation in this common life is so essential that even the dead depend on it for safeguarding the growth of their being as a person. Becoming a person is thus a continuous and perpetual process, which does not end at death. Personal identity in the beyond depends on ties to the earthly community and to the one still to come; it increases to the extent that from the beyond one lives in interaction and in harmony with the members of the three-dimensional community. If we look at it close up, this conception also explains the veneration for ancestors in Black Africa. Even if they can no longer suffer or die biologically, they continue to have certain human needs, such as hunger, thirst, love, the sense of justice, peace, etc. They can be worry-free in all this only if the community of the living does not forget them or cause them any harm.

In addition, in order to ensure happiness forever, continuity in the descendents has to be secured. For this reason, the not-yet-born occupy an important place in the community. The ancestors make it their business to watch over this continuity and to provide the living with everything necessary for their well-being. In case the ancestors forget, the living will remind them and complain about it, if necessary, by threatening not to bring them food or drink (Nsuka 1970, 264). A prosperous progeny is indisputably one of the conditions ensuring the well-being of all. Thus, one cannot ignore the not-yet-born; they already deserve to be called “persons” because, even before they take shape, they embody the living and the dead in such a way that they are the future and carry everybody’s hopes.

The articulation of community and individual must be seen as a chance for achieving and completing individual freedom. In Africa, if one cannot fulfill oneself as a person outside the community, individual freedom is possible only through participation in the community’s life within “being-with-the-others”: my freedom as an individual can only be real and total if I free the community at the same time. In the same way, the community as a whole can enjoy true freedom only if it frees me as an individual. Strong and abundant life for all is possible only in this continual interaction. Seen from this angle, African freedom is never conceived to be something that opposes the individual to the community. The golden rule, rather, is *the individual with the community so that all are with all*. In Western societies, one tends to see too much of the negative side of freedom, in the sense of freeing oneself from obstacles that prevent self-fulfillment. Freedom cannot only consist in *being free from*, but it is also *being free for* and *being free with*. This “being for and with” gives a further dimension to freedom, since it implies sharing life with all.

It is obvious that in a community where the individual must never exercise self-determination without taking into account other members, questions concerning individual conscience will not pose themselves as they do in Western morality. For some Western thinkers, the individual conscience is the ultimate decision-making authority and one must respect it unconditionally. In Africa, on the contrary, the

issue of individual conscience has to be discussed in relation to palaver, which is the place and the authority where the community reexamines the words hidden in each person's heart. These chewed and digested words must resurface in order to be ruminated collectively, so that they can prove their innocence. Even if chewed and swallowed, one does not know if the words have also been digested. If it is not the case, they could, if uttered rashly, destroy the community instead of putting it together. For this reason, it is palaver's task to control them and accept them only if they are able to give life abundantly. Ultimately, these tried and sifted words constitute the individual conscience. This conscience is the result of a process based on the ancestors' and the elders' experience, yet regularly subjected to a new examination.

The ancestors' words and deeds, the norms they set, are made available to the current generation so that it has life and continues to look after the deceased, and also so that it prepares the future of the not-yet-born. In order to have a clear conscience, it is not enough to know the ancestors' words and deeds, or the norms they set, and to apply this knowledge following a private decision. The community's regular evaluation becomes, so to speak, the norm, "normalizing" individual conscience. If this is the case, the individual conscience is not the highest court of appeal for moral decisions; rather, communal conscience, above all, measures and determines the individual conscience.

This conception of communal conscience is of immense importance because in the end it excludes the fundamentalism, based on privately internalized principles, whereby everyone can make their own decisions and commit acts which can go so far as to be seriously detrimental to the common good. Individual freedom that is not integrated into the community is a bomb that can explode at any time and cause tremendous damage. Based on the above example of conscience, individual freedom does not necessarily lead to personal fulfillment. It also contains a certain amount of tyranny against the community. Communal freedom, by contrast, if it is used in a controlled way, is a necessary safeguard against tyranny in the world.

The Relevance of African Ethics

In what sense is African tradition still of interest in the modern world? Is it a bygone tradition lost in the mists of time? On the contrary, African ethics is of interest to the modern world in at least three areas related to the three-sided community: the practice of human rights, questions concerning the elderly, and issues relating to abortion and euthanasia. In what follows we will not go into the details of these complex debates. Our presentation will be limited to very basic information (see Bujo 1998b, 36–53; 1993, 17–25).

Human Rights

The above reflections must make us attentive to another understanding of human rights. The Western interpretation, which begins with the individual, seems to have little impact on the African anthropological conception. Indeed, for Africans, it cannot be about absolutizing the individual's rights while neglecting the community dimension. Any right deserves to be called a right only to the extent that it does not lose sight of the common good. One of the typical examples is the right to private property. In Africa, the property of the individual belongs at the same time to the community as a whole. It falls to

the same individual to manage it well for the general good. In this connection, it is interesting to observe that in many African communities the notion of poverty is somewhat different from that in the Euro-American world. In Africa, the goal is not to possess things but to form relationships. One is not poor because one possesses nothing material, but true poverty consists in having no human relations, after having lost one's parents or other family members, for example. Even with regard to material things, the point is not to "possess" them in the Western sense but to have relationships with them. Certain African languages where the verb "to have" is missing express precisely that. So, in Swahili, one talks about "kuwa na" (to be with). It is the same thing in Lingala, which says "kozala na" (to be with). This relationship to material things primarily aims at promoting human relations. One sees how the right to private property in Africa must first focus on the community without neglecting the individual. Children's right to education calls for a similar argument. Children do not only belong to the parents in the Euro-American sense, but also to the whole clan community. The right to education must therefore involve this community as a whole and not limit itself to the parents alone. When in modern Africa one talks of human rights violations, it is absolutely necessary to take into account the context as we have just described it.

Issues Concerning the Elderly

In modern society, particularly in the West, young people no longer seem to be interested in the elderly other than as a burden to get rid of. Advertising praises eternal youth. As everything centers on profitability, the elderly are relegated to oblivion and anonymity, since they prove unable to perform as society requires.

The value of African tradition could usefully be reasserted here. In Africa the elderly are treated with great respect, and by virtue of their long experience are considered a source of wisdom. Even if they are no longer able to generate or bear biological life, they continue to strengthen and increase the life of the whole community through their great wisdom. When one talks of teaching through experience, it is not at all about transmitting technological knowledge, for instance, because younger people can be experts on this. The experience African tradition talks about is at a more existential level; this experience is what provides technology itself with its soul, so that it is not know-how devoid of wisdom. A technology devoid of wisdom is dehumanizing and leads to death. From the African point of view, a society that dispenses with the experience of the elderly ruins itself because it will not be able to identify the forces of life and death in the cosmos. Even supposing that an old person is mentally frail and unable to benefit others with their experiences, this does not degrade them to the level of a "negligible quantity." In Africa, everybody knows they are carried by the elders, even by those elders who are now invalids. We have life in its various manifestations thanks to them. Even if they can no longer hand down their wisdom to us, it is our duty to demonstrate our gratitude and to share with them our presence in order to increase their vital force on their painful path to the ancestors.

Issues Concerning Abortion and Euthanasia

The subject of the elderly closely relates to discussions about the beginning and end of life. Stormy debates on the status of the embryo reveal many divergent opinions on the determination of the precise moment one can begin to talk of a *person*. The various arguments often hinge on the determination of symptoms

indicating cognitive potentialities and other identifiable human performances. In this sense, one talks of the appearance of the “large brain,” which is supposed to be a sign that the embryo has evolved towards an “autonomous” human being.

In the African tradition, it would be futile to look for such a debate. If interpersonal relations make up the person, it is appropriate to determine on this basis whether or not the embryo enjoys the status of an individual human person. For a traditional African, there is no doubt that a fetus or an embryo is steeped in interpersonal relations. He or she belongs to the world of the not-yet-born and is fully integrated into the community of the living and the dead. The fetus or the embryo lives and is encompassed within the love of the visible and invisible community. He or she is the hope of the living and of the dead, who survive in him or her, not only on the biological level, but also as he or she enriches the community in every way to increase life in the broad sense of the word. In other words, the fetus or the embryo, still incapable of providing services, is the ancestors’ messenger, and he or she connects them with their descendants still on earth. Seen from this point of view, there is a continuous interaction between the living, the dead, and the not-yet-born, and this too constitutes the embryo as a person whose life must absolutely be respected.

In close relation to this issue is the case of the dying. The discussion which dominates the Western scene as far as euthanasia is concerned does not exist in this form in most of the African traditions. In Black Africa, caring for the dying is crucial. “Caring consists in staying in living touch with the dying person and in conveying to him or her the feeling that he or she is still someone even in this condition, where his or her physical strength abandons him or her,” and that he or she keeps developing as a person through his or her pain (Bujo 2002, 19). Dying persons restore their being as a person through interpersonal relations with those caring for them, but in turn, the sick and the dying help the people around them to become aware of their own personality, with its highs and its lows. Thus, through the way they accept their suffering, the sick and dying contribute to the edification of the living, whose personality grows, too. Thus, a dying person’s sickness and last days are a chance for everybody, the sick and the dying and those caring for them, to enrich each other and to become even more conscious of their respective identities.

If one refers to this African conception, euthanasia as it is understood in the West, far from protecting human rights, in fact violates them because it annihilates a person’s identity. In its original meaning, euthanasia should consist in helping the dying to feel accepted by his or her family circle, as the African tradition tries hard to do.

Conclusion

Our study is only an overview, which by no means claims to exhaust the ethical questions in Black Africa. From what has been said, however, it appears that African ethics has its own logic, which deserves to be respected in intercultural and interreligious dialogue. At a time when the world centers on globalization, denying African culture its identity and wanting to level it to a monoculture or a global ethos, are a kind of neocolonialism, African ethics aims to promote life in abundance. This is possible only if one respects diversity within cultures. Far from being an impoverishment, diversity is an unprecedented chance and treasure, whereas globalization is a cultural cloning seeking to impose a monoculture, which can only be dictatorial and oppressive. By contrast, the world will be able to enhance life and find peace only if we respect the plurality of the cultures in dialogue with each other.

CHAPTER 85

Trajectories in African Ethics

Laura S. Grillo

When confronted with conflicting demands, inexplicable contradictions threatening the integrity of one's worldview, or faced with the moral uncertainty that contradictions elicit, recourse must be made to moral deliberation in which one's actions are consciously evaluated and determined by principles and priorities. West African religions offer such a discipline in the form of divination, a process that invites reflection on personal actions and their consequences, and consideration of their place within the dynamic patterns of cosmos, not just as a backdrop of human action, but as an integral and determinative part of it.

West African Divination: Moral Philosophy and Ethical Enterprise

By common definition, divination is a technique used to determine the future and to make authoritative pronouncements about it. In the context of West African religious traditions, this is not its primary objective. Rather than merely projecting the future, divination inquires about the significance of the present. Its aim is not prediction, but diagnosis. Divination is sought at moments of crisis, when a person becomes acutely aware of a disjunction between an ideal model of reality and the experience of human existence, when what "is" does not conform to what "ought" to be. Clients come to diviners when confronted with the disquieting experiences of disease, conflict, and inexplicable misfortune to ask, "Why me? Why now?" The divinatory inquiry never yields an unambiguous answer, but presents its finding in the form of another puzzle – a cryptic message encoded in the cast of the diviner's accoutrements (sticks, shells, seeds, bones). Its interpretation draws the client into a reflection about the self in relation to others and to one's own hidden desires. The divinatory consultation invariably culminates in a prescription for a sacrifice, that aims at reestablishing a dynamic equilibrium among individual, society, and cosmos.

West African religions are not concerned with salvation but are focused on health, fecundity, and power – the forces that sustain life and community. These are the values that constitute "the good." The purpose of a divinatory consultation is to root out the source of suffering and alleviate it, restoring social harmony and physical health. These are understood to be mutually dependent and sustained by the ancestors, the guardians of the moral order.

Divination is therefore at the core of a coherent religious system and operates as a pivotal institution. It brings ultimate meaning to bear on the troubling events and circumstances of its clients' everyday

lives. Its techniques subject seemingly random experiences to the framework of cosmic order elucidated in myths, and show them to be the reiterated patterns of precedent established by ancestors and culture heroes. For example, in the practice of Ifa, the renowned Yoruba divinatory system, the diviner (*Babalaow* or “father of secrets”) recites a verse (*odù*) correlating with the pattern cast by a random throw of cowrie shells. These verses relate how, at the founding of the world, the divinities or other mythic persona resolved dilemmas similar to those facing the client. The sacrifices they performed then become the clients’ prescriptions for action in the present. Divination demonstrates that the archetypal actions effected by the primordial forebears still reverberate in the microcosm of the created world and echo in the lives of contemporary humanity. It is premised on the notion that “every concrete being is implicated within the whole [cosmic] system [and it is divination’s] reading of the signs that defines this system” (Bastide 1973, 34). Divination is first and foremost a highly pragmatic enterprise. It addresses the immediate and pressing concerns of actual life crises and decisions.

Like ethics, divination addresses the interface between a system of values and the contingencies of experience to which it must be applied. The work of divination is not about articulating the principles and propositions of a moral philosophy, but rather about applying discrimination and discernment to concrete moral problems. Participation in divination and the practice of ethics alike require more than mere conformity to cultural standards of good and evil, right and wrong. Both call for a deliberation of the subtler question of how to apply principles in support of the right and good to the exigencies of everyday existence, and how to adjudicate experience in light of these ideals.

In what follows I first present two well-known cases of West African divination. Arguing that these ritual practices epitomize ethical engagement, I will underscore how divinatory participation demonstrates two key aspects of ethical agency: *responsiveness* (to the immediate contingency of experience and the human beings involved) and *responsibility* (to critical values about good and evil and to social commitments to forge a personal destiny in keeping with these values). To consult a diviner, a deliberate action that invokes personal deliberation on one’s most heartfelt desires, hidden motives, personal accountability, choices, and their ramifications, is to practice ethics. The ambiguity of power – spiritual as well as mundane – makes deliberate ethical agency all the more necessary. This inquiry will allow us to trace current trajectories, showing divination to be a vital strategy for coping and for asserting moral purpose.

Dogon of Mali: Responsiveness to Cosmic Dynamic

Dogon divination is generically called “divination by the Fox” and includes the reading of actual fox tracks left across a divining table that has been traced in the sand. The origin of this practice is reflected in Dogon myths.

According to Dogon cosmogony, Amma’s first attempt to create the world failed (Griaule and Dieterlen 1965; Pelton 1980). The elements remained stagnant and sterile. Amma set them into motion by emitting the vibration of his first word. This churned the elements within the cosmic egg to form the original pairs of twin primordial beings. But the world as we know it was created in response to the restless determination of Ogo, one of these beings. The impatient Ogo broke away prematurely from the cosmic egg (or womb), tearing away a piece of the placenta which he scratched and stretched to form the earth. Next, he stole some primordial grain which he used to attempt to create a fecund world of his own making. When

this failed and without his intended twin partner, Ogo attempted intercourse with a mound of this placenta-earth, but still failed to produce fecundity. At every turn Amma intervened to thwart Ogo's rebellious efforts. The havoc that Ogo sewed upon the intended cosmic order nevertheless gave shape to the world. Rather than destroying the mutated universe, Amma repossessed the new creation by consecrating it through sacrifice. Then, to ensure the ongoing manipulation of the cosmic elements and the earth's fecundity, Amma created human beings.

In creating men, Amma began with the formation of the clavicle. Its resemblance to a hoe alludes to their purpose on earth – to work the fields and cultivate grain. Agricultural labor recreates the original generative act, Amma's stirring of the first elements. Ultimately, to punish the ever-subversive Ogo, Amma reduced him to the abased form of the fox, Yurugu. But in a last magnanimous gesture, Amma granted Ogo the favor of serving humanity as the bearer of divinatory pronouncement. Because the cunning and duplicitous Ogo-Yurugu, as the mediator of divinatory "speech," retains an important measure of generative power, it is said that he "stole speech" from Amma. Just as Ogo tore and stretched the cosmic placenta to create the earth, the Dogon diviner etches into sand the table of signs, called *kala*, literally meaning "torn." The table represents the world and each person's situation in it. Once the tracks of a fox's pawprints are found traced across these tables, the divinatory interpretation begins. So Ogo, the trickster, is the inaugurator of divination and in the form of Yurugu the fox, is its herald.

From this mythology about the mutually dependent origins of cosmos and divination, we see that Dogon divination cannot provide a simple code for behavior, since its founding mediator is the unpredictable trickster. And precisely because this mythology does not represent a totalizing view of cosmos as fixed and determined by a High God, Dogon divination does not offer a vision of a preordained order either. Instead, from its very inception and by its practice, Dogon divination recognizes that the cosmos is characterized by change, by inexplicable ruptures of order. Full of moral vagaries and indisputable transgression (such as Ogo's incestuous relations with his placenta/Earth-Mother), the myths offer no overt prescription for moral action, nor even a didactic warning against the violation of norms. Instead, the repercussions of Ogo's behavior are extended into the present through divination.

The fact that divination is mediated through the unreliable and deceitful Fox can be interpreted as an implied commentary on humanity's precarious situation within a world of constant permutation. Actually, the anomalous figure of this trickster may be considered an ideal foil for provoking moral reasoning. Through his play with boundaries and mischievous exploration and transmutation of reality, tricksters comment on all forms of social and cosmic order, including moral order. For this reason, Dogon divination does not offer a facile solution to a client's problems, but an opportunity to puzzle out choices and their possible ramifications.

In seeking signs and guidance from within the phenomenal world, Dogon divination is responsive to the symbolic coherence within creation as well as to the creator from whom it is indivisible, for Dogon myth makes clear that Amma is the cosmic egg and the vibration from which all creation derives. Moreover, the mythology points to the ongoing *responsibility* human beings bear as determining agents of Amma's dynamic world. It suggests that without the deliberate, ongoing manipulation of the elements, the earth would remain as stagnant and sterile as Amma's earlier, failed attempt at creation. From this view, human beings are charged with an ethical duty of cosmic proportion. Both cosmic and social well-being depend on the fulfillment of their duty in sustaining the fruitfulness of its patterns and rhythms. Therefore, divination can be understood as an ethical act, for the working harmony of the cosmos ultimately rests on a vigilant participation in the dynamics set in motion at the primordium.

I have characterized Dogon divination as evincing *responsiveness* to the coherence of a cosmos, underscoring that this natural world is a milieu in which human action figures significantly as a force that sustains its creative dynamic and therefore “the good.” In the discussion of Yoruba divination that follows, we focus on the active engagement of *responsibility*, and divination as the means of negotiating moral identity and forging ethical agency.

Yoruba of Nigeria: Negotiating Moral Identity and Ethical Agency

The ancestors feature prominently in traditional African religions as the guardians of moral order. They ensure conformity to standards of social behavior and enforce moral obligations by inflicting misfortune or suffering upon living kin who transgress these norms. While troublesome and sometimes even serious, such affliction is not considered an “evil,” but chastisement aimed at correcting immoral behavior. It is through divination that the specific wishes of the ancestors can be discerned, and it is through the sacrifice prescribed by divination that they are appeased: “Yoruba religious practice depends on two factors, descent and divination. In combination they produce a very fluid religious system” (Drewal and Drewal 1983, 247). Interestingly, the ancestors are not concerned with ethics in the sense of personal virtue. The moral order is a responsibility that humans bear for the proper functioning of the whole, but adherence to the good does not ensure personal reward but life itself. Moral problems are posed less as a choice between good and evil than an alternative between life and death (Thomas 1982, 141).

Where the natural order is viewed as a moral order, events cannot be considered to occur at random. They happen in order to promote an ethical purpose and the distribution of rewards and punishments. Further, from such a perspective, all circumstances and experiences are morally significant (Shweder 1991, 157). However, it does not appear that there is *always* such a clear-cut correlation between moral rectitude and the facts of life in West African systems of thought. Not all suffering and misfortune can be ascribed to the neglect of duty or the sanctions of the ancestors. There is also an acknowledgment of scandalously unjust reversals of fortune in which the cause is not a moral failing of the sufferer. One explanation offered is a bad prenatal destiny, a choice for which the person is not truly deemed accountable but must nevertheless struggle. However, when projects fail despite all efforts and precautions or when health inexplicably shrivels, such meaningless suffering – the essence of evil – is traced to the malevolence of witches. The concept of “witch” in West African traditions is a complex one. People identified as witches are often those who display anti-social sentiments such as anger or jealousy, or whose behavior conveys that they are too self-sufficient: they are reclusive, arrogant, or ungenerous. Not only is it possible that the wicked may prosper, but indeed, inordinate prosperity is suspect as an indication of witchcraft! The source of evil is located in the human world, and lurks in the heart of the hidden person (Marwick 1987, 424). It is diviners who can identify the witch plaguing a client and who, on occasion, may cause the accused culprit to confess and relent. Diviners and witches are often represented as opposites and agonists: witches operate in darkness and secrecy, diviners practice by day in public places; witches veil their activities and obscure their power, the diviner is to serve as a medium of revelation so that the invisible can be given form for all to see; witches intercede to cause sickness and impede success, diviners intervene to diagnose illness or the cause of misfortune, prescribe remedy and protection, and promote the flourishing of destiny.

A closer look at how people use the term “witch” and conceive of witchcraft reveals that in fact an opposition between “diviner” as a force of “good” and “witch” as source of “evil” is too simplistic. Most traditional African societies hold to the belief that certain people are able to use supernatural means for their own ends. Their power is great, but ambiguous. It can be used for good or evil, to protect or destroy life. Yoruba tradition maintains that life-sustaining “power” (*ase*) is an ambivalent force. Its ambivalent nature requires that it be harnessed by culture for the greater good (cf. Drewal and Drewal 1983). So witches derive their power from the same supreme creator god who invests the entire cosmos with its creative impulse. Witches choose to exercise it for evil (see Abimbola 1977).

Many interpreters of African cultures offer a socially pragmatic basis for belief in witchcraft, emphasizing the frustration and aggression that arises within the restricting conditions of a “closed society,” one that relies on harmonious relations. Fear of accusation and its repercussions ensures that standards of appropriate moral conduct are scrupulously maintained. However, the ramifications of both accusations and confessions of witchcraft belie this explanation. Rather than serving to alleviate hostilities, the identification of a witch usually increases social tension. Adherence to beliefs in witchcraft actually undermines moral behavior, since it encourages subterfuge and suspicion about others. Belief in witchcraft, in other words, entails a moral system that acknowledges the existence of moral ambiguity and the ambivalent and hidden quality of personal motives, and calls for a process that will attend to these more complex problems.

Because power is ambiguous, the potential for witchcraft is understood to be innate and unconscious. The election of divination as a means of confronting one’s hidden motives is an ethical act, for it ensures the proper and responsible direction of personal destiny. The Yoruba recognize that evil intentions are not readily apparent but belong to that occult dimension of the human being to which only divination offers access. “God forgot to split the feet of a duck, and a crane uses its leg as a tail; but no one can recognize the footprints of a cruel man” (Clarke 1939, 249). Divination is a means to explore otherwise unexamined motives and hidden dynamics that reveals one’s moral “footprint.” Moreover, divination strengthens that inner core of deliberate intention that provides protection as well as moral resolve. Abimbola represents the Yoruba approach in this way: “When a person is troubled by the *àjé* (witches), he is encouraged to call on his own *ori* [literally, ‘head,’ the seat of the self and personal destiny revealed through divination] which he chose for himself shortly before he left *òrun* (heaven) for the earth” (Abimbola 1977, 82). Sacrifices are made to the *ori* to promote the flourishing of destiny, for the type of *ori* chosen before birth – the very nature of one’s destiny – remains unknowable, a mystery that can only be guessed at the end of one’s life (Abimbola 1973, 87). It is left to each person to make every attempt to enhance the full potential of his or her allotted destiny through wise choices and proper action; and for this, divination is an essential guide.

Every divinatory inquiry entails an implicit awareness of the competing interests of the public persona and the inner self. The tension between individual and collective, inner and outer self is an ethical dilemma, and while it can never be finally resolved, the ongoing permutations in the dynamic can be negotiated. While clients of divination may come with personal decisions and seemingly private ills, the process necessarily calls upon clients to “formulate and continually revise their moral identity,” that is, one established in concert with that of the community, both social and spiritual (Johnson 1993, 126). In order to resolve a dilemma, divination situates the individual within the nexus of relations.

In calling upon the client’s sense of responsibility to self and other, divination radically contests a view of a moral person as essentially an atomistic, rational ego, applying universal principles or absolute

mandates uniformly. Divination involves an ongoing negotiation between individual and society, and rests on the assumption that no absolute moral law is universally viable. Furthermore, it undercuts the view that “traditional” societies enforce a univocal decree of requirement for action.

Trajectories for West African Ethics

In the context of West African traditions, divination is the core of a pragmatic religious system. In the ethnically heterogeneous context of the city, though, diviners and their clients do not necessarily share a common ethnic origin. Here, divination cannot rely on standard conventions to make its practices coherent and persuasive. There is no common mythic model upon which experience can be predicated and the ritual cannot necessarily exploit a common symbolic lexicon.

Nevertheless, in the West African metropolis of Abidjan (Côte d’Ivoire), amid skyscrapers and traffic jams, diviners are, in fact, very present, strategically placed on street corners and in marketplaces, or operating in recessed courtyards and consulting rooms off bustling streets. Clients come with their most pressing concerns, confident in the efficacy of divinatory techniques to cast their misfortune into manageable terms. The lively presence of divination in Abidjan (as in other West African cities) is an indication that such ritual is not a thing of the past but vividly relevant in the contemporary scene. Extracted from the traditional milieu, does urban divinatory practice still operate as an ethical system in which responsibility and responsiveness are critical components?

The indigenous population of Côte d’Ivoire is comprised of over 60 distinct ethnic peoples. In addition, the long-term political stability and relative economic prosperity drew immigrants and refugees from all over West Africa. The techniques of urban divination are as varied as the many ethnic neighborhoods that comprise Abidjan. While traditional practices flourish, signs advertising clairvoyants and “consultants” who use palmistry, astrology, or tarot also lure the urban clientele. The impressive array of alternative divinatory techniques being practiced in Abidjan strikingly represents the kaleidoscopic quality of religiosity in this city in creative flux and recombination. The prevalence of divination in Abidjan reflects the urban plight even as it provides clients with a means of addressing the acute distress that a modern metropolis engenders. Clients are compelled to seek out divination in light of the social dysfunction of “under-development” and the alienation of the city. Urban diviners are often themselves economic refugees, no longer functioning as ritual specialists in the service of community, but as paid professionals who cater to a clientele of individuals. The promising talents of diviners advertised on billboards are presented like other commodities on the market. The practices reflect the capitalist and individualistic milieu in which they now operate.

These trends do not mean, however, that the ritual process has undergone degeneration to the degree that it no longer holds value as an ethical enterprise. While there is no effort on the part of diviners or their clientele to appeal to an entire, cohesive tradition, urban divination is genuinely grounded in its traditional techniques, and these have always been innovative and adaptive. Even the most consistent of divinatory systems, such as Ifa which requires that every diviner undergo rigorous training and ritual initiation before being admitted into the coterie of specialists, has always included innovation. For example, Ifa diviners invent new *odù*, interpretive verses associated with the ideograms cast by the random fall of kola nuts (William 1966, 408–421). This seems to defy the common assertion that the verses constitute a fixed canon of the Yoruba divinatory technique. Moreover, many traditional divinatory

forms exist in which there is no systematic interpretation of signs. Diviners readily admit that even among those who use identical techniques there is no consensus about the meaning of the patterns cast, and that the rules of interpretation are few. What is consistent and authentic in both traditional and urban contexts is the appeal to the practice of divination itself and to the underlying premises that support it.

Contemporary clients continue to perceive a need for protection and release from the tyranny of invisible forces, for even in the city there persists the conviction that, along with the empirically demonstrable facts of underdevelopment, it is the elusive powers of spirits, witches, and spells that undermine life. Divination provides a sense of empowerment by enabling the client to consider the crisis at hand from the overarching vantage point of cosmic dynamics. It allows the client to envision possibilities for control and relief to problems that might otherwise remain beyond the purview of his or her ability to act (see Jackson 1989). As Guedou Joseph, a practitioner of Fa from Benin put it, “God says, ‘get up and lift your heavy load and I will help you load it onto your head’ [where it can be carried]. When you make sacrifice you lift your burden, and God places it on your head.”

Urban divination offers clients a critical alternative to Western, materialist appraisals of the problems of modernity that plague them. Rather than capitulating to the economic rhetoric of development theory to explain the inevitability of the paucity of jobs, the lack of access to adequate healthcare, corruption, bureaucratic mismanagement, and other facts of daily existence, urban West Africans turn to divination as an explanatory frame. It asserts that circumstance must be interpreted in terms of less tangible realities and that destiny must be negotiated accordingly (see van Binsbergen 1995). The potent appeal of urban divination is that it revivifies underlying precepts and values, even as it asserts an alternative interpretation of the miseries that plague the typical inhabitant of the city.

In the urban sphere ancestors play a significantly reduced role. They are neither the source of divinatory messages nor recipients of propitiatory offerings. Rather, it is personal spirits, more anonymous and nebulous, who intercede in the negotiation of destiny. Urban divinatory prescriptions are more individual and therapeutic than political. For example, rather than being asked to sacrifice a goat in a public ritual and distribute meat to relatives involved in a dispute, a client might be asked to wash her face in milk, and leave a kola nut at a crossroad. Furthermore, urban diviners repeatedly assert that a client makes sacrifices not to appease either personal spirits or ancestors, but rather to empower his or her own soul or spiritual double. At first glance, this adjustment seems to reflect adaptation to the anonymous urban situation, where moral precepts can no longer be sustained by adherence to traditional values or community life. However, it is ultimately no different from the Yoruba appeal to one’s own *orí*, or “head,” as the seat of personal destiny that must be propitiated in order to properly unfold. Divinatory sacrifice is so pervasive that beggars install themselves at busy crossroads where they are certain to secure daily alms. Reinforced by mutual good will, sacrifice elicits a visible acknowledgment of a trans-ethnic African identity. It binds the hybrid population into a visibly coherent moral community.

By validating the reality of essential common postulates like witchcraft as the source of evil and the corrective power of sacrifice, divination has contributed to a popular sense of transnational affiliation across political boundaries. These “traditional” notions are increasingly becoming the hallmarks of a “new amalgam” identity which is clearly being forged today among urban West Africans from various countries, who readily assert that there is no difference among them (Jules-Rosette 1979, 226). This new sense of identity does not fall back on the largely bankrupt notion of citizenship that has had little to offer contemporary Africans whose nations are rife with civil wars, on a continent where the extent of

refugee migration lends new meaning to the term “African Diaspora.” The highly visible and vital practices of urban divination rely on a worldview that transcends ethnic boundaries and reinforce an ethos that binds and sustains community. Divination redefines problems in terms of a familiar interpretive framework and transcribes the dynamics of power into idioms that have currency across West Africa. Drawing on this overarching schema, urban divination represents a vital link to the indigenous religious world of meaning even as it shapes contemporary social reality.

In the urban situation every instance of divination is a deliberate undertaking, for it is the client who decides to initiate an inquiry. The client retains a large measure of control over the entire ritual process, from the choice of a diviner to participation in the interpretation of the signs, including the decision whether to accord it any authority at all. No prescription is enforced. It is up to the client whether to perform the recommended sacrifice, or to ignore the prescription and perhaps consult yet another diviner. Thus, divination calls for a constant appraisal of the choices and ramifications of action open to its participants. At the same time it provides for the kind of deliberation and decision making that give principled direction to action. Ultimately, however, divination recommends the individual to the community through sacrifice. In this way the divinatory process straddles the stereotypical thought/action dichotomy in an important way. Its ritual is not an unreflected exercise of repetition, and its foundational beliefs are not unquestioned. Instead, through divination, belief is exercised and practice is deliberated.

In the alienating context of contemporary urban life, where the negotiation of daily existence is increasingly difficult and unpredictable, divination is perhaps more critical than ever as a mechanism by which a sense of communal identity and moral purpose can be asserted, and a sense of personal agency is grasped and affirmed. This makes it easy to predict that divination will certainly continue to assert itself as a critical component of urban life and a vital affirmation of what may be considered a distinctively West African ethic.

8 Religions of the Americas

CHAPTER 86

Indigenous Peoples

Vine Deloria, Jr.[†]

Religion as a distinct and separate activity of life does not exist for most indigenous peoples. They are a wholly empirical people, deriving their understanding of life from their experiences and the traditions of previous experience handed down in stories and practices. They formulate a general perspective on the rhythms of the natural world and derive practical principles to serve as guidelines for human behavior. From observation they know that everything in the universe has life and they set as their goal achieving a knowledge that will enable them to blend with other forms of life within the cosmos. They do not, as a rule, distinguish between things wholly physical and intangible experiences that we may call fantasy, hallucination, or even spiritual revelations. Dreams, apparitions, and unusual events that they may experience in the course of living are regarded as essential elements in their lives, a valuable source of information that can be obtained in no other way. Yet in their daily lives much care is taken to distinguish between purely secular behavior and the unusual event that reveals the sacred dimension of life.

This entry explores the moral outlook of indigenous people in North America. Of course, one must realize that crucial distinctions among these communities and other indigenous people around the world would need further attention. Yet by drawing on the resources of Native-American tribes, the wisdom and also present challenges facing indigenous people can be discerned and explained. The entry concludes with the threat posed to these peoples.

Moral Identity and Moral Order

Concern for moral identity seems to be grounded in the conception they hold about the creation of the world. Yet even in the simplest stories of the creation event one finds that the narratives are already structured by a sense of morality and purpose. The Creator and his/her assisting spirits are already bound to respect certain limitations on the exercise of their powers. We often find the kinship patterns directing the behavior of the major divine actors in the creation drama so that the universe cannot exist unless there is already an orderly structure within which the supernaturals can act. These relationships are not restricted to humans, but assist in defining the manner in which birds, animals, and other forms of life behave and relate to each other.

For an impressive number of indigenous communities, humans are regarded as the last creatures to be created. The other creatures have already arrived or have been created and know how to live in the

[†] Deceased.

physical world using the special talents and knowledge given them before humans enter the picture. Sometimes, without any antecedent, the birds and animals themselves create the world or act as cooperative partners with the spirits to do so. We are, therefore, the junior members of the web of life and we must learn from all other creatures. Some of the songs of indigenous peoples recite and celebrate the strength and knowledge of the animals, the wisdom of the birds, the rhythmic growth of the plants, and other attributes in which other forms of life have faculties superior to our own.

A primary talent, it seems, of indigenous peoples consists in the ability to describe the cycles of life experience in spoken words and ceremonies that express what all creatures feel at a given moment. We can also reflect on the nature of the world and seek cooperative relationships with animals and plants that enable them to reach their highest possibility of fulfillment. Our role becomes apparent to us when, in a great catastrophic event, such as an earthquake or flood, we find the birds and animals coming to us, looking for guidance and safety, as if we were capable of resolving the crisis.

The other creatures provide us with examples of how to live in different landscapes as individuals, families, and groups of families. By watching how birds and animals feed themselves we can find food in the most obscure places. The Sonoran desert of Mexico and southern Arizona, for example, appears to be without redeeming qualities as a food supply, yet the Indians who lived in the area knew over a hundred plants that were nutritious and edible by closely observing what the birds and animals ate and, most important, when they harvested their food. In the deep forests, adopting the diet of the bears and small water animals led to the discovery of edible foods and medicines. We have always relied on the examples of other creatures to show us how to live productively on the earth. Today, these practices are being formalized in a new science, zoopharmacognosy, the effort to learn how animals use different roots and plants to cure their illnesses.

Indigenous peoples particularly noted the social behavior of other creatures. Buffalo, for example, graze in certain set patterns with the adult bulls in advance of the buffalo family, younger males always on the outside of the family group, and the cows and young calves in the center. In the harshest blizzard the buffalo will form a wedge with the older animals on the outside of the group, the younger in the center, with the animals most in jeopardy from the blizzard changing places occasionally so that no single animal must bear the brunt of the icy wind beyond limits of endurance. In migrating, this pattern is always used so that the younger animals are protected from predators. When an individual is injured, buffalo – like elephants and other animals – gather around and try to assist the stricken member of the family. The Plains Indians copied this pattern in their hunting migrations with but one change. The elder men having experience and powers led the tribe so that their advice could immediately be sought should trouble occur.

While some animals seem to cede the leadership of the group to the male who demonstrates physical superiority, the real leader of the herd or group is not always the strongest male but often the male that has some kind of charismatic status within the herd. Close and continued observation of a herd can reveal this nearly hidden phenomenon. From this behavior we learn that in the animal world it is the appropriate behavior, considering all conditions, that provides the real leadership. We also learn that animals on the outside of the herd or on the edges of the prairie dog town are sentinels or scouts whose duty it is to alert the group in case of danger. Many indigenous peoples pattern their social and political activities after these ways of the animals, and often they come to believe that they and the animal are one spirit because they can harmonize with the animals so well. One level of their moral vision is that of *imitation*.

Moral Understanding and Interspecies Communication

Mere imitation is sufficient to ensure that humans fit into the environmental food chain with the animals. But the question arises how the non-human creatures *know* the things they do. How do their actions and reactions mirror the experiences we have? How do they have the same kinds of emotions, love, loyalty, jealousy, and sacrifice that we have? Do we gain their knowledge only by imitation or is there another way to establish a personal relationship with other forms of life? Eventually, indigenous people concluded that other creatures were peoples also, distinguishable from us primarily by a different physical shape and apparent destiny but capable of enjoying a great variety of emotional experiences that we recognize in ourselves.

Here the quest for a better understanding, the distinctive characteristic of our species, comes into play. Indigenous peoples sought to learn the most closely held secrets of the birds and animals, so they spent a great deal of time watching them and meditating on what they had observed. How did animals respond to certain life-threatening situations? How did they protect their young? How did the burrowing animals store food for the winter? How could animals identify minute changes in the weather and take precautions long before humans became aware of the changes? Often, meditation laid the groundwork for an encounter with a bird or animal. In dreams, animals and birds might appear and give humans a song, instruct them in how to gather medicines, or offer to provide protection in dangerous ventures. These communications were as real as if they had been experienced in the secular daytime event. They were always empirically verified when the human sought to make use of the information given in a dream.

The understanding of the nature of the organic world is radically changed when a bird, animal, or plant speaks to a human. While this event could occur in dreams or visions, it was also possible to encounter another creature during the daily chores and receive instructions that could immediately be put into motion. A woman might be out gathering roots and berries and hear a voice calling to her, a voice she had never heard before. After searching diligently to locate the source of the communication she might find a plant that she had not known previously. The plant might express its desire to help her. It might tell her how to harvest its fruit, how to make it edible, or how to prepare a broth or soup for nutrition or medicinal purposes. There was a berry bush on the Great Plains that produced sweet berries when approached downwind but sour berries when the harvester approached upwind. Such a radical change in the usefulness of the fruit of the plant might be discovered accidentally, but it also might be part of the instructions given by the berry bush.

In most episodes of interspecies communication, the non-human participant tells the human that he or she has been under observation for some time and has proven worthy of the bird or plant's friendship. The human must have shown a morality consonant with the morality of the cosmos, a morality recognized and cherished by other creatures: the practice of showing respect for the non-human. The non-human therefore trusts the human to use its knowledge or assistance in the proper way. At the deepest level of life, and with a strict adherence to the cosmic order, other creatures seem to have a great affection for us and are always ready to communicate with us. If we are worthy in their eyes, they adopt us.

Countless stories describe how humans came to have a natural technology through the intercession of non-human beings that taught the humans how best to use them or call upon them. Thus, the cedar told the Pacific Northwest peoples how to make canoes, the ground turnip and camas root told the women how to harvest and cook them, remembering always to place a pinch of tobacco in the hole where they had once taken root. Squash, corn, and beans, the Three Sisters, told the Iroquois that they must be

planted together if they were to blossom and bear a plentiful harvest. The cottonwood told some young boys to advise their parents to use its leaf as a pattern for the tipi. The buffalo told the Blackfeet to change their way of hunting lest their numbers decrease and they disappear.

From Imitation to Participation

At the stage where there is interspecies communication the morality that had once existed at the level of *imitation* now becomes a *participatory morality* in which humans and non-humans are fulfilled. The occasional confrontation with the non-human beings proved such a benefit that the people looked for other ways of opening themselves to more communications with the other creatures. This desire was expressed in the practice of the vision quest, which became almost universal among indigenous peoples in North America. Here humans humbled themselves before the living universe, fasted for days asking for guidance in the life ahead, and sought friendship with whatever creature might take pity on them.

During this experience the petitioner might simply hear a voice announcing that the higher powers were pleased with the human's effort and encouraging one to live a good life. Sometimes an animal or bird would tell the human that his or her sincerity had touched their hearts and so they would give a song to sing when needing their assistance. Thereafter, unless the gift was misused, the human could call upon the other creature for help and guidance. The human receiving this gift has all the positive powers that are innate to humans and the capability of calling on an animal helper to solve problems that humans alone cannot solve. A human with a spiritual helper, then, is held to a higher standard of morality than a person lacking such a relationship. But the power was always exercised on behalf of the community.

Often, people would create societies composed of other people who shared experiences with a certain animal. Thus the Fox society had members who had enjoyed a positive relationship with that animal and sought to display his observed virtues in their own lives. They were forbidden to kill or eat the animal that was helping them and therefore had to trade for furs, hides and other body parts with those hunters who had no relationship with the fox. In a typical village all the local animals would be represented by humans who had personal relationships so that the community as a whole benefited.

This benefit included those people who had special relationships with the winds, thunders, and powers of the four directions. It was therefore necessary for the community to be aware of the limitations placed on them by these relationships and not to cause undue harm by violating one of the prohibitions. The non-humans could punish the humans when an agreed boundary was violated, when the plant or animal was not accorded respect, or when the powers were misused. Since the community benefited from the positive side of the relationship it could also suffer from a violation by an individual. At such a time the injured non-human of the incident would usually inform a spiritual elder of the community and measures would be taken to resolve the issue. Since climatic elements had immense power, the people took special care not to offend them or to repair the damage of the relationship as quickly as possible.

Most important in understanding this web of life and the sharing of knowledge is that the individual bird or animal knew the limits of their relationship and judged the human accordingly. Strangely, individuals of the species seemed to have an intimate knowledge of the promises made earlier to a human by another member of the same species. We seem to have here a variant of the 100th monkey

phenomenon in that when a human desired assistance from one of his non-human friends, spiritual help came from a local individual of that particular species. Otherwise, birds and animals pursued their normal lives. Sometimes a different bird or animal would appear and inform the human that it also carried the responsibility for performing certain tasks and therefore had come to perform the promise. We are here undoubtedly talking about a higher spirit manifesting itself through the medium of a bird or animal, rather than those creatures themselves having superior minds or the inclination to deal with human necessities.

The Spiritual Lives of Sacred Places

Mountains, lakes, rivers, buttes, and mesas were found to have spiritual lives of their own and a superior knowledge of what had come before. When humans approached a natural feature they would often meet, in human form, the spirit of that place. They would be told the limits of their relationship with the location. Finding sacred locations was not difficult because geological uniqueness seemed to be part of the sacred nature of things, indicating that there was individuality in physical features also. Thus, the spectacular Spider Women's Rock in Canyon de Chelly attracted the Navajos and was recognized as a sacred site, the Hopis held springs sacred, and the Bear's Lodge (Devil's Tower) was understood as a sacred location for many Plains tribes.

The actual listing of these locations in North America would be quite long, although many tribes shared sites for ceremonial purposes. The Cheyennes and Sioux both regarded Bear Butte near the Black Hills as a special place to do vision quests and seek spiritual guidance. The Medicine Wheel in Wyoming was a special location for many of the local tribes and they marked this spot of primary power by creating a large circle with spokes to indicate the center. Other sacred locations were so ordinary that unless a human knew the history and geographical boundaries of the site, they could not be located by guesswork. Over many generations, then, it was possible to understand a vast landscape and how different sites related to each other. Four impressive mountains marked the boundaries of Navajo land and it was known that a special "dome" of sacred power existed within these boundaries.

There were, by the same token, places where the people discerned and avoided some kind of evil or forbidding force. The Yellowstone geysers of Wyoming, the Badlands of North and South Dakota, and several canyons in Utah immediately come to mind as sites where people discerned a negative presence. In the Pacific Northwest some lakes were regarded as extremely dangerous and to be avoided at all costs. There were many stories of how people disappeared while using the lake and these were sufficient in warning people of the dangers at some locations. Often these lakes were the places where water monsters appeared, so that it is difficult to tell whether it was the story of the monster or the lake itself that was hostile.

Medicine men relate that special piles of stone were placed around the perimeter of bad places to warn people away from them. Sites could also attract ghosts of people long dead who had suffered a tragic fate at a particular location. As a consequence of the ability to discern evil locations and spirits, the people had to become intimately acquainted with the complete powers of a particular landscape and limit their activities accordingly. A location where some great tragedy had occurred might be avoided because that tragedy might be reenacted by the spirits of the people who died there. Ghostly reenactments of a tragic event were not unusual.

Elders say that in very early times the spiritual leaders of their tribes were introduced into the secrets of sacred places by learning special ceremonies that enabled them to go inside mountains and rivers as if they were a normal part of the physical world in which they lived. The Cheyennes spoke of a cave at Bear Butte into which they could go to converse with the spirits. Secular observers could not find the cave and there was no physical evidence of its existence. However, when a certain ceremony was performed, the Cheyenne medicine men seeking advice from the spirits could easily find the cave. It did not otherwise exist in our physical world. The Sioux had a similar experience with the Bear's Lodge (Devil's Tower) and medicine men maintained that another world with trees, lakes, and rivers existed within that structure.

Many tribes related how the Little People lived in springs and waterfalls and could take humans to their homes underwater without injuring them. Since people abducted by the Little People could not return except under unusual circumstances, people were generally afraid to risk themselves at these locations. The Little People could come out of their world into ours and perform most of the daily routine functions that we do. Indeed, some Crows and Shoshones relate how they have encountered Little People while hunting in the Wind River Mountains in Wyoming. They seem to have a physical reality in these encounters.

That large inanimate natural features could have a sentient existence and intellectual life created yet another level of morality to which people were bound. The Black Hills, for example, were set aside for the benefit of the animals and they were believed to gather there on occasion to celebrate their existence. People could go into the Hills to gather lodge poles and foods, but they were not supposed to disrupt the other creatures in their use of the place. This higher morality of the *unity of life* is characterized by the requirement humans exercise *self-discipline* and *provide* for the birds and animals. It was roughly the equivalent of our game preserves today, but had considerably more status in the eyes of the people.

An Ethics of Life and Current Challenges

What were the forces in the natural world that possessed such power as to change, in an instant, the lives of all the living beings? Noting wind, rain, snow, and fire, observing the infinitude of the starry heavens, and finding there energetic powers of immense intensity, humans sought to understand the larger cosmos. Remembering the place where wind and snows originated they identified the four directions as having immense powers and in large part determining the fortunes of human beings. Even these directions seemed to possess personality and thus it was that they personified the directions, often representing them as human figures and personalities. Since these powers were far superior to those of the most knowledgeable humans, rituals were structured so that the powers of the universe were first addressed before human concerns were voiced. In the Southwestern United States the people created the sand painting that reproduced the bounded cosmos in miniature. In the Plains and woodlands the ceremonial pipe was raised and pointed to the four directions, then to the sky and finally to the earth. By recognizing the spiritual context in which appeals for help and prayers of thanksgiving were made, the people conformed to the requirements of a *moral universe*.

The power that was first discerned to exist in every entity in the world and enabled them to move was understood as representing an ultimate *unity of life*. The difference between species was one of structure only and people classified the organic world by the means of locomotion – flying, crawling, creeping, and

walking creatures. Birds and animals seen together in benign relationships gave testimony that among the other beings friendships existed similar to the benefits that people received from each other. Each apprehension of non-human relationships revealed the deeper life of the spirit.

Morality, then, was a function of the universe but manifested in the knowledge and behavior of all living things. The “ethics” of indigenous peoples thereby includes within its vision *imitation*, *participation*, *self-discipline*, and *unity of life* wherein human existence is set within a wider reality of sacred places, interspecies communication, and manifold powers. The point of this “ethics of life” was to allow all creatures to fulfill their destiny insofar as they could do so without disruption of other forms of life. There were, to be sure, predator–prey relationships in the food chain, but they were understood as having been reached by mutual consent between humans and the other creatures. We live on the game animals but we contribute our bodies to the earth to become soil in which grasses grow to feed the animals.

Once this chain of being was disrupted, indigenous peoples were unable to fulfill their duties toward the rest of creation. It was and is disruption by conquest, social displacement, racial and ethnic bias, and economic and technological development that threatens indigenous ways of life around the world. The only morality that has become adopted in this threatening situation is from the civilized invader, a morality wholly foreign to the world in which we really live.

CHAPTER 87

Origins of Ethics in the Religions of the Americas

David A. Clairmont

In tracing the origins of ethics in the religions of the Americas, one faces a number of challenges. First, one is faced with identifying what falls inside the broad label “religions of the Americas” and what falls outside it. For example, should one include only those communities that predate, in terms of historical continuity, the arrival of European colonial powers or should one include recent communities in the Americas that understand themselves to be distinctively American expressions of cultures from around the globe? Second, even if one were to restrict investigation to those cultures with longstanding geographic or cultural continuity in North, Central, and South America, how should one go about selecting what is “representative” of the great religious and wider cultural diversity of this vast region’s indigenous peoples? Should one investigate only communities that predated colonial invasions and maintain a strong cultural presence in one region of the Americas, or should one also consider the communities that existed at the time of first contact with colonial powers but no longer survive intact as they once did? Third, even if one were to select a community with such historical continuity, one is still faced with the task of making sense of the ethical significance of a community’s “origins” since these communities, like others across the globe, are not static collections of religious beliefs and practices but change to negotiate new social, political, economic, and moral challenges with each new period of their histories.

One way of thinking about ethical “origins” is to examine different ways that individuals and communities think about the importance of *that which comes before*. Naturally this would include some consideration of how the first nations of the Americas considered the importance of their own cultural histories and community values in the face of challenges to their group identity and ways of life posed by the arrival of colonial powers. In each set of challenges, we are able to observe the presence of the complex questions with which these communities struggled but also the central place that negotiations of religious and other cultural values played in that process. The purpose of this entry is not to provide an overview of the earliest expressions of religious views of the Americas’ first nations. Rather, this entry considers the idea of ethical origins and the ways that some indigenous communities of the Americas thought about, fought to preserve, and yet scrutinized their histories in light of new challenges occasioned by contact with other indigenous communities and with other peoples arriving on their shores.

In the examples discussed below, our focus will be primarily on the religions of the indigenous peoples of North America. Roger Iron Cloud and Raymond Bucko summarize that “Today there are 561 federally recognized tribes, while other groups continue to seek recognition. At the time of European contact, according to estimates, the number of Natives in North America was between 1.3 million and 10 million people.

The 2000 census places the number of Native people who self-identify as solely Native American at 2.4 million (1% of the total population), with 4.3 million more who self-identify as “Native American and other” (1.5% of the population). A third of the Native population is under eighteen years of age. More than half of all Native Americans live away from reservations” (Iron Cloud and Bucko 2009, 119). Since it is not possible to chart the origins of each of these tribes, even if one were to limit the scope to North America, the approach followed here will be to offer examples that give some sense of the specific religious and wider cultural contexts but also that offer insights that could be useful in understanding other indigenous communities of the Americas. When speaking of these communities collectively, we shall refer to these communities under one of three broad designations currently used by scholars and by the members of these communities: First Nations, Native Americans, and indigenous peoples.

In the preceding entry in this volume, which examined the meaning of ethics in the lives of indigenous peoples, Vine Deloria, Jr. offered the following assessment:

The ‘ethics’ of Indigenous Peoples . . . includes within its vision *imitation, participation, self-discipline, and unity of life* wherein human existence is set within a wider reality of sacred places, interspecies communication, and manifold powers. The point of this ‘ethics of life’ was to allow all creatures to fulfill their destiny insofar as they could do so without disruption of other forms of life. There were, to be sure, predator–prey relationships in the food chain, but they were understood as having been reached by mutual consent between humans and the other creatures. We live on the game animals but we contribute our bodies to the earth to become soil in which grasses grow to feed the animals. Once this chain of being was disrupted, indigenous peoples were unable to fulfill their duties toward the rest of creation. It was and is disruption by conquest, social displacement, racial and ethnic bias, and economic and technological development that threatens indigenous ways of life around the world.

(Schweiker 2022, 749)

Building on Deloria’s insight in conversation with other scholars who have written on the ethical dimensions of the indigenous peoples of the Americas, this entry investigates how “what has come before” provides moral guidance in the development of character (the focus on imitation), in the development of community (the focus on participation), in the development of identity (the focus on self-discipline), and in the development of metaphors for understanding the truth about the world (the focus on unity of life). In each case, the approach will be to examine a different indigenous tradition of the Americas to illustrate how these traditions rely on what is prior to carry out the work ethics – broadly speaking, the project of living a good life in the company of others who have gone before us, who are present now, and whom we will meet again in some way in the future.

The Character of What Has Come Before

One way of understanding the importance of what has come before in the ethical outlooks of the indigenous religions of the Americas is through the idea of character. In the life of any community, events occur that occasion the people’s response. In his article “Weathered Character: Envy and Response to the Seasons in Native American Traditions,” Tod Swanson argues that “the moral life of traditional Indian groups centers around the formation of a powerful well-weathered character, that is,

of a disciplined personality capable of responding appropriately to the unpredictable in seasonal movement” (Swanson 1992, 281). Drawing examples from the Papago people of Arizona, the Páez of Colombia, and the Quichua of Ecuador, Swanson suggests that character is expressed in terms of appropriate or fitting response to the events – natural and those set in motion by personal choices – that occur in the life of a community. For example, discussing the Páez account of character, Swanson quotes one of the teachings of the Páez religious and military leader Manuel Quintin Lame (1880–1967) in his book *Thoughts of the Indian Schooled in the Colombian Forests*. “Behold the star that rises in the east called ‘the Sun’; behold the concert of the major stars which form the clock that is fixed above our heads; behold the harmonious . . . singing of those choirs of the forests; behold the internal order of the woods when it is the turn of the torcaza dove [to sing] . . . of the alondra . . . of the concert of grasshoppers who perturb the ear with their strident song” (Swanson 1992, 280). Describing the process of drawing moral lessons from seeing and hearing the events of the natural world, Swanson argues that for the Páez, “moral character is a memory scarred by hard knocks, repeated interruptions, and adjustments to the procession of smells, tastes, sounds, and colors that mark times of day and year. It is this memory that orients mature persons so that they can respond in appropriate timing to the ‘internal order of the woods’ which is the ‘word of God in the mountains’” (Swanson 1992, 281). Following this Páez counsel produces character because the process of listening and responding has a twofold effect.

First, to respond appropriately means not only to fit into a naturally occurring order but also to learn when, how, and how much to act in response to what is transpiring. For the Páez, “bad timing is related to envy and to gluttony. It stems from the desire to fill a space that at that moment belongs to someone else or to some other species. The ‘choirs of the forest’ are models of the moral life because they have learned when to sing and when to be silent in relation to the other singers” (Swanson 1992, 280). So, whereas acting with appropriate response contributes to the formation of virtue, acting rashly, excessively, or in a way that is insensitive to one’s surroundings contributes to the formation of vice. Second, while virtuous character can be recognized by those outside the community, specific virtues are cultivated by particular people given the events they hold in common and share with their families, wider kinship networks and tribal communities. For example, as Swanson explains, “The Papago [of present-day Arizona] (their name, Tohono O’odham, means ‘Desert People’) have a Desert People character because the limits of their endurance have been stretched and fixed by the seasonal movement of their particular part of the Sonoran desert. By contrast the Pima, or River People, are recognized as a distinct people (even though they speak the same language) because their limits have been fixed by the different environment of the Gila River” (Swanson 1992, 293). Although this may seem to be an observation simply about each group’s response to the particularities of their geography, Swanson’s point is precisely that this attunement to place has a pedagogical effect on character more generally. Drawing on examples from the Lakota people of present-day North and South Dakota, Deloria argues that elements of the natural world can themselves provide this kind of guidance: “Many Indigenous Peoples pattern their social and political activities after these ways of the animals, and often they come to believe that they and the animal are one spirit because they can harmonize with the animals so well. One level of their moral vision is that of *imitation*. . . Indigenous peoples sought to learn the most closely held secrets of the birds and animals, so they spent a great deal of time watching them and meditating on what they had observed” (Deloria 2005, 554). In this way, the origin of good character may be found in the process of imitating and responding appropriately to one’s surroundings. Character is shaped through imitation and response to what has come before in the place that one lives.

The Community of What Has Come Before

Another way of understanding the importance of what has come before in the ethical outlooks of the Indigenous religions of the Americas is through the idea of community. Shaping present practices through the process of handing on wise teachings from elders and other reliable guides is central to the formation of moral communities. Yet continuity of present practice with past models is not the only way that a community draws on its ethical origins. Equally important is shared historical experience which highlights particular elements of that past tradition that are important for the community's survival and flourishing.

First, community mediated through past examples comes primarily from stories and there is a close connection between the passing on of stories and the development of virtues noted earlier. As Joseph Marshall explains reflecting on his upbringing in Lakota culture, "I knew growing up that at some point I was supposed to be the things I learned in the stories: compassionate, honorable, and brave. . . I knew this because the storytellers lived the lessons they imparted in their stories, and they practiced what they preached. They were compassionate, they were honorable, and they were brave and wise" (Marshall 2001, xiii). Stories passed down from elders or storytellers from kin groups serve as both moral and practical guidance. Not only do stories have the capacity to illustrate in a vivid manner virtues that allow the community to flourish, so the same stories often involve practical lessons for survival under conditions of environmental adversity or persecution.

Yet the community itself is not only a collection or mediator of virtues but is itself a form of excellence to be taught and emulated to future generations. As Roger Iron Cloud and Raymond Bucko explain,

In Lakota society community and kinship are one. The name Lakota itself means 'allies' and Lakota are related to each other through birth, marriage, or adoption. ... "Kinship was the all-important matter. Its demands and dictates for all phases of social life were relentless and exact; but on the other hand, its privileges and honorings and rewarding prestige were not only tolerable but downright pleasant and desirable for all who conformed. By kinship all Dakota people were held together in great relationship that was theoretically all-inclusive and co-extensive with the Dakota domain. Everyone who was born a Dakota belonged to it; nobody need be left outside." Both by tradition and in contemporary society today Lakota do not distinguish themselves primarily as a nuclear family or even as a Nation (although this is important politically) but as a *tiyospaye*: an extended family. These units lived in a balance between communal dependency and individual autonomy.

(Iron Cloud and Bucko 2009, 121–122)

As Albert and Sylvan White Hat explain, the strength of the bond of *tiyospaye* is also considered a virtue and is related to a more general sense of connectedness (*mitakuye oyas'in*) which speaks about the strength of bonds not only among extended family but among the various aspects of the natural world, between creator and creation, and between past, present, and future (Bowen 2005, 126).

Second, shared historical experience also allows present community to unite around a sense of ethical origins. As Beatrice Medicine states, "The common theme that all Native American cultures share is the post-contact decimation of peoples, the destruction of native life-styles and languages, and the subordination of aboriginal peoples in what has been called a 'civilizing' process toward a superimposed 'superior'

mode of life. The subjection to a dominant, white, racist society is the common experience for Native Americans in the present day” (Iron Cloud and Bucko 2009, 119). Reflecting on the teaching of Joseph Marshall, Robin Byerly states that “who and what we are as individuals, as a community, as a society, and as a nation, are the strengths and weaknesses with which we face and live life. And what we contribute to the identity of the whole begins with each of us individually. Our journey toward wisdom begins the moment we are born. Every experience and the consequences we suffer or the rewards we reap shape us into who and what we are. Life itself is a process of curing and hardening” (Byerly 2015, 5). Lakota culture recognizes that awareness of shared historical experience brings some virtues into clearer focus at certain times than at others, even if all the virtues upheld by the community are necessary for the good of the individual and the group in the long run. As Lakota elder and professor Sylvan White Hat, Sr. argues, over the years Lakota teachers have identified a number of virtues that are important for sustaining community life: *unsiiciyapi* (humility), *wowacintanka* (perseverance), *wawoohola* (respect), *wayunonihan* (honor), *cantognake* (love), *icicupi* (sacrifice), *wowicake* (truth), *waunsilapi* (compassion), *woohitike* (bravery), *cantewasake* (fortitude), *canteyuke* (generosity), and *woksape* (wisdom) (White Hat 2014; Marshall 2001; Caldwell 2017). He explains that some virtues are foundational to all others such as *unsiiciyapi* (humility) while others have a special relation one to another and a fittingness to certain kinds of events or people. For example, *wowacintanka* (perseverance), *woohitike* (bravery), and *cantewasake* (fortitude) share certain similarities but each has distinctive characteristics which can only be illustrated through stories. As Marshall explains, *wowacintanka* is taught through stories in which ancestors survive in unlikely circumstances or when immediate family members overcome difficult situations for the good of the community (Marshall 2001, 20–36). Similarly, *woohitike* (bravery) and *cantewasake* (fortitude) are related virtues but while the former is illustrated through stories of resistance to invasion and assimilation the latter is illustrated through the examples of family members who endure changes in living conditions and overcome despair in response to apparently hopeless situations (Marshall 2001, 141–179).

The *Identity* of What Has Come Before

Closely related to community in establishing the importance of what has come before is the construction and maintenance of identity. Continuity of a person with their culture in terms of basic values, shared events, and overarching narratives is central to a sense of belonging to that culture. Identity is a feature of both individuals and of communities realized over time through processes of internalization in light of tradition and externalization in dialogue with other people and cultures. One of the central ways that identity is linked to what has come before in the religions of the Americas is through continuity of practices, especially in the face of external threats that sought to destroy traditional cultures and cultural influence. Often this happened at Christian mission schools, where students were forced to abandon their native languages, behaviors, clothing, art, music, and food. For example, Karen McKellips discusses the effects of nineteenth-century educational programs on Cheyenne and Arapaho children. She explains, “Cheyenne and Arapaho children before this time had learned much of what was needed to function in their societies through play and imitation of the activities of their elders. . . For the Cheyenne, piercing the ears of a child was ‘symbolic of opening the mind to learning, understanding, discipline, and knowledge’ . . . Through the open ears a rich oral literature passed from generation to generation the philosophical aspects of life as a Cheyenne” (McKellips 1992, 12–20). Contrasting the practices at

St. Labre Indian School in Ashland, Montana with traditional Crow and Cheyenne educational practices, Donna Peterson discusses how “Pre-Columbian Indian education always involved the entire community. Before children could be recognized as mature tribal members, they mastered survival skills, such as hunting, fishing, curing meat, tanning leather, and making clothing. They also cultivated an appreciation of their cultural heritage and acquired spiritual awareness. Directed practice through imitation helped hone a child’s talents” (Peterson 2015, 105). As the influence of Crow and Cheyenne children’s traditional cultural practices were systematically removed through European educational systems, so too were their connections with their families. As Raymond Bucko explains, “Under a joint effort by the Bureau of Indian Affairs and the Child Welfare League of America, 25 percent to 35 percent of all Indian children were adopted by non-Native American families. ...This practice was intended to strike at the heart of Native American cultures. To remove children from their families was to undermine the foundation of Native American culture” (Bucko 2007, 76). Whether through forced removal to church-sponsored boarding schools or to European families through involuntary adoption, Native American children were robbed not only of their family connections but also of their families’ connections to ancient tribal lands. Noting the vital connection between Indigenous knowledge and the lands of Indigenous communities, Leanne Simpson argues that “Knowledge comes from the land through the relationships indigenous peoples develop and foster with the essential forces of nature. These relationships are encoded in the structure of indigenous languages and in indigenous political and spiritual systems. They are practiced in traditional forms of governance, and they are lived in the hearts and indigenous peoples. Without intact ecosystems, indigenous peoples cannot nurture these relationships” (Simpson 2004, 378).

Indigenous communities responded to attacks on original identity through various forms of resistance: the active maintenance (or in some cases later revival) of traditional language study, the practice of storytelling, and the continuation of traditional religious ceremonies. Yet tribes and their tribal governments have also used available legal means to reestablish land and family connections. For example, many tribes have disputed government interpretations of older treaties that restricted hunting and fishing on tribal lands while other legal developments such as the Native American Graves Protection and Repatriation Act of 1990 requires the return of human remains and other items central to Native American tribal culture to be returned to the tribes (Bucko 2007, 78). In these cases, identity is an important expression of ethical origins since what has come before in the community’s way of life has been deliberately attacked and even forcibly removed, resulting in the need for Indigenous communities to defend their rights to family and cultural continuity.

The *Metaphor* of What Has Come Before

One last expression of ethical origins to consider in establishing the importance of what has come before is metaphor. Often moral guidance that comes from earlier generations is passed down not in terms of moral principles or laws but through metaphors that link the actions of the human community now to actions of revered persons from the community’s past or to divine beings that serve as models for human behavior. A metaphor is not a one-to-one correlation between seemingly disparate concepts but a creative association opening up new pathways for thinking and acting. Discussing the Hopi of present-day Arizona, Maria Glowacka and Emory Sekaquaptewa, discuss the meaning of the terms “*wukwnavoti* or

‘ancestral knowledge’ (literally, ‘old,’ *wuy*; and *navoti*, a noun derived from the verb *navota*, ‘notice by means of any of the senses, learn, hear’), passed down through generations in oral, visual, and other expressive forms. *Wukwnavoti* encompasses customary practices and their usages that have been tested by the ancestors and proven beneficial to human continued existence, cultural institutions, and ritual and domestic activities” (Glowacka and Sekaquaptewa 2009, 169–170). That which the community’s ancestors pass down through these various forms communicate “*qatsivötskwani* (literally ‘the path of life that will be [morally] straight’), to fulfill their destiny as a people and to achieve the perfect world symbolized by the concept of spiritual entities, the *katsinam*” (Glowacka and Sekaquaptewa 2009, 166). Although these images can be understood as communicating the guiding principles affirmed by the community and modeled by the spiritual entities governing the world, they are not communicated as moral principles translatable into universal moral laws applicable to any context. Rather, they operate within a specific cultural provenance and function metaphorically to draw effective associations that guide community life.

As Glowacka and Sekaquaptewa continue, “These life-guiding principles have great ancestry, having been preserved in collective cultural memory through the verbal messages of narratives and songs; pictorial images on objects such as ceramics, baskets, kiva mural paintings, and rock inscriptions; and expressive forms (movements, attire, paraphernalia, etc.) associated with ritual performances that are intimately tied to physical places of cultural significance” (Glowacka and Sekaquaptewa 2009, 166). Many words, songs, art forms, food and clothing can function as metaphors, since they all point beyond the specific use of the object in question. The reference might be to stories, or rituals, or the quality of heart (*unangwa*) of certain ancestors, or to the gifts of rain or other life-sustaining forces that transform the desert landscape into an image of paradise – a land of flower light. What unites these diverse references is that they point to a form of life that unifies the community in a twofold sense. These places, people, and practices draw the community together around a vision of a good life, in harmony with others and with the *katsinam*. Yet the community is also unified across the generations. Recalling again the wisdom of the ancestors, Glowacka and Sekaquaptewa emphasize that

Wukwnavoti encompasses customary practices and their usages that have been tested by the ancestors and proven beneficial to human continued existence, cultural institutions, and ritual and domestic activities. ...Customary practices, such as planting, performing ceremonies, grinding corn, decorating pottery, and preparing ceremonial paraphernalia, serve the rejuvenation and perpetuation of life and are referred to in the Hopi language as *natwani*, or ‘life-promoting practices.’ The term *natwani* is composed of two words, *naa* (‘self’) and *tuwanta* (‘to test’), and in its cultural meaning refers to testing oneself in one’s beliefs on a predestined path of life and testing one’s worth as a member of the collectivity.

(Glowacka and Sekaquaptewa 2009, 170)

In each of these practices, it is the metaphorical sense of places, people, and practices that links the community to what has come before. When we relate a story or teach a young person a craft or a ritual, we are linking them with a past that they have not seen. Yet they do see the effects of that past in their present through the presence and lessons of those who have endured and who have struggled to live a good life in the face of challenges posed by the land, by other people, and even by the results of one’s own actions. Our words and actions can have power through metaphor since they can stand for or point to something more

than what we set out immediately to accomplish. Interpreted within a cultural context, what we say and the artifacts we create can link us to the past through reminders of what a community did to survive and can link us to the future as they offer examples for future generations. These practices are time-tested even as they tested those who have passed them on for the well-being of those who will come after us. As Deloria noted, these practices have the capacity to express a unity of life horizontally, vertically, and across time.

Conclusion

Character, community, identity, and metaphor all express ways that the religions of the Americas have drawn on what has come before to guide the life of the community through imitation, participation, self-discipline, and unity of life, values that Deloria suggested were elements of ethical living shared by many Indigenous Peoples. Given the problems involved in presenting the “origins of ethics” for such diverse groups of peoples, we have examined the work of a number of scholars from these communities to suggest that what is important in the idea of ethical origins is not establishing the earliest point of departure so as to pass on a static vision of a beginning but the process of relating to earlier tradition in forming the values, guiding principles, and practices that guide community life today. The other entries in this volume will explore other communities’ attempts to do something similar – to honor the old ways and return to them for guidance and encouragement in the face of recurring challenges from the legacy of colonialism and the new challenges of inter-cultural conflict and cooperation arising with each new generation.

CHAPTER 88

Modes of Interpretation of Indigenous Religious Ethics (of the Americas)

Garry Sparks

Introduction

The study of the religious ethics of Indigenous peoples in general, and particularly in the Americas, is arguably more complex than with other religions. In addition to the challenge to render moral understandings from Native religions, the histories of approaches have also confronted their own ethical challenges. As a result, the material on Indigenous religious ethics is comparatively sparse and still an emerging field (as Richard Brant (1954) and Christopher Vecsey (2013) have noted, albeit with regard to Native American philosophical ethics in particular). The ethical problems confronting the study of Indigenous religious morals are part and parcel of those in the approaches to the wider study of Indigenous histories, cultures, and religious worldviews as well as the ethical concerns raised by Native peoples (e.g. ethnic discrimination, environmental and sexual abuse, etc.). In the past few decades, trends in the methods of approach and modes of interpreting the worlds of Indigenous peoples have aimed to address both subjects – the ethics of Native peoples and the ethics toward and with Native peoples.

This entry will summarize a set of ethical issues pervasive within studies of Indigenous peoples followed by a general historical overview of dominant approaches toward religious ethics of Native peoples in the Americas since the sixteenth century, which is the history from which these methodological and interpretive ethical problems emerge. Most of this earlier work was conducted by missionaries. Their methods – whether proto-ethnographic, philological, and etiological – were informed by their aim: to fit Indigenous understandings into non-Indigenous (i.e. Western European) thought analogically, to reframe a radically unfamiliar thought-world in relation to the already familiar. By the late twentieth century, an increasing shift to understand Indigenous worlds more on their own terms as well as to redress many of the ethical issues in approach fostered recent turns by scholars toward dialogical and “multinatural” modes. Finally, as an example of these shifts, a specific set of terms from K’iche’ Maya moral discourse will illustrate the religious ethics of a specific Indigenous American people.

Ethical Problems in Studies of Indigenous Peoples (Religious Ethics)

The methodological challenges in studying Indigenous American ethics are four interrelated, and in some cases mutually reinforcing, problems. The first concerns the issue of authority, namely how and

who can speak on Indigenous worldviews. Increasingly, since the 1970s, European-tradition scholars have deferred to the emic perspective, as argued most notably by the Lakota intellectual Vine Deloria, Jr. There are three commonly-recognized criteria Indigenous peoples accord someone insider status. In the United States for example, insider status requires official enrollment in one of the 574 legally recognized American Indian nations, which is largely based on percentage of direct lines of familial descent or Native “blood.” Within that, deference is given to those members who have elder status and are understood to adhere to distinctively traditional beliefs and practices (i.e. non-European, non-Christian, pre-modern, etc.). However, quasi-insider status can sometimes be conferred on non-Native persons adopted into a family or nation (such as through the *hunka* ceremony among Lakota). A third criterion requires knowledge of an Indigenous language. Unlike other scholarly fields (such as Arabic for Islamic studies, or Greek for biblical studies or Classics), proficiency in Native languages is too often not seen as a requirement by non-Native peoples for studying Indigenous worlds even in the academy. By contrast, for many Indigenous peoples a scholar’s ability to “speak ‘our’ language” is indicative of an eligibility to speak not just *with* but also *about* (but still rarely *for*), to help translate Native worlds to “outsiders.” In this sense, language proficiency signals a value of solidarity and respect, or harmonious equality, between Natives and non-Natives as well as approaching the study of Indigenous religions on par with the study of historically dominant religions. Furthermore, it evinces the extent to which many Indigenous peoples understand language as epistemologically essential to their world.

A second problem concerns the categorization of some religions as “indigenous,” “native,” “autochthonous,” “endogamous,” “primitive,” “archaic,” etc. With the nineteenth-century development of “world” religions, such as by the World’s Parliament of Religions at the 1893 Columbian Exposition in Chicago, non-dominant religions were often widely considered less consequential or even less civilized. And while many Indigenous peoples were geo-political expansionists prior to contact with Europeans (such as Mexica (Aztec), Inka, Comanche, Lakota, K’iche’, etc.), they did not build modern empires and, thus, non-world religions were those of “conquered” peoples of Africa, the Americas, and even parts of Asia or of peoples with little material culture left of their pre-contact religious worlds. A residue of this categorization resides in current survey textbooks on religion where there is usually at best only one chapter on Indigenous religions as a type of religion (e.g. shamanism or animism) or grouping together largely diverse and historically unrelated traditions based on a geography (e.g. indigenous African religion or Native American religion) or ethnic constituency (e.g. the Maya religion) even though a label of European religion or English-speakers’ religion would be rejected as overly simplistic, all religions (such as Christianity) are indigenous somewhere, and each “world” religion gets its own chapter rather than typological grouping (such as in a single chapter on monotheism or native religions of Asia Minor).

A related third problem is that because of this typological treatment in the field of religious studies, Indigenous religions are often construed as a distinctive kind of religion that can be understood in terms of some shared underlying principle such as animism, totemism, or shamanism – despite distinct geographies, histories, languages, and cultural demographics. At its most extreme, this approach has also even denied them recognition or status as a “religion” on par with other religious systems by treating them instead as magic, superstitions, folklore, etc. – a Native “spirituality.” As a result of this history of typologizing, many modern approaches have presented religious and ethical systems of Indigenous peoples either as static, frozen-in-time, or less “developed” – and, thus, supposedly emblematic of some original religion from which all other religions evolved – or as distinctively mixed, hybridic, or syncretized and, thus, implicitly impure and inferior compared to a “world” religion of a “civilized” people.

Finally, a fourth issue concerns the problem of source material. Aside from the archeological record, such as of the Classic Era Maya (ca. 250 CE–ca. 850 CE), there is little to no pre-contact Indigenous religious texts. Information on Native religious ethics culled from cosmogonic and theogonic stories, ritual and moral prescriptions, songs and prayers, and even the tracings of worship sites all bear traces of engagement with (even if in reaction against) an imperial religion like Christianity. Folklorists, ethnographers, ethnohistorians, and their consultants are rarely critically trained in the histories and diversity of Christianity, and thus unaware of how previously non-Native presuppositions have already affected their material, methodologies, or interpretive lenses. Even attempts to filter out Christian aspects, and thus to identify a less syncretistic and more purely pre-contact Native religious worldview – such as in Richard Neihardt's *Black Elk Speaks* ([1932] 2008) or even Elisabeth Burgos Debray's *I, Rigoberta Menchú* ([1983] 2010) – were predicated on romantic understandings of Native Americans, and the works fail to reflect on how their authors' romanticism grew from a European Christianity, let alone how such an approach denied Nicholas Black Elk and Rigoberta Menchú Tum their full intellect and agency as, respectively, Lakota and K'iche' Maya Catholics. Furthermore, due to early Christian missionaries and Native people's strategies of cultural adaptation and appropriation in both Indigenous and Christian symbols or the crafting of neologisms in a local language by missionaries, many seemingly ancient aspects of an Indigenous religion can be traced to some engagement with Christian missionaries, a fact which is rarely recognized. For example, recent critical histories by Natives and non-Natives focus on some of the major ethical themes among Native peoples in the wake of mission work, such as sexuality (as in Ramón A. Gutiérrez (1991) and Richard White (2010)), ethnocide (as in George Tinker (1993)), or land and sovereignty (as in Rolena Adorno (2007)).

While there are no easy or definite answers to these thorny issues (as evinced in this entry and the extent to which it also perpetuates some of them), scholars, teachers, and students can no longer be excused for ignoring them. They are among the more perennial ethical problems raised by Native peoples concerning studies of Indigenous histories, cultures, religions, and ethics. The turn by scholars from an analogical mode for a dialogical mode within the past few decades exemplifies the effort at redress – methodologically and interpretively – collaboratively with Native peoples.

Colonial Modes of Interpretation: Analogical

The initial mode of interpretation of morals of Indigenous peoples of the Americas was largely predicated on the establishment of analogies between what was understood by turn of the sixteenth-century Europeans and the wholly unfamiliar peoples they encountered. While explorers like Christopher Columbus (who related the peoples, land, and waterways of the Caribbean with the garden narratives in Genesis) and Diego Velázquez de Cuéllar (who related Maya buildings on Cozumel to Muslim mosques) made such analogies, early Christian missionaries, namely mendicants, employed an analogical mode more systematically, through a variety of approaches, and with an acute focus on religious beliefs and morals.

In general, the concern for Indigenous religious morality throughout much of the missionary literature consists of three Classic themes of sexual ethics (e.g. incest and polygamy), cannibalism (i.e. ritual and dietary), and idolatry (i.e. atheism or demonology). Notably, these were also the same criminal charges – incest, cannibalism, and atheism – made against early Christians by the Roman Empire in Late Antiquity to which some of the first Christian apologists, like Athenagoras of Athens (ca. 133–ca. 190),

replied. Ironically, via appropriation of wider Roman culture in the wake of Christianity becoming the empire's official religion, these same charges continued to be made but by Church jurists against suspected practitioners of remnants of local or indigenous European religions, such as with the witch trials of the medieval era. Early Europeans to the Americas, like Columbus, also tended to divide local populations along such ethical lines, such as his portrayal of Taínos as divided between the humble Arawaks and the cannibalistic Caribs.

Such approaches appear, for example, in arguably the first book by a European written in the Americas – Hieronymite friar Ramón Pané's *Relación* or *Account* ([1498] 1999). Arriving with and staying behind after Columbus's second voyage (1494), Pané attempted to learn the language and customs of the Taínos and wrote what is akin to an ethnography in which he both compares them with Iberian Muslims and investigates their supposed idolatry. This ethnographic reportage on Indigenous religious beliefs, practices, and ethics continued with the *Relación* by explorer Álvaro Núñez Cabeza de Vaca ([1542, 1555] 2003) on the Native peoples from Tampa Bay to the Gulf of California. As one of four shipwrecked survivors (three Spaniards and one enslaved African, Mustafa Estebanico de Azemmour), Cabeza de Vaca documents a nine-year journey (1527–1536) along the Gulf of Mexico and Rio Grande, and from being enslaved by Native peoples to learning local languages and rituals, which they mixed with Catholic prayers. Within Cabeza de Vaca's account is a notable shift toward a discourse, practices, and symbolism of healing, pairing local ideologies of illness and health with the therapeutic Christian soteriology, namely the metaphor of salvation.

With the arrival of mendicant missionaries, namely Franciscans and Dominicans in the 1520s and Jesuits by the 1570s, onto the *terra firma* of the Americas a more strategic use of analogical interpretations of Indigenous worldviews began. The humanism heavily present in the leading Iberian universities (e.g. Valladolid, Salamanca, Alcalá de Henares, Seville, and Coimbra) but also convent colleges since the late fifteenth century brought a highly philological approach. Whereas the proto-ethnographic approach found since medieval traveler accounts that documented the customs, practices, and laws of local peoples of foreign lands continued with these mendicants, the humanism of Desiderius Erasmus, Diego de Deza, O.P., and Francisco Jiménez de Cisneros, O.F.M., added a value to seek and preserve ancient written sources as part of the *ad fontes* movement, a critical and historical understanding of texts, a systematic analysis of rhetoric toward both Classical languages (e.g. Greek, Latin, Hebrew, and even Arabic) and vernaculars (e.g. Castilian, Nahuatl, Otomí, Yucatec, Zapotec, Quechua, etc.), and an appreciation of a text's wider cultural context for more meaningful translations *ad sensum* rather than *ad verbum*.

Furthermore, in addition to various differences between them, these early mendicants subscribed to competing theories of semiotics that influenced their translation and interpretation strategies. Specifically, the return of Francisco de Vitoria, O.P., from Paris introduced the scholasticism of Thomas Aquinas at the universities of Valladolid and Salamanca by the 1520s. Mendicants, largely Dominicans and later Jesuits but also some Franciscans, schooled in Thomistic realism and a more formalized analogical mode of thinking saw signifiers as distinct from the signified, which was understood to relate to universals. Loanwords (e.g. *Tz'aqol B'itol*, "Framer, Former" in K'iche' Maya) or neologisms (e.g. *nima-jaw*, "great lord" in K'iche' Maya) fashioned from one language could mean the same as or similarly enough in another language (e.g. *Dios*). By contrast, other mendicants, namely Franciscans and Augustinians, schooled in nominalism denied the existence of universals and understood an indivisible, or at least more highly contextualized, relationship between a sign and its referent. Nominalist mendicants were more skeptical of appropriating Native terms for Catholic theological and moral doctrine,

resorting more often to neologisms or indigenizing terms from Spanish or Latin (e.g. *Tyox* from *Dios* for use in Kaqchikel Maya). With Thommaso de Vio Cajetan as the head of the Dominican Order during the years of first contact between missionaries and peoples of the Americas and his efforts to promote Aquinas's use of analogies of proportion as a formal method in his treatise on the *Analogy of Names* (ca.1511), Salmanticenses missionaries were more optimistic about the ability to establish commensurability analogically between Indigenous and European religions whereas nominalists were more suspicious and judicious.

However, despite their differences in theories of interpretation, for colonial-era mendicants ethnographic work proved instrumental for their philological work, in which they developed the first multilingual grammars (*artes*) and lexicons (*vocabularios*) on Indigenous languages, and historical work. Many of their studies on American languages – like Nahuatl, Zapotec, Otomí, Yucatec, and K'iche' – not only were qualitatively superior to many of the first studies on European vernaculars by their contemporaries but also predated by decades if not centuries some of the first dictionaries in European languages, like Finnish.

While not a distinct genre as by the nineteenth century, the ethnographic descriptions of Native understandings of proper relationships between people, elements, and forces of the natural world and the wider cosmos including time, ancestors and other non- or semi-material beings appear throughout the lexical entries and as discourse examples in their Native-language grammars. But they also appear in the jeremiads in their sermons and catechisms written in Native languages. More explicitly and extensively, they appear in the encyclopedic *historias* on a particular people or region, or comparatively between Native Americans and other known peoples of the world (such as ancient Greeks, Egyptians, or Jews) for a new kind of comprehensive global history (such the *Apologética historia sumaria* (ca.1555–ca.59) and *Historia de las Indias* (1561) by Bartolomé de las Casas, O.P.). Among the most notable for the study of Native religious ethics and exemplary of this ethnographic and philological approach is Franciscan friar Bernardino de Sahagún's *Historia general de las cosas de Nueva España* (also known as the *Florentine Codex* (ca. 1540–ca. 1571)), specifically Book Six on Nahua “Rhetoric and Moral Philosophy” (1969). Written in both Spanish and Nahuatl by Nahua scribes, this volume consists of a collection of traditional Mexica (Aztec) prayers expressing normative concerns regarding health, politics, kinship, commerce, agriculture, and so on. Along with other collections, such as by Andrés de Olmos, O.F.M., in 1533 and 1556, mendicants like Sahagún recognized that Indigenous moral concerns were articulated through a formal and intensely poetic high-register of speech called *huehuetlahtolli*, “ancient word,” understood by Mexica and other Nahua as the language of, by, and for ancestors and the divine.

In her examination of Franciscan literature in Nahuatl, *The Slippery Earth* (1989), ethnohistorian Louise Burkhart documents how some mendicants aimed to establish analogies between indigenous notions of pollution, wellness, hygiene, excess, absence, center, balance, and so on with biblical concepts of sin and Aristotelian virtue ethics. The culling out of Native moral discourse from mythic stories, aphorisms, and prayers rendered in traditional rhetoric resourced the translation of Catholic ethics by mendicants. On one hand, the antiquarian approach of collecting Indigenous religious narratives and sayings, often treating them comparably like Aesopian fables, to read a set of morals continued with later colonial mendicants (such as Dominican friar Francisco Ximénez's copy of the K'iche' Maya *Popol Vuh* or “Book of the Council” ([ca. 1701–1704] 2007)) but also later professional scholars like folklorists and anthropologists, both non-Native (such as Richard B. Brant's *Hopi Ethics* (1954), Paul Radin's *The Trickster* (1956), Elisabeth Tooker's *Native North American Spirituality of the Eastern Woodlands* (1979), Alfredo López

Austin's *The Myth of the Opossum* ([1990] 1993), and Christopher Vecsey (2015)) and Native Scholars (like *American Indian Myths and Legends* (1984) by Alfonso Ortiz with Richard Eroles).

On the other hand, colonial-era Jesuits working with Indigenous peoples in the Andes, Southern Cone, and Rio de la Plata region took the analogy between health and salvation to a more explicitly medical or etiological approach. Andrés Prieto, in *Missionary Scientists* (2011), documents how Jesuits among Quechua, Aymara, Mapuche, and Guaraní saw the key to religious conversion as contingent on missionaries' abilities to not only master Native languages but also become the religious and moral authority by becoming the authoritative medical practitioner in an Indigenous community. Their ethnographic and linguistic studies of Indigenous religious ethics were not simply metaphorically related to construals of illness and salves but also to Native understandings of botany, herbal medicine, and therapeutic techniques so that a Catholic priest could displace the village "medicine man."

Late- and Post-Modern Modes of Interpretation: Dialogical

Later strategic readings of clerical records on Native morals often in Native languages as well as of documents by Indigenous authors mostly in Indigenous languages represent a wider shift toward a dialogical mode. This interpretative shift followed and aided two interdisciplinary movements in the latter half of the twentieth century: ethnohistory and new philology. The first, ethnohistory, aimed to reread the historical record, often resourced by modern ethnographies on Native peoples to fill in gaps (albeit at the risk of anachronistically projecting or "up-streaming" later Native worlds into the past) for perspectives of Indigenous peoples. Where only texts by non-Indigenous authors, such as trial records, existed inversive strategies of critical analysis inferred what the Native understandings might have been. For example, White (2010) culls out Native understandings of ethical relations through examination of colonial French and Jesuit records on marriage, trade disputes, and warfare where written Lakota accounts have not survived. Likewise, recent ethnohistorians, like David Tavárez (2013), mine colonial Spanish inquisitorial records of heresy trials against Zapotec and Nahuatl to construct their religious worlds based, in part, on an inverted read of mendicants' distorted portrayals of Native "idolatry."

However, ethnohistorians who focus on milieus like in early colonial Mesoamerica also have available documents written by Native elites by which to balance out European accounts. By the 1970s historians, namely James Lockhart and his students, began to learn the Native languages – such as Nahuatl, Zapotec, Yucatec, K'iche', Kaqchikel, Quechua, and so on – to work with an augmented paper-trail and revise historical understandings by pairing the Indigenous and non-Indigenous perspectives or, when contradictions were found between the accounts, privileging the Native record in an effort to correct the long dominance of a Eurocentric historiography. Like many early Christian jurists in Late Antiquity, most of the earliest post-contact Native literature appear in legal genres, such as land deeds, wills, affidavits, and petitions, most likely taught to them by mendicant missionaries influenced by theories of natural law and rights from schools like Salamanca. Within the Native literature ethical concerns and concepts focusing on familial relations, posterity, distribution of property and titles of status, and cosmic commitments to the divine, ancestors, and one's own afterlife (or afterlives) are measured by implied ideal norms, with failings casuistically detailed, and in their authority grounded via Native stories of origin of their community, lineage, or even the cosmos.

Undergirding these two late-twentieth century shifts was the linguistic turn in philosophy, history, and many social sciences, specifically the dialogical turn as explicated by Dennis Tedlock with Aashwi (Zuñi) and K'iche' Maya texts (1983, 1995) and Bruce Mannheim with Quechua texts (1995) drawn from, for example, the literary and language theory of Mikhail Bakhtin and his notion of dialogism. In contrast to what Bakhtin called monologism and the tendency to have a single narrative or interpreting voice dominant or Tedlock's concern for analogism where the missionary's or ethnographer's voice talks above, beyond, or after a text's various (including Indigenous) voices, dialogicality is defined as talking back and forth, through language, and meaning is not fixed but rather constantly negotiated (Tedlock 1979). The various voices implicitly if not explicitly imbedded that composed a text are held in tension. Native voices within Native authored texts as well as within non-Native authored texts are to be heard by aligning and juxtaposing contemporaneous historical but also with archeological and ethnographic records, by learning Native languages, and by reading texts with Native speakers. The Indigenous religious ethical systems and discernments emerge from the multivocality, or heteroglossia, within the record but also of and with present-day Native intellectuals.

This dialogical turn and the effort to include more Indigenous voices has been further aided by the recent increase in published Native American intellectuals on religion and ethics. In addition to Vine Deloria, Jr. (2006), this also includes now George Tinker (2008) along with Clara Sue Kidwell and Homer Noley (2001), Winona LaDuke (2005), Raymond Austin (2009), and Viola Faye Cordova (2007) with Thurman Lee Hester, Jr. and Laurie Anne Whitt (Waters 2004) as they explicate religious themes like sin, justice, solidarity, and sovereignty but often by focusing on Indigenous religious ethics but particularly with and through environmental, legal, educational, and medical concerns.

Multinatural Relations: Example of Three Sets of Maya Moral Construals

Bakhtin's notion of dialogicality, while not understood as "two interlocutors" but rather "across language," entails the entextualization of the multiple voices not only between people but also within one's own head, an inter- and intra-subjectivity. For appreciation of religious understandings of Indigenous peoples of the Americas, like the Highland Maya, such contruals of multiple voices or selves within (and not merely roles, identities, or perspectives of) a moral agent helps to understand how some Native religions may not adhere to the idea that a person only has one soul. Likewise, such as with the Highland Maya, many Indigenous peoples of the Americas extend ethical norms to non-human "peoples" or "nations" of animals, plants, natural forces and elements, celestial objects, the semi-material stewards of cosmic phenomena, ancestors, and co-creators of the cosmos to whom the peoples of the world hold an "original debt" (rather than an original sin). According to Brazilian anthropologist Eduardo Viveiros de Castro (2011), based on his research with Indigenous peoples of the Amazon, such a Native ontology is better understood as a "multinatural perspectivism" where humans are to live in right relationships with animals and ancestor spirits – and the domains of such relationships may overlap such as with a person having (or one of a person's soul being) an animal spirit companion (*nawal* in K'iche') – but they are not of the same nature. Viveiros de Castro contrasts such an ontological multinaturalism with the multicultural relativism in so-called modern Western thought that currently influences many current ethical and legal relations between non-Native people. This recent ontological turn in studies of and with Indigenous

Americans, building off of the dialogical turn, has led to the use of Viveiros de Castro's Amazonian-informed heuristic to other Native peoples from the Arctic circle to the Mesoamerican highlands.

Unfortunately for Anglophone readers, most of the recent literature on Indigenous religious ethics is not available in English since it is written by Indigenous intellectuals – namely from Mexico, Guatemala, Brazil, and Bolivia – whose secondary language is Spanish or Portuguese. The recent religious and legal literature by the K'iche' Maya of Guatemala is particularly illustrative given the fact that they have a virtually unbroken literary tradition in their Native language dating at least to the 1550s, such as the *Popol Vuh* ("Book of the Council") and Native notarial records like land deeds and wills, but are also among the survivors of the human rights abuses, including genocide, of the 1970s and 1980s. From which three sets of differentiated but interrelated moral terms predominate in their high-register of ritual and moral discourse and serve to depict K'iche'an ethical discernment for a notion of restorative justice but does not necessarily align with ethical and metaphysical construals of the Abrahamic religious traditions or globalized legal theories (Sparks 2018).

Most notably, a key concept in K'iche' ethics is a doctrine of maintaining or reestablishing a sense of ordered harmony or equilibrium within a moral agent and between others (human and non-human). While the K'iche' do not have a single term like other Indigenous American peoples do for similar concepts – such as *hózhó* among the Diné (Navajo) – it is implied within their moral discourse. Like the *huehuetlahtolli* of the Nahua, *tzij* (literally "word" or "truth" in K'iche') often consists of high-registers of speech that employs formal rhetoric, different kinds of poetic parallelisms, and archaic turns of phrases (some of which can be found in ancient glyphic texts) and take a variety of genres, such as advice or counsel giving (*pixab'*), prohibitions (*awas*), and shaming (*yajanik*) reserved for public ceremonial occasions or private consultations by a *chuchqajaw* or spiritual guide, such as a daykeeper (*ajq'ij*). Ethical discernment entails the addressing of the various perspectives of moral subjects (including, for example, victims and accused but also their wider communities of relations and influences) and mediating among the network of subjective positions. Rather than simply "good" or "evil," moral agents, especially spirits and animals, are understood as more capricious. Religious, social, and ethical discourse is composed not of such mutually exclusive concepts but rather dualisms of complementary opposites.

For example, therapeutic and aesthetic norms dealing with notions of health, nutrition, clothing, and patterns of design operate along a balance between "hot" (*q'aq'*) and "cold" (*tew*) qualities. Understood metaphorically, this set of terms has little reference with either temperature or flavor. For example, maize is "hot" and beans are "cold" regardless of whether cooked or spicy. Notions of physical, psychological, spiritual, or social illnesses are construed as imbalance between "hot" and "cold" elements in one's life, excesses or deficiencies that a traditional healer can diagnose and counterbalance. Like a scale between "hot" elements on one end and "cold" elements on the other end within a person, household, or ecology, any tilting too far to either end is understood not as "evil" but rather "not good" (*man utz taj*). A day's meals are to have both "hot" and "cold" foods, weavings are designed and displayed attentive to "hot" and "cold" colors, and emotions, bodily functions, physical activities, and words carry "hot" and "cold" forces.

Similarly, the notions of "positive" (*wikiq'ab'*, "right-hand" or counter-clockwise) and "negative" (*moxq'ab'*, "left-hand" or clockwise) express an ideal relationship of balance within divisions of the human body, domestic sphere, and cosmic dynamics. For example, the night sky rotates in the "positive" direction and so too should how farmers wind bean vines around maize stalks and weavers wind yarn into balls. Before and after meetings or religious ceremonies people greet each other by moving in a

positive direction around the circle. A daykeeper may receive twitches or “signals” in the blood on the left or right sides of her or his body, just as the directional spinning and movement of the flames in a fire offering ceremony, that convey positive or negative messages from God, saints, spirits, and ancestors regarding imbalances in relationships, offenses, warnings of adverse results, as well as suggestions for recompense and restoration of proper relations. While a state of harmonious balance between the “hot” and “cold,” and the “positive” and “negative,” is referred to as “good” (*utz*), the imbalance between any of these two poles is not usually called evil (*itz*) but rather “difficult” (*k’ax*), “dirty” (*tz’il*), or “ugly” (*itzel*), or simply “not good” (*man utz taj*).

These three pairs of moral or normative terms construe how K’iche’an Maya convey how they ought to relate and work with themselves and others, including animals, natural phenomena, and divine entities nominally along symbiotic lines of reciprocity and mutual respect if not also deference. While, on one hand, the aspects of the ethical life can tilt too far either to the “hot” or “cold” or the “positive” or “negative” sides when an offense, debt, or illness results to, thus, be rebalanced through corrective actions and a loose analogy with virtue ethics made by non-Maya interpreters. However, on the other hand, while such imbalances are “not good” the balance between “not good” and “good” can only tip too far to the former’s end and never too far to the side of “good.” In this sense, the ethical life according to K’iche’ Maya, at least for humans, can never consist of too much “good,” justice, peace, health, or respect.

The recent interpretive turns – namely dialogical and by extension ontological and metaphysical in fields like contemporary anthropology, ethnohistory, Native-language studies, as well as religious studies – aim to address ethical issues raised by Native peoples in the methods and modes of how their worlds are studied. The more Indigenous religious ethics are studied and interpreted with and by Native people – and concertedly with a specific people rather than always more generally – the more traditional analogies with other ethical systems, such as with presumed universal contrarian binaries between good and evil, emerge as more multivariigated and inclusive of Native ethical terms and concerns.

CHAPTER 89

Enduring Indigenous Religious Practices in the Americas

Santiago Piñón, Jr

Introduction

Whereas much scholarly attention has been given to Christianity in both its Catholic and Protestant forms in the Americas, the global interactions of religion in the Americas that are remnants of indigenous religious practices are still largely neglected. For instance, in *Latin American Religion in Motion*, edited by Christian Smith and Joshua Prokopy (2004), eleven of the fourteen chapters are devoted to various forms of Catholicism and Protestantism. In Michael Löwy's *The War of Gods: Religion and Politics in Latin America* (1996), the focus is on liberation theology, the Catholic Church, and politics, but there are no hints of other religions or religious people who may have been interested in the political issues the book addresses.

In this regard, an interesting and more promising approach is found in *Migración y creencias* (Migration and Beliefs), edited by Olga Odgers Ortega Ortiz and Carlos Ruiz Guadalajara (2015). It traces how various religious practices can be found in various regions of the Americas due to migration and the crossing of many borders. Many of the essays mention indigenous religious practices, but these are mostly focused on indigenous people practicing Catholicism, Protestantism, and Islam. A focus on Islam should be unsurprising given the Moorish influence in Spain prior to the colonialists' voyage to what would later be referred to as the New World.

Theoretical Considerations

Rather than follow the same trajectory as such scholars of Christianity's global interaction in the Americas, I focus here only on those particular religions and practices that are more obscure in that they deviate from the common understanding of what is accepted as Christianity, and on those religious practices that are a form of resistance. Some resist domestic abuse, which is based on patriarchal ideologies, others resist the commonly held social hierarchies that result in gender inequality and economic disparities. Still others resist authority in its many forms, whether ecclesial or political. Common to all of them is an anthropocentric concern – that of survival.

Because being centered on survival, the question of ethics of these religious adherents and practices becomes especially relevant and important. Some ethicists adopt an anthropocentric perspective that

highlights what is morally right or wrong for humanity (e.g. Joseph Fletcher). Others prefer a theocentric approach that focuses on a divine authority to determine what is morally right or wrong (e.g. Immanuel Kant). This entry considers both approaches.

While there are benefits to the anthropocentric and theocentric perspectives, perhaps a more fruitful way of understanding global encounters between Christianity and indigenous religions syncretizes anthropocentric and theocentric concerns. In all of the following examples indigenous people adopt various forms of Christianity, but often do so simply for the sake of survival or respect rather than conviction or choice (Deloria 2003). Conversion to Christianity often takes place under duress, such as the threat of annihilation. Yet such conversion does not actually demand that the convert renounce his or her previous religion. In fact, many indigenous people continued and continue their previous religious practices even after adopting Christianity (Clatterbuck 2017). Whereas Western conceptions or claims of truth require the denial, or announcement of the falsity, of other perspectives and positions (de Sousa Santos 2015), indigenous people maintain the truth of their claims, but also admit other possibilities (de Sousa Santos 2018). For instance, the oral history of the Mescalero Apache creation story narrates a particular understanding while maintaining the possibility of other perspectives (Mescalero Apache creation). As one considers global encounters of Christianity with indigenous groups one must keep in mind the complexity of such situations.

A difficulty in understanding Christian global encounters has to do with our knowledge – or rather lack of knowledge – of indigenous cultures and religions. For example, the only record that the Taino people lived in the Caribbean islands was composed by Ramón Pané, a Catholic priest (Taylor and Stewart 2013) – rather than an account by a Taino person. One therefore has to attempt to disentangle from such experiences the Western categories of what constitutes religion and a civilized society that have been superimposed on indigenous people. By the same token, such a portrait of indigenous culture may be romanticized by the one who has encountered these cultures. Moreover, much of the available information about indigenous people is the result of colonization. Tainos continue to exist in spite of almost becoming extinct as a result of genocide at the hands of the white European (Schroeder et al. 2018). Even uncontacted indigenous people have been affected by colonization either through direct exploitation or indirect observance, which has impacted the indigenous community (Arnold and Wallace 2011).

Another difficulty in considering Christian global encounters in the Americas is the prevalence of Christianity in both its Catholic and Protestant forms, which has left little room to hear the voices of other Christian adherents. Without a doubt, Catholicism and Protestantism in the Americas is deeply and often perniciously intertwined with colonialism. This is especially evident in the actions of Hernán Cortés, who would tear down indigenous sacred shrines and replace them with Catholic banners (Sánchez 2008). Protestants welcomed Indigenous Americans allegedly to share a Thanksgiving meal, but even this resulted in the loss of land during the first encounter, and the loss of life at the second encounter (Dunbar-Ortiz 2014). Even with the prevalence of Christianity in the Americas there is still evidence of indigenous religious practices that have prevailed.

In spite of the threat and reality of genocide, indigenous people have survived by adapting and adopting the colonizer's religion (Clatterbuck 2017). While many people adopted both Catholic and Protestant forms of Christianity, there are indigenous religious practices that are often unidentified.

How can one make sense of such religious practices? Scholars often use a semiotic approach, or the study of signs, symbols, and interpretations, to attempt to explain culture through common symbols. This “thick description” of culture seeks to give meaning to human actions (Geertz 1973). Yet a problem

sometimes associated with this position is the fabricated chasm between symbol and the meaning attributed to the symbol (Fiske and Taylor 2013). This attribute is either situational or dispositional (Heider 2013). Meanings assigned to the symbol are dependent on the attributor's situational or dispositional definition. A situational definition is reached when the symbol is understood in light of the context, or situation, of the individual/culture that owns the symbol. For instance, that an indigenous person adopts a respect for a "sacred text" such as the Bible may have been determined by the fact that ruthless Christians spared her life. On the other hand, Europeans considered indigenous people to be heathens because of their rejection of Christianity, then justified their massacre on the basis of this rejection, in essence blaming those people for what the Christians called an ungodly or sinful or heathen disposition (Todorov 1999).

The chasm between the attribute (here, godlessness) and the attributor (European Christians) (Asad 2009) creates that dualism that assumes there is little or no relation between the situation and the disposition of the individual. Westerners have imposed that idea on indigenous people; such a dualism is a foreign notion among many indigenous people. Indigenous people believe there is absolutely a connection between the situation and the disposition of the person, for the "interdependence of all things in nature determined their culture, that is, ethics, morals, religious expression, politics, and economics" (Cajete 2004). Religious ethicists must therefore take into account the mutual dependence between human beings and nature that indigenous peoples and religions affirm deeply. For example, they recognize the elements of nature, such as water, as sacred objects, for they sustain all forms of life (Burgos-Debray 1994). This relationship implies that the actions of people must be understood in relation to a whole – community, nature, world. Unlike ethics that recognizes actions as a reflection only of the individual, and vice versa (Mora 2018; Gustafson 1984), indigenous people insist that at the center of who they are and what they do is the community rather than the individual (Cordova 2004). The encounters between Christians and indigenous people are more than individuals meeting one another. They are communities who represent their respective religions. As such, a judgment made with regard to an individual is a judgment of the entire community she represents. For instance, when European Christians encountered and categorized particular indigenous people as heathens, they automatically included all indigenous people in the Americas in that categorization. Likewise, to describe white European Christians as responsible for the genocide of indigenous people encompasses all Christians of European descent.

Practical Considerations

Violent Encounters

The Christian encounters with indigenous people in the Americas have always been violent. That Columbus returned to Spain with six indigenous people and presented them to Spain's monarchs is evidence that the encounter was everything but peaceful. The queen understood that the strangers before her were not in Spain of their own free will. Acknowledging they were enslaved, she harshly rebuked Columbus, stating that he had no authority to enslave "Spain's subjects." Although the Spanish Crown officially rejected the enslavement of indigenous people in the New World, the Spanish conquistadores instituted the *encomienda* system as a way to force indigenous people to provide them with free labor. An *encomienda* is a system that provides indentured servitude. Legally, it is not slavery, but for all practical

purposes it is a form of enslavement. In exchange for manual labor, a master would promise to provide a Christian education and allow the servant to go free after a set number of years, of which the master conveniently did not keep track, resulting in countless years of indentured servitude. Although Latin America was the first to ban all forms of slavery, the legal prohibition to enslave indigenous people led to the introduction of African slavery into the newly conquered land.

In addition to the *encomienda*, the Spaniards also used a document known as the *requerimiento* to justify violence in the Americas. Before Spaniards could wage war, they were required to read the *requerimiento* to indigenous people. This text summarized the story of creation, various papal bulls, and demanded that the hearers acknowledge the authority of the Church, the Pope, and Ferdinand and Isabella as king and queen. The text also demanded that indigenous people listen to and respond to the Christian gospel. If they rejected either the ecclesial/political authority or the gospel, then the Spaniards felt justified in waging war against them.

The first public outcry against the Spaniards' cruel treatment of indigenous people took place in December 1511 when the Dominican friar Antonio de Montesinos condemned the Spaniards for their "cruelty and tyranny" against "innocent people." Among the congregants who heard Montesino's sermon was Bartolomé de Las Casas, who would eventually go through a conversion, get rid of his *encomienda*, and become the staunchest polemical defender of indigenous people. Reports and writings by Las Casas led to numerous debates over how Spain ought to act toward the inhabitants of the newly colonized lands. The most influential was the Valladolid debate (1550–1551) between Bartolomé de Las Casas and Juan Ginés de Sepúlveda. The latter argued that war against indigenous people was justified due to what he called their "crimes against nature," which included cannibalism, human sacrifice, and other perceived immoralities. The former argued that the inhabitants were free people and should be treated humanely. Unfortunately, the most prolific and best trained theologian in the sixteenth century was unable to participate in the debate as he had died four years before that.

Embarrassed by the rumors that his countrymen were acting viciously and cruelly toward indigenous people, Francisco Vitoria, the Prime Chair of Theology at the University of Salamanca, began to lecture on issues that considered Spain's presence in the New World. His most mature work was *De los indios*, delivered in 1538–1539. Vitoria argued against Spain's rule, but nonetheless made allowances for Spain's presence in the Americas. Vitoria's work is important because it represents an "encounter" with the Americas without his actually having traveled to the New World.

In addition to significant Spaniards such as Las Casas' and Vitoria's concern about Europeans' violent encounters with the inhabitants of the Americas, indigenous people also exercised their own agency. For instance, after Columbus arrived in the Caribbean in 1492, he built a fort that he named La Navidad before returning to Spain. When he returned the following year, he found that the inhabitants had completely destroyed the fort and killed the remaining Spaniards. In every place that the Spaniards landed, indigenous people resisted the taking of their possessions and their complete annihilation by defending themselves. The extent of this resistance is especially evident in *La noche triste* (July 1, 1520) (The Sad Night), which resulted in Cortés and the native allies being forced out of *Tenochtitlan*, the Aztec capital. When Cortés returned the following year, he found that the Aztecs had succumbed to smallpox and other Western diseases. Although the Aztecs were severely weakened by disease, they bravely resisted until their final surrender in August 1521. The political conquest of the Aztecs allowed for the Franciscans to move freely throughout the New World. While some refer to the Franciscan arrival as the beginning of

the spiritual conquest, indigenous people and their religious practices/beliefs have endured throughout time. The following are a few examples that hint at indigenous practices.

María Lionza

Located prominently in Caracas, the capital of Venezuela, is the statue of María Lionza, depicted with well-endowed exposed breasts. Holding a pelvic bone high above her head as a symbol of fertility, María Lionza is mounted on a tapir, a wild pig common in South America. She is the most prominent deity of a trinity that includes the Indian Chief Guaicaipero, and El Negro Felipe, who is a black slave. Each member of this trinity represents individuals who have experienced great oppression and injustice in Latin America. María Lionza is a “protective figure for society’s underdogs, women, the native peoples, persons of African descent, the poor, and the disenfranchised” (Nichols 2006, 78). People in Venezuela are attracted to María Lionza because she is concerned with *lo cotidiano*, the everyday affairs of common people.

People dedicated to María Lionza are able to seek advice and assistance from the deity through mediums and mediators who ensure that she remains relevant to people. Similar to the patriarchy that was present in the United States in the nineteenth century, Venezuelans have social constructs that expect women to submit to and live into these oppressive roles. In addition to the hierarchies between men and women, there are also social and economic hierarchies that are established and often difficult to overcome.

Breaking gender stereotypes, women who follow María Lionza are empowered to speak as mediums by channeling the spirit of the deity. Mediators, or interpreters, are women who make known the desires and expectations of María Lionza. These women, mediums, and mediators break the stereotype that women should remain silent and stay out of the public life by speaking on behalf of the deity. This is especially apparent in both men and women seeking the assistance of María Lionza via the mediums and mediators (Nichols 2006). Mediums and mediators overcome economic barriers by charging fees so that others may access their gifts. Mothers/daughters, mediums/mediators, are able to change their economic status by working together and charging higher fees. Especially important is the fact that the deity is no respecter of persons, a fact evident by the deity choosing to speak through individuals regardless of their social or economic status.

In addition to the sessions in which individuals commune with María Lionza, devotees participate in all-day events. On Sundays, large number of people visit Sorte, a sacred mountain in the state of Yaracuy, and make their arduous way up the path in a pilgrimage that reflects their devotion and dedication.

More than twenty-five narratives describe the origin of the goddess, María Lionza. Some of these narratives portray the goddess as the daughter of an Indian chief, while other narratives depict her as a young Spanish woman who assists indigenous people. She is then glorified as a deity for her benevolent work. There are also narratives that reflect her care and concern for the environment. The thread that ties together these narratives is her constant care and concern for others, as well as nature.

The parallels between devotion to María Lionza and to Christianity should be obvious especially when one recalls that she is one deity among a trinity just as Jesus Christ as Son is alongside the Father and Holy Spirit in Christianity’s trinity. The encounter between Christianity and indigenous people in Venezuela gives us insight into how the introduction of African slaves into the New World results in

some Afro-Latinos to look to María Lionza for spiritual fulfillment. One should be unsurprised that people are attracted to María Lionza, especially when one considers that the Aztec and Mayan pantheon included by male and female deities. These deities continue to show their presence in contemporary practices.

Santisima Muerte (Most Holy Death)

Another religious symbol that has recently gained prominence in Mexico and in the United States is *Santisima Muerte* (Most Holy Death). Andrew Chestnut, a leading scholar of *Santa Muerte*, argues that the saint can be traced back to Spain and the female version of the Grim Reaper known as *La Parca* (Chestnut 2017). In the eighteenth century, Catholic missionaries used the female Grim Reaper to evangelize indigenous people. Some scholars, such as Daisy Machado, identify *Santa Muerte* among the pseudo-saints in Latin America such as Jesús Malverde, a Robin Hood and Zorro-like figure who protects individuals who have marginalized by the law (Machado 2018).

Though there is some evidence that devotion to *Santa Muerte* was prominent as early as 1994, and maybe even earlier (Bastante and Dickieson 2013), both Chestnut and Machado identify 2001 as the key year that *Santa Muerte* rose in prominence. That was the year that an older lady turned her home into an altar dedicated to Saint Death. The house is located in one of the most dubious neighborhoods in Mexico, home to many individuals who are marginalized economically and to others who live outside the boundaries of law.

Santa Muerte is consequently often associated with Mexican drug cartels, sex workers, and human trafficking, although many others are also devotees. The prominence of *Santa Muerte* is evident from the many shrines to her along the Mexican/US border. Strong devotion to this saint is reflected in the economic impact she has at retail stores that sell various objects to show devotion to *Santa Muerte*. In many of these stores, *Santa Muerte* outsells the Virgin of Guadalupe, the patron saint of Mexico. In some *botanicas*, stores that sell herbs, votive candles, and so on, both Saint Death and the Virgin of Guadalupe are placed side by side on a personal altar.

Many drug traffickers and sex workers are attracted to Holy Death because of her non-judgmental approach. Her abilities are reflected in the votive candles of various colors. The most ominous color is the black candle which represents vengeance and protection. Drug cartels and human traffickers light the black candle and ask *Santa Muerte* to protect the cargo they are transporting, and also pray for the demise of their competitors. The most popular candle is red, which symbolizes love and pleasure. Individuals use this candle while they petition to *Santa Muerte* that their partner remain faithful. Votive candles are also available in other colors, each representing specific desires or requests of devotees, including financial stability, health, and so on. A seven colored candle is available which allows devotees to expand their requests.

Devotion to *Santa Muerte* is motivated by many reasons, making it impossible to identify a single factor for this saint's precipitous rise in popularity. Common among most devotees is the belief that Catholicism and Protestantism have failed to address the needs and concerns of many people. Also common is the resistance to authority figures, such as priests and ministers, and institutions, religious or legal, that try to dictate what beliefs and practices are acceptable.

Indigenous people may have been willing to accept *La Parca* from the Catholic missionaries, as argued by Chestnut, because the female Grim Reaper was similar to the ancient deity *Mictecacihuatl*, Lady of the

Dead and queen of the underworld (Fernández 1996). Along with her husband, *Mictlantecuthli*, she ruled the afterlife. Unlike Christianity that prescribes a final destination of either heaven or hell for all people, the Aztecs believed in a common destination, Mictlán, for all, regardless of the life that one leads. All people, regardless of social or economic status, will meet death. For many in the Americas, death is something that is not fearful. In fact, many believe that death never has the final word. Death becomes a transition into a different kind of existence. As such, loved ones are able to continue their relationship with those who have died especially during celebrations like the the Day of the Dead.

Día de los muertos (Day of the Dead)

The Aztec belief in the gods of death are reflected in the devotion to *Santa Muerte*, but also in contemporary practices such as *Día de los muertos* (Day of the Dead). The ancient practice coincided with the migration of the monarch butterflies. The Aztecs believed that the butterflies were the souls of their loved one who had passed away. Initially, the celebration was held throughout a two-month period, but with time that long celebration was reduced to the days between October 31 and November 2. Many indigenous people continued to celebrate *Día de los muertos* after the downfall of the Aztec Empire. Catholic authorities allowed the practice to continue as All Saints Day, amalgamating the two traditions. However, they prohibited it when they realized that indigenous people were celebrating a festival dedicated to the dead rather than All Saints Day.

The religious practices of *Día de los muertos* continue to this day, and are now even the focus of two popular movies, *The Book of Life* and *Coco*. We see the extent of the marketing of Day of the Dead in the widespread retail sale of paraphernalia to be used at school activities, home gatherings, and so on. In assuming that the Day of the Dead is a Mexican Halloween, many people today are unaware that this is an indigenous practice that can be traced to the Aztec devotion to the gods of the afterlife that has endured in spite of religious authorities banning the practice (Marchi 2009). While Day of the Dead was a very public celebration, there are others that have been more clandestine such as *curanderismo*.

Curanderismo (Healing)

Curanderismo, often understood as folk healing and folk medicine, is often marginalized and discredited as not being real medicine (Gonzales 2012). As a healing tradition, *curanderismo* has roots that can be traced to ancient practices identified with pre-contact Meso-American indigenous people (Ortiz de Montellano 1989), and resists the Western split by viewing the individual as a body and spirit union (Smith 1974). Yet it is this same supposedly real medicine that has adopted what Foucault referred to as the “medical gaze” which disassociates the body from the person’s identity (Foucault 1973). Many individuals of indigenous descent understandably resist the separation of the body from the soul/spirit (Clatterbuck 2017; Gonzales 2012; Tinker 2004). Recognizing the need to have a medical approach that overcomes this fracture of the person, medical schools like the University of New Mexico offer medical courses on *curanderismo* (Kesler, Hopkins, Torres, Prasad 2015; Salazar 2013; Chavez 1984). Yet, there are some who attempt to secularize *curanderismo* by focusing on the medicinal values of herbs without referencing spiritual and religious aspects of persons and life (García 1991; Wilson 2018). By contrast,

curanderismo incorporates the spiritual aspects of human existence, which resist rationalistic explanations (Hunter-Hernández et al. 2015). While there are studies that recognize that and how patients benefit from spirituality, it is usually understood merely as a coping mechanism and not as something that undergirds life itself (Unantenne 2013). As a spiritual practice, *curanderismo* can be performed only by those individuals who have been called by God and given the gift of healing.

A *curandero/a*, one who practices *curanderismo*, may specialize as a midwife (Gonzales 2012), herbalist (Tafur 2009), or exorcist (Ceja-Zamarripa 2007). Training, or *desarrollo* (development) to work in one or all of these areas begins when an individual recognizes they have this gift from God. Afterward, the individual works under the tutelage of a more mature *curandero* who will teach the apprentice how to conduct various rituals, and to use trances and possessions to make contact with the spiritual realm.

Some of the rituals that are conducted during a *curanderismo* session include lighting candles, offering prayers, and reciting the Apostle's Creed. The most popular ritual that is requested is the *limpieza* (cleansing). A *limpieza* is sought when an individual believes they may have *mal ojo* (evil eye), which manifests itself in flu-like symptoms such as fever, chills, and the common cold. Many healers resist charging for their services but are willing to accept a donation. Often, patients are asked to purchase their own materials for the various rituals, materials that can be purchased at the local botanica (herb store) along with various teas, herbs, oils, incense, and candles. Botánicas also often serve as the place where *curanderas* can meet their patients for their sessions.

One well-known *curandero* was José de Jesús Fidencio Constantino Síntora known as El Niño Fidencio by his followers (Aponte 2012). El Niño Fidencio died in 1938 and is buried in Espinazo, Nuevo León, Mexico. The small village hosts a pilgrimage every March and October so that followers may enhance their faith and healing powers. Tradition maintains that El Niño had the gift of healing and cured various illnesses including tuberculosis and leprosy. During the festival, devotees expect to receive a blessing from El Niño through a medium.

Curanderas who are dedicated to El Niño specifically resist the Catholic Church by referring to themselves as priests, and often dress themselves in clerical garments common to priests. In addition to *curanderismo* resisting the advancement of science, it also resists how one normally defines medicine by maintaining a unity between body and spirit.

1 Practices and Communities

CHAPTER 90

Practices and Communities (Christianity)

Todd Whitmore

Now, the devotion to the Eucharist, especially Adoration, I was doing it every day, at the same time, twelve [noon]. Yes, so I would go there, every day, one hour. A kind of a question came, saying, “Whose work are you doing? What about the owner of this work? When do you have time with Him? Now you have divided all the days for the other people, you have not given a day with Me?” It struck me. So, I said, “Yeah, You are right. I think there is a point here.” And then it dawned on me that I must extend the hours of Adoration. And so, I began to tell people, “You know, Friday is my day of reporting to the Lord. Because the work that I am doing is His, so I must report to him what I’ve been doing. And, then, it gives me a chance, also, to listen to Him.” So, I started doing adoration on Fridays from morning, after my Mass. Instead of, after Exposition [of the Sacrament], go for breakfast and come back, I refused to go for breakfast. So, I would only expose the Blessed Sacrament there, I stayed there, no breakfast, no lunch. I would stay the whole day – from morning until 6:30 in the evening.

Now I’m there in front of God, I’m an ambassador of humanity. Every human person is somehow being represented by me there in front. So, I must pray for the needs of every human person. And this has now grown, you know, all these years, in me. And you’ll hear me at certain times tell people that my tribe is humanity.

So, this devotion of Eucharist has become now part of my life. I feel it has given me a lot of strength. And, especially during the peace process [between the Lord’s Resistance Army and the Ugandan government], where I’ve been involved with many other people. It has always kept me focused. What I was absorbing from the Eucharist, was trying to influence also my relations with others. Even in the most desperate situations, I tell people, “Don’t lose hope. Don’t lose hope. Let us keep going. The Lord is there. He knows His time.” So, the devotion also has given me the spirit of feeling together with really humanity as a whole. And, whenever anything happens anywhere in the world, I feel this is a part of us.

(Archbishop Jean Baptiste Odama of Gulu quoted in Whitmore 2010, 65–67)

There are any number of ways a religious ethicist can interpret and assess Archbishop Odama’s intertwining practices of Eucharistic Adoration and peacebuilding, both of which take place in the context of his formation in the larger Roman Catholic community in northern Uganda. Anthropologists have historically distinguished between interpretations that are emic or internal to the community in question and etic or external to that community. In what follows, I will present different spaces in which religious

ethicists and others have wrestled with issues of emic and etic interpretation regarding the practices of communities.¹ The first section will focus on the debate in Christian ethics in the United States at the close of the twentieth century. The second part will turn to more recent efforts in Christian ethics in the United States to turn to fieldwork in a way that complicates questions of emic and etic status. In these first two sections, I will lift up exemplar scholars for more detailed analysis. The last section of the entry will show how the turn to fieldwork to interpret practices and communities in theology extends beyond those scholars described as ethicists. Attention to this wider literature is important to get at the matter of practices and communities more broadly, and raises the question of whether the distinction between religious ethics and other theological disciplines has been overdrawn.

Christian Ethics in the United States at the Close of the Twentieth Century

In Christian religious ethics in the United States at the end of the twentieth century, the emic/etic distinction took shape in the form of a debate about the extent to which internally Christian (emic) concepts and symbols should shape interpretation of practices and communities, and to what extent the (etic) frameworks of social theory and the social sciences should have an interpretive role. For instance, should religious ethicists interpret the communal practice of Eucharistic Adoration in northern Uganda primarily or even exclusively in light of an emic doctrine of transubstantiation that involves the living Christ speaking directly to Archbishop Odama, or should they draw upon the literature in anthropology and psychology on “magical thinking” that views a risen Christ speaking as in important respects not real, even if beneficial in its effects on the Archbishop’s peacebuilding? This emic versus etic debate as it pertains to practices and communities was sharply evident in Christian religious ethics in exchanges between Stanley Hauerwas and James Gustafson.

A stress on the practices of a (specifically Christian) community has been central to Stanley Hauerwas’ work from early on. It stems from his concern that Christianity as it has taken shape in the United States has been absorbed by modern, liberal (in the classical sense) culture: “I am trying to save the church from the liberal project” (Hauerwas 1997a, 16). That liberal project is one of suppressing public articulation and embodiment of deep beliefs for the sake of a thin but, it is argued, relatively stable consensus. In acceding to this consensus, Christianity has, according to Hauerwas, lost all that has made it worth living. However, simply retrieving distinct Christian beliefs is not sufficient. “[N]o matter how orthodox it may be, theology divorced from the practices of the church cannot help but be ideology” (Hauerwas 1997a, 58). That is to say, if Christian belief is not embodied in distinctive practices, then it will, regardless of the intent of the believers, end up reinforcing the liberal status quo. “[F]ailure to attend to these material practices results in their being made part of quite foreign narratives and/or lost altogether” (Hauerwas 1997a, 7). Only when beliefs are embodied in practices can they resist absorption into liberal culture. “For that is the heart of the matter – namely, practices. Practices make the church the embodiment of Christ for the world” (Hauerwas 1997a, 68). Such practices, however, are not sustainable

¹ Though the literature I treat here is centered on Christianity, I would not be surprised if there were strong analogues in other religious traditions.

apart from a community that engages in them. A person does not take them up in isolation. Practices can only be undertaken, in Hauerwas' words, "in good company" (Hauerwas 1997a, 9).

In interpreting Archbishop Odama's practice of Eucharistic Adoration, then, a Hauerwasian perspective would likely stress that it is part of a set of communal practices that displays the truth that the war in northern Uganda is not the last word on reality, that rather Jesus' claim, "I will be with you always, to the end of the age" (Mt 28:20) is true. This is why Odama can tell those in his care, "Don't lose hope. Let us keep going. The Lord is there. He knows His time." Odama's practice of prayer, together with that of his peacebuilding in the midst of war, are exemplifications of the truth that Christ is, and will continue to be, Lord of all creation.

Hauerwas does not draw from that group of disciplines typically identified under the rubric of the "social sciences" to further elucidate the practices of the community and their meaning.² He is very careful to say that his project of describing Christian communal practices is not sociology, at least as this is most commonly understood. At this point, Hauerwas takes up John Milbank's position as articulated in the latter's *Theology and Social Theory*, a work that critiques modern social theory and social science as presupposing a violent narrative that is inimical to the Christian narrative of love (Milbank 1990). Hauerwas takes from Milbank "the astounding claim that theology must be its own social science" (Hauerwas 1997b, 192). Thus, the Church is "not a site" for secular sociological inquiry (Hauerwas 1997a, 29).

At the root of Hauerwas's resistance to social theory and science is his concern that allowing such etic frameworks as interpretive rubrics for understanding Christian communities and practices involves the subsumption of what ought to be a theological enterprise under secular ways of construing the world. Citing Milbank as inspiration, he writes that sociology as it is usually practiced "is an attempt to make us believe that the way things are is the way things have to be. The world sets the agenda." The result is "the domestication of the gospel." Hauerwas wants the Christian community – the Church – to "claim its own sociology in a way that narrates the church's life" (Hauerwas and Willimon 1996, 68). In the terms of this present entry, Hauerwas' concern is that if the etic modes of interpretation are brought to bear on the Christian community and its practices, then all emic interpretation – and the practices which such insider interpretation limns – is in danger of being lost. In the case of Archbishop Odama, for instance, his practice of Eucharistic Adoration and its related belief that Christ is still Lord of all creation are necessary to keep in view in order to understand the risks he took to negotiate with the Lord's Resistance Army.

James Gustafson charges Hauerwas' etic-averse ethics as giving in to a "sectarian temptation" that is at once irresponsible and impossible. It is irresponsible because it refuses to engage in an exchange of mutual critique and wisdom with the other communities in a society that is pluralistic. "God is assumed to be the tribal God of a minority of the earth's population." Such a posture is also self-deceptive because communities cannot be pneumatically sealed in just such a pluralistic society. Christian communities are always in de facto interaction with other communities such that any given Christian is also a member of these other communities of interpretation. True sectarianism is impossible (Gustafson 1985, 92, 86, 84).

² I put "social sciences" in scare quotes here because some of the practitioners of the disciplines in question – many in cultural anthropology in particular – do not understand their practice as one constituting a science as that is often understood.

Gustafson's use of the term "sectarian" displays his indebtedness to the social theory of Max Weber and the latter's typological method of sociological interpretation as retrieved by Ernst Troeltsch. Weber and Troeltsch distinguished between "church" and "sect" types of religious organization. As articulated by Weber and Troeltsch, "church" membership is a result of birth into the community, and the community in question participates in and is accommodating to the larger society; "sect" membership is typically through adult decision, and the community understands itself in opposition to society. In *Christ and Culture*, Gustafson's teacher, H. Richard Niebuhr, appropriated and complexified the typology (Niebuhr 2001). Gustafson himself appropriates the typological method in his *Christ and the Moral Life* (Gustafson 1968).

On this Niebuhrian-Gustafsonian read, what is relevant about Archbishop Odama's involvement in the peace negotiations in northern Uganda is less that it is a sign and outgrowth of his distinctive Christian practices – all of the types of Christian communities are shaped by what they identify as Christian beliefs and practices – than it is an indication of his being a part of a Catholicism that manifests itself as a "church" type of Christian community that engages with rather than withdraws from the world and its problems. Evidence of this "church" type activity is not only in Odama's peacebuilding with the government and rebels, but also in that he joined with leaders of other denominations and religions – Muslim, Orthodox, and Anglican – to form the Acholi Religious Leaders' Peace Initiative (ARLPI), overcoming decades of mutual suspicion and hostility in order to better address the problems that were besetting the world.

Gustafson's approach has its own liabilities, and that is its tendency to jettison key emic Christian claims in the face of social and natural science. In his major constructive work – the two-volume *Ethics from a Theocentric Perspective* – his use of the sciences leads him to reject the ideas of providence, a personal God, and Jesus as the Christ (Gustafson 1981, 1984). In "The Sectarian Temptation," he is most direct: "Jesus is not God" (Gustafson 1985, 93). In this he is consistent with Niebuhr's "radical monotheism," and raises the question of whether both have appropriated not only Weber's typological method, but also his understanding of modernity – even modern religion – as disenchanting. The modern world is such that, in Weber's words, "there are no mysterious incalculable forces that come into play . . . This means that the world is disenchanting" (Weber 1958, 139, 350). For Weber, the Incarnation "stands in the way of a strict monotheism" (Weber 1978, 415, 467, 506). Gustafson's theology as inherited and developed from Weber, Troeltsch, and Niebuhr is a manifestation of Hauerwas' fear that appropriation of etic viewpoints through the sciences – both social and natural – will lead to the loss of what is distinctively Christian (Gustafson 1985, 93).³

Yet the liabilities of an almost exclusively emic approach to practices and communities will not go away. One of the frequent criticisms of Hauerwas' work is that the Church and its practices that he describes – or rather prescribes – exist nowhere in the known world. When he joined with William Willimon to write *Where Resident Aliens Live*, he did so to address this criticism of their earlier work, *Resident Aliens*. Interesting about his response is that he thought he *already had* adequately detailed the Christian practices in the first volume. "We are surprised when many persons say, 'Where in the world

3 Gustafson himself acknowledges that his "stoical piety may be more Swedish, or even northern Swedish, than Christian." It is important to note, however that although Gustafson's work is not Christian, it is theological. In his effort to preserve God as the sovereign God in the face of the history of Christian anthropocentrism and contemporary science, he finds it imperative to reject a God who reveals himself in a unique way in Jesus Christ.

is this church which you describe?’ Or ‘The church you want doesn’t exist.’ We thought we had bent over backward, in our illustrations and narratives in *Resident Aliens*, to use examples that were ordinary, local, and typical, so as to underscore that sort of prophetic church we had in mind already exists, at least in glimpses” (Hauerwas and Willimon 1996, 17). His use of the terms “illustrations” and “examples” are themselves illustrative of the problem, and that is that without the careful appropriation of the skills and practices of the social sciences, Hauerwas’ accounts of the church he wants can remain only anecdotal in vignettes, hardly something that is going to shape the hearing community’s practices in any but the most superficial ways. To make his theology *work* the way he wants it to work – with its readers and listeners appropriating the practices he prescribes – he must provide the kind of “thick description” that Clifford Geertz calls anthropologists to undertake. Whether due to his formation in traditional modes of theology or his allergy to the social sciences, he never does. Neither does Milbank. Their theologies, therefore, are performative failures.

What is needed for the adequate presentation of practices and communities in religious ethics, then, is an approach that draws from ethnographic methodologies such as participant observation and the qualitative interview, and ethnographic literatures such as the works of Geertz, for theological purposes – that is, for witnessing to the world in writing as we have been witnessed to in the field. This way of approaching practices and communities in religious ethics is relatively new, and the aim of the next section is to detail its development.

The Turn to Fieldwork in Religious Ethics

In recent years, ethicists in the Society of Christian Ethics (SCE) have begun to turn to qualitative fieldwork as a way of attending to practices and communities. 2009 saw the formation of the “Fieldwork and Christian Ethics” interest group. In 2011, Christian Scharen and Aana Marie Vigen drew together nine ethicists for an edited volume, *Ethnography as Christian Theology and Ethics*. Scharen and Vigen co-wrote the first four chapters, one of which contested the, “Critiques of the Use of the Social Sciences in Theology and Ethics,” and another that set out, “Theological Justifications for Turning to Ethnography.” The remainder of the volume consists of chapters by others exemplifying what theologically-oriented fieldwork looks like (Scharen and Vigen, 2011). Both Scharen and Vigen have published book-length fieldwork-based texts, as have a number of the contributors to the edited volume, including Todd Whitmore, Melissa Browning, Emily Reimer-Barry, and Peter Gathje (Scharen 2004; Vigen 2006; Whitmore 2019; Browning 2014; Reimer-Barry 2015; Gathje 2006). For these ethicists, doing fieldwork is not just a matter of gathering data to plug into a theology; rather, fieldwork itself, together with the writing that arises out of it, is a way of doing theology. In Scharen and Vigen’s words, fieldwork and the writing that stems from it, “is a way to access *both* human experience and knowledge of the divine. Thus, it can be more than a mere tool in the doing of theology; it in itself can be an *expression* of theology” (Scharen and Vigen 2011, 65). Though not part of the Scharen/Vigen volume, the work of Luke Bretherton, Jennifer Beste, and Michael Banner should be included here (Bretherton 2010; Bretherton 2015; Beste 2018; Banner 2014).

Unlike Hauerwas, these ethicists undertake social scientific fieldwork, using etic methods and constructs, to investigate the practices of communities. Unlike Hauerwas and Gustafson, they do not think that such appropriation of the sciences entails the loss of Christian affirmations on the part of investigator. Rather, these researchers use field methods to raise moral and theological questions in and for the

Christian tradition. With regard to Archbishop Odama and the practice of Eucharistic Adoration in the Acholi Catholic community in northern Uganda, for instance, careful investigation of the practice can raise the question of whether the fact that the Acholi belief in Jesus speaking through the Eucharist funds radical witness during a time of war undercuts Weber's claim that "magical thinking" stifles moral action. Perhaps, such investigation might suggest, modern Western Christianity itself has become too "disenchanted," and thus too immobile in the face of existential threat.

Initially alongside of, and now in conversation with, the above scholars, some womanist religious ethicists have undertaken field methods. The turn to field methods has been prompted in part by the appeal to the specific experiences of black women as a resource for doing liberationist-oriented theology. While, like black theology generally, the initial instances of this turn were informed by black music and literature – in other words, to sources that may have begun orally, but are now written down – some more recent research includes field methods to investigate the question of current practices within the community. This latter approach has the advantage of not moving too quickly to claims about the generalized "experience" of the group in question. Linda Thomas, writing in 2004, calls upon black theology, and womanist theology in particular, to appropriate field methods for researching and interpreting the living practices of their respective communities (Thomas 2004, 37–48). Angela Sims' oral history project on lynching and AnneMarie Mingo's similar project on black women in the civil rights movement are important instances of such field methods in Christian womanist ethics (Sims 2016; Mingo 2015).

It is helpful to look at Traci West's 2019 book, *Solidarity and Defiant Spirituality: Africana Lessons on Religion, Racism, and Ending Gender Violence* as a recent benchmark for the possibilities for the use of field methods in the doing of religious ethics. West takes as her starting point her concern about gender-based violence against black women and girls. Part of the reason is statistical. "In general, most studies have found that black females experience intimate partner violence, rapes, and sexual assaults at higher rates than white females" (West 2019, 40). However, what drives much of the statistical disparity is a social devaluing of women of color. There are "standard associations of evil, sin, and ignorance with darkness" (West 2019, 230). Black women and girls stand at the vulnerable intersection between misogyny and anti-black racism. In an effort to learn how to better resist gender-based violence against black women and girls, West travels to Ghana, Brazil, and South Africa to learn from anti-violence activists in these locales.

A number of things make West's book stand out as an exemplar of what religious ethics can look like when it turns to field methods. Her methods hold up to scrutiny from a social science perspective. She interviewed 180 people in the three countries, with seventy-five of those interviews being two-hour, one-on-one exchanges. Meeting such standards of rigor is not for the sake of an apologetic theology proving itself to social science; rather it is important because the traditions of social science have thought long and hard about what makes for the adequacy of a claim about the practices of communities. Theologians can disagree with those standards of adequacy, but, if they do, they need to provide *reasons* for the difference if theology is to be understood as an *academic* discipline. In keeping with her methodological seriousness, West engages the wider ethnographic literature, and here not only on the topic of gender-based violence, but on the doing of ethnography more generally.⁴ Theologians doing fieldwork sometimes fail to cite and enter into conversation with the wider literature, as if doing fieldwork is just a

4 West's main interdisciplinary interlocutor is the critical ethnographer D. Soyini Madison. For the text West engages, see D. Soyini Madison, *Critical Ethnography: Method, Ethics, and Performance*, Third Edition (Thousand Oaks, California: Sage Publications, Inc, 2020).

matter of hanging out. The reverse analogy would be if an anthropologist said, “I’m thinking about God; therefore when I write down my thoughts I am doing theology just as they are doing it in theology departments.” We would rightly object that they need to engage the traditions of theological thought. West’s interdisciplinary accountability is a helpful antidote to writing that presents itself as, but in fact is not, interdisciplinary.

West is aware that in order to adequately render her findings into writing, she needs to alter the usual genres of religious ethics, and she does so in an interesting way (West 2019, 16). Even though her rigor is first of all based on the number and extent of her interviews, she understands that those interviews are not simply a matter of gathering “data” to present in an abstracted way. Therefore, she presents the interviews as moments of encounter between different, even if in some ways overlapping, worlds. To do this, she appropriates the anthropological method of participant observation, or what she prefers to call “a participatory method of learning” of the interview encounter, and the written result is a kind of thick description of the encounters (West 2019, 230). An added benefit of this approach is that it allows West to write herself into the text in a way that highlights her affective responses to the witness and words of her interlocutors. West is clear that she is not providing – and is not trying to provide – a comprehensive ethnography of her interviewees. Her writing seeks to present her “engagement with the leaders and their community settings rather than . . . an ethnographic portrait of them” (West 2019, 20–21). Part of West’s interdisciplinary awareness is her knowledge that not all qualitative research is, or ought to be described as, full-blown ethnography.

Placing the interviews in the context of the encounter between interviewer and interviewee not only generates a livelier text than would otherwise be the case, it also foregrounds what West calls the “productive frictions” that ensued and that are at the center of her book (West 2019, 191). These frictions occur, and can only occur, because West presents herself – and repeatedly so – as an outsider. In doing so, she counters two tendencies regarding the role of the emic and the etic in religious ethics. The first is the tendency in Christian ethics in the Hauerwasian tradition to align what is emic with what is Christian. This is because of its focus on developing and preserving specifically Christian practices. However, as West points out, many Christian communities have a longstanding practice of subjugating both women and people of color, and so deflect attention away from the problem of gender-based violence against black girls and women. Some of West’s interviewees are deeply distrustful of Christianity for this reason. West is there to *learn*. If such an approach is thought of as other-than-Christian, we need only remember that the Gospel often has Jesus affirm persons not of the people of Israel – Syrophoenicians and Samaritans, for instance – as exemplifications of faithfulness. Exemplification by the “Other” can be, and for West is, an integral part of a “defiant spirituality.” West’s designation of herself as an outsider also sits crosswise with the efforts of some African-Americans to seek out Africans as a deeper exemplification of their own experiences. “Romanticized depictions of the organic connection for all peoples of African descent deserve our suspicion and distrust” (West 2019, 236). West offers instead the counsel that there is such a thing as “positive awkwardness” (West 2019, 235). “Appreciation of divergent forms of antiviolence knowledge can further a spirit of defiance [against gender-based violence] . . . It can provide release from any presupposition that common cause and trustful alliance must be formed out of political sameness and cross-culturally homogenized universal truths” (West 2019, 238).

West’s interviews do specify many practices along the way – for instance, monitoring police and other official responses, holding religious leaders to account by exposing them to the realities of gender-based violence, and providing space for conversation among various parties – but she lets these unfold in the

course of the interviews rather than simply listing them, so as to counter any (mis)perception that the practices are easily transportable. With regard to any possible engagement with Archbishop Odama, West's emphasis on conversation between differing communities would likely indicate an appreciation of the way in which the Acholi Religious Leaders Peace Initiative has drawn together persons from different traditions to combat violence. Her approach would then ask how that armed conflict peacebuilding engages the issue of violence against women and girls, not just by the Lord's Resistance Army, but also by clergy and other men in the archdiocese. Odama articulates a universal vision of love: "I'm an ambassador of humanity." West warns that the "defiant Africana spirituality" that she is engaged with, "has to cultivate a degree of uneasiness with standard articulations of Christian love . . . Christian love rhetoric has traditionally enjoyed an unperturbed attachment to transphobic and misogynist denials of gender equality" (West 2019, 237). Representatives of the Acholi Religious Leaders Peace Initiative have sought to address violence against women. Still, with West's placement of the lived encounter at the center of her method, it is impossible to know in advance what would come out of an interview she would have with the Archbishop. There would be no presupposition that because both are Christian and black that there would be automatic shared emic perspectives on gender-based violence against women and girls. West and Odama do share an emphasis on hope, however: "Defiant spirituality gives birth to hope," she writes (West 2019, 223); Odama's practice of Eucharistic Adoration leads him to tell the people of the archdiocese, "Don't lose hope. Don't lose hope." Probably, any encounter between the two would not be easy, but would also involve "positive frictions."

Beyond "Ethics"

Though West, Vigen, Mingo, and Whitmore have joined to co-edit the T. & T. Clark Studies in Social Ethics, Ethnography, and Theologies book series – another sign of the continuation of the turn to fieldwork in religious ethics – it is also important to highlight theological appropriations of fieldwork methods that do not present themselves under the rubric of "ethics." Mary McClintock Fulkerson's *Places of Redemption: Theology for a Worldly Church* is a frequent touchstone for religious ethicists doing fieldwork (Fulkerson 2007). More recently, Natalie Wigg-Stevenson's *Ethnographic Theology: An Inquiry into the Production of Theological Knowledge* stands as another exemplar text, as does Emily Hunter McGowin's *Quivering Families: The Quiverfull Movement and the Evangelical Theology of the Family* (Wigg-Stevenson 2014; McGowin 2018). Presenting their projects as simply theology and not theological ethics helps counter the view that ethics can involve fieldwork because it is an "applied" discipline, whereas theology "proper" is a form of speculative or theoretical knowledge that need not involve itself with on-the-ground inquiry.

Wigg-Stevenson's position at the University of Toronto, described as a professorship in "contextual education and theology," points toward the practice of "contextual theology," as initiated by Shoki Coe of Taiwan and later taken up by others (Coe 1973, 1974; Bevans 2002; Bergmann 2017; Moschella and Willhauck 2018). While not all contextual theologians use field methods to describe and interpret practices and communities, the orientation of this kind of theology opens up in this direction. This is also the case in what is called "practical theology," as it is practiced both in the United States and Europe (Swinton and Mowat 2006; Moschella 2012). Pamela Couture's *We Are Not All Victims: Local Peacebuilding in the Democratic Republic of Congo* is an instance of religiously oriented fieldwork that places itself under the

rubric of practical theology (Couture 2016). The Ecclesiology and Ethnography Network, founded in 2007 by Christian Scharen and Pete Ward, and the journal, *Ecclesial Practices*, generate much fieldwork-oriented practical theology as well. Both Mary Clark Moschella and Jan Holton have taken an ethnographic turn from within the context of their institutional positions in “pastoral theology” (Moschella 2006; Holton 2016). “Lived religion” as a focus of study in the work, for instance, of Robert Orsi, though more often placed within the ambit of religious studies than theology, takes the fieldwork turn in a way that troubles the religious studies/theology dichotomy (Orsi 2005, 2010; Hall 1997). Work by Maureen O’Connell and Rebecca Spurrier straddle the areas of ethics, liturgical studies, ritual studies, and aesthetics (O’Connell 2012; Spurrier 2019). In a way similar to womanist theologians discussed above, Ada María Isasi-Díaz and Jeanette Rodriguez have employed field methods under the rubric of Latina, mujerista, and indigenous theology (Isasi-Díaz 1993, 1996, 2004; Rodriguez 1994, 2018). Looking again beyond the Americas and Europe, any treatment of fieldwork as a means to address the practice of communities has to include the work of Mercy Amba Oduyoye and the Circle of Concerned African Women Theologians (Oduyoye 2018).

Assessing practices and communities within a wider context of theological and religious inquiry accentuates two factors already present in fieldwork done under the rubric of religious ethics. The first is that such research questions any theoretical or institutional division between theology and ethics, a division indebted to a problematic assumption that theology can be done as if from nowhere, and that theological ethics is the “application” of theology to somewhere. Theology of any kind arises out of the lived context within which it is written. In other words, theology itself is a communal practice. Attention to the details of that practice can raise up for inspection any exclusions of groups of people in the doing of theology. The second factor, related to the first, is evident when we note the relatively high proportion of women, including women of color, in the turn to fieldwork. This suggests that such a turn is at least in part prompted by the previous marginalization of women and people of color from the production of theology as typically practiced. Such power dynamics can also suggest part of why so few leading white male theologians, even those who call for thicker accounts of Christian practice, have yet to turn in any rigorously accountable way to lived communal practices.

CHAPTER 91

Islam – Communities and Practices

Kirsten Wesselhoeft

Scope of the Entry

Muslims reflect upon, learn, and practice ethics in a diverse range of communal settings, which include not only local entities such as charities, schools, and mosques, but also transnational intellectual currents and organized global networks. These communities serve as sites of knowledge production and transmission, providing the contexts for Muslims to deliberate how traditional sources and methods should shape their ethical lives, and how they will shape Islamic traditions in turn. Contemporary Muslim communities are not only arenas in which to cultivate ethical practices and virtues; they are also important ethical ends in themselves: the preservation of these communities, or the creation of new forms of collective belonging, is itself a significant ethical practice for many Muslims.

For the purposes of this entry, “ethics” refers to norms for how to live rightly or well, practices that aim to implement or cultivate these norms, and reflection on how those norms should be inhabited, formulated, and derived. In Islamic scholarly traditions, reflection on ethics encompasses and draws together moral philosophy, scriptural exegesis, jurisprudence, spiritual manuals, collections of hadiths (traditions of the Prophet Muhammad) or sayings of other holy figures, and etiquette manuals, as well as other genres. Muslims beyond the scholarly elite draw extensively on these texts in their moral deliberation. Equally important in their ethical development, however, are the communities in which ethics is modeled, taught, and debated, and the practices or habits that give life to moral norms and aspirations. These communities and practices are cultural visions of how to live rightly or well as a Muslim – visions that may be closely engaged with, or relatively disconnected from, Islamic textual traditions.

Individual Islamic communities not only foreground specific ethical practices; they also emphasize the appropriate attitudes for enacting these practices. For example, a study circle at a mosque might encourage not only the observance of regular prayer, but also the correct mindset that should animate that prayer. Likewise, members of a social activist organization might not only foreground the value of justice, but also encourage a particular embodied attitude in one’s pursuit of justice. The range of practices, values, and dispositions that are fostered in Muslim communities are framed in terms of Islamic traditions. They may be drawn from the Qur’an or Muhammad’s lived example; they may emphasize the methodologies of moral reasoning developed by classical jurists, or they may take inspiration from the lives and writings of significant Muslim thinkers, from Rabi’a of Basra (d. 801) to Ibn Taymiyyah (d. 1328) to Malcolm X (d. 1965). Moral communities may develop markedly divergent interpretations of

shared texts, including the Qur'an, and develop local ethical norms and practices that are not shared by Muslims elsewhere (El-Badawi and Sanders 2019). These communities are also the sites for sharp debate over ethical issues, determining the stakes of the disagreement and the forms of rhetoric that will be persuasive to that community's public. Ethical debates among Muslims do not take place in isolation, particularly in a world in which many non-Muslim entities aim to influence Islamic values. Muslim communities are shaped by moral projects and priorities that transcend religious identity, and Muslims pursue their moral development in non-Muslim spaces and institutions as well as Islamic ones.

Communities

Schools

One prominent setting in which Islamic ethics are explicitly taught is the religious school or seminary, known in many parts of the world as a *madrasa*. The pursuit of learning has always been a central Islamic virtue in and of itself, enjoined in the Qur'an and in numerous hadiths. In some contexts, religious schools for children and adults serve as sites of transmission of traditional norms and dispositions, often through an intimate pedagogy between teacher and student, and through physically embodied actions and attitudes. Ebrahim Moosa describes how the daily routine at a Deobandi madrasa in India integrates ritual worship, study, and recreation into a harmonious whole in which each everyday act inculcates piety (Moosa 2015). In his study of West African Qur'an schools, known as *daaras*, Rudolph Ware refers to an "epistemology of embodiment" that animates Islamic education in the classical style (Ware 2014, 37). In the Qur'an schools he describes, children learn reverence for the Qur'an and for the Prophet Muhammad through ingestion of the text as well as memorization of it. They learn humility and communal responsibility by seeking alms and food in the streets. Physical hardship is understood to be instrumental to the formation of disciplined character. As Ware writes, "Knowing was produced as much by the limbs as by the mind. . . . The people were the books, just as the Prophet was the Walking Qur'an" (49). This type of Islamic school functions not only as a local moral community, but as a link in an imagined community of tradition, bound together through the embodiment of the Qur'an, that stretches back to the Prophet himself.

Other institutions of Islamic learning are self-consciously modern, and Islamic values are studied as systematic and objective. These schools have been important sites of both tension and cooperation between traditional religious intellectuals (*'ulama*), religious reformers, and state elites, and their respective visions for Islamic morality in the broader public sphere. Whereas the *'ulama* worked with understanding of Islamic ethics derived principally from their interpretation of *shari'a*, religious reformers from different professional backgrounds tended to take an eclectic approach to moral pedagogy and rhetoric. Their projects of grassroots social reform began with the moral improvement of individual Muslims – a goal that depended on modern mass education, rather than specialized scholarship in religious sciences. Modernist projects of Islamic moral education that came to prominence in countries as varied as Egypt, Turkey, and Indonesia were part of a worldwide turn toward "mass education of a moralistic sort" as a hallmark of nation-building projects at the turn of the twentieth century (Hefner and Zaman 2007, 33–34). In many Muslim-majority contexts, this link between nation-building and moral education had the effect of situating religious schools as at once sites of state-driven pedagogy and centers of religiously-grounded ethical resistance to state power.

In addition to their roles in these national and transnational political dynamics, individual religious schools function as communities of ethical reflection. Institutions as diverse as Al Azhar in Cairo, Darul Uloom in Deoband, India, or Zaytuna College in Berkeley, California form moral communities of students and teachers who dedicate themselves to reflecting on the ethical questions and methodologies of Islamic traditions. The prominence of such institutions, and the dynamism of the landscape of Islamic education today, speak to the centrality of the pursuit of knowledge as an enduringly central Muslim ethical practice.

Mosques

Mosques are much more than places for performing collective worship. They are sites of teaching and study, centers of spiritual retreat, nodes of charitable activity, masterful works of architecture, and vectors of political authority. Mosques function as highly symbolic moral communities for the faithful who frequent them, but also, in many cases, for the broader public, whether Muslim or non-Muslim.

During the twentieth century, mosques became increasingly prominent as sites of popular ethical formation. As part of a global revival in religiosity during the late twentieth century, the “mosque movement” drew large numbers of men and women to mosques to hear lessons from religious teachers and participate in study circles (*halaqat*). This movement, also referred to as the “*da’wa* (religious preaching) movement,” gave mosques a renewed cultural prominence as places where pious Muslims could access religious instruction outside of a formal curriculum of study. While it is linked to and in part the result of the educational reform movements discussed above, the mosque movement has been a grassroots development, rather than a top-down reform. Classes and study circles emphasize the relationship between Islamic knowledge from canonical sources, personal spiritual development, and the practicalities of daily life. The large-scale participation of women in this movement was a new development in many regions, where mosques had been male-dominated both in terms of their authorities and their publics.

In her influential analysis of female participants in the mosque movement in Cairo, Saba Mahmood (2005) describes mosque classes as the sites in which the moral authority of canonical texts is produced, as these texts are cited, commented upon, and connected to everyday life by the teachers and students. They are also sites of moral persuasion and debate among women, as religious teachers strive to instruct their audiences not only in correct behavior but in correct patterns of argumentation and justification, and attendees sometimes contest and challenge their teacher’s reasoning. This atmosphere of engaged discourse is itself an important ethical practice developed in mosque study circles, which valorize interactive and personalized patterns of relationship with authoritative texts or individuals.

In contexts where Muslims live as religious minorities, mosques are often the most visible indices of Muslim presence as religious minorities in the broader cultural landscape. This makes them prominent settings for interreligious dialogue, interface with state authorities, and acts of anti-Muslim discrimination. Many European and American mosques must work to foster a sense of collective belonging across ethnically, racially, and socioeconomically diverse congregations. Many mosque communities also work to present “Islamic values” as compatible with “American,” “British,” or “German values,” to Muslims and non-Muslim audiences alike, by hosting public educational events and open houses, engaging in community service, or issuing public statements. In these environments, the moral work of mosque communities goes well beyond religious preaching, encouragement of ritual worship, or the cultivation of personal piety to include representation, dialogue, and advocacy.

Charities and Community Organizations

While mosques often conduct charitable and community service work, independent charitable organizations also constitute communities of ethical engagement, often outside of the structures of authority that typically characterize both mosques and schools. Related to the charitable endowments (*waqfs*) that have long been pillars of Islamic civilizations, contemporary Islamic charities anchor the Islamic practice of giving (*sadaqa*) in contemporary cultures of volunteerism. While some Islamic charities emphasize traditionally humanitarian values of empathy and benevolence, and Amira Mittermaier shows that many also exemplify a “*nonhumanitarian* ethics of giving” – that is, a practice of giving to the poor not out of compassion, but in order to give “to God,” as a response to divine command and a recognition that wealth belongs not to rich or poor, but to God alone (Mittermaier 2019, 5–6). Lara Deeb (2006) described how community service organizations were primary sites for Lebanese Shi’a Muslim women to develop the qualities of strength and activism, modeled on pious women from the family of the Prophet Muhammad, that would fortify them for more public religious activity.

While most Islamic community organizations emphasize charitable activity, others focus on civil rights and political engagement. Like Deeb’s description of the Lebanese Shi’a volunteer organizations, Muslim activist organizations cultivate the value of visible public engagement, often framed in terms of the struggle for justice, resistance to oppression, and the pursuit of knowledge and truth. For example, the Malaysian organization Sisters in Islam advocates for legal reform on issues of women’s rights, both in terms of the religious establishment and the Malay state. Sisters in Islam and similar activist groups create moral communities that are focused on effective action in the existing political system, and are inevitably embedded in the norms and practices of their local political environments.

Transnational Movements

Muslim moral communities are not limited to local institutions where believers gather in person. For centuries, religious movements have linked Muslims from diverse social, political, and linguistic contexts in a shared set of moral and spiritual practices. Sufi orders, or *tariqas*, have united Muslims across long distances through shared teachings and patterns of devotion, and allegiance to founding teachers. Sufi *tariqas* spread through a genealogy of initiation; each teacher deriving authority from their own teacher, links in a chain of transmission going back to the Prophet Muhammad. As ethical movements, *tariqas* unite their members through shared ritual practices, such as *dhikr* and pilgrimage, through the disciplined cultivation of humility, abstention, and love, and through emulation of a teacher. While most *tariqas* have developed regionally, some have spread worldwide. Writing about a Sufi order that has spread from Pakistan to Europe, the Middle East, and southern Africa, Pnina Werbner emphasizes the intense bonds of love for the order’s founding saint that animate a vast transnational organization. For these Sufi devotees, she writes, the journey of transnational migration becomes incorporated into a whole moral cosmology of journeys: the personal journey on the Sufi path, the saint’s journey to found the order, and the pilgrim’s journey to the shrine (Werbner 2004, 13–14).

In the contemporary period, the global reach of the Muslim community, or *umma*, has taken on particular importance for many Muslim thinkers. The *umma* is often discussed as a loosely unified global community, whose collective moral and spiritual condition should concern all Muslims. This global vision of Islamic ethics has inspired numerous transnational networks in the twentieth century. Two

very different networks, the Tablighi Jama'at, which originated in colonial India, and the Gülen or Hizmet Movement, which originated in Turkey in the 1960s, show how transnational organizations facilitate the spread of particular approaches to Muslim ethics across diverse cultural and political contexts. The Tablighi Jama'at is a grassroots revivalist movement that emphasizes austere piety, sincerity, and missionary activity (*da'wa*) directed toward fellow Muslims. The Tablighi movement practices face-to-face *da'wa* activity and codified manners of behavior and dress, and, like many Sufi movements, places particular ethical value on travel itself. The Tablighi missionary's travel represents and facilitates the movement within the self from worldly pursuits to religious concerns. By crossing political, cultural, and political boundaries, the Tablighi missionary demonstrates the transcendence and the universal efficacy of his or her message. Like the Tablighi Jama'at, the Gülen Movement places special value on international religious outreach and supporting fellow Muslims in their personal piety. Unlike the Jama'at, the Gülen Movement has a strong cultural association with Turkishness, and works through institution building, rather than through individual *da'wa*. Strongly anchored in Turkey, and led by US-based Turkish intellectual Fethullah Gülen, the Gülen Movement has founded schools and cultural initiatives around the world. These institutions provide services and education, and promote core values of service (*hizmet*), humanitarianism, and dialogue. Gülen institutions strive to reach non-Muslims as well as Muslims, articulating their values in universal moral language and emphasizing intercultural dialogue.

Beyond formally structured transnational organizations, Muslims also find moral community through looser global networks of individuals and organizations that share a common ethical orientation. One such movement has become known as the "progressive" Muslim movement, an amorphous intellectual and ethical current with nodes of local community scattered around the globe (Safi 2003). Progressive Muslims have no fixed doctrine or specific ethical practices, but share an orientation toward social justice and gender equality. Some progressive Muslims have founded gender-mixed and LGBTQ-affirming mosques, while others have cultivated literary publics as moral communities through novels, poetry, and film that express progressive Muslim values. They have found virtual community through list-serves and online forums, and have created activist organizations in many countries that seek to promote gender egalitarianism, pluralism, and justice, both in Muslim communities and in their broader societies.

Practices

Ritual Observances

Framed in Islamic jurisprudence as the fundamental responsibilities that Muslims owe to God, acts of ritual worship (*ibadat*) are central ethical practices of Islam. Ritual worship is often summarized in terms of the "five pillars" of Islam, which are enumerated in several hadiths: the testimony of faith (*shahada*), ritual prayer (*salat*), giving alms (*zakat*), fasting during the month of Ramadan (*sawm*), and making pilgrimage to Mecca (*hajj*) if one is physically and financially able. Of these, prayer, almsgiving, and fasting feature most prominently as regular ethical practices in the lives of Muslims. Pilgrimage is a prominent ethical practice in its broader sense, which includes but is not limited to the hajj.

Many Muslims strive to perform the ritual prayer multiple times a day at appointed hours, which vary based on the position of the sun. Ritual prayer involves a fixed series of bodily postures and recited

Arabic verses from the Qur'an, and can be performed anywhere that is clean and undisturbed. Worshippers orient themselves toward Mecca, in present-day Saudi Arabia. The collective prayer, performed on Fridays at noon, is particularly important for male worshippers, although open to all. Ritual almsgiving, or *zakat al-mal*, is one of several forms of charity practiced by Muslims, in the form of an annual donation calculated as a fixed percentage of the believer's total assets above a predetermined threshold. This donation can be given to needy individuals or to eligible organizations, especially those who serve people experiencing poverty or oppression. Zakat is understood as an act of worship that purifies one's wealth and helps to protect the individual from greed. In this sense, and in the way it is calculated according to a formula, it is distinct from other acts of charitable giving, known as *sadaqa*.

The most widely observed Muslim ritual is the fast of the month of Ramadan, the ninth month of the Islamic calendar. During Ramadan, most Muslims abstain from food, drink, and sexual activity between pre-dawn and sunset, with exceptions for people who are ill, traveling, elderly, menstruating, pregnant or breastfeeding. During the day, many try to maximize prayer, meditation, scripture reading, and charity, strive to increase their kindness, generosity, and patience, and make particular effort to avoid wrongdoing. While fasting is an individual practice, fast-breaking is communal. In the evening, Muslims gather at homes, mosques, and community centers for fast-breaking meals called *iftars*, festivities, and nighttime prayers called *tarawih*. The spiritual and physical intensity of the Ramadan fast focuses on training the soul (*nafs*) to have control over desire, to empathize with those who go hungry and thirsty not by choice, and to become closer to God. Ramadan is often seen as an intensive school for the self, a season that cultivates gratitude, fortitude, and discipline, and creates a sense of unity among Muslims.

Pilgrimage is an orienting moral experience for millions of Muslims. While making the hajj to Mecca is an aspiration for many Muslims worldwide, only a minority of Muslims perform this pilgrimage, which is costly, challenging, and subject to bureaucratic regulation. For those who do, the ritual recalls not only the example of the Prophet Muhammad, but also the footsteps of Hajar, mother of Ismail, and her search for water in the desert. Repentance is an important part of the hajj, particularly on the Day of Arafah, when pilgrims visit the mountain where Muhammad delivered one of his final sermons in order to seek divine mercy. In addition to or instead of the hajj, Muslim pilgrims also visit a wide range of sacred sites, most of which mark the graves of holy individuals. In particular, millions of Shi'a Muslims make pilgrimage every year to the city of Karbala, in modern-day Iraq, to the tomb of Husayn, martyred grandson of the Prophet Muhammad. Thousands of other pilgrimage sites are scattered around the world, which Muslims of all sects visit in order to honor the deceased, seek closeness to God, and ask for blessings (*baraka*) for themselves or their family – health, marriage, children, or success in business (Arjana 2017). Pilgrimage is thus not only a pious act in and of itself; it is also a way to seek and to punctuate the good life.

Beyond the “five pillars,” Qur'anic memorization and recitation, supplicatory prayers (*du'a*), and devotional remembrance of God (*dhikr*) are also ritualized practices of worship that mark the everyday moral lives of many Muslims, both within and outside of the mosque and classroom settings discussed above. Supplicatory prayer, or *du'a*, differs from ritual prayer (*salat*) in that it does not necessarily involve specific bodily postures, and the words of the prayer may be either recited or extemporaneous. *Du'a* punctuate everyday life as well as major life events. They are often offered before and after eating, while on a journey, when faced with a major decision, when ill, and when faced with great trials. *Dhikr*, or devotional remembrance, involves rhythmic recitation of the names of God, or short phrases of praise or supplication, as a voluntary act of worship that cultivates a spiritual state of closeness to God. *Dhikr* is

often performed individually, following daily ritual prayers or throughout the day, but can also be performed collectively and in unison. This latter practice is often associated with Sufi groups, which have developed specific traditions of *dhikr*, as a private group ritual and sometimes as a public performance.

Collectively, acts of ritual worship are a significant part of how Muslims strive to live rightly and well. For many, they are moral responsibilities owed to God, forming the starting point for the pursuit of moral excellence. They are also fruitful occasions for the development of social virtues, such as gratitude, generosity, patience, and mercy. Ritual worship is part of how many Muslims navigate moral challenges, including injustice, oppression, and ill health. While many of them can be performed individually, all acts of Muslim ritual worship link the worshipper to the moral community of Muslims in the broadest sense, the global *umma*.

Cultivating Character

A well-known hadith, often referred to simply as the Hadith Jibreel, reports a conversation between Muhammad and the Angel Gabriel in which Gabriel asks Muhammad to explain three levels of religious commitment – *islam*, faith (*iman*), and excellence (*ihsan*). Muhammad defines *islam* in terms of the “five pillars” detailed above. He defines faith, or *iman*, as belief in a core set of theological tenets – the existence of angels, the lineage of prophets and revelations, divine judgment, and divine omnipotence. Finally, Muhammad defines excellence, or *ihsan*, as serving God as though you could see God, in the knowledge that God, though unseen, sees the believer. This hadith is often cited as a model for spiritual development in which the performance of ritual worship, or *islam*, is only a starting point on the journey from worship to faith, and from faith to excellence. The cultivation of *ihsan* is often framed as a project of forming good character (*akhlak*). Muslims have used specific practices of self-observation, self-discipline, storytelling, and emulation of exemplars in order to develop and refine character and excellence (Zargar 2018). Drawing on the hadith literature as well as classical Greek thought, premodern Islamic moral psychology outlined a set of internal practices of self-observation and self-discipline, known collectively as the “training of the self” (*riyadat an-nafs*). These practices, often followed under the direction of a spiritual teacher, aim to cure the ego of excessive desire and prepare the believer for death. The cultivation of character is also pursued through everyday practices that are integrated with cultural life, and can apply to the collective as well as the individual self. For example, Elizabeth Bucar describes how women’s modest fashion cultivates the character not only of women who strive to dress piously, but also cultivates the collective character of the social body at large (Bucar 2017, 16–17).

Consumption

Muslim ethical thought has always been concerned with patterns of consumption, both of food and other material goods, and with the individual and social management of wealth. Ethical practices of consumption and abstention are observed both as ways of following divine guidance and as ways of pursuing justice and broader social good (*maslaha*). Ethical practices relating to animals include regulated practices for the raising and slaughter of animals intended for human consumption, whose meat is known as *halal*. Food ethics also include practices of abstention – from blood, carrion, intoxicants, and the meat of some animals, as well as from meat that was not slaughtered according to *halal* regulations. In the contemporary period, many Muslims have connected the longstanding concern for animal treatment and

stewardship of natural resources in Islamic ethical traditions to a broader understanding of “the environment as an ethical idea” (Gade 2019). As a set of lived practices, Islamic environmental ethics is interpreted quite diversely: for some, it entails vegetarianism, for others, land and resource conservation, for others, political mobilization.

Like the consumption of food, the consumption and exchange of material goods has always been a concern for Muslim moral thinkers. The jurisprudential tradition has produced voluminous reflection on the regulation of trade, contracts, and property through the guiding principles and aims of Islamic law (*maqasid al-shari'a*). In addition to the different forms of charity discussed above, key economic practices include the avoidance of interest (*riba*), uncertainty in trade, and gambling or speculation. In the context of global capitalist economies based on interest, debt, and speculation, Muslims have developed a range of ethical practices and orientations toward economic activity. Some choose or avoid specific financial products – choosing an Islamic investment firm that avoids interest-bearing investments, for example, or avoiding credit cards or traditional mortgages. Others seek to make consumer choices guided by their Islamic values and identity, such as participating in “halal tourism,” consuming Islamic media, arts, and fashion.

Gender and Family

As in all moral traditions, Muslim ethical practices, virtues, and communities are experienced in gendered ways. Gender and family have also been important arenas of Muslim ethical expression. Men and women have differently embodied ways of performing religious virtue, experience religious norms in gender-specific ways, and have different ways of integrating their Islamic moral practice with the ethics of broader society (whether their society is Islamically-inflected or not). In Sufi tradition, certain virtues and practices are themselves “gendered” masculine or feminine, not in order to restrict them to males or females, but to use gender relations as an analogue for human beings to access relationship with God (Shaikh 2012). In male-dominated religious movements, including Sufi fraternities, virtues of brotherhood and chivalry (*futuwwa*) have been cultivated as part of a pious masculinity. In broader social contexts, gendered visions of virtue and moral practice have often emphasized chastity outside of heterosexual marriage, complementarian gender roles within marriage, and reserve or distance in mixed-gender relations, in order to avoid the possibility of immoral sexual conduct or desire. Many Muslim communities are sex-segregated (especially mosques) or otherwise homosocial spaces. Heterosexual marriage and child-rearing have been valorized for men and women, not only as institutions through which virtue and character can be pursued, but as ethical practices in and of themselves.

Since the colonial era, Muslim discourses on gender have for the most part been formulated, whether explicitly or implicitly, in response to widespread Western assumptions that Muslim women are oppressed and downtrodden. Contemporary Islamic understandings of gendered modesty developed in tandem with, and often in contradistinction to, Western ethical practices of gendered heterosociality. Gendered sartorial practices, including forms of head-covering for women, have been important ways to cultivate modesty and modernity as personal and societal virtues, shifting in meaning according to the political context (Bucar 2017). Modesty and other feminine virtues can be the basis for religious authority. As Joseph Hill describes, female spiritual leaders in Senegal foreground their feminine morality, including modesty, humility, motherhood, and domestic labor, as the basis for social power and religious leadership, a dynamic he terms “wrapping authority” (Hill 2018, 12).

Secular Practice and Muslim Ethics

As we have already seen, Muslim ethical practices and communities are entwined with heterogeneous moral frameworks, including secular, liberal, and capitalist discourses and practices. The development of secular morality in Europe has increasingly been in explicit contrast to a certain understanding of Islam and Muslim practice. Secular political formations from France to Turkey to India have shaped the social possibilities and significance of Muslim ethical projects. At the same time, Muslims have taken up liberal and secular moral frameworks for their development as ethical subjects. For example, Nadia Fadil describes how European Muslims conceptualize not-fasting or not-veiling, not simply as the absence of an ethical norm, but as substantive embodied practices that shape their moral lives as liberal or secular Muslim subjects (Fadil 2011). Alternatively, contemporary Muslim theologian Sherman Jackson identifies the “Islamic secular” in classical religious thought: a domain of activity not regulated by Islamic legal norms but nonetheless framed by pleasing God and living well (Jackson 2018). Muslim ethical communities and practices continue to evolve, spreading through global currents, offering resources for new political and environmental challenges, and orienting Muslims toward the continuing conversation of Islamic ethical tradition.

CHAPTER 92

Indian Religions

Ankur Barua

Hindu configurations of religious ethics are distinctive styles of cultivating, within the bounds of the temporal world, certain types of ethical virtues which are often presented as accompaniments on a pilgrimage toward a transcendental goal. Various forms of Hindu reflections on ethical living are an ongoing dialectic where worldly situations are read through the prisms of foundational scriptures, narrative materials, and mythic templates, and their pivotal concepts are at times re-envisioned or reformulated in the light of worldly modes of existence.

The Possibility of Hindu Ethics – Between Universalisms and Particularities

The question as to whether or not the classical Indic systems, which are often grounded in or which claim affiliation to the Vedic scriptures (ca. 1500 BCE), have ethical dimensions or cultures of moral philosophy was intensely disputed during the colonial centuries in South Asia. Starting from around 1800, various Western Orientalists, European writers, and Christian missionaries charged “Hinduism” with lacking solid ethical foundations, and pointed to socioreligious forms of hierarchical caste-based and gender-based discrimination as evidence for its indifference to the cultivation of other-regarding virtues. The following charge by Claudius Buchanan (1805, 33) is representative of this polemic strand of Western evaluations of the ethical insubstantiality of Hindu lifeforms: “The Hindoos have no moral *instruction* . . . The Hindoos have no moral *books* . . . They have no moral *gods*.” From around this time, the supposed ethical indifference of the Hindus is connected to the motif of world-renunciation and the doctrines of *karma* and reincarnation, which are said to breed attitudes of cosmic pessimism, world-denying negativism, and fatalistic apathy. A galaxy of Hindu figures – sometimes characterized as “reformers” – such as Swami Vivekananda (1863–1901), M. K. Gandhi (1869–1948), Sarvepalli Radhakrishnan (1888–1975), and others, engaged with such critiques by revitalizing certain strands of scriptural texts and configuring more pronouncedly this-worldly styles of Hindu living. From a definitional point of view, of course, the key question relating to these hermeneutical pathways is whether the premodern or modernized worldviews have specifically “ethical” components. For Christian missionaries and British writers around, say, 1850, the foundations of ethical understanding were provided by specific criteria – for the former, it was the Mosaic law, and for the latter, it was often forms of Benthamite

Utilitarianism and notions associated with evolutionary theories. It is often argued in this context that there is no normative reflection on “ethics” in Hindu lifeforms where the descriptive codes, norms, and values which shape ways of living are instead deeply particularistic, and refracted by the caste-based and gender-based markers of specific individuals. A highly influential Sanskrit text in this context is the *Manusmṛti* (ca. 200 CE) which lays out a socioreligious template with differentially-layered ethical obligations, duties, and responsibilities for individuals of the four castes (*varṇa*), and for men and women. More recently, this “particularism” has been characterized by A. K. Ramanujan (1989, 45–47) as a form of context-sensitivity in ethical matters in the following way: “One has only to read Manu after a bit of Kant to be struck by the former’s extraordinary lack of universality. He seems to have no clear notion of a universal *human* nature from which one can deduce ethical decrees like ‘Man shall not kill,’ or ‘Man shall not tell an untruth.’ . . . To be moral, for Manu, is to particularize . . .” However, this particularism in itself should not be taken as demonstrative of an absence of concerted engagement with ethical matters in Hindu universes. On a comparative note, a survey of Western ethics indicates that Utilitarianism and Kantianism, with their explicit universalisms or theoretical generalizations, do not exhaust the conceptual domain. For instance, thickly contextualized evaluative concepts such as ἀγαθός (“good”) and ἀρετή (“virtue”) in Homeric locations too are understood in terms of the fulfillment of one’s socially allotted role (MacIntyre 2000, 16–22). Further, as is indicated by recent debates relating to whether there is a transcultural “human nature” which can ground universal patterns of ethical behavior, or whether ethical norms are ineluctably shaped by historical settings, Western ethical thinking is not necessarily connected with the quest for abstract principles or criteria. More to the point, as we will see, forms of classical and contemporary Hindu ethical thinking are structured by “descriptive” characterizations of idealized settings of life and by “normative” components of types of worldly living that are said to lead to human flourishing within “religious” visions of the ultimate good. We will study the following dialectic which structures ethical patterns of existence across various Hindu theological, cultural, and social universes.

Human beings have the potentiality to realize, through the pathways of various ethical disciplines, their true spiritual center of gravity – whether this is the universal self (*ātman*), or some mode of devotional communion with the Lord Viṣṇu or Śiva, and so on – which is beyond the hierarchical asymmetries of particularistic *dharmic* contexts.

Human beings are currently subject to the processes of *karma* and reincarnation, and accordingly their ethical patterns of living are situated within socioreligious domains of *dharma* which are marked by particularistic codes, obligations, and duties.

As we will see, this dialectic – between the attainment of liberation (*mokṣa*) which is beyond all worldly differentiations, and the cultivation of certain this-worldly virtues within the cycles of reincarnation (*saṃsāra*) – produces a volatile nexus across numerous Hindu sociocultural spaces.

The Vedic Origins of *Dharmic* Visions

The operative term in Hindu ethical reflection, as the dialectic suggests, is *dharma*, which encompasses a rich conceptual range centered around the notions of order, structure, and foundation at various ontological, ritual, social, political, and ethical levels. Therefore, as various scholars have noted, *dharma* should not be identified with, even if aspects of *dharma* can be partly correlated with,

notions of morality, propriety, conduct, justice, law, virtue, norm, duty, and others. Thus, the Ṛg Veda (ca. 1500 BCE) speaks of *ṛta*, which applies to the natural laws which structure the physical cosmos, the moral worlds of human existence, and the sacrificial order that binds humans to the deities. The term *ṛta* is connected to *dharma* in some places, and the plural form of *dharma* refers to the specific sacrificial rituals which are believed to maintain the cosmic order. The core theme in the concepts of *ṛta* and *dharma* can be characterized as “identity-through-interconnection”: every entity is allocated a specific position, status, and role in an intricately woven harmonious web of deep interconnections, and it flourishes through an actualization of its identity within and through the whole. The whole itself is sustained by the Vedic sacrifices on earth (*yajña*) which are the theurgic instruments which reinforce the interlinkages (*bandhu*) between the hierarchically ordered and yet interrelated human and divine orders (Smith 1998). The intricate connections are constituted, according to a famous hymn in the tenth chapter of the Ṛg Veda, by a primordial sacrifice through which the body of the cosmic Person (*puruṣa*) was ritually dismembered into the natural elements, human social groupings (*varṇa*), the heavens, the earth, animals, and so on. The symbiotic interrelations between the sacrificial and the cosmic is indicated by the production of “natural” entities such as horses, goats, and sheep by the sacrifice, while these entities also become “sacrificial” implements for the maintenance of the “natural” order. The most famous verses of the hymn declare: “When they divided *puruṣa*, into how many parts did they arrange him? . . . His mouth became the Brāhmaṇa [priests]; from his arms the Rājanya [later Kṣatriya, rulers] was made; his thighs became the Vaiśya [agriculturalists]; from his feet the Śūdra [servants] was born.” Through this homologization of cosmic structure with social role, the *dharma* pertaining to each part is connected to a sacral order within which individuals should seek their proper function. The basic template of the intertwining between the human and the divine orders is elaborated in various post-Vedic traditions where *dharma* is simultaneously affirmed as ontological description and normative injunction. Derived from the root *dhṛ*, which means “to uphold,” *dharma* describes the stable operations of the physical universe – thus, it is the *dharma* of fire to burn and of water to quench human thirst. At the same time, *dharma* is to be expressed through the specific form of socioreligious conduct or duty called *sva-dharma* (“own-dharma”), which is also the *dharma* specific to the four stages in life (*āśrama*) – celibate student, householder, forest-dweller, and ascetic – and the four caste groupings (*varṇa*). This structure of *varṇa-āśrama-dharma* is a worldly concretization of the *dharma* that runs through and shapes the wider cosmos, and an individual’s pathway toward spiritual fulfillment consists partly of the proper alignment of the “sociocultural” *dharma* and the “natural” *dharma*. In other words, a post-Vedic Hindu formulation of the question, “How should I live in the world?” would be, “What is the *dharma* within whose environs I should situate myself?”

The Dialectic of Living in the World and in the Spirit

Against this historical backdrop, we return to the central dialectic which shapes patterns of ethical reflection in Hindu universes – the fulfillment of the obligations and the cultivation of the virtues associated with *dharma*, and the spiritual transcendence of all worldly constraints through the quest for liberation (*mokṣa*). In working out these themes, various forms of Hindu discourses are shaped by the two principal bodies of scriptural texts – the Vedic literatures and the *Upaniṣads* (ca. 800 BCE) which are called *śrūti*

(“that which is heard”), and the treatises on the *dharma*, namely, the *Dharmaśāstras*, the epic narratives such as the *Rāmāyaṇa*, and others which are collectively called *smṛti* (“that which is remembered”).

From roughly the third century BCE onwards, we find the priestly Brahmanical defenders of Hindu sionormative living valorizing the notion of *dharma* as the basis of the sacral order of *varṇa-āśrama-dharma*, and their own sociocultural identity as speakers of Vedic Sanskrit. For key thinkers associated with the ritual-philosophical system called Mīmāṃsā such as Kumārila Bhaṭṭa (ca. 700 CE), the Vedas, which are concerned with the injunctions for performing ritual sacrifices, do not have any human author and are an authoritative source of knowledge of the *dharma*. This normative concern with *dharma* as the structural framework for Brahmanical ritual purity is continued in the genre of texts called *Dharmaśāstras*, of which the *Manusmṛti* (ca. 200 CE) is perhaps the best known, which lay down the socioreligious duties of individuals relative to their *varṇa-āśrama-dharma*, provide modes of expiation (*prāyaścitta*) for the transgressions of *dharma*, and outline the administrative and juridical duties of a king. For the *Manusmṛti*, the Vedas provide a cosmic template for both the ontological structures of the universe and the normative systems of the social order. Recapitulating the key motif of the cosmic Person from the Ṛg Veda, it prescribes differentially-structured types of *dharmaic* activities for the four *varṇas*: for instance, the duties of the Brahmins encompass preserving Vedic knowledge and performing sacrificial rituals, and the Śūdras are said to gain *dharmaic* virtue by serving the three higher *varṇas* dutifully. In the social visions of the *Dharmaśāstras*, as long as individuals remain in the two *āśramas* of the celibate student and the householder, the distinctions which are specific to class and gender are to be maintained. The gradualist movement of worldly individuals across the *āśramas* within one lifetime, and across the castes (*varṇa*) over several lifetimes, is often highlighted in the *Dharmasūtra* (ca. 300 BCE) literature. Thus *Āpastamba Dharmasūtra* (I.1.4–7) states that there are four classes (*varṇa*), Brāhmaṇa, Kṣatriya, Vaiśya, and Śūdra, and, in this order, each preceding class is superior by birth to each subsequent. Crucially, by following the path of *dharma* people belonging to a lower class ascend to the next higher class in their subsequent birth, while by following the path of *adharma* people belonging to a higher class descend to the next lower class in their subsequent birth (II.11.10–11). These transitions across *varṇas* are structured by the law of *karma* which ensures that the birth of an individual in a specific *varṇa* is not a cosmic happenstance but a result of their *karmic* momentum acquired over previous lives. Therefore, individuals should fulfill their *dharmaic* obligations because they are said to enjoy supreme and unlimited happiness by following the *dharma* specific to them. The sociocultural exclusions of Brahmanical Hinduism are also clearly stated in this corpus: the *Āpastamba Dharmasūtra* (II.2.8) states that it is a sin (*doṣaḥ*) to touch, speak, or look at a socioritual outcaste (Cāṇḍāla) while the *Vasiṣṭha Dharmasūtra* (18.11–12) records the view that the Śūdras are a cremation ground and one should not recite the Vedas in the presence of a Śūdra (Olivelle 2000, 25, 89, 77, 425). Further, the *āśrama* system applies only to the members of the first three *varṇas* and not to the Śūdras, and also not to women who are bound by specific forms of *dharmaic* obligations. Their *śrī-dharma* is configured by the *Manusmṛti* largely in terms of their relations of obedience to men – their fathers, husbands, and sons (9.3), and particularly married women who dutifully serve their husbands are said to be exalted in heaven (5.155).

However, if life within the world is thus regulated by the minutiae of the textures of *varṇa-āśrama-dharma*, the mendicant renunciant who has renounced all social matrices has transcended these densely-contoured sets of obligations and duties. The emergence of this dialectic – living within the *dharmaic* structures of the world and progressing to a state beyond its regulative bounds – has to be located historically in the appropriation, by *Dharmaśāstras* such as the *Manusmṛti*, of asceticism or

world-renunciation (*saṁnyāsa*) into Brahmanical universes. Initially the renouncer outlooks were sharply opposed to Vedic sacrificial worldviews, and pitted wilderness against village life, celibacy against marriage, and ritual inactivity against ritual performance (Olivelle 1992, 46). Therefore, the exaltation of the world renouncer in some of the early *Upaniṣads* above all social life, which is ideally regulated by *dharmic* norms, led to a fundamental tension within Vedic lifeworlds which insisted that people should perform specific types of actions. The *Dharmaśāstra* literature, which seeks to draw the world renouncer back into the fold of social obligations, is full of numerous tensions about the significance of renunciation. For instance, the *Manusmṛti* (6.87–90) declares the *āśrama* of the householder to be the best, and the other three *āśramas* are said to converge there. The reason for exalting this *āśrama* is connected to the prohibition on individuals from pursuing liberation (*mokṣa*) from the cycles of reincarnation without having first paid the three debts to ancient sages, ancestors, and gods (6.35–37). Once they have discharged these debts, they can become a wandering mendicant who practices various yogic techniques such as breath control, withdrawal of the senses, and others, and become completely free from the world, with the self (*ātman*) as the sole companion and bliss as the goal (6.49). Thus, bringing together the two types of Vedic activity – one which is driven by worldly desire (*pravṛtta*), and the other which is free from desire and based on knowledge (*nivṛtta*) – the *Manusmṛti* says that individuals who are dedicated to *pravṛtta* activity become equal to the gods, while those who are dedicated to *nivṛtta* pass beyond the five elements (12.88–90). The depictions of the final *āśrama* in the *Manusmṛti*, where individuals retreat from the sphere of worldly activity, recur more clearly across the *Saṁnyāsa Upaniṣads* which emphasize the rejection of external ritual paraphernalia and the realization of the transcendental essence which is beyond name and form. For instance, the sages, according to the *Nārada-parivṛjaka Upaniṣad* (142–145), are said to bear harsh words patiently and have no hostility to other living beings. Their only marks are a begging bowl, a place of residence at the foot of the trees, a ragged garment, a solitary life, and impartiality toward all (Olivelle 1992, 178–179). A contemporary Hindu monk, Swami Nikhilananda (1968, 27) presents the life of such a self-realized individual in these terms: “Now his goodness is spontaneous. He is free but not whimsical, natural but not given to license . . . Such virtues such as humility, unselfishness, charity, and sympathy which he had previously practised as spiritual disciplines now adorn him like so many jewels.”

The *Bhagavadgītā* (ca. 200 CE) is the classic attempt to intertwine these opposing pulls of life across the *dharmic* world and renunciation of the world. The text states that it is not activity in itself which binds individuals to the cycles of reincarnation (*saṁsāra*), but only those actions which are performed with attachment to the fruits of actions. Therefore, the pathway to *mokṣa* lies not through physical renunciation but the cultivation of a sense of inner detachment. The Lord Kṛṣṇa is presented as the highest, eternally unbound, transcendental person who can remain engaged in the world, and thus maintain the cosmic order, precisely because he continually acts without any attachment. The *Bhagavadgītā* is a synthetic fabric with interweaving threads of knowledge of the self (*jñāna*), selfless action (*karma*), and devotional love (*bhakti*) of the personal Lord – later Hindu commentators, from premodern contexts to recent times, would expend much of their exegetical energies on demonstrating the primacy of one of these over the other two as the spiritual technique that specifically guides individuals toward liberation. The same attempt at synthesis between ethical behavior in the here and now, and transition toward liberation shapes the doctrine of the four goals of human existence (*puruṣārthas*) – the three this-worldly values of material prosperity (*artha*), sensual enjoyment (*kāma*), and *dharma*, and the fourth, eternal goal of liberation (*mokṣa*). In the line of the *Manusmṛti*, some Hindu thinkers have claimed that the first

three structure the ethical preparatory ground for individuals who are urged to live a full life and continue, in and through such worldly existence, their pilgrimage toward the fourth destination.

Vedāntic Variations on *Dharmic* Templates

In other words, by moving across the idealized system of the three *āśramas*, structured by *dharmic* distinctions, the renunciant becomes a sage established, in the fourth *āśrama*, in the universal self beyond all distinctions. A survey of classical Vedāntic Hindu universes, from roughly the eighth century CE onwards, indicates that they too have operated with a conceptual contrast between an individual's metaphysical identity and an individual's sociological role. The former is the imperishable self (*ātman*) which, whether it is conceptualized as non-dual with the eternal reality, Brahman (thus Advaita Vedānta) or ontologically dependent on Brahman (thus the multiple strands of theistic Vedānta), is beyond all *dharmic* markers of caste, gender, and others. The latter, in contrast, is the precisely graduated sociological persona through which the imperishable self is refracted into a world of multiplicity. The general Vedāntic claim is that the cultivation of certain types of ego-effacing virtues – such as self-control, benevolence, nonviolence, and others – is an integral aspect of the realization that the true self (*ātman*) is the spiritual basis of all reality, and thus of the journey toward liberation from the world.

We find this dialectical move in some of the exegetical writings of Śaṅkara (ca. 800 CE) who developed an influential reading of the *Upaniṣads*, which states that while the empirical ego is marked with various worldly designations, liberation from *saṃsāra* lies precisely in the intuitive realization that the true self (*ātman*) is non-dual with Brahman which transcends all descriptions (*nirguṇa*). Because of spiritual ignorance (*avidyā*), individuals are unable to perceive the deeper non-duality that underlies the discrete objects of the world. Thus we find Śaṅkara starting his *Upadeśasāhasrī* by noting that the student who presents himself to a guru must be appropriately qualified: he is dispassionate toward all things which are transitory, has given up desires for worldly possessions, and reached the state of a wandering ascetic; and he is a Brahman whose caste, profession, knowledge of the Vedas and family have been examined. The guru will ask the student who is eager to cross the ocean of transmigratory existence: “Who are you, my dear”? If the student replies that he is a Brahman's son belonging to a specific family, who has become a wandering monk, he will be chided by the teacher for associating the pure self, which is free from caste, family, and purificatory ceremonies, with these bodily markers (I, 1, 9–13). Śaṅkara is here moving across the famous two “levels” of reality in Advaita teaching: while the transcendental truth is that all individuals are metaphysically non-dual (*advaita*) with the qualityless Brahman, on the conventional plane, one needs to be a Brahman male to have the requisite socioritual qualifications for Vedāntic enquiry. However, after the Brahman student has realized the metaphysical nullity of caste and gender, and right knowledge (*jñāna*) has been attained, there is the cessation of the duties relating to the specific castes (II 17, 47). From this transcendental vantage-point, the following affirmation is valid: “I have neither good nor bad deeds, neither release nor bondage, neither caste nor stages of life, since I am bodiless” (II 10, 6) (Swami Jagadananda 1989, 2–10, 205, 113). Thus, for the Advaita sage, life in the world is characterized by a gradual withdrawal from all forms of social activity which are shaped by the *karmic* subjectivities of desire. We thus note a powerful conceptual tension emerging between an ethical particularism at the conventional *dharmic* level and a radical spiritual transcendence, one which can also be discerned in the *Vivekacūḍāmaṇi*, sometimes attributed to Śaṅkara. After realizing one's true

spiritual essence, an individual should cease to identify with the conventional designations of false bodies, in the manner of actors giving up their assumed persona. Such a liberated sage (*jīvanmukta*) looks everywhere with an eye of equality in the world which is conventionally full of elements which are distinct from one another (Swami Madhavananda, 111–112, 163–164). The other-regarding orientation of the sage is articulated, though from a different metaphysical standpoint of pluralism, in Patañjali's *Yoga-sūtra* which states that through the cultivation of intense forms of self-control, one becomes attuned to the world at large – thus, the yogi is said to cultivate (I.33) friendliness (*maitrī*), compassion (*karuṇā*), gladness (*muditā*), and equanimity (*upekṣā*) toward objects.

While the multiple forms of theistic Vedānta, unlike Advaita, regard the world as metaphysically real, these exegetical-theological streams often converge in stating that the Śūdras do not have the requisite qualifications for scriptural enquiry into Brahman, which is a central requirement for liberation. Śaṅkara's arch-rival Rāmānuja (1017–1137 CE) too argues that the Śūdras do not have in this lifetime the required capability for Vedāntic instruction. Rāmānuja's social gradualism ("the Śūdras could be ready in subsequent lifetimes for enquiry into Brahman, but not right now") should caution us against romanticizing the medieval devotional (*bhakti*) movements as a form of Indian proto-communist revolt of the masses. On the one hand, some of the holy individuals (*sants*) such as Kabir (ca. 1500 CE) rejected notions of scriptural revelation, image worship, and caste hierarchies, and their ethical views emphasized nonviolence, humility, compassion, and reverence for all. They sometimes used Vaiṣṇava names of the deity such as Ram, Hari, and Govinda for the formless (*nirguṇa*) deity, and declared that ultimate liberation is accessible to all individuals. On the other hand, however, these movements should not be viewed as subaltern uprisings, for they usually did not seek to institutionalize radical social egalitarianisms but rather viewed notions of caste (*jāti*) as an obstacle in an individual's spiritual progress (Pande 1989, 98). The operation of the dialectic between the affirmation of spiritual egalitarianism and the shaping of ethical striving by *dharmic* insignia can be noticed in universes as diverse as the Vīraśaivas, the Caitanya Vaiṣṇava tradition, the Bāuls, and others.

In his study of some contemporary representations of the medieval Vīraśaivas or Lingāyats, R. J. Zydenbos (1997, 535) argues that some of the radically egalitarian motifs associated with them should be attributed not to their "founder" Bāsava himself but to more recent reformers in Vīraśaiva society. The Vīraśaivas offered possibilities of social equality for those who would live in accordance with Vīraśaiva norms which were broadly continuous with Brahmanical values relating to spiritual progress such as the rejection of the use of intoxicants and the adoption of a vegetarian diet. The Caitanya traditions too have grappled with the "translation" of the affirmation that Caitanya (1486–1534 CE) was the divinity who descended to the world to rescue women, Śūdras, and sinners, into a direct engagement with socioeconomic asymmetries. Some strands modeled their social radicalism on readings of the cowherd maidens (*gopī*) in the *Bhāgavatapurāṇa* (ca. 1000 CE) as the supreme devotees precisely because they repudiate their social *dharmic* obligations in response to the call of the enchanting flute-music of Kṛṣṇa. A central question in these traditions was whether the worldly imitation of the *gopīs* was to be strictly mental or whether the practitioners should put on the clothes and the ornaments of these feminine characters. The option that was condemned by a council in 1727 was that the practitioners should transform their physical bodies so as to imitate (*anusāra*) the exemplary female models (Haberman 1988, 98). Thus, by and large, the early devotees accepted certain social restrictions relating to *varṇa-āśrama-dharma*, such as devotees of different castes not intermarrying or inter-dining with one another. For a relatively more straightforward repudiation of vestiges of the Brahmanical modes of living enshrined in the *Dharmaśāstras*, as well as a rejection of sociological gradualism in place of an emphasis on the here-now, we could turn to the

songs of the wandering minstrels of Bengal, the Bāuls, which direct the attention of the listener, somewhat in the style of Kabir, to the “I” which is beyond all distinctions of religious community and caste. The Bāuls believe that within the human body lies not only the celestial bodies such as the sun and the moon, but also the divine essence which lies hidden in the “man of the heart,” which is beyond distinctions of caste, social mores, and cultural conventions. J. Openshaw has highlighted the multiple uses of the notion of the “I” (*āmi*) in the songs of a Bāul, Rāj Khyāpā (1869–1946). The members of his community employ the term *bartamān* (“the living”) to refer to themselves, and contrast themselves with the followers of orthodoxy or orthopraxy (*anumān*). Their songs elaborate a distinction between the inner perspective of the “I,” which is free from distinctions of self and other, high and low, pure and impure, and the external perspective which is the world of hierarchy, discrimination, and ranking. Rāj adopted a radically iconoclastic stance toward all social hierarchies on the basis of his claim that the interiority and the subjectivity of the “I” transcend all worldly categories. Here it is significant that the followers of the *bartamān*-path have, according to Openshaw (2005, 192), sometimes developed folk versions of Advaita Vedānta, and directed their non-dualism toward socioeconomic issues: “I have often heard even uninitiated rural Bengalis, Muslims as well as Hindus, explain ‘non-dualism’ as non-differentiation and non-discrimination [*advaita*] in a highly radical sense, for example, in terms of lack of possessiveness . . . The more conventionally religious would rarely draw such radical corollaries of course.”

As these medieval and early modern instances indicate, Hindu forms of ethical thinking involve attempts to read life in the world through the prisms of foundational texts, gurus, and mythic forms. For another concrete example of such ethical reasoning, consider the argument developed by Rammohun Roy (1772–1833) against the ritual immolation of Hindu widows (*sati*) on the funeral pyres of their husbands. Roy (1885–1887) noted that texts from the Hindu traditions which praise such con-cremation approve, in effect, the fruition of desires as a goal to be pursued, and argued that, in fact, a number of authoritative scriptural sources such as the *Kaṭha Upaniṣad*, the *Muṇḍaka Upaniṣad*, and the *Bhagavadgītā* specify that those who hanker after the perishable fruits of rites move away from the supreme end of eternal beatitude. Across several Hindu lifeworlds, rich resources of ethical thinking are provided also by the epic narratives of the *Mahābhārata* (ca. 200 BCE–400 CE) and the *Rāmāyaṇa* (ca. 200 BCE–200 CE), some of whose central characters are taken as figures to be emulated in one’s ethical decisions within familial, social, and interpersonal contexts. The *Mahābhārata* is a richly textured web of narrative, mythic, and didactic elements where some characters are presented as working their way to liberation through ethical dilemmas generated by the conflict between the particularistic forms of *dharma* and the commitment to universal values. The narrative of the *Rāmāyaṇa* turns around the paradigmatically moral king, Rāma who, with Lakṣmaṇa, his dutiful brother, rescues his wife, Sītā, an exemplar of wifely virtue, from the clutches of a demon king. As A. Dhand (2002, 364) has argued: “A study of the conduct of the ideal man, Rāma, gives us a good idea of the values that Hindus prize in their lives, and according to which they structure their own relationships.”

Modernist Universalisms

Over the last few centuries, a galaxy of Hindu figures such as Swami Vivekananda (1863–1901), M. K. Gandhi (1869–1948), Sarvepalli Radhakrishnan (1888–1975), and others, have sought to delink traditional Hindu lifeworlds from their particularistic moorings in *varṇa-āśrama-dharma* and present

Hinduism as expressive of the universal *dharma* which is projected as transcending the bounds of race, caste, gender, and nation (Halbfass 1988, 345–346). They reinvigorated a classical distinction between the *varṇa-āśrama-dharma* and the common ethical principles of the *sādhāraṇa-dharma* which are applicable to all, and highlighted the latter as the quintessence not only of Hinduism but also at times of the world religions. For instance, the *Manusmṛiti*, a standard source of *varṇa-āśrama-dharma*, also delineates five virtues which are common to all four *varṇas*: nonviolence, truthfulness, not stealing, purification, and control over the senses (10.63). According to the modernized Advaita visions of these figures, through the active cultivation of ego-transcending virtues, individuals begin to realize the deep non-duality that pervades all spheres of reality.

Some of these universalized reconfigurations were prompted by the Christian missionary critique that Hindu lifeforms were pervaded by attitudes of world-renunciation, *karmic* fatalism, and cosmic pessimism, and were devoid of ethical structure. In response, Swami Vivekananda spoke of a “practical Vedānta” directed toward social engagement, which he argued was grounded in the Vedāntic dictum “thou art that” (*tat tvam asi*): because all human beings are rooted in the eternal self (*ātman*), one must love one’s neighbor who is essentially oneself. Thus, he argued: “The Vedānta philosophers . . . discovered the basis of ethics . . . Why should I not injure my neighbor? . . . [E]ach individual soul is a part and parcel of that Universal Soul [*ātman*], which is infinite. Therefore in injuring his neighbor, the individual actually injures himself. This is the basic metaphysical truth underlying all ethical codes” (1982, 383). In fact, service to the poor, the illiterate, and the afflicted, knowing them to be embodiments of the divine reality, is the highest religion. For Vivekananda, then, ethical commitment toward the world and Advaitic trans-personalism are deeply compatible: indeed, only through liberation from egoism, attachment and fear is true ethical behavior possible. The imprint of Western critiques is visible also in Radhakrishnan’s attempt to reconfigure Hindu ethical engagement on the scriptural basis of the *Bhagavadgītā*: “It is a great pity that the Hindu religion and philosophy have been so interpreted in the past as to give color to a quietistic and unpractical code of duties, quite in accord with the introspective turn of the Hindu’s mind. The whole spirit of the *Bhagavadgītā* is a protest against this quietistic spirit” (1914, 183). Radhakrishnan goes on to argue that the *Bhagavadgītā* urges individuals not to retreat to a mystical solitude but to remain engaged in ceaseless activity, even as they seek to overcome modes of egoistic attachment to the world.

To return to the theme introduced at the beginning of the entry, Hindu ethical reflection interweaves “descriptive” and “normative” elements from a diverse array of scriptural texts, which have been interpreted by influential gurus, preceptors, and teachers. Ethical agency in these universes is exercised toward the cultivation of certain values, excellences, and virtues which are highlighted by scriptural sources, prescribed by traditional lineages (*sampradāya*) of exegetical interpretations, and encoded into idealized characters in epic narratives. Thus, the *Bhagavadgītā* declares that the system of four *varṇas* is founded by Kṛṣṇa, and also directs individuals to cultivate forms of even-mindedness which are associated with virtues such as humility, nonviolence, patience, simplicity, and others (13.8–12). A focused set of virtues appears in Vātsyāyan’s commentary on the *Nyāyasūtras* (1.1.2), which states that the virtues of the body are charity (*dāna*), protection of others, and service (*paricaraṇa*) to others; the virtues of the speech are truthfulness, beneficial words, gentle speech, and Vedic study; and the virtues of the mind are kindness, indifference to material gain, and piety (*śraddhā*). The cultivation of such virtues is placed against the backdrop of conceptions of the good life, which are diversely configured across the complexly-layered Hindu traditions, ranging from social living within the systems of

varṇa-āśrama-dharma to the solitary existence of the itinerant renunciant, while premodern and contemporary readings of the *Bhagavadgītā* argue that life in the world is not only not opposed to, but constitutes the ethical ground for, the quest for liberation from the world.

CHAPTER 93

Chinese Religions: Practices and Communities

Beverley McGuire

In present-day China, we have seen a revival of religious communities and practices, as well as a resurgence of values that held sway in earlier periods of history. Following widespread destruction of temples from Republican anti-superstition movements and repression during the Maoist era, especially the Cultural Revolution, temples have been rebuilt, festivals have returned, and five religious traditions – Roman Catholicism, Protestantism, Islam, Buddhism, and Daoism – have again been officially sanctioned by the state. Longstanding values placed on family and beliefs in moral retribution have re-emerged despite efforts to change such kinship ties and eradicate religious worldviews. Divination, geomancy (*fengshui*), and fortune-telling, deemed “superstitious” and prohibited during the 1982–1984 campaign against “spiritual pollution,” continue to be used today to address peoples’ concerns about finances, marital troubles, and other matters.

Practices and values have been reformulated in light of social changes as well as different economic and political structures, and they vary according to geographic context, social location, and other factors. For example, in mainland China one finds fewer temples and less evidence of shamanic practices and spirit possession in urban centers than rural areas, which some attribute to tighter political control that limits opportunities for religious activity. As Robert Weller notes, “Religion thrives especially where the central bureaucrats are more distant – the south, rural areas, and at small scales” (1999, 87). Although difficult to measure, some studies suggest there may be one temple per 400 inhabitants, and temple groups that include all villagers provide common moral obligations and incentives to cooperate (Goossaert and Palmer 2011).

In many rural communities, people continue to worship gods and immortals in temples to pray for blessing such as good health, longevity, descendants, and material prosperity. Although popular religion has “hibernated” somewhat as secret home altars and modest chants have replaced elaborate temples and rituals, temple festivals with dance troop performances, folk operas, and processions continue to provide a way for people to express values such as hosting and mutual help (Chau 2006). During temple festivals celebrating gods’ birthdays or showing gratitude for prosperity, people make offerings, burn incense, and kneel on mats to consult divination devices. By contrast, in many cities in mainland China, urban dwellers may only have access to a few officially designated monasteries, churches, and mosques that function largely as tourist attractions or museums rather than living communities, and while yearly festivals may be well attended, regular visitors remain rare. As a result, many city residents lack any knowledge of proper temple etiquette, and by the twenty-first century

Buddhist and Daoist temples had young clerics show visitors how to light and burn incense, bow, or step over gate thresholds (Goossaert and Palmer 2011, 273).

Despite rural and urban differences in temple worship, the transition to a market economy has generated spiritual needs and desires, and surveys conducted in mainland Chinese cities show a prevalent interest in religious culture. Some have argued that market forces and the spread of corruption have created a “spiritual void” (*jingsheng kongxu*) and “crisis of faith” (*xinyang weiji*) in mainland China following the collapse of Maoist utopianism and China’s “Reform and Opening up” (*gaige kaifang*) initiated by Deng Xiaoping in 1978 (Goossaert and Palmer 2011, 191). Robert Weller describes two cultural responses to the market economy, both of which undermine geographic ties: one tending toward a utilitarian granting of individual desires, the other toward a universalizing set of moral values (Weller 1999, 88). In the early twenty-first century, the Chinese Communist Party identified various problems plaguing society – the worship of money, the pursuit of pleasure, unbridled individualism, putting personal interest above all sense of justice, putting private interest above the common good, and an inability to distinguish good and evil – and emphasized the need to raise the “moral quality” (*daode suzhi*) of the people and educate them about the “eight honors and eight shames” (*ba rong ba chi*) (Billoud 2007, 55–56). Although the latter slogan was turned into an object of ridicule by many Chinese people, it speaks to underlying moral concerns about materialism, corruption, and selfishness. As we will see, another way that Chinese people have sought to address these issues is through the practice of self-cultivation, which found new outlets in the late twentieth and early twenty-first centuries through the *qigong* movement, the growth of Christianity, the revival of Buddhism, and popular Confucian movements.

Family

In contemporary China, family remains a prominent value, especially the parent-child relationship and its accompanying responsibilities. Confucius emphasized that one could not develop moral sensibilities outside the familial context – that our feelings, attitudes, and actions toward our parents and elder siblings play a foundational role in our moral development (Cline 2015, 8). Children learn rituals (*li*) from their family members and teachers, and they practice them until they can perform them naturally so they become means of expressing proper dispositions. As they mature, they develop a better sense of discernment about when and how to appropriately perform such rituals. Among those rituals was ancestor veneration, or worshipping the spirits of one’s ancestors that retained influence over their living descendants. Traditionally sons were expected to uphold “filial piety” (*xiao*) by obeying and caring for their parents, holding funeral rituals upon their death, finding the proper burial site through geomancy (*fengshui*), and engaging in daily worship and offerings to appease their deceased spirit. However, such funerary practices changed following the funeral reforms promoted by Nationalists and Communists in the twentieth century that included new memorial services, the prohibition of wailing, wearing traditional mourning clothes, or presenting offerings to the deceased, and compulsory cremation instead of cemeteries. Today those in cities tend to accept cremation and do not have domestic ancestral shrines, however, in rural areas of southern China tombs for urns, cemeteries, and ancestral shrines are common (Goossaert and Palmer 2011).

Although some policies and processes have affected family structure and dynamics – most notably the One Child Policy introduced in 1979 and rural-urban migration that began following economic reforms

in 1978 – families continue to play a large role in the moral development of children. However, the logic of “filial piety” has become inverted as parents and grandparents now focus on nurturing young children (Goossaert and Palmer 2011). In urban settings, especially among wealthier upper-class families, the One Child Policy resulted in what some referred to as the “little emperor” syndrome as single children received excessive attention from their parents and grandparents. In rural settings, as parents seek employment in cities, grandparents often assume the role of caring for the children left behind. The documentary “Last Train Home” (2009) powerfully depicts how this can affect the respect that children display toward their parents whom they sometimes resent for leaving them behind.

Festivals

Despite these changing dynamics, family continues to be a core value within Chinese society as evidenced by the continued practice of ancestor veneration (*zuxian chongbai*) and festivals such as Spring Festival, Grave-Sweeping Festival (Qingming), and Mid-Autumn Festival. Recent studies have shown that over 70% of Chinese adults venerate the spirits of their ancestors or deceased relatives and visit the gravesites of ancestors (Hu 2016). In southern Chinese villages, lineage halls – often renamed “senior citizens’ centers” to avoid being labeled feudal or superstitious – are sites for ancestor worship during the last day and first day of the lunar year, when family members bring offerings and burn incense (Tam 2011). Although urban residents and migrants are less likely to practice ancestor worship because of their separation from extended families and ancestral gravesites, they often make special efforts to return to their familial homes during festivals – especially the Spring Festival where families share a reunion meal and paste red paper cutouts on their doorways seeking happiness, wealth, and longevity. Reunion meals often feature various meat dishes, especially pork and chicken, and a hot pot symbolizing the coming together of family members. Northern Chinese typically make dumplings to eat at midnight, while southern Chinese make glutinous new year cakes (*niangao*), but both foods symbolize wealth and prosperity. During the Grave-Sweeping Festival, which was declared a public holiday by the People’s Republic of China (PRC) government in 2008, families visit the tombs of ancestors to clean the gravesites, pray to the ancestors and make ritual offerings of food and burn joss sticks and joss paper.

Food continues to play a seminal role in Chinese culture, not only in festivals but also daily life. Chinese meals typically consist of two components: (1) a starch (typically rice, noodles, or steamed buns) and (2) vegetables and meats. Each person has their own bowl of rice, and they pick food out of communal plates with their chopsticks. Although marriages, funerals, and other formal occasions often include large banquets with endless dishes of food and copious amounts of alcohol, typical daily meals are more modest. The Chinese understand food as medicinal, paying attention to not only the kind and amount of food one eats, but also selecting appropriate foods at particular times dependent on one’s health condition. Foods are classified into *yin* and *yang* categories, and one can eat foods from those categories to counterbalance any disequilibrium between *yin* and *yang* forces in the body.

Buddhist vegetarian diets often serve as a marker of religious identity. Indeed, one of the largest criticisms levied against Buddhism when it was introduced into China was the threat it posed to society in its monasticism and to culture in its vegetarianism. Buddhist apologists defended themselves by arguing that both practices upheld the value of the family – the former being a filial act toward saving one’s parents alongside other sentient beings, the latter being a safeguard against the possibility of eating that

which may have been a parent in a former life – but today vegetarianism is often synonymous with Buddhist affiliation. When I lived in mainland China in the late 1990s, I soon discovered that the only way to ensure my food was vegetarian was to state that I was Buddhist (*wo xin fo*). Chinese Buddhist monks continue to uphold vegetarianism, and although few lay Buddhists are strict vegetarians, most observe a vegetarian diet on certain days in the Chinese lunar month such as the full moon and new moon, or during festivals such as the lunar New Year's Eve.

Although in late imperial and early modern periods strict vegetarianism excluded people from certain social networks because banquets were the venue for creating such connections, as lay Buddhist groups in mainland China understood vegetarianism as part of their morality and the Taiwanese middle-class increasingly identified themselves as Buddhists starting in the 1970s, it became acceptable and understood as part of an ethical lifestyle by the late twentieth and early twenty-first century (Goossaert and Palmer 2011, 282). In some new urban settings, vegetarian restaurants became meeting places for those in search of a more ethical lifestyle.

Body Cultivation

Body cultivation traditions have also thrived in the late twentieth and early twenty-first century. Traditional techniques of manipulating the flow of *qi* through the body re-emerged in the twentieth century as a cultivation method (*xiulianfa*) with health and therapeutic benefits, and it continues to be popular not only among mostly elderly Chinese who gather together in parks to do *taijiquan* but also among those who practice *qigong* (“breath training”) and other bodily practices. Previously understood in the context of Daoist or martial arts training, *qigong* was reinterpreted in the 1950s as a type of medical treatment and institutionalized in the state's national medical system as part of traditional Chinese medicine (Otehode 2009). In the 1980s and 1990s, the Chinese ministries of health and sport promoted *qigong* as an inexpensive health care, which fueled a “*qigong* fever” that included movements around charismatic *qigong* masters who reputedly cured people of illness, or *qigong* practitioners who after entering trance states are said to be possessed by Guanyin, the Jade Emperor, or other gods in “spontaneous movements *qigong*” (Palmer 2011, 89–90). It was arguably one of the most prevalent forms of urban religiosity until the suppression of Falungong in 1999, with an estimated one-fifth of urban residents having contact with *qigong* from the 1970s until then (Goossaert and Palmer 2011, 287).

Qigong encompassed a variety of gymnastic, breathing, and meditative techniques, and it was practiced in parks and other public spaces in the late twentieth century. Although some viewed it as a secular form of physical exercise, many *qigong* manuals drew from Daoist and Buddhist texts, or emphasized the moral dimensions of the practice. As David Palmer notes, body cultivation was understood to encompass the corporal, emotional, social, and spiritual as an undifferentiated whole, and by practicing *qigong* one was not solely nurturing one's body but also cultivating virtue – an embodied virtue that in Chinese cosmology was associated with power (Palmer 2011, 104–105). Whether one engaged in *qigong* for therapeutic reasons of health, or as a type of religious practice, one understood the practice as promoting the flow of *qi* through the body and bringing it into alignment with nature. Although most *qigong* groups were disbanded following the crackdown of Falungong, and only five completely secularized forms of *qigong* were allowed thereafter, other types of self-cultivation flourished in its stead, including Chan summer camps run by Buddhist monasteries

and courses in nourishing life by Daoist groups, as well as some scripture-recitation and meditation sessions led by Confucian movements (Goossaert and Palmer 2011, 289).

Moral Retribution

Although relatively few people in mainland China have any formal religious affiliation – only 5% according to a 2005 survey – most believe in moral retribution: the rewarding of virtuous action and punishing of bad behavior understood to occur either automatically because of karma or after death through a postmortem judicial process in the courts of hell. According to a 2007 study of over 3,000 Han Chinese, 77% believed in the idea of divine retribution or cosmic recompense (*baoying*) (Yao and Badham 2007). Amid widespread criticism of materialism, corruption, and greed perceived to be rampant in contemporary society, some turn to religious practices as a means of combating moral degeneration (Osnos 2014). Middle-class residents in Shenzhen speak of taking their destiny (*mingyun*) into their own hands, constructing home altars, joining other spiritual seekers in vegetarian restaurants, and reading Daoist stories, Buddhist sutras, or works of Confucius and Mencius (Fan and Whitehead 2011).

Ethnographic studies of lay Buddhists show their concern for maintaining Buddhist commitments even while engaging in business ventures (Jones 2014) or achieving greater balance (*pingheng*) in their lives (Fisher 2014). They differentiate Buddhist moral frameworks of cause and consequence (*yinguo*) from the practice of gaining status through the cultivation of relationships (*guanxi*), emphasizing the importance of reciprocal relationships to all beings in the universe, not just those based on social proximity (Fisher 2014, 106). Ian Johnson describes the latter as a “studied indifference in society – the unwillingness to help people outside one’s *guanxi* network” (Johnson 2017, 139). By contrast, lay Buddhists seek to build new connections by creating karmic links (*jieryuan*) with others through the printing and free distribution of morality books and other Buddhist media (Fisher 2014; Chau 2011). Such morality books were common in late imperial China as they promoted the idea that people can “create their own destiny” (*zooming*) by improving their moral status through good deeds. Another practice commonly used in late imperial times to understand and control one’s fate, which has re-emerged today, is interest in divination and the *Book of Changes* (*Yijing*).

Divination

Fortune-telling and divination remain prevalent in contemporary China as people cope with uncertainty and anxiety, despite the continual charge of “superstition” (*mixin*). A pervasive phenomenon throughout Chinese history, divinatory practices include predicting one’s fate using the *Book of Changes* (*Yijing*), fortune-telling, spirit writing, dream interpretation, geomancy, astrology, and numerology. Chinese Buddhists have used divination as a means of diagnosing their karma, relying on the method to reveal their karmic obstacles so that they can then redress those through repentance rituals designed to eliminate their karma. The Buddhist monk Mengcan includes a set of plastic tops alongside his commentary on a divination sutra so that practitioners might perform rituals in their own homes.

Professional geomancers continue to use *fengshui* to determine appropriate sites for graves and houses, and they calculate auspicious dates for weddings and funerals, but one can also find *fengshui* compasses

and do-it-yourself manuals in local bookstores. Despite the massive migration of workers to factories in coastal cities, villages continue to use *fengshui* – capturing the energy of wind and water – in their architectural decisions and configuration of the village and graves of ancestors (Tam 2011). For example, houses in villages must not stand out from the others, so as not to be blamed for misfortunes in the village. Diviners in contemporary China have a somewhat ambiguous status, insofar as they are relegated to the margins of society but also respected by clients for their expertise and advice. They provide a sort of spiritual counseling and address their psychological needs.

People also engage in divination practices at temples, where they believe that deities can respond (*ying*) to their entreaties through their magical efficacy (*ling*) (Chau 2006). Divination sticks remain a common feature in Chinese temples: to address questions concerning business enterprises, marriages, jobs, examinations, and children, people “draw divination sticks” (*chouqian*) by shaking the container until a bamboo stick (*qian*) drops or shoots out of the divination stick container (*qiantong*); they then retrieve a divination poem slip (*qianzhi*) that corresponds to the number on the stick (Chau 2006).

Tradition

In the twenty-first century, the Chinese government has promoted a vision of “traditional culture” (*chuantong wenhua*) as a symbolic resource for legitimacy and national solidarity. A year after UNESCO launched the category of “intangible cultural heritage” in 2003 to protect oral traditions, performing arts, social practices, rituals, and festivals, and other practices, the People’s Republic of China began identifying items of traditional culture that might officially be designated “intangible heritage,” including local cults to deities such as Mazu and Jigong, village temple festivals, as well as official cults to Confucius. In this way, certain religious traditions have become promoted as parts of Chinese culture and worthy of preservation for nationalistic reasons and tourism development (Goossaert and Palmer 2011, 343–344).

The Chinese government has increasingly portrayed Confucian traditions as constitutive of traditional culture, sponsoring Confucian ceremonies connecting Confucian values with Chinese national essence (Sun 2013; Billioud and Thoraval 2009). For example, in the Confucius festivals performed in September of 2007 in the city of Qufu in Shandong Province, where Confucius was born and buried, the inaugural ceremony depicted Confucian “Chineseness” (*zhonghua qing*) – understood to be a fundamental character of China that transcends borders and ethnicities – as a common cultural heritage that might harmonize and unify the entire world, exemplified by China hosting the Olympic Games in Beijing (Billioud and Thoraval 2009, 89). The Chinese government presents a broad image of tolerance by defining “Chineseness” as that which unites Han Chinese with other ethnic minorities, however Buddhists in Tibet and Muslim Uyghurs in Xinjiang have challenged the Chinese national identity imposed by the government, protesting and resisting the state’s repression of religion and restriction of cultural autonomy (Lu and Gao 2018; Potter 2003). Similarly, since 2004 the government has established thousands of Confucius Institutes in overseas colleges and universities to promote Chinese language and culture, which is viewed by some academics as impinging on intellectual freedom and an attempt to build “soft power” by promoting Chinese culture as a way to extend its political influence.

Although some criticize “Confucian studies” (*ru xue*) and large-scale rituals in the name of Confucian culture as encouraging cultural nationalism, many grassroots Confucian activists promote the tradition as a way to address moral and intellectual concerns (Goossaert and Palmer, 345). Such activists have

rediscovered and reinvented new rituals in their attempt to revive Confucian traditions in the early twenty-first century. They study the Confucian classics, keep personal diaries as tools for moral self-cultivation, come together to perform rituals, and even develop virtual online “academies” that connect those who have an interest in Confucianism (Billioud and Thoraval 2009, 95). Indeed, Chinese cyberspace has provided a venue for many individuals searching for meaning to find new pathways for moral and spiritual cultivation (Palmer 2004).

Technology

Religious themes continue to appear in mass media and popular culture, such as martial arts novels, films, and television that include Buddhist monks, Daoist priests, and people with miraculous powers (Goossaert and Palmer 2011, 277). Mass media, publishing, and the Internet have made it relatively easy to disseminate information about religious traditions. Although Chinese cyberspace is relatively self-enclosed, there have been increasing connections with Taiwanese, Hong Kong and overseas networks. Buddhist websites do not criticize the government, corruption, or environmental degradation but instead cater to religious seekers and commercial interests by encouraging meditation, sutra recitation, vegetarianism, and self-cultivation, and also selling religious paraphernalia and promoting pilgrimages (Laliberté 2017, 146).

Technologies are often interpreted as potential supplements to, rather than substitutes for, religious practice. For example, Buddha-recitation devices (*nianfo ji*) – portable plastic boxes that use modern technology to reproduce the Buddha’s name endlessly – are used to create a spiritually efficacious environment, replicating the self-sounding environment of the Pure Land for Chinese Buddhists who engage in the practice of reciting the name of Amitābha Buddha (Heller 2014). Digital technologies such as mobile apps for religious practice, cyber-pilgrimages, and Buddhist social media can connect people with religious knowledge and monastic networks (Tarocco 2017). On the one hand, some Buddhists portray Web 2.0 technology as a means to accumulate wisdom and serve as a type of “storehouse consciousness,” while on the other hand they acknowledge that technological progress and busy lives often do not allow for sufficient exercise or the purification of body, speech, and mind (McGuire 2017).

Western Applications

Not only have Chinese people found new significance in their religious traditions, but a number of Western scholars have too, although they address a somewhat different set of concerns. Several recent works have emphasized ways that early Chinese philosophy might serve as constructive resources for Westerners today, including Michael Puett and Christine Gross-Loh’s *The Path* (2016) and Erin Cline’s *Families of Virtue* (2015). Puett and Gross-Loh make the case for rituals creating an “as if” world that helps refine one’s ability to respond properly to situations. For example, a child estranged from an overly critical mother might act “as if” she was nurturing, and by adopting that tone and stance, they might elicit a caring response from their mother (Puett and Loh 2016, 44–45). They emphasize the importance of actively working to shift patterned habits and entrenched narratives that limit our perception of the world. Because the world is fractured and fragmented, people are responsible for generating order. They

write, “we do this through daily self cultivation: working through our rituals to improve the way we relate to those around us; cultivating energies in our bodies so that we can live with more vitality; training our hearts and minds to work through daily decisions in a powerfully different way; and resisting our tendency to cut ourselves off from experience, so that we become constantly receptive to new things” (Puett and Loh 2016, 197). Puett and Loh present early Chinese philosophies as correctives to Western myths about living in an age of freedom where the goal is to find oneself and live authentically according to an inner truth.

Erin Cline argues that evidence-based approaches to early childhood intervention and parental caregiving supports Confucian claims about the important role that parents play in the lives and moral development of their children. If we take the Confucian views seriously, they would lead one to endorse certain social and policy changes, such as mandated paid leave for parents in the United States and the Nurse-Family Partnership program that provides first-time low-income mothers with home visits from public health nurses during early pregnancy through the first two years of the child’s life. Confucian stories and anecdotes can provide a resource for rethinking and reshaping contemporary attitudes, practices, and policies related to the family.

My own current research considers the ways that Chinese philosophies may contribute to a more robust understanding of moral attention – the capacity to discern and attend to the morally salient features of a given situation. Moral attention involves suspending one’s thought in order to actively receive something or someone else in all of their complexity and particularity. Although most scholars associate moral attention with Western philosophers such as Simone Weil and Iris Murdoch, Chinese religious traditions describe various means of facilitating moral attention, including Confucian techniques of moral cultivation, Daoist practices of “fasting the mind,” and Buddhist meditation. Such techniques may be useful for redressing the contemporary tendency toward “continuous partial attention,” a phrase coined by Linda Stone that describes the process of paying simultaneous attention to numerous sources of information, but at a superficial level. In an “attention economy” designed to draw our attention to our digital devices and away from those who surround us, we may benefit from reflecting on the ways that it impacts our interpersonal relationships by examining ourselves on various counts, or becoming more finely attuned to our surrounding environment by gathering ourselves in emptiness, or widening the scope of our concern to consider all types of sentient beings who need our attention and care. In this way, Chinese religions could contribute a great deal to how we approach technology and direct our attention.

Conclusion

In present-day China people continue to value family, participate in festivals such as the Grave-Sweeping Festival, and believe in a moral universe that rewards good deeds and punishes bad acts. However, they negotiate their values under very different circumstances from previous historical periods, in the wake of urbanization, family planning policies, and economic reforms that have often dissolved geographic ties, impacted family dynamics, and fueled a sense of moral crisis. Chinese people have sought out religious practices in response to the materialism, corruption, and inequality they perceive to be rampant in Chinese society, engaging in body cultivation techniques, reciting scriptures, and exchanging morality books. Although temples continue to address spiritual needs of some who remain in villages, others who dwell in cities have formed groups that meet in restaurants and draw from a variety of religious texts.

Alongside the rebuilding of Buddhist and Daoist temples, there has been a Confucian revival that includes state-sponsored ceremonies to Confucius as well as grassroots activism promoting the Confucian tradition as a way to address contemporary moral concerns. Technologies have afforded the opportunity to supplement religious practices in innovative ways, and Chinese religious ethicists have produced new work that urges Westerners to take early Chinese traditions seriously as resources that can address ethical issues facing us today.

CHAPTER 94

African Religions: Practices and Communities

Ebenezer Akesseh

Introduction

The epistemic discourse on religious ethics offers sufficient cues for understanding the importance, role and function of communities in (African) religious ethics. Communities and practices embody the values and beliefs of a group of people. Through their practices, communities express their supernatural beliefs and demonstrate how those beliefs guide and influence the lives of the members. Thus, though religions possess “untold treasures of moral wisdom, that is, practical guidance about how to live justly and well that include beliefs and practices about the nature of human assistance, social life, what is good and righteous, and reality itself” (Schweiker and Clairmont 2020, 1), the communities play invaluable role in how their members conceptualize and apply those practices and “treasures of moral wisdom.” Through their practices, communities also transmit standards of right and wrong to future generations. Not only do communities shape practices, but practices also shape communities. They provide an opening into understanding the communities’ moral fabric and, also, constitute the prism through which individuals confront their social reality. Thus, communities and practices exercise a normative role in defining and determining standards of rightness or wrongness. Since communities express the core tenets of their life through practices, any analysis of the moral life of a community ought to consider the importance of practices and communities and the relationship between them. Religious ethics, therefore, needs to take into account communities and practices as well as the textured relationship between practices and communities in thinking through questions regarding how people understand what it means to live a good life.

Practices and Communities in African Ethics

The meaning of life and the prescriptions and proscriptions for a virtuous and responsible life in African culture are deeply embedded in a community’s beliefs and practices. The absence of revealed scripture and authoritative sources for its ethics, as found in some religions, makes it very important to understand communities and their practices in African religions. Not only do communities and practices help to understand the way of life of African communities, they also illustrate that African moral reasoning combines the descriptive and prescriptive dimensions of moral reasoning as well as a hybridization of

classical ethical theories. As Odozor has noted, “traditional African moral reasoning is partly deontological, partly teleological, and partly everything else, depending on the issues at stake, the view of God the individual has, and the understanding of the human good in question which needs to be preserved, articulated, or enhanced” (Odozor 2014, 250).

Discussions of communities and practices in African thought must take into account the relationship between culture and religion since the beliefs and practices of a community are intrinsic to a community’s culture. African writers have underscored the inextricable relationship between religion and culture in African religions (Mbiti 1990; Magesa 1997; Gyekye 1996). According to Odozor, “African religion is the culture, and the culture is religious” (Odozor 2014, 86). Because religion underpins almost every aspect of social life in Africa and provides “definitions of the universe and humanity’s place in it,” any attempt to separate the two is an exercise in futility (Assimeng 2010). However, it is important to note that religion can be meaningfully differentiated from, even though it is deeply connected with culture, since religion primarily can be described as a community or a person’s “response to what is Ultimate in the human experience of existing insofar as that response is a conscious cultivation of one’s form of conscious being” (Martin 1975, 467). In order to understand the significance of practices and communities in African ethics, it is necessary to lay out, first, how individuals see themselves in relation to the community and how the community exercises its responsibility toward the flourishing of her members. Second, it is important to examine how African communities use practices which are deeply religious to guide and orient the behavior of their members; and third, the impact of social change on practices and communities. This three-layered approach will provide a conceptual basis to assess the contribution that practices and communities can make to a moral issue confronting an African country.

Before we analyze the invaluable role of practices in African religions, it is essential to establish the origins of communities in African thought. African communities trace their origins to a common ancestor(s). In some sense, one can say that their views of such figures are spiritualized. The ancestor(s) is seen not only as a historical figure(s), they are also recalled in connection with the values they espoused during their lifetimes and in the founding of the tribes. Obrumankoma, Odapagyan, and Oson, for example, are the founding fathers of Fanteland in Ghana. Their prowess and valor in protecting Fanteland are captured in Fante folklore and songs (Shumway 2011). The founding narratives expressed through folklores and music also serve as one of the ways of uniting communities around shared values.

The notion of community is foundational to African thought. Kwame Gyekye illustrates the idea of community in Africa by analyzing three novels – *The African Child* by Camara Laye, a Guinean; *No Longer at Ease* by Chinua Achebe, a Nigerian; *The African* by William Conton, a Sierra Leonean – and affirms the moral significance of African communities (Gyekye 1995). Polycarp Ikuenobe describes a community as the “logical and epistemic foundation of the normative conception of a person and the basis for a person’s own view of self-identity and ways of doing things” (Ikuenobe 2006, 53). In other words, a person’s attitudes and ethical foundations are formed by being a community member. Menkiti also posits that the sense of self-identity, which the individual comes to possess, cannot be made sense of except by reference to the collective facts of the society which he inhabits. This is because the reality of the communal world takes precedence over the reality of individual life stories (Ifeanyi 1984). Gyekye illustrates this point further using the Akans of Ghana. He opines that among the Akans, the conception and development of an individual’s personality and identity are inseparable from her participation in the group (Gyekye 1995). Thus, the community is at the center of every activity, practice, belief, and value.

Though the community shapes one's moral and social identity, it is essential to note that the individual does not lose his or her identity in the community; neither does the community dissolve the individual's ethical identity (Bujo 2001). According to Bujo, an individual is described as a "process of coming into existence in the reciprocal relatedness of the individual and the community" (Bujo 2001, 87). In general, the relationship that exists between the individual and the community manifests itself in the kind of moral principles and the moral reasoning that grounds the content of moral education in African cultures (Ikuenobe 2006).

The understandings of the importance of community as captured by Gyekye, Ikuenobe, and Bujo poignantly illustrate two interrelated issues, namely, the role that the community plays in the life of Africans and the fact that the community's sustenance depends on the ways through which the community helps people perform their roles and responsibilities. Such a functionalist perspective accentuates the fact that "the human person acts more effectively to the extent that he holds fast to solidarity with those like himself; for thus he raises the quality of the vital force not only for himself but rather for the whole community, indeed for the whole of humanity" (Bujo 2001, 5).

Having outlined the centrality of communities to African thought, some of the practices found in African religions with attention to how they impact African ethical discourse will now be examined. Generally, practices and rituals depict how communities relate to the supernatural, to the environment, and to one another. As Nukunya has opined, the beliefs and practices associated with the supernatural operate at different levels and in different forms. Though they differ from place to place on the continent, we could deduce some general categories, including, High God, small gods, ancestors, witchcraft, sorcery, and magic (Nukunya 2016). Practices associated with the worship of the High God, the small gods and ancestors are expressed through offering sacrifices and pouring of individual or communal libation usually performed by priests and clan heads. Festivals are also occasions where communities through their practices manifest their belief in the High God, the small gods and ancestors. The practices associated with festivals are considered necessary for sustaining the life-giving force of the community and they serve as a means of social cohesion.

A group of practices through which communities pass on standards of excellence are the rites of passage. The rites "connect human beings with the other visible and the invisible world of God, the ancestors, and the spirits" (Magesa 1997, 114). The rites cover four stages of a person's life – birth, puberty, marriage, and death. According to Magesa, each of these stages has to do with the vitality of human life – birth as transmitting the vital force, puberty (initiation) as a confirmation of the vital force, procreation as the preservation of the vital force and funeral rites as the availing of the deceased elder's vital power. Accompanied by the appropriate rites and practices, the rites of passage are moments when the power of life is intensified for the individual and community (Magesa 1997).

Without describing the various rites in detail, it suffices to note that apart from their religious value, the rites also serve as an essential means of moral formation from the cradle to the grave. The practice of dipping a form of liquid on the tongue of a child during naming ceremonies in some African communities is usually accompanied by words that require the child to speak the truth and cultivate honesty. Additionally, by naming a child after an ancestor, the child is expected to emulate the virtues of the ancestor. Failure to do so means bringing the ancestor's legacy into disrepute. Thus, the community uses the naming ceremony to address moral issues related to living an upright life. Though the rites are for the child, they also remind those present to cultivate honesty, sincerity and other virtues emphasized in the ceremony.

The puberty or initiation rites are a time to learn ancestral wisdom. During the period, boys and girls are taught the values of cooperation and sharing, the relationship between human life and the rest of creation, domestic and social virtues, sex and sexuality, good manners and grooming, and the forms of self-identity. In addition to these, bravery and courage are emphasized for boys whereas tenderness and affection are stressed for girls. In many societies, the ceremony is supposed to check immorality or premarital sex since adolescents are required to be chaste before going through the puberty rites. Failure to meet this requirement brings shame to the initiate's family. He or she also incurs the displeasure of the gods and the ancestors (Magesa 1997; Lartey 2014). The puberty rites, therefore, illustrate how communities think through moral responsibility, sexual ethics and social cohesion and address them through formation.

Marriage is understood universally in African religion as an essential social institution. It is the meeting point for the three layers of human life – the living, the departed and the unborn (Sarpong 1974). The practices associated with the rite emphasize that marriage is the acceptable social structure for transmitting life. It is also the context for the proper expression of sexuality. The practices also point to society's approval of legitimate unions and the respect accorded to children of such unions. The stages of the marriage ceremony emphasize the enduring nature of marriage. The couple also receive instruction on how to live together as part of their preparations for marriage. The marriage rites, then serve as the means through which the community approaches the moral questions relating to marriage such as creating stable families and avoiding marital instability.

The practices associated with death rites stress the importance of living a fulfilling and responsible life. As Nukunya notes: "Though everyone on his or her death would go to the spirit world, not every dead person forms the center of attention during the ancestral rights. This honor is reserved only for the ancestors, those who led good and exemplary lives and died honorably and in advanced age" (Nukunya 2016, 73). The death rites, therefore, underscore the importance of living the moral values one was introduced to during the naming ceremony, puberty rites, and marriage rites since they count toward whether or not one becomes an ancestor.

Certain practices are related to the environment. These include the prohibition to fish and farm on certain days of the week in some communities. For example, the Akans and the Gas of Ghana forbid fishing on Tuesdays, Thursdays, and Fridays are considered days of rest for the earth for the Akans. These prohibitions are based on religious motives. The sea is believed to be the abode of the gods among the Gas and Akans. Hence Tuesdays are dedicated to them. The earth is also believed to be the abode of the earth goddess known as "Asaase Yaa" among the Twi and "Asaase Efua" among the Fante. Thursdays are designated as the day of rest, where the earth goddess is known as "Yaa," and Friday in communities where she is known as "Efua" (Nukunya 2016). Certain species of trees are also considered as totems and, therefore, are not to be cut down. These practices are not only limited to the Akans of Ghana. In his book *The Life of a South African Tribe*, Junod describes the prohibition of farming, gathering wood or any form of activity in designated forests. Transgressing such a directive was met with various kinds of punishment. The fear that the people have of these sacred woods is inculcated and passed on through terrifying tales. In Junod's words, "in low tones, and with frightened looks, these are related in the evenings, and the feeling of awe is fed and maintained by these legends" (Junod 1962, 352). Also, among the Maasai, a species of parasitic fig tree known as *oreteti* is considered sacred and, therefore, not to be touched. According to Hodgson, "*Oreteti* trees held water in their trunks and fissures, . . . the Maasai saw these thickets as links growing from the sky and Eng'ai down to the earth and humans; they were therefore

considered holy places where people could be closer to Eng'ai. Maasai men and women visited these holy trees either alone or in groups to pray, worship, and plead to Eng'ai for rain and other blessings" (Hodgson 2005, 29–30).

The mention of prohibitions above brings into focus how African religions use prohibitions, also known as taboos, to encourage and discourage a variety of practices and customs. Taboos relate to several practices associated with many areas of human life, including death, sacred persons and things, marriage and sexuality, dietary norms, and the environment (Magesa 1997). Though there are a number of taboos, Bujo notes that "many taboos function to protect the individual and group morality. They draw attention to its basic principle, namely, life, at least slowly to an interiorization or deepening of the moral norms, which amounts to a formation of the conscience. This leads the individual to accept a deeper ethical obligation and guarantees the good of the community" (Bujo 2001, 128). What usually gives taboos their force is the strong notion of sanctions associated with them. According to Mbiti, "breaking a taboo entails punishment in the form of social ostracism, misfortune, and even death. If people do not punish the offender, then the invisible world will punish him. This view arises from the belief in the religious order of the universe, in which God and other invisible beings are thought to be actively engaged in the world of men" (Mbiti 1991, 41). The taboos concerning the environment are not only to protect the ecosystem, but they are also grounded in the understanding that the earth should be preserved for future generations.

Religious and social change have had a significant impact on African communities and practices. With the introduction and spread of Islam and Christianity some practices are considered fetish. Others are weakened because there were parallel structures in Christianity. As a result, African religion has moved from being the religion of the majority to become the religion of the minority. Urbanization has also had a significant influence on the organization of communities and practices. The development of industries and market economies in many African countries caused people to migrate from their place of birth into urban centers. Nukunya opines that one of the effects of urbanization and migration "is the demise or at least the weakening of traditional sanctions which used to sustain accepted kinship behavior" (Nukunya 2016, 193). Formal education and technological improvements have also attenuated the prohibition of some traditional practices. Religious reasons which were used to justify the observance of certain practices that deal with social control are now considered antiquated and, therefore, viewed with cynicism. Nukunya points out that "the weakening of the sanctions has set in motion alterations and innovations in social life, which in turn lead to further reductions in the effects of the sanctions" (Nukunya 2016, 193).

The effects of religion and social change on practices and communities do not suggest communities and practices have entirely lost their force in African ethics. Some African practices are still observed in their form. These include practices associated with marriage rites, festivals and the preservation of the environment. Other practices are observed in their essence. The strong sense of familial bonds and solidarity associated with African communities have also retained their influence on certain aspects of life in African societies. For example, one cannot make sense of the rational expectations and the actual operations of bureaucratic institutions without a good sense of how people conceptualize their obligations toward their kinship group.

One of the challenges of African ethics is how to make sense of ethnicity and tribalism through the prism of African ethics. The formation of nation-states in Africa meant bringing together many ethnic groups with their respective traditions of looking out for members of their clan or lineage. This brought

to the fore a culture of “me” versus “them,” which already existed among tribes. In many societies, the strong sense of “me” versus “them” can be traced to histories of inter-tribal wars and the slave trade when communities would capture and sell members of other communities but usually not their own (Perbi 2004). These divisions were further entrenched in some societies during colonial rule (Katongole 2011). Currently, ethnocentrism manifests in the civil service (Lentz 2014), in the media (Wasserman 2014), in politics (Bayart 2009) and other facets of life in many countries. Ethnicity remains one of the banes of Africa’s under development (Ilorah 2009). Ethnicity needs to be mentioned here because it introduces a certain qualification to the strong sense of communal life and solidarity that is usually identified with African ethics. In other words, the prevalence of ethnocentrism raises a germane question regarding how communities express strong standards of equity and fairness and yet limit those standards mostly to members of their communities.

A Moral Challenge in An African Context

African societies are faced with certain social conundrums and moral dilemmas that they continue to seek ways to address. The final part of this entry questions the issue of environmental degradation in Ghana and examines how some practices within African religions offer useful solutions toward addressing them. Rapid population growth, urbanization, human encroachment, and deforestation have resulted in the loss of a variety of species and ecosystems in Ghana (Attuquayefio and Fobil 2005). According to the Ghana 2012 Ministry of Land and Resources report, the country’s original forest cover of 8.2 million hectares stands at only 1.6 million. The rate of depletion has become alarming in the past few years. As a result, experts have warned that at the current annual depletion rate of 2 percent (equivalent to 65,000 hectares) due to illegal logging, the country stands the risk of losing its forest cover. In addition to illegal logging of rare species of trees, Ghana is also contending with how to deal with small-scale illegal mining popularly known as “galamsey.” Arable farmlands that are the means of sustenance for families have been destroyed due to surface mining. Also, essential water bodies that serve as sources of drinking water such as the Tano, Akobra, Pra, Oti, and Ofin rivers are polluted; thus putting the lives of those who depend on these rivers and their tributaries at risk. In its 2018 proposal for a review of aggregate revenue requirement and tariff, the Ghana Water Company Ltd. noted the effects of small-scale illegal mining on their stations at Kibi, Osino, Anyinam, Bunso, Daboase, Obuasi, and Sekyere Hemang. They also added that the sources of water for Nsawam, Konongo, and Winneba dried up in 2016 due to human activities (2018 report, 23). Those who engage in illegal mining work under life-threatening conditions, and some later contract respiratory diseases. The pits and stagnated water bodies they leave behind become death traps and breeding grounds of mosquitoes. Illegal mining and other human activities along water bodies also have biodiversity implications because they destroy both flora and fauna. There is, therefore, the need to pay attention to the menace of environmental degradation as a biodiversity issue as well, because “the variety of life is valuable in and for itself, is necessary for healthy ecosystems, provides biological resources, helps create healthy societies, has monetary worth, [and] inspires significant research” (O’Brien 2010).

In addition to government policy directives, it can be argued that African religions offer invaluable ethical resources that could help in reorienting the behavior of those whose practices are degrading the environment. African practices associated with the environment emphasize the intrinsic value of

creation to human existence. The responsibility of the Akan toward nature is grounded within their understanding of what nature itself is. As already noted, the practice of not farming on certain days is based on the belief that the earth is governed by a mother spiritual force, “Asaase Yaa/Asaase Efua” (Busia 1954; Ephraim-Donkor 2010). The practice also ensures nature is given some rest to ensure the regeneration and fecundity of the earth because they believe that the perpetuation of human life on earth is bound to the fecundity of the earth. The Akan traditionally believe they are responsible for how they use the earth’s resources. Danquah expresses that sense of responsibility in the following words: “in our culture, [we] do not only hold in trust for the present and future generations all the natural resources on which our welfare and continuance of the community depend, but [we] are also accountable to the ancestors for the proper management of the resources” (Danquah 1968, 12). The Akan sense of responsibility and accountability, is rooted in the idea that the land is a finite resource that they are holding in trust for future generations. In other words, since all the clan members, including those unborn, have a stake in the use of the land, it is imperative to use it judiciously (Sarpong 1974). This sense of responsibility toward the earth together with respecting the land for its intrinsic worth and not only for its instrumental value are resources in African ethics which can serve as ways to raise constant awareness, and reorient behaviors toward the land.

Taboos associated with the environment, especially those concerning land and water bodies, can also be useful in addressing the threat of environmental degradation. The sacred part of the river, where fishing is prohibited, serves as an incubator for breeding and regeneration of fishes found downstream (Garbrah 2000, 70). Such a taboo even if it is stripped of its supernatural basis, still has a scientific validity for its observance. The same can be said about the prohibition of felling rare species of trees which are shrouded in myths. Appiah-Opoku, in his assessment of the relationship between beliefs and stewardship and conservation of the environment, opines that taboos and traditional beliefs continue to exercise remarkable influence on people’s understanding of stewardship in some Akan communities. From his study of the monkey sanctuaries at Fiema and Boabeng, Appiah-Opoku argues that although there is pressure on the land around the area for other uses, the belief that the two species of monkeys found in the forest – the black and white monkeys (*Colobus polykomos*) and mona monkey (*Cercopithecus campbelli*) – are children of the gods has ensured not only the preservation of the endangered species but also the flourishing of other flora and fauna in the sacred grove (Appiah-Opoku 2007). Thus, in order to guarantee the preservation of certain critical and finite resources and prevent wanton exploitation of nature, conservation policies must take the interventions that traditional practices provide seriously.

Conclusion

Communities and practices provide an essential means of understanding and appreciating African ethics. Though religious and social change have impacted some practices of African communities, it does not suggest that African beliefs and practices have lost their force. They continue to serve as the lens through which people filter their decisions and actions. Cardinal Onaiyekan’s assertion that “every Nigerian, whether he is Christian or Muslim, retains within him some basic elements of the Traditional Religions of our people” holds for many Africans (Onaiyekan 2013, 86). Since, “acknowledging the important role played by particular traditions in the way people conceive of the good and of moral value, and in the way they make judgments is crucial to any public discourse properly so-called today”

(Odozor 2014, 70), it is important to engage the notion of communities and practices in African ethics to ascertain the contribution they can make to addressing present moral concerns. This fact has been illustrated by showing that certain beliefs, practices, and sanctions associated with the environment in African communities – recognizing that the fecundity of the earth is tied to the longevity of humanity; appreciating the earth for its intrinsic value; allowing nature days of rest to allow for rejuvenation; preservation of finite resources through the observance and application of sanctions; holding the earth in trust for the present and future generations – can help to address the current problem of environmental degradation confronting the continent.

2 Modes of Interpretation

CHAPTER 95

Modes of Interpretation in Jewish Ethics

Elias Sacks

Much ink has been spilled on the promise and perils of “Jewish ethics” – on what this phrase might denote and how it might both illuminate and distort. This entry addresses a different, yet also fraught, topic: the role of textual interpretation within this contested field. It is commonplace to encounter descriptions of Judaism as a “book religion” or “text-centered tradition.” Jewish reflections about topics from God to human nature to politics, the story goes, often appear in commentaries on earlier sources rather than systematic philosophical treatises, and Jewish history is itself the story of a geographically dispersed, internally diverse people devoted to reading and rereading a shared set of biblical and non-biblical books.

Such claims reflect important dynamics within Jewish life, but they also run the risk of obscuring a more complicated reality. As important as textual interpretation has been to the Jewish tradition, the nature and status of the texts being interpreted have been understood in diverse ways. It is doubtful that Jews have always thought of themselves as engaging “biblical” and “non-biblical” works (or conceived of these sources as “books”). On the contrary, during the Second Temple Period, many Jews seem to have understood their textual universe less as a collection of clearly defined canonical and non-canonical books, and more as elements within a vast library or archive of divinely inspired writings that would never be fully accessible in any specific body of literature (Mroczek 2016).

Diverse views have existed not only regarding Judaism’s texts, but also regarding interpretive activity itself – regarding what Jews are supposed to derive from an engagement with inherited sources. One example is the history of the Babylonian Talmud, a sprawling compilation of legal discussions, narratives, and other types of material emerging from the rabbis of late antiquity. While this source has come to be seen as a reference guide to laws governing Jewish practice, it has not always played this role. Rather, there is substantial evidence that this work was used in widely disparate ways during the Middle Ages, with communities (and individual authorities) disagreeing with one another about how this work should be used in pedagogy and legal decision-making (Fishman 2011). Indeed, as tempting as it might be to imagine Jewish sources as the shared legacy of a text-centered people, this picture runs the risk of glossing over a long history of conflicts over which texts merit interpretation and who should have access to this material. A case in point is the eighteenth- and nineteenth-century central and eastern European movement of cultural renewal known as the Haskalah (sometimes translated as the “Jewish Enlightenment”). Its overwhelmingly male authors have often been cast as figures committed to providing a broad Jewish public with access to Judaism’s textual heritage, especially the Bible (either in

Hebrew or in German translation). Recent scholarship, however, has suggested that these intellectuals were animated by a desire to *limit* certain types of access to Jewish texts – to combat the growing popularity of Yiddish renderings of the Bible (and Yiddish literature more broadly) among women and uneducated men, and to thereby reassert elite male control over what was being read and who was doing that reading (Litvak 2012).

The aim in what follows is to explore the relationship between textual interpretation and Jewish ethics in a way that foregrounds this type of diversity and disagreement. More specifically, the entry will survey the history of this relationship between hermeneutical practices and ethical reflection, and it will argue that some of the central questions in contemporary Jewish ethics are interpretive ones. The entry begins with examples of how interpretation and ethical reflection are intertwined in premodern sources. The entry then explores the persistence of this relationship in modernity, focusing on historical-critical study and feminist hermeneutics. It concludes by highlighting two types of questions about textual interpretation that are central to contemporary Jewish ethics: (1) What should ethicists be interpreting? Which texts should shape Jewish ethical thinking, and to what extent should ethicists look beyond textual sources to nontextual voices emerging from contemporary communities? (2) Why should ethicists be interpreting? What challenges confront ethicists committed to exploring Jewish sources, and what should ethicists seek to derive from these texts in the face of such challenges?

Two remarks on terminology. For the sake of space, the entry avoids intervening in debates about the nature of “Jewish ethics” and instead operates with a capacious understanding of this concept, using the phrase to refer to traditions of reflection in Jewish sources and communities about conduct, character, and concepts such as goodness and rightness. Moreover, since the entry seeks to highlight rather than resolve questions about the relationship between these traditions of reflection and practices of textual interpretation, it avoids privileging any one account of what interpretation involves. That is, the entry is not interested in determining whether interpretation involves recovering original meanings intended by texts’ authors, ascribing new meanings to inherited material to secure its enduring relevance, or something else entirely. Rather, “textual interpretation” is used to refer, broadly, to the activity of engaging textual material. When the entry links textual interpretation and ethical reflection, the focus is on ways in which ethical reflection in Jewish sources and communities has involved invoking, exploring, and discussing texts. Similarly, when the entry argues that some of the central questions in contemporary Jewish ethics are interpretive ones, the claim is that some of the debates at the heart of Jewish ethics today revolve around how, why, and even the extent to which textual material should be engaged.

From Ezekiel to Maimonides

Textual interpretation and ethical reflection are already linked in the materials that would eventually form the Hebrew Bible. Consider Ezekiel 18:

What do you mean by quoting this proverb upon the soil of Israel, “Parents eat sour grapes and their children’s teeth are blunted”? As I live – declares the Lord God – this proverb shall no longer be current ... Suppose that [a wicked father], in turn, has begotten a son who ... has done what is right and just, and has carefully kept all My laws: he shall live! The person who sins, he alone shall

die. A child shall not share the burden of a parent's guilt, nor shall a parent share the burden of a child's guilt; the righteousness of the righteous shall be accounted to him alone, and the wickedness of the wicked shall be accounted to him alone. (18:2–20)¹

Rejecting the idea of intergenerational guilt in favor of a notion of individual moral responsibility, this passage stakes out its view not by simply asserting the latter doctrine, but rather by engaging an inherited source. Citing a proverb about parents' grapes and children's teeth, these lines advance an interpretive claim about the adage's meaning (that it casts children as responsible for their parents' sins) and insists that this moral perspective is no longer valid. This passage goes so far as to articulate its own ethical position by reworking the imagery of that earlier source, affirming individual responsibility by redeploying the proverb's familial language to declare that "a child shall not share the burden of a parent's guilt, nor shall a parent share the burden of a child's guilt." This proverb, in fact, might not be the only source at issue here: given affinities between Ezekiel's language and passages in sources such as Deuteronomy, it is possible that the former is launching its attack on intergenerational guilt by implicitly drawing on texts (such as Deuteronomy 24:16) that stress individual responsibility (Fishbane 1985, 284, 293, 410 et al.).

Textual interpretation and ethics are also intertwined for the rabbis, the network of male intellectuals from late ancient Babylonia and Palestine whose work would yield sources such as the Mishnah, Talmuds, and midrashic collections. In many cases, rabbinic materials cite biblical passages to support claims about individual conduct or provide exemplars of moral behavior (Mittleman 2012, 52–87; Fonrobert 2013). In other cases, rabbinic sources engage scriptural texts to raise moral concerns about inherited traditions. One widely-cited instance concerns the command in Deuteronomy 21:18–21 to execute a "stubborn and rebellious son" who does not heed his parents' "voice." Some rabbinic sources seem to reflect moral discomfort with the prospect of executing rebellious children and respond by attempting to interpret this law into practical irrelevance. One passage uses seemingly minor textual features to limit the law's applicability, advancing (among other claims) the proposal that the biblical description of the wayward child as not heeding his parents' "voice" restricts the command to rare cases where a mother and father are exceedingly similar in voice and other physical characteristics; even more strikingly, this rabbinic passage speculates that the law in question was never meant to be implemented but instead was given only so that individuals might "study it and receive reward" for engaging in biblical exploration (TB Sanhedrin 71a;² Fonrobert 2013).

Some rabbinic sources go further and cast textual engagement itself as a means of ethical cultivation. On this view, studying the Bible in a community of disciples under an authoritative teacher can result in Scripture being so powerfully internalized that an individual's desires, impulses, and emotions are transformed (Schofer 2005). Consider this passage from the rabbinic collection *The Fathers According to Rabbi Nathan*:

The bad *yetzer* [inclination] is thirteen years older than the good *yetzer* [inclination]. From the belly of a person's mother it grows and comes with him. If he begins to desecrate the Sabbath, nothing in him protests ... [If he goes to do an act of transgression, nothing in him protests.] After thirteen years, the good *yetzer* is born. When he begins to desecrate Sabbaths, it says to him, "You idiot! Look, it says, 'The one who desecrates it will surely die!'" (Exod. 31:14). When he goes to

1 Biblical translations follow the NJPS unless otherwise noted.

2 Following the translation in Epstein (1961).

commit murder, it says to him, “You idiot! Look, it says, ‘If a man spills the blood of another man, his blood will be spilled’” (Gen. 9:6). When he goes to do an act of sexual transgression, it says to him, “You idiot! Look, it says, ‘the adulterer and the adulteress will surely die’” (Lev. 20:10).

(Schofer 2005, 87)

While a person is born with an evil inclination, this innate tendency can be overcome by engaging the Bible’s words, which inculcate dispositions to act in accord with scriptural dictates.

Medieval Jewish figures also discuss inherited texts – both biblical and rabbinic – in order to advance claims about moral conduct. Consider the emergence of philosophical exegesis: the practice of reading texts such as the Bible in light of ideas derived from philosophical frameworks such as neo-Platonic and Aristotelian thought. Perhaps the best-known practitioner is the twelfth-century philosopher and jurist Moses Maimonides, who devotes considerable attention to topics such as virtue and repentance while also drawing on broader philosophical trends to elevate intellectual over moral perfection – to argue that intellectual perfection is the ultimate *telos* of the human being, whereas moral cultivation is a means toward this end.

The important point for us is that Maimonides advances such claims, in part, by engaging Scripture. Consider his philosophical magnum opus, *The Guide of the Perplexed*, which devotes its concluding chapter, in part, to Jeremiah 9:22–23: “Let not the wise man glory in his wisdom, neither let the mighty man glory in his might, let not the rich man glory in his riches; but let him that glorieth glory in this, that he understandeth and knoweth Me: that I am the Lord who exercise loving-kindness, judgment, and righteousness, in the earth. For in these things I delight, saith the Lord.”³ On the one hand, Maimonides invokes these verses to stress the superiority of intellectual over moral excellence. Reading the phrase “wise man ... in his wisdom” as a reference to someone who has attained moral perfection and “he understandeth and knoweth Me” as a reference to someone who has achieved intellectual perfection, Maimonides suggests that Jeremiah arranges these attainments in a clear hierarchy: by privileging the individual who achieves (intellectual) understanding and knowledge over the individual who obtains (moral) wisdom, the Bible indicates that moral cultivation is subordinate to intellectual perfection. On the other hand, Maimonides also uses these verses to hint that intellectual perfection may itself have ethical consequences. By concluding with a reference to the intellectually perfect individual knowing that God “exercises loving-kindness, judgment, and righteousness, in the earth,” Maimonides claims, these verses indicate both that the pursuit of intellectual perfection yields knowledge of God’s attributes of action, and that such knowledge generates a commitment to *imitatio dei* and practical activity in the world (Maimonides 1963, 636–638; Mittleman 2012, 106–118).

Modernity

Textual interpretation and ethical reflection remain intertwined in modern sources. While this relationship is evident in thinkers who continue earlier modes of reading such as philosophical exegesis, it also persists among figures who adopt emphatically modern hermeneutical approaches.

3 Following the translation in Maimonides (1963, 636–638).

One example is historical-critical study, a method that emerges in the seventeenth and eighteenth centuries and treats sources such as the Bible not as pristine, divinely authored texts, but as human creations profoundly shaped by the historical contexts in which they originated. This approach might seem to undermine the prospect of ethically significant textual engagement: if sources such as biblical books are humanly authored compositions rooted in the ancient world, we might wonder whether such texts have much to offer us today. For some thinkers, though, a historical-critical approach is crucial to addressing contemporary questions. Consider Gordon Tucker, a rabbi involved in recent debates in one Jewish denomination, Conservative Judaism, about the status of homosexuality. Troubled by a widespread mode of argumentation that forbids non-heterosexual sexual relationships by citing the biblical verses Leviticus 18:22 (“do not lie with a male as one lies with a woman; it is an abhorrence”) and 20:13 (“if a man lies with a male as one lies with a woman, the two of them have done an abhorrent thing; they shall be put to death”), Tucker – as part of a broader argument – notes that such reasoning “rests on the assumption that the words of Leviticus (and, of course, those of the other four books of the Pentateuch) express directly and completely the will of God.” However, he continues, many Jewish groups (including his own denomination) reject this assumption because, among other reasons, they affirm the importance of historical-critical study:

The non-acceptance of biblical infallibility is not merely a negative verdict on the divine authorship of the Torah born of academic skepticism; it is a ... message about the ways in which God and humans find each other ... God’s will is not infallibly represented in the Torah, but only imperfectly, in a form that awaits the engagement and honest searching of religious communities ... Could it perhaps be that critical study itself was given to us precisely so that we would not let the text of the Torah stand as an impediment to the acceptance, fulfillment, and normalization of God’s creatures?

(Tucker 2006, 6–7)

Undermining the assumption of “biblical infallibility,” historical-critical study empowers contemporary Jews to treat a text such as the Bible as a deeply significant yet unavoidably imperfect human source that articulates “God’s will ... in a form that awaits the engagement and honest searching of religious communities.” Historical-critical study, that is, casts texts such as the Bible in terms that broaden the contours of how Jews might wrestle with topics such as sexuality. Precisely because a text such as the Bible constitutes a human attempt to discern God’s will, readers are authorized to take such material seriously while nevertheless looking beyond its legal prescriptions for guidance in a wider range of sources, from narrative texts in classical writings to the lived realities of contemporary communities.

Questions about textual interpretation are also central to Jewish feminism. Identifying “Jewish feminism’s ethical core” as the conviction that “women’s subordination in Judaism and the larger society are real and unjust and that change is urgent and necessary,” Judith Plaskow, one of the first feminist Jewish theologians, writes:

Given the centrality of textual interpretation in Judaism, rereading Jewish texts ... has been a crucial mode of Jewish feminist ethical engagement ... Feminists have offered new readings of canonical sources and also expanded the canon to include modern texts by Jewish women. They have produced [biblical] commentaries, critical analyses of biblical and rabbinic texts, as well as readings of contemporary feminist literature.

(Plaskow 2013, 272, 279)

Textual interpretation is crucial to Plaskow's own work, most notably her groundbreaking *Standing Again at Sinai*. Calling on contemporary Jews to "render visible the presence, experience, and deeds of women erased in traditional sources" (Plaskow 1990, 28), Plaskow suggests that addressing this textual silence requires endeavors such as feminist historiography that recovers women's experiences, literary projects that imaginatively retell and supplement biblical narratives, and liturgical compositions that incorporate these discoveries and stories into the rhythms of Jewish life. Textual interpretation also figures prominently in the work of Rachel Adler, who pursues the "ethical task" of transforming Judaism by developing "a text-bound theology" that is "concerned not only with critiquing androcentric structures, categories, and motifs and constructing feminist theory and interpretation, but also with mending and healing Judaism by encountering, renewing, and reclaiming the holiness in texts" (Adler 1998, xv, xxv). On this view, a feminist commitment to reimagining Jewish life requires a twofold hermeneutical project of laying bare the patriarchal, misogynistic dynamics in classical Jewish texts while also showing that these sources have lessons to offer contemporary readers. Indeed, as we will see, feminist thinkers have called not only for new ways of relating to classical Jewish texts, but also for new conceptions of precisely which texts – and of the extent to which texts – matter for ethical reflection.

Contemporary Questions

Given this history, it should not be surprising that interpretive questions continue to loom large in contemporary Jewish ethics. This entry concludes by highlighting two such questions.

The first concerns the materials that merit interpretation. When introductory surveys outline the textual sources of Jewish ethics, the focus is typically on "classical" texts: texts that have long been recognized as part of the Jewish literary canon. Two recent introductions to the field identify the Bible, rabbinic works, medieval ethical treatises, legal codes, and responses to legal queries as the key sources of Jewish ethics, with one introduction adding a brief reference to "philosophical, literary, and liturgical works, as well as music and some art" (Newman 2005; Dorff and Crane 2013, 8–9).

There is much to be said for engaging classical texts. Adler (1998) insists that continuing to read and reread this material represents a way to hold the Jewish tradition accountable for its failings while also uncovering ethically significant teachings that eluded previous generations. Nevertheless, some contemporary thinkers have argued for bringing previously neglected texts into conversations about ethical questions. Laurie Zoloth emphasizes classical texts that have not typically been treated as resources for ethical reflection, arguing that such sources might introduce perspectives and concepts that are desperately needed in Jewish (and non-Jewish) ethical discourse. For example, she suggests, the often-neglected biblical book of Ruth reflects the lived realities of women and addresses issues of friendship and scarcity in ways that generate a language of community and responsibility crucial to theorizing the just allocation of limited public resources (Zoloth 1999). In a different vein, Rebecca Alpert stresses the importance of broadening Judaism's conception of what counts as sacred literature. Seeking to create a Judaism in which lesbians can be full participants, she argues that this endeavor requires not only new interpretations of ancient sources, but also "an effort to find or rediscover Jewish texts from other eras that incorporate a lesbian sensibility and the creation of new sacred texts that are affirmatively Jewish and lesbian" (Alpert 1997, 8). Twentieth-century texts (from autobiographies to plays to psychoanalytic writings) that feature Jewish lesbians can show that lesbians have always been part of Jewish life; emerging bodies of

literature such as Jewish lesbian fiction can generate new, more inclusive visions of religious practice and community.

A more disruptive move appears in the work of Michal Raucher, who argues that it is insufficient to simply reread and expand the Jewish textual universe. Rather, Raucher insists, Jewish ethics should move beyond a “text-reliant approach” that privileges written sources when searching for norms, concepts, and other resources relevant to ethical deliberation. More specifically, Jewish ethics should also embrace ethnographic research into the lived realities of contemporary Jewish communities – research that explores and articulates modes of ethical deliberation employed by non-elite members of such communities, and that thereby makes these modes of thinking available for analysis and use. Her work, for example, explores ways in which ultra-Orthodox Israeli women construct their own ethics of reproduction in tension with (and even opposition to) male authorities, making choices about medical care and reproductive technology that involve distinctive conceptions of divine service and women’s agency.

For Raucher, ethnographic analysis both reflects the ways in which ethical decisions are made in real-life settings and elevates marginalized voices typically excluded from religious writings. This approach is also more intellectually honest than text-focused alternatives:

Can ethnography provide us with normative ethics, rather than descriptive ethics? It is my contention that the question, so often posed as a critique of ethnography as ethics, is flawed ... The text-reliant approach is itself particular, yet more easily framed in universal terms. Legal codes and philosophy incorporate limited voices and speak to a particular subset of the population, despite claiming to be universal and normative. As a method of ethics, ethnography is more transparent in its contextual commitments.

(Raucher 2016, 648)

For Raucher, all modes of ethical analysis – whether rooted in texts or ethnography – are partial and context-specific, reflecting some perspectives while excluding others. Part of what distinguishes ethnography, however, is an awareness of this partiality. Whereas interpreters of religious texts often fail to acknowledge the degree to which these sources reflect the views of only some (typically elite) groups, ethnographers cannot help but recognize that they are exploring the views of specific individuals and communities. One type of question facing contemporary Jewish ethics, then, is the following: what should ethicists be interpreting? Which texts should shape Jewish ethical thinking, and to what extent should ethicists look beyond textual sources to nontextual voices emerging from contemporary communities?

A second question focuses less on what ethicists should be interpreting, and more on what such activity can accomplish – on what thinkers might hope to derive from the sources they engage. Louis Newman has suggested that many Jewish ethicists assume that interpreting a text involves discovering a single, authoritative meaning that can be applied to contemporary debates. On this model, an interpreter identifies sources that address the topic with which she is concerned, extracts the determinate meaning of those texts, and applies that meaning – for instance, a set of principles or behavioral norms – to the question at hand.

Unfortunately, Newman argues, this approach fails to appreciate the complexities of textual engagement:

Many of those engaged in contemporary Jewish ethics are inclined to treat the provisions of talmudic and medieval texts as if they were less open-textured than in fact they are. The Jewish legal tradition does not really constitute a body of views and precedents that “speak for themselves” to

contemporary issues. Rather, it offers us categories, concepts ... and notions of the relationships that obtain among moral agents. It provides a rich resource of values and principles ... But the texts do not, either individually or collectively, dictate how to use or apply these resources. That is up to the interpreters.

(Newman 1998, 176)

Newman's point is that what texts offer are not single, authoritative meanings that can be applied in a straightforward manner to contemporary problems, but rather an array of principles, concepts, and other resources that interpreters must figure out how to deploy – and that might plausibly be deployed in different ways by different interpreters.

It is not only the task of recovering and applying textual meanings that is fraught with difficulties. Rather, the task of identifying sources that address the topics with which ethicists are concerned is itself problematic. One worry is that as much as a text might seem to address an issue of contemporary interest such as capital punishment or sexual ethics, the primary concerns animating this material might be very different (Epstein-Levi 2018). For example, Beth Berkowitz (2006) argues that key rabbinic texts on execution are often concerned less with actual historical enactments of the death penalty, and more with the authority of the rabbis themselves – with establishing this authority by providing detailed descriptions of executions that might never have occurred but that are nevertheless cast as lying within the scope of rabbinic power (and punishing violations of rabbinic law).

Given these problems, why read Jewish texts at all? For Newman (1998), what this material provides are the resources to make ethical judgments that cohere with the overall thrust of the Jewish tradition. Even if Jewish sources supply concepts and principles without clarifying how such tools are to be deployed, Jewish thinkers can make reasonable judgments about these matters by constructing accounts of the Jewish tradition itself – of what renders the history of Jewish thought sufficiently coherent to count as a (relatively) cohesive tradition. Jewish sources, in turn, can be used to make ethical judgments that fit with these (constructed) accounts of the overall trajectory of the Jewish tradition.

To be sure, Newman acknowledges, different thinkers might address this task in widely divergent ways. Some might decide that what unifies the history of Judaism is a concern with law, and that the task of Jewish ethics is to mine Jewish sources for relevant legal cases, distill the guiding principles behind these precedents, and apply those principles to contemporary questions. Others might determine that what holds the Jewish tradition together is a conviction that Jews stand in a covenantal relationship with God, and that the task of Jewish ethics is to turn to Jewish sources for guidance regarding what responsibilities might follow from such a relationship. Still others might conclude that what undergirds Judaism is an overarching story about God's actions and the trajectory of human history, and that the task of Jewish ethics is to examine Jewish sources to better understand the behaviors and obligations incumbent upon – and the possibilities open to – individuals and communities committed to playing a role in that narrative. In all of these scenarios, though, what texts provide is not a set of clear, authoritative meanings, but rather a collection of resources that contemporary Jews are charged with deploying to reach ethical judgments that reflect, and extend, the coherence of the Jewish tradition.

Another account of what interpretation might achieve focuses less on the continuity of the Jewish tradition as a whole, and more on the modes of reasoning that this tradition employs. The background is a set of developments often grouped together under the heading “Textual Reasoning.” Emerging over recent decades, these developments begin from the premise that Western academic and traditional

Jewish practices of reasoning are neither identical nor impervious to critique, and that these modes of thinking should therefore be brought into conversation with one another. On this view, Jewish texts enact “indigenous” modes of analysis and argumentation that differ from, and thus might be illuminated by while also serving as a corrective to (and being challenged by), modes of thinking employed in North American and European academic disciplines (Ochs 2002).

Applied to Jewish ethics, this approach suggests that textual interpretation might recover and evaluate Jewish modes of reasoning relevant to contemporary moral questions. One example appears in the work of Rebecca J. Epstein-Levi, who frames this mode of textual engagement as a response to the second difficulty outlined above: the prospect that texts (such as rabbinic sources) that seem to be about topics such as capital punishment or sexuality might be more concerned with other issues. This point, she argues, need not imply that such texts are irrelevant. On the contrary, although rabbinic texts about a topic such as sexuality might be primarily animated by very different concerns, there may be other phenomena that function for the rabbis in ways that are similar to the ways in which sexuality functions for twenty-first-century readers, and rabbinic modes of reasoning about those topics may thus provide resources for contemporary ethical deliberation.

Epstein-Levi focuses on rabbinic notions of impurity, a condition that limits an individual’s ability to participate in certain types of communal and ritual activities and can arise and be transmitted through various physical processes. She argues that rabbinic views on this topic bear striking affinities with contemporary understandings of sexually transmitted infections (STIs), and that the ways in which the rabbis reflect on this impurity thus provide models for efforts to think about STIs in our own context:

Too often, frank and medically accurate discussions of STIs and the best ways to manage them are stymied by shame, stigma, and misinformation. The Mishnah’s [a rabbinic text edited around 200 CE] exhaustive, matter-of-fact, detailed, and depersonalized patterns of discussing social contagion ... offer a model for de-stigmatizing STI discourse and making it so commonplace as to be unthreatening ... The Mishnah’s recognition of multiple types and subtypes of impurity ... [is] a particular corrective to the modern and contemporary West’s tendency to treat all STIs as the same terrifying affliction: one is either “clean” or “infected.”

(Epstein-Levi 2018)

On this view, what textual interpretation yields is less a set of conceptual and normative resources that allow us to extend the continuity of Jewish thinking, and more a window into distinctive habits of reasoning that might enrich and redirect contemporary ethical discourse. If one type of question central to contemporary Jewish ethics concerns the objects of textual interpretation, then, a second concerns the aims of this activity: why should ethicists be interpreting? What challenges confront ethicists committed to exploring Jewish sources, and what should ethicists seek to derive from these texts in the face of such challenges?

There is little reason to expect that these questions will receive definitive answers. This entry would suggest, however, that it is precisely such debates that will shape the future of Jewish ethics. Jewish ethics, we might say, is a terrain where Judaism’s status as a text-centered tradition is subject to interrogation, contestation, and reimagining. It is a terrain where questions about the aims, objects, and relevance of textual interpretation stand at the center of contemporary thinking.⁴

4 I thank Sarah Imhoff and Martin Kavka for their feedback on earlier drafts of this entry.

CHAPTER 96

Modes of Interpretation (Christianity)

Christina G. McRorie

Like other belief-oriented religions that are based in revelation and that make claims about the nature and proper conduct of humanity, the Christian tradition can be read as a dynamic and ongoing project of moral interpretation – of scripture, doctrines, and religious identity and authority; of bodies, beauty, and human flourishing; and ultimately, of value, justice, and the meaning of human history itself. This entry will suggest that these processes of interpretation can be productively viewed as having both an inward- and outward-facing aspect, and that these aspects are continually mutually reinforcing within Christian ethical theory and practice.

The outward-facing aspect arises from the way that Christianity, like other moral traditions, holds that its core claims provide the truest moral narration of all of human experience. The Christian tradition claims to communicate to the world the truth of humanity's situation, as revealed through Christian scriptures, the incarnational event, and in the ongoing experience and wisdom of the community of Christian believers, or church, since then. This truth centers on the claim that humanity has been created by a loving God who, despite humanity's tendency to sin, invites humanity to enjoy its ultimate destiny: loving reunion with God, made possible through the life, death, and resurrection of Jesus Christ. This is the “good news” of the gospel: the “truth” that describes our situation, and then calls us to a certain kind of ethical and spiritual action that it has itself enabled, because it has “set us free” (John 8.32). Part of the action that Christians believe they are called to is the sharing of this good news with others through evangelization. Christian ethics is shaped in no small part by this task, as its moral precepts are intended to enable believers' very lives to bear witness to God's redemptive activity in human history. At the same time, Christian ethics also aims to provide moral descriptions and analyses that correctly orient believers to “the world,” as well as to their own lives (for more on “the world” as a theological trope significantly structuring Christian thought and practice, see Pypers 2000). Christians believe, that is, that God's revealed truth – which the Christian church has the task of interpreting and sharing – can be used to read and render intelligible the “signs of the times.” (Originally found in the words of Jesus in Matthew 16, this phrase has been used especially in Catholic Christianity after the Second Vatican Council to emphasize that Christians have an obligation to attend to, and critically engage, social and historical developments.)

This entry discusses these elements of Christian moral reflection as “outward”-facing in nature, given that they involve the Christian community interpreting divine revelation for others, and using revelation to interpret the moral terrains Christians face in different times and places. In these we can see a kind of

outward momentum, as it were. At the same time, however, even in these apparently externally oriented modes, Christian ethics also has what can be called an “inward”-facing momentum, when one considers that each new moral claim made on behalf of the tradition at the same time offers a new interpretation of that tradition.

This internal reinterpretive process is, to a certain extent, inevitable. Even if a moral claim or practice merely aims to extend – and not to alter or develop – the tradition, even this reaffirmation entails some degree of reinterpretation as scripture passages, doctrines, rituals, moral sensibilities, and ethical norms are articulated and inhabited in new historical contexts. Often this process is tacit and latent; this entry will discuss some of the ways in which key elements of the Christian moral tradition itself have become reinterpreted over time almost as if by accident, as a result of wider societal changes. Just as often, though, reinterpretation of the moral tradition itself occurs as a result of conscious deliberation and contestation, as Christians disagree about the practical consequences of shared claims about God, the nature and destiny of humanity, and justice and moral obligation – a disagreement which, this entry notes, has frequently arisen in response to historical developments.

The linkages between these two aspects of Christian moral discourse are therefore many: even as Christians use their tradition-specific commitments to render meaningful the moral terrains they face, this process at the same time reaffirms and gives new shape to those very commitments. Likewise, when Christians explicitly refine and adapt their internal ethical commitments, this has consequences for how they interpret the world, and for the way that they articulate the good news they believe they are charged to share. In short, every Christian moral claim necessarily reinterprets for Christians both their own tradition and “the world” that their tradition claims to speak to, and about.

Although these two aspects of Christian ethics are thus ultimately not separable either in practice or conceptually, this entry addresses these in turn. It begins with the outward-facing nature of Christian ethics, highlighting a growing awareness of how ethical analysis of “external” moral questions and social phenomena is a mode through which the tradition itself adapts and develops. It then turns to the inward-facing nature of Christian ethics, discussing the heightened attention paid in recent history to the relationship between theology and culture, and introducing the emergence of contextual theologies and ethics. This entry concludes by noting some of the opportunities and challenges that globalization presents for the ongoing development of Christianity as a moral tradition.

Ethics as an Outward-Facing Process of Interpretation

As just mentioned, Christianity claims to offer the truest and most fundamental narrative interpretation of reality itself, including and especially of our experience of ourselves as moral agents. For those who inhabit and live by its theological and moral claims, perceptions of the world are shaped by the Christian view of humanity’s situation before God and God’s gracious action in response – i.e. the doctrines of creation, fall, and redemption. Much of what sets Christian ethics apart from Jewish and Islamic ethics stems especially from the latter of these two: the Christian claim that humanity’s willful disobedience of God’s commands has refracted back upon us by predisposing us to sin (which state the language of a “fall” describes), and that this damage to our moral agency can only be healed by God’s redeeming action in our lives. It is with a focus on the distinctive Christian doctrine of the fall that the Swiss Protestant theologian Karl Barth is alleged to have quipped, “only Christians sin.” That this worldview

is self-confirming can be seen in Reinhold Niebuhr's equally famous, if somewhat contradictory to Barth's view, remark that original sin "is the only empirically verifiable doctrine."

It is through this theological worldview that Christian moral reflection assesses its subject matters. Modes of inhabiting this narrative (or put differently, of operationalizing it) vary widely within the tradition. Some Christian moral discourses, for example, emphasize humanity's objective duty to obey divine commands, and the way that disobedience severs right relationship with God. Others focus on the agent's cultivation of virtue and progress toward holistic flourishing, and see these as integrally related to the restoration and further perfection of moral agency that sanctification brings. Likewise, while some approaches to Christian ethics focus on humanity's ability to cooperate with our own moral healing, others highlight our inability to remedy our own wickedness and moral blindness unaided, and in so doing underline the role of divine grace in the moral life. Regardless of theological emphasis, however, the Christian search for moral guidance and certainty takes place within the horizon of this broad theological narrative of humanity's fall and need for redemption.

Given that Christian scriptures contain a number of clear and even specific moral commands, it might appear that Christian ethics is primarily a technical discipline, requiring the straightforward application of pre-existing standards to individual and social behavior. As it happens, however, there is growing awareness that even apparently obvious moral judgments presuppose – and therefore also propose – contestable interpretations of reality; that is, that prescriptive "ought" claims about obligation always rest upon and entail descriptive claims about what "is" empirically true.

A lively and ongoing discussion within the subfield of natural law ethics illustrates this. Christian natural law reflection assumes that God designed human nature in accordance with certain moral precepts that are universally accessible through the use of human reason. On this view, all that is needed for ethical analysis is to discern these precepts through rational reflection (undertaken in light of Christian revelation) on what is natural for humans – on what sorts of habits and activities enable them to function according to their divine design, and therefore conduce to their flourishing. As twentieth-century conversations about sexuality have rendered particularly visible, however, what appears self-evidently "natural" varies according to one's social, cultural, and even technological context. While traditional Christian sexual ethics describes homosexual relationships as unnatural and therefore immoral, for example, an increasing number of Christians view these relationships as natural, and therefore morally on par with heterosexual relationships. Reflecting on this, Catholic ethicists Todd Salzman and Michael Lawler observe, "When we derive moral obligations from 'nature', we are actually deriving them from our human attention to and our interpretation and evaluation of 'nature'" (Salzman and Lawler 2008, 49). This inevitable reliance upon interpretive work means that ethical pronouncements not only make a bid to shape Christian actions, but also Christian perceptions of reality in the first place.

This fundamentally descriptive function of Christian ethics may have been less visible in premodern times due to the restriction of theological and moral production to a celibate and male clerical elite. At the same time, ethics during this period also primarily addressed individual behavior, and situations demonstrably requiring new moral analysis emerged fairly slowly. Consider, for example, the gradual transformation of the usury prohibition over the course of nearly a millennium. During the transition from a feudal to a largely trade-based economic order in most of Europe, new lending and insuring practices emerged. Prompted by a need to adjudicate between licit and illicit finance, scholars and ecclesial authorities inductively generated a series of categories and arguments for assessing these practices that ultimately added up to a substantial revision of the usury prohibition, in both theory and application.

The conceptual developments undergirding these arguments (such as the time value of money, and money's capacity to function as capital) also established the intellectual framework undergirding Western capitalism to this day. However, neither the scope of this change in the moral tradition itself nor the significance of its innovative interpretation of life in markets was visible for centuries, given the very slow pace of the social transformation that this process of moral reflection addressed.

In recent centuries, this interpretive aspect of Christian ethics has not only become more apparent, but also accelerated along with the pace of social, political, and technological change. Arguably, this began with the discovery of “society” in the modern era, which prompted the extension of Christian thought to the moral analysis of political, social, legal, and economic institutions and outcomes, and even of culture itself. The fields of Protestant social ethics (which encompassed the social gospel movement of the late nineteenth and early twentieth centuries) and Catholic social thought in particular consciously seek to use Christian categories of thought to describe and analyze contemporary social events, institutions, and outcomes. In more recent years, technological advancements have further opened up a number of new domains in need of moral interpretation and description, including genetic enhancement, artificial reproductive technologies, intellectual property law, the use of Big Data, space travel, nuclear weapons technologies, social media, and so forth. Whether or not academics, religious leaders, or lay adherents are aware of it, the process of describing the moral terrain in each of these new areas has also given new shape to the Christian tradition itself. The next section turns to this aspect of Christian ethics.

Ethics as an Inward-Facing Process of Interpretation

The claim here is that each ethical pronouncement necessarily also reinterprets the tradition. As much as Christianity is used to interpret culture, culture also inevitably provides the backdrop against which – and therefore the tools with which – Christianity itself is interpreted.

Historical Issues

Historically, the tradition has had little recognition or reflection on this fact, for at least two reasons. The first of these has to do with the fact that, as noted above, much of Christian history occurred in the pre-modern era, before widespread awareness of culture and social structures as contingent variables in our experience of the world in general, and as factors influencing moral reasoning in particular. Moreover, for much of its history, Christianity was largely practiced within Christendom in Europe and the Near East, which, although certainly not culturally monolithic, was not as varied in culture as is global Christianity today. With fewer comparison points, there was less need to notice the contingent role of culture.

The role of culture in prompting and structuring moral adaptation within Christianity was also less likely to be embraced given the perennial Christian anxiety about “the world,” in light of the scriptural charge to be “in the world, but not of it” (John 17; see also Romans 12). Christians have regularly interpreted this to mean that all cultures are in some way sinful and in need of redemption, and that the Christian ethic ought to transform the wider culture in which it operates, rather than the other way around. At times, this has also been developed into the claim that Christian ethics is incompatible with and therefore requires a rejection of and withdrawal from secular culture. (Protestant theologian

H. Richard Niebuhr (1951) identified this as the “Christ against culture” approach to Christian ethics; Protestant theologian and historian Ernst Troeltsch (1992) referred to this as the “Sect type” of the tradition’s social expression, and noticed that its ascetic and radical impulses were present even within the “Church type” social philosophy of medieval Catholicism, which intended to encompass and organize, rather than withdraw from, society.)

Such anxieties notwithstanding, recent theological scholarship has examined the way that the Christian tradition is inevitably the product of an ongoing negotiation with – and not just rejection of – particular other traditions and cultures. That is, there simply is no single, self-contained, or clearly demarcated “Christian culture” as such. Along these lines, Kathryn Tanner has drawn upon contemporary cultural anthropology to argue that Christian identity is fundamentally relational; as Tanner puts it, a certain amount of “borrowed materials always go to make up Christian words and deeds,” even as Christian theological claims rework this material in new and interesting ways (Tanner 1997, 148). This has always been the case, and can be seen at earlier moments in the tradition; other examples include the role of feudal imagery and values in shaping Anselm’s satisfaction theory of atonement, and the way that early Protestant substitutionary theories of atonement reflect the legal and political thought of the sixteenth century. Standing on this side of the post-Enlightenment critique of foundationalism – not to mention amidst pluralism and our constantly revolutionizing capacities for global communication – Christians are now simply more aware of this ongoing and open-ended process of engagement with non-Christian cultural and moral traditions.

Indeed, a case could be made that the process of enculturation within Christianity is not only now more visible, but also currently accelerating. One factor in this is clearly the global diffusion of Christianity initiated by European colonialism. This has been complemented by a slow diffusion of theological and ethical production. Although lay piety has always been an important factor shaping the tradition, until at least the Reformation era official theological production was restricted to a celibate and male clergy. Since then, the gradual enfranchisement of women, lay and married persons, and racial and cultural (and in some cases, sexual) minorities has brought new perspectives and experiences into conversations about what constitutes the Christian moral tradition. Furthermore, globalization has enabled an increased cross-pollination between these conversations, such that today it is not at all inconceivable that a Protestant American seminary student might be assigned to read a contemporary Asian and Catholic liberation theologian’s analysis of political economy, for example.

This entry is suggesting that the process of incorporating such new insight necessarily involves a reinterpretation of the tradition. Indeed, there is a growing awareness that this can be a fruitful, generative reinterpretation (although this sentiment is not universal, as the following section will note). A significant insight of the Roman Catholic Council of Vatican II, for example, was that revelation itself is more adequately understood as symbolic, and an invitation to encounter God, than as a static deposit of faith contained within propositional claims. This insight itself authorizes reasonable room for re-articulations of even core dogmatic affirmations, so that they continue over time to adequately communicate and express their revelational content (for more on this development, see McBrien 1981, 70).

Contextual Theology and Ethics

Academically, this insight can be seen reflected in the rise of what have been called “contextual” theologies and ethics, a genre that takes seriously the post-modern claim that there is “no view from nowhere.” This literature emphasizes that articulations of Christian claims have always been shaped by the social,

political, technological, and historical contexts out of which they have arisen. With this in mind, scholars argue that Christians ought to use a hermeneutic of suspicion to discern where this formative effect has been a distorting one, and when revision is therefore appropriate. Delores Williams's critique of atonement theory in light of black women's historical experiences of surrogacy and oppression offers one example of this kind of reinterpretation of Christian thought (Williams 1993, 161–170).

Contextual scholarship is as constructive as it is critical, and assumes that diverse contexts yield new and useful vantage points from which to engage in constructive as well as corrective theological reflection. Among others, feminist, black, liberationist, womanist, and *mujerista* theologians have contributed novel articulations of Christian beliefs and narratives that are grounded in their distinct experiences, struggles, insights, and concerns. Reasoning that women have historically been more susceptible to self-abnegation than to pride as their fundamental sin, for example, Reformed theologian Serene Jones has offered a feminist reinterpretation of the doctrines of justification and sanctification in which the experience of grace in sanctification precedes the experience of judgment in justification (Jones 2000, 49–68). Likewise, in light of the striking analogy between the crucifixion of Jesus and the brutal lynching of black Americans, black liberation theologian James H. Cone (2011) has argued that the suffering of the lynching tree provides a vantage point from which to better understand not only American religious history, but the tragic mystery and salvific meaning of the cross.

These are clearly academic examples of theological production, and as always the question of how and to what extent this reflects and influences the wider practice of Christianity as a religion is an open one. As anthropological and sociological studies of religious communities remind us, however, innovative reinterpretation of Christianity is not restricted to academia; theology and social practice exist on a continuum of theological production, and therefore also of reinterpretation of the Christian moral tradition. Significant reinterpretations are often advanced indirectly, and emerge from local liturgical and spiritual practices and art.

The recent growth of the prosperity gospel movement and prosperity theology in developing nations offers an example of this. This movement is centered upon a reinterpretation of the Christian faith in which Christ's atonement guarantees believers physical and material well-being. In most articulations of this theology, these divinely given blessings are accessed through the individual's godly behavior and faith, which is often demonstrated by making financial donations to a church (for more on this, see Bowler 2013). Scholars have pointed out that this movement's especial popularity among the poor, immigrants, and citizens of developing and impoverished countries is due in part to the sense of agency that its emphasis upon miracles and the causal efficacy of individual belief allows (Jenkins 2006, 90–97; also Coleman 2000). That is, the appeal of this controversial reinterpretation of Christianity as a moral tradition may lie in not only in its reframing of the faith itself, but also in its altered depiction of global capitalism as a moral terrain.

Challenges and Opportunities Brought by Globalization

Globalization presents both opportunities and challenges to the process of development in Christianity as a moral tradition. Communication technology and media now enable Christians in diverse contexts to be in instant dialogue, and as noted a much wider range of voices are now heard in these dialogues than has historically been the case. Conversations about how to interpret, apply, and develop Christian ethics are clearly the richer for this.

At the same time, however, the connected and networked nature of global society today also makes disagreement over correct interpretations of Christian ethics more visible, and lends these disagreements a new speed and intensity. Controversy over prosperity theology illustrates this, as a number of critics allege that prosperity gospel preachers have not only strayed outside the boundaries of orthodox theological and ethical teaching, but are also taking advantage of their congregations.

Especially contentious are debates over issues related to gender and sexuality. In the past centuries, Western societies have experienced a dramatic shift in views on gender equality and sexuality, and many North American and European Christians now support the ordination of women and moral affirmation of homosexual marriages. This has led to open and ongoing institutional debates on these issues within many Christian communities, such as the Anglican Communion, and actual schism of ecclesial polities in some cases (for more on the particular case of the Anglican Communion, see Hassett 2007). In other communities such as the Roman Catholic Church and the Eastern Orthodox Church, conversation on contested issues is less visible at an institutional level, but ongoing nonetheless within theological scholarship and the laity. It remains to be seen how these diverse communities will mediate these divergent and incompatible interpretations of the tradition.

Of course, not all reinterpretations of Christianity are advanced or welcomed intentionally. A certain amount of development in Christian moral thought occurs in the background, as it were, and only becomes visible after the passage of much time. These are transformations in the tradition prompted by wider cultural and social transformations. The gradual development of Christian thinking and practice with regard to the ethics of lending at interest, mentioned earlier in this entry, offers one example of this.

Another can be found in the remarkable expansion of moral responsibility in modernity that has been the result of our increased awareness of and power to influence what happens to distant strangers. As social scientist Alan Wolfe has put it, “The sheer complexity of modern forms of social organization creates an ever-widening circle of newer obligations beyond those of family and locality,” such that now, the scope of moral obligation “seems to be without limits” (Wolfe 1991, 3; see also Ignatieff 1985). We now regularly conceive of ourselves as having obligations to what Seyla Benhabib calls “the generalized other,” which includes not only perfect strangers living miles away but perhaps also those not yet living (Benhabib 1988). As one result of this the scope of the tragic (sometimes called natural evil) seems to have shrunk, and domains in which unalleviated suffering is viewed as moral evil have expanded. This has been a gradual and indirect transformation that has indelibly marked modern interpretation of what it means for Christians to follow Jesus, as individuals, as families and communities, and as citizens of secular and pluralistic polities. As noted earlier, one response to this systemic shift can be seen in the fields of Catholic social teaching and Protestant social ethics. These discourses extend Christianity’s interpretive capacities vis-à-vis the issues of modern life; through them Christians develop normative descriptions and analyses of issues and phenomena that exceed the individual scope of earlier moral teachings. These articulated expansions of Christian thought thus reflect and respond to the more fundamental reinterpretation of moral sensibilities that modern social life has prompted.

Christians today are undoubtedly living through a number of similar moral transformations prompted by globalization. One of these is surely the way that living in increasingly pluralist societies shaped by immigration is forcing Christians to think more carefully about the relationship between their religious and cultural and national identities, and about the proper role of Christian moral claims in public discourse. Another may be the way that the experience of living within capitalist institutions trains indi-

viduals to conceive of themselves fundamentally as consumers, and of their freedom and agency as exercised primarily through choice. It remains an open question as to how Christian ethical thought and practice will be reshaped by and in turn critically address these and other ongoing epochal shifts. Whatever path its evolution takes, however, it will certainly be the result of an continued and dynamic process of interpretation and reinterpretation, of both the external signs of the times, and of the core of the moral tradition itself.

CHAPTER 97

Ethics in Islam

Paul L. Heck

To speak of ethics (*akhlāq*) in Islam is to speak of dispositions in the soul as the byproduct of monotheistic faith, dispositions that restrain or direct one's behavior. With a proper reverence for God, one will not cheat or lie. One will show forbearance rather than seek vengeance. One will fulfill duties to others faithfully and not break promises. A saying of the Prophet Muhammad links faith to ethics: "The believer with the most perfect faith is the one with the best ethics."

The point is emphasized by Fazlur Rahman (1919–1988) in *Major Themes of the Qur'an*. The monotheistic message of the one creator who knows all aspects of the human condition, both outer actions and inner dispositions, inspires a pious reverence (*taqwā*) that is not so much about knowing the right as it is about adhering to it in the face of temptations to prefer one's own whim (*hawā*). In all this, the concept of repentance (*tawba*) is paramount. One does not do repentance so much as one is drawn to it by God's mercy (*rahma*). Repentance is a turning to God as much as it is a turning from sin. A saying of the Prophet Muhammad depicts him seeking God's forgiveness and repenting seventy times a day despite being a sinless figure in Islam. In other words, he is not repenting from sin so much as he's growing in knowledge of God's mercy for him and his community. Ethics in Islam is thus essentially tied to the question of the inner life. Moral obligation as determined by the law is one thing while ethics is another.

Knowledge of moral obligation is the task of jurists and moral theologians, who seek to determine the divine will for humans in their varied affairs in society, from marriage to commerce. These scholars engage a range of sources that make up the sources of the Muslim way of life (*sharī'a*), bringing the human mind to bear on the words of revelation. Of course, there is considerable diversity in what is held to be morally incumbent upon a believer in a particular situation, making *sharī'a* more a conversation of legal scholars than a code, which marks it with a certain flexibility, not so much in terms of its penal aspects as in the range of opinions and rulings that *sharī'a* scholars might issue on a single moral question. What is more, their positions may or may not align with state law (*qānūn*), which itself has moral weight in the scale of *sharī'a*, particularly in relation to the aims of the Muslim way of life, since the purpose of state law in principle is to preserve stability in society without which Muslims would not be able to pursue their religious obligations. Ethics, in contrast, is a turning of the soul to God.

Without this fundamental orientation (the act of faith), one's piety does not make sense. Some therefore say that faith (*īmān*) precedes scripture (*qur'an*). That is, scripture has no hold on you unless you have already turned to God's mercy. In this view, the moral life is contingent upon recognizing and entrusting oneself to the one creator of all. This is not to suggest that Islam denies the possibility of a

moral life apart from faith. Human nature is not hopelessly fallen in Islam. However, Islam would say that the ethical life is fullest when enhanced by faith in God, because without faith, your motive for doing good will invariably be mixed with a worldly logic.

Ethics in Islam is thus about character and character traits as much as it is about specific morally incumbent actions. In other words, ethics flows from one's inner constitution. One's ethics – good or bad – are acquired from one's education and the company one keeps. It is possible to change traits in one's character once formed, but ethics in Islam are primarily about a state of the soul and a way of acting that flows naturally from one's character. For example, one should not have to swear oaths in order to act righteously. One does so because one is habituated to living out of devotion to God (*al-ikhlaṣ li-llāh*). There has been considerable discussion among Muslim scholars over the years about the nature and scope of ethics (*akhlāq*) in relation to both Islam's doctrines (*ʿaqāʾid*) and corpus of legal rulings (*aḥkām al-fiqh*). Following the discussions within Islam over the centuries, ethics here is treated as character traits that may be either inborn or acquired, that are embodied in one's behavior in society, and that are most fully realized as a result of sincere worship of God. Good ethics includes justice, kindness, patience, generosity, selflessness, humility, modesty, gratitude, continence, loyalty, and honesty. Bad ethics include vengefulness, selfishness, gossip, slander, lying, and the use of profanities. Ideally, one should live out of love for others, not fear of reprisal, being ready to forgive them to maintain love as the norm in response to knowledge of God's love and forgiveness, as suggested in the following verse from the Qur'an (3:31 "The Family of 'Imran"): "Say [the Angel Gabriel addressing Muhammad]: If you should love God, follow me [Muhammad], and God will love you (or make you beloved) and forgive you yours sins, for God is forgiving and merciful."

Such ethical characteristics are not exclusive to Muslims but are universal values. The Qur'an itself suggests that the right thing to do is known even apart from revealed decree. It is therefore more accurate to speak of the uniqueness of ethics in Islam not in terms of specific character traits but in terms of the relation such traits have to worship in Islam and the hope of divine favor. A saying of the prophet links ethics to worship: "With good ethics, the believer realizes the ranks of those who pray at night and fast during the day." In other words, one's character is part of the calculation of divine favor no less than the performance of ritual actions in worship. Ethics in Islam is thus a state of the soul before God and not only a matter of words and deeds. In that sense, one's ethics are to be strengthened through worship. The closer the believer draws to God, the more committed he or she becomes to preserving good relations with family, fellow believers, and with all of creation. The Qur'an does speak of righteousness (*birr*) in terms of obedience to God but also in terms of honesty, patience, and commitment in one's relations with others. Thus, as a result of the greater awareness of God that comes through ritual actions, believers are ethically fortified to endure worldly trials without loss of virtue, that is, without succumbing to the temptation to act with duplicity. This is because they have been sensitized to the passing nature of this world and the rewards from God for living according to ethical convictions even when one's social environment encourages corruption. This sensitization begins through the pious exhortations (*mawā'iz*) of parents and preachers who discipline youth with a desire for paradise and a fear of hellfire (*targhib wa-tarhib*), but eventually such discipline is to mature whereby one examines one's own life for forces that strengthen or weaken one's personal ethics. The goal is conviction that a life of virtue before God is its own reward. That is, it results in abiding as opposed to passing pleasure (*ladhdha*).

Goodness is thus a function of devotion to God, and so Muslims connect their ethics to the ethics of God (*akhlāq allāh*), which are represented by the ninety-nine names of God as revealed in scripture: generous,

forgiving, kindly, merciful, just, good, forbearing, grateful, wise, affectionate, etc. By regularly reciting these names and contemplating their meanings, Muslims are able to identify their own lives with God's traits, thereby putting God's ways over their own whims. Such a practice cultivates a spirit of selflessness, sacrifice, and the willingness to forego the right to retribution, as seen in a prophetic saying that calls believers "to pardon those who wrong you, to give to those who deny you, and to repair relations with those who break off relations with you." The ability to respond to transgressions against oneself with such charity reflects a high level of ethics that is essential to the moral coherency of any society. Without such forbearance, society would devolve into endless litigiousness. In Islam, it is the quality of a soul that – because it worships God – has been imbued with a vision greater than that of self-regard, that is, a certain magnanimity that permits one to suffer fools gladly and respond to harms committed against oneself with leniency. The fact that the process begins from God – worship of God and recitation of God's names and other pious formulae – means that God is behind the ethical process. To put it in the language of Islam, the fact that you are faithful to God in acts of worship is a sign that God is granting you success (*tawfiq*), whereas failure to perform acts of worship is a sign that God is forsaking you (*khidhlān*). And the success that God grants you to persevere in your religious duties provides you with the awareness of God that allows you, in turn, to act with the selfless manners embodied in the above prophetic saying and to live in greater harmony with your society and surroundings. In contrast, when God forsakes you, as evidenced in a failure to persevere in worship, the result is ethical failure: whatever worldly success you might enjoy, you are deprived of the ability to act with a selflessness made possible by worship of God, leaving you in greater disharmony with your surroundings. One can thus speak of double success granted by God: success in worship and the ethical success it nurtures.

This is not to suggest that good character or good behavior is the automatic product of ritual actions such as praying and fasting. Such actions do make the soul sensitive to life for God and God's ways rather than one's own. However, one might undertake acts of worship without a properly ordered soul. In short, worship alone is not sufficient for the ethical life in Islam. For this reason, no less than worship, good character in Islam depends on a formation in a heritage of wisdom embodied in aphorisms of both Muslim and non-Muslim provenance. From very early in the history of Islam, such maxims were collected in literary anthologies for the education of the ruling class, but they have also enjoyed wide popularity over the ages to this day, serving as points of contemplation that allow for growth in wisdom in relation to both character and behavior (that is, the inner and the outer life). Such sayings are meant to teach and inspire a particular etiquette, known in Islam as manners of behavior (*adab*, pl. *ādāb*), for every life situation. Such manners vary depending on one's rank in society but generally serve to encourage high-mindedness in one's dealings with others. There are very precise norms detailing how one should eat, travel, address others, deal with family members and neighbors. The point of these norms has been to cultivate "other-awareness." Prominent among such wisdom sayings (*ḥikam*) are many hadiths (prophetic sayings) that call to patience amidst tribulation. One is to remain confident in God's deliverance, whatever the circumstances, rather than compromise one's character. And one will be rewarded by God for such fortitude, because to await God's deliverance is to think well of God, which a prophetic saying describes as a kind of worship.

It is therefore not inaccurate to think of ethics in Islam in terms of what the Christian West has long meant by conscience. Despite debate over its meaning, conscience captures the essence of the ethical life in Islam. On the one hand, conscience is less about a set of fixed rulings and more about awareness of and commitment to ethical principles that shape moral decisions, which may vary depending on a host

of factors. In one situation, it might be better to hold one's tongue, while in another, to speak out. On the other hand, conscience is about morality by conviction, not coercion. Believers know that God observes their character and their behavior, committing them to goodness in the heart no less than in words and deeds. Even apart from the watchful eyes of society and the state, believers know they are accountable to God. The Qur'an makes it clear that one's interior state is known to God no less than one's actions, giving believers the sense that they always stand before God – as if living Judgement Day in real time.

No single word in the heritage of Islam translates for conscience as the term features in the Christian West, but the concept is embodied in a complex of notions, including the idea in the Qur'an of "the self-blaming soul" (Q 74:2). One chides oneself for moral failings. The motive could be fear of divine punishment for one's sins on Judgment Day, but it is often a deeper conviction of right and wrong that results from awareness of God as object of devotion, which, in turn, evokes a sense of freedom from a self-centered need to possess things of this world at the cost of one's character. Again, ethics in Islam is not so much about specific norms as it is a deepening commitment to the moral life that flows from worshipful awareness of God.

This is not to overlook the role of the law – *sharī'a* – when it comes to moral decision-making in Islam. Obedience to the rulings of God's law is undeniably one element within the ethical formation (*ta'dīb*) of the soul, but it needs emphasizing that the readiness to obey the law of God – with conviction and not by coercion – is contingent upon the cultivation of a sense of devotion to God. After all, when it comes to God's law, there is no distinction to be made between what is legal and what is ethical. That is, believers might dissent from statutory law, remaining or even growing in God's good graces by dissenting from manmade law that is seen as deviating from *sharī'a*. But dissent from God's rulings, once determined with certainty, is a different matter, not only jeopardizing one's standing before God but also putting the believer at odds with his or her own conscience. Conversely, believers might seek refuge in *sharī'a* when rulers violate *sharī'a*-sanctioned rights, such as rights to life and property, which cannot be taken without a *sharī'a*-approved cause. However, there is no such recourse when it comes to liberties beyond what *sharī'a* sanctions, including adultery, theft, consumption of intoxicants, and defamation of another's reputation. A contested area of discussion today is the relation of Islam's moral teachings to modern conceptions of human rights, which are often seen as secular in origin and oriented to the moral autonomy of the individual rather than society's common good. A plethora of Muslim scholars, men and women, debate the issue; the conclusions one draws depend to a large extent on one's assessment of individual moral judgment either as arbiter of right and wrong or as personal whim that needs to be restrained by divinely revealed norms. The moral reasoning of Islam has traditionally given more weight to *sharī'a*-informed communal norms than to individual moral choices. In other words, moral truths guide communities and are thus to be discovered, not determined, by individuals, who flourish only within community. Debates on human rights in Islam take shape according to the state under which one lives and the success of lobbying efforts by Muslims and non-Muslims in favor of one cause or another. A host of controversial issues are at stake from voting rights to female genital mutilation; both issues have received *sharī'a* approval and *sharī'a* disapproval. The state decides permissibility, weighing compliance with international conventions alongside national religious sentiment.

Of course, *sharī'a* rulings come with levels of ambiguity. Muslims have long disagreed on the legal status of a host of issues, even when all appeal to *sharī'a* reasoning, which is complex in its processes and variegated in its sources. This is not the place to discuss the history of jurisprudence in Islam, but it is worth noting that sources of *sharī'a* are manifold and not limited to scripture, resulting in a kind of legal

reasoning that takes into account context as well as both benefit and harm to individuals and communities. For example, a Muslim in good conscience will not eat pork or drink alcohol – not because of a health benefit to be gained by abstaining from such things but because the legal consensus holds that consuming such things is a transgression of God's law, since scripture, it is affirmed, is clear on this particular matter. However, in addition to God's law, especially when clearly revealed in scripture, there is also the question of the wisdom behind the ruling, often understood as a calculation of benefit. Thus, *sharī'a* license is generally given to the consumption of medicine that contains alcohol or pork substance and also to the use of perfume that contains a small percentage of alcohol as preservative. However, others, also using *sharī'a* reasoning, might calculate benefit solely in otherworldly as opposed to worldly terms. Thus, in this case, they might not permit consumption of such medicine or perfume, despite worldly benefit, since it puts one's otherworldly interest in jeopardy, namely, deliverance from hellfire. Better to forego worldly benefit and preserve one's soul through a simple obedience to God's clear decrees without a casuistic run around them.

Similarly, a believer who follows this type of religious reasoning might conclude that dying as a martyr is preferable to living under infidel rule even if there are worldly benefits to be gained from doing so – such as material prosperity in exchange for peace with infidel rule. However, well-known *sharī'a* principles controlling the process of discovering God's ruling on a matter generally give weight to worldly benefit. Such principles, including the idea that religion cannot cause distress (*ḥaraj*) or harm (*ḍarar*) to believers, were at play in recent highly controversial decisions to overturn long-standing *sharī'a* rulings perceived to be based on gender bias: property inheritance and interreligious marriage in Tunisia and divorce practice in India. In these cases, it was held that traditional Muslim positions – where females receive a smaller portion of inheritance than males, are not permitted to marry non-Muslims as males are, and are subject to a potentially whimsical divorce process initiated by husbands apart from state oversight – actually offend the divine will by pretending it privileges one gender over another. However, one might ask whether such state decisions enjoy popular Muslim support. Another example along these lines is slavery. It is in the *sharī'a* books as permissible, but does it represent *sharī'a* intents and aims (*maqāṣid*)? ISIS terrorists have used the existence of slavery in the *sharī'a* heritage to justify the enslavement of captives, but it is arguable that the Qur'an, by encouraging the manumission of slaves, effectively sought to do away with the institution.

Still, in other areas, the global context plays a role. For example, developments in modern science have raised questions about the permissibility of organ transplant, which depends on a non-traditional determination of death, whereby the patient is declared braindead while bodily functions are maintained for the purpose of harvesting organs. This flies in the face of the long-standing assumption that God determines death, not the medical establishment, and yet the benefit to be gained from organ transplant has weight. At the same time, even if a *sharī'a* authorities permits organ transplant, the sentiments of the faithful, shaped by traditional attitudes of death, may keep them from becoming organ donors. Such controversy is also at play in the case of modern banking practices. Many Muslims have no qualms with interest-bearing accounts. In their view, the usury condemned in the Qur'an is limited to compound interest that accrues on the interest of a loan in default, which is different from the interest of a regular bank account. Nevertheless, recent decades have seen the rise of faith-based economics in Islam where banking operates by a share in the profits from financial investments rather than a predetermined interest rate. The popularity of *sharī'a*-compliant banking today likely comes from the desire of the believers to conform to God's law as they see it, but in some circles it might be a way to distinguish the

ethics of Islam from non-Islam. The rise of Islamist thinking over the course of the twentieth century took inspiration in part from such figures as the founder of the Muslim Brotherhood, Hassan al-Banna (1906–1949), who saw Islam's revelation as a force to separate and protect the Abode of Islam from the West. This risks stripping *sharī'a* of its global relevance, making God's law not a universally applicable standard but rather the mark of a particular culture in a particular territory over against the rest of humanity. One finds such sentiment, for example, in the view of Abul Ala Maududi (1903–1979) on contraception. Despite a tradition that permits contraception, even if not encouraging it, he argued it was against God's law, seeing the spread of contraception as a ploy by the West to limit the numbers of Muslims. Other Muslims, in contrast, seek to align the ethics of Islam with modern sentiments, for example, around domestic violence, rejecting the plain meaning of Q 4:34 and its injunction to husbands to beat recalcitrant wives as but a byproduct of premodern patriarchal myth-making.

While *sharī'a* might give substance to ethics in Islam, the latter cannot be reduced to a set of rulings deemed to be God's law that one obeys or disobeys. There have been dizzying discussions over the centuries involving the specific rulings of God on a range of issues, as noted above, and such rulings have shaped the way Muslims behave in society. However, the science of ethics in Islam has long been identified with the spiritual journey (*sulūk*) that stands at the heart of Sufism. There, the goal is the formation of the soul such that it is always oriented to God – a process that works hand-in-hand with *sharī'a* learning but is not reducible to it. After all, obedience to *sharī'a* alone is no guarantee of selfless character, which is the goal of ethics in Islam. To be sure, the relation of *sharī'a* to the science of ethics varies from one group of Muslims to another. For some, ethics is circumscribed by *sharī'a* rulings. In other words, by obediently following the precedents of the Prophet Muhammad in all things, one is ethically satisfied, that is, confident one will enjoy heavenly reward. However, the possibility that one might obey the law hypocritically inspired many scholars, notably al-Ghāzālī (d. 1111), to ground ethics in love for God as the precondition of obedience to God, not unlike the idea at Psalm 1:2 of King David taking delight in God's law: we obey a divine ruling freely when we do so out of love for divine knowledge. In contrast, we might obey it only grudgingly or even as a result of social or political coercion, making its ethical value suspect. Moreover, to limit Islam's ethics to a simple obedience to *sharī'a* rulings raises questions about the competence of Islam to guide believers in societies where *sharī'a* is not followed or enforced. What gets you to live as a good Muslim when no one else does? Can you be a good Muslim if there are no signs of public commitment to Islam? Islam's ethics, bespeaking universal values as noted above, offers general character standards by which to live in ethical harmony in a society where Islam is not the norm.

A question that has received hardly any attention in the scholarly literature is the link of ethics in Islam to emotions. Should fulfillment of one's ethical convictions be a cause of joy, failure to live by them be a cause of sorrow? And can one attribute a role to emotions in the formation of one's character? Does a response of joy at the sight of goodness, of sorrow at the sight of evil, contribute to one's growth in the purposes of ethics in Islam? The answer depends in part on how emotions are defined: as disturbances in the soul, in which case they would not benefit and may even harm character formation; or as movements in the soul, in which case they could contribute to the consolidation of good habits in the soul, such as compassion to those in need and incomprehension at the maltreatment of weaker members of society. All this remains to be studied: Does emotional experience work in tandem or at cross purposes with the goals of ethics in Islam? Does a sense of disgust at poor conduct in society strengthen one's sense of ethical conviction or weaken it? Does a feeling of joy make one grateful, a feeling of sorrow ungrateful – gratitude being a marker of belief in Islam, ingratitude a marker of unbelief?

Here, we can only briefly point to possibilities in this understudied area. It is well known that emotional expression can be prompted by social expectation. One might cry from sorrow when one is expected to do so, for example, at a funeral. But one might also cry as a result of a spiritual movement in the soul, underscoring a link between emotional expression and ethics. To illustrate: weeping is not univocal. In Islam, preachers are known on occasion to cry on the pulpit during the Friday Prayer to express contrition for the community's ethical failings. It signals fear of Judgment Day but also a call to repentance, crying indicating sincerity. The tears of the preacher, in turn, prompt the gathered faithful to cry out of remorse for their sins. Here, crying follows social expectation. One should cry in public as a way to demonstrate sincerity of repentance for one's failings. But there are other types of weeping. One might shed crocodile tears to trick people into giving them money. One might cry over something lost. In both cases, this type of emotional expression indicates a soul that is ethically impoverished. One should not be ready to deceive, regardless of gain, and one should not be so attached to worldly goods as to become disturbed at their loss. In contrast, one might cry out of reverent awe of the greatness of God and God's mercy and guidance. It is difficult to link this kind of weeping wholly to social expectation. Well-known preachers, such as Ṣāliḥ al-Maghāmsī (b. 1963) of Saudi Arabia, are known to shed tears amidst a religious lesson as if to signal a sense of being overwhelmed by a sense of God's greatness, but it would not be right to classify all instances of this kind of weeping in terms of social expectation. The fact that one might shed tears in private moments out of a sense of God's greatness suggests that they reflect a genuine spiritual movement in the soul.

Notwithstanding ambiguities, it is arguable that emotional expression, such as weeping out of a sense of reverent awe (*khashīya*) of God's greatness, actually has agency when it comes to growth in the ethical life. It is not the tears of the trickster or those of one anxious over worldly affairs but the tears of reverent awe that work to soften the heart and make one more merciful and compassionate toward others. The emotional movement of tears, then, accompanied by reverence of God, works to elevate one's character. Emotional expression accompanies the process of consolidating the kind of ethics to which the Qur'an calls the Prophet Muhammad, namely, relations with his community that are based not on a hardened heart but a heart softened by God's mercy (Q 4:159). One sees this in two hadiths. In the first one, 'Abd Allāh Ibn al-Shikhkhīr reports that he came upon the prophet while in prayer, and from his innards came crying like the whistling of a pot of boiling water. This hadith connects emotional expression to ritual action. While it does not specify the exact cause of the prophet's tears, the context – the prophet at prayer – valorizes this kind of emotional expression as ethically productive movement rather than upsetting disturbance in the soul. In the second hadith, Usāma Ibn Zayd reports that the prophet wept at the death of a grandchild. When the prophet is asked by Sa'd Ibn 'Ubāda how it could be that the Messenger of God might display grief, since, one assumes from the question, grief could be taken as a sign of weakness of faith, Usāma responds that such weeping as displayed by the prophet is a mercy that God plants in the hearts of those who worship God. In other words, the prophet's tears are not the tears of the mourner, inconsolable over the loss of a loved one, but rather the tears of one whose heart has been softened in his or her dealings with others as a result of one's awareness of divine mercy. This, it might be argued, is why prophets are known to have cried for their communities – not from remorse over sins but from a gentle-heartedness that is the fruit of their deep knowledge of divine mercy. Emotions, then, are not just a physical reaction that meets society's expectations. Rather, they express a story in the heart that is basic to the human experience but also productive of ethical dispositions as taught by Islam.

It is not wrong to question religious communities about divergence in ethical standards when it comes to outsiders as opposed to insiders. One verse from the Qur'an (Q 5:45) calls believers to be gentle with one another but stern with unbelievers. Notwithstanding the diverse ways in which such a verse has been understood, there have been Muslims who see it as a mandate for two sets of ethical standards, one with fellow believers and another with non-Muslims or even with Muslims from a different confessional heritage. The way in which doctrinal commitment can limit one's ethics with those seen as doctrinally deficient cannot be overlooked. Some voices within the global movement known as Salafism contend that monotheistic worship is the primary criterion of ethics. Those deemed polytheist – including fellow Muslims accused of undue exaltation of their spiritual leaders – are to be spurned and even attacked. The extent to which such thinking is actually practiced is another question, but one must recognize that in Islam, as in other traditions, even if faith can and does work to strengthen universal ethical commitments, it can also result in a dubious bifurcation of duties to fellow humans. This tension in the ethics of Islam is something for Muslims to resolve in light of global developments and Islam's own teachings. For example, when it comes to the ethics of war, states that constitute what has been known historically as the Abode of Islam, are obliged to treat prisoners of war according to the Geneva Conventions. In contrast, militant groups look to premodern precedent to justify the beheading of enemy combatants and even of non-combatants. As a result, the ethics of war in Islam can appear quite ambiguous. At times, jihad thinking aligns with principles of just war theory and the goal of reducing violence, bloodshed, and property damage. At others, the goal seems to be a quasi-imperialist domination of Islam over others.

Mercy is arguably the ethical trait of Islam par excellence. The establishment of justice, where everyone gets their due, is the task of rulers, but even with just rule, no society can flourish without some witness to God's mercy. On the one hand, society requires a form of governance to establish order, including the adjudication of conflict and the suppression of crime and chaos. On the other hand, in addition to justice, there is also need for a show of God's mercy to soften human hearts, which easily become hardened by life's trials and tribulations as well as by failures of justice in the world. One easily becomes bitter and resentful with harmful impact on one's relations with others. What is it that prompts believers to act with mercy and to forgive those who have wronged them or to seek to reconcile with groups opposing their own? There is a host of factors in the mix, but one cannot overlook the influence of a kind of saintly character in Islam, which in principle works for the reconciliation of hearts in society. Justice is to be served – including punishment when crime is committed – so that order be maintained, but without the power of divine mercy and a resulting impulse to reconcile, hearts will remain opposed and groups will sooner or later clash again. The harmony of society therefore depends on its leaders modeling gestures of mercy. To put the issue in the language of Islam, the law might call people to extend charity to those in need, but models of mercy are needed to inspire people to do so with a willing heart. One might hope for political leaders to model gestures of mercy, but politics is oriented to the display of power more so than it is to the show of merciful gestures. Thus, traditionally, the orchestration of mercy in society has been the role of saintly figures, whose very existence reminds people of God, inspiring them to forget suspicions and enmities and place their trust in God and act with kindness rather than envy and resentment. One classical example of such a saintly figure is Abū Saʿīd Ibn Abī l-Khayr (d. 1049), spiritual virtuoso of eleventh-century Persia, whose intense focus on divine rather than earthly sovereignty inspired kindness and merciful gestures among his followers – in contrast to religious leaders who emphasized the strict letter of the law and sultans who ruled for the sake of their own glory and dominion.

There have always been pious preachers in Islam who call rulers to use power for the common good rather than their own interests and who admonish them when they fail to do so, and there have also always been saintly figures who, as models of divine mercy, inspire a richer ethics in society. The evidence suggests that it is as a result of their own direct experience of God's mercy that they are able to bring about mercy in society, doing so by calling their followers together in what could be called beloved communities in service of the poor as a counter model to the gated communities of the world that lack such compassion for others. In contemporary society, the role of modeling divine mercy is still played by saintly figures but no less by individuals and organizations that exist to serve the needy in society by charity (*ihsān*).

Of course, while the academic scholar might distinguish the ethical from the legal heritage of Islam, Muslims do not live by such a dichotomy. The two go together, one informing the other. This is clear from the revealed texts – qur'anic scripture and prophetic sayings – where questions of character and questions of law are never bifurcated. To sum up the overall tradition: there is preference for peace, aversion to war, but readiness to use force against wrongdoers, rebels, and sowers of corruption. Those whose soul is rightly oriented to God amidst worldly conflict are deemed martyrs. There is approval of truthfulness, modesty, and reconciliation with adversaries; disapproval of lying, arrogance, hypocrisy, and strife in society (traditionally implying intra-Muslim conflict but today sometimes extended to include enticement to immoral Western ways). The believer is to remain true to the covenant made with God and be mindful of the heavenly merits earned from acting in accordance with divine commands and prohibitions.

Islam's ethical vision is marked by two overarching concepts. The first, *ḥaqq*, is indicant of divine truth, the other, *rahma*, of divine mercy. The first term also implies the nature of a person, thing, or situation, that is, what is owed to it. Everything has its *ḥaqq* (its due or right). For example, the destitute have a *ḥaqq* in the wealth of the community. Judges are to rule in accordance to *ḥaqq*. It is the *ḥaqq* of believers to be supported by God. The term is contrasted to falsehood (*bāṭil*) and personal whim (*hawā*), suggesting that humans, fickle creatures, are averse to live according to divine truth. Human life can only be taken by *ḥaqq*, that is, on the basis of what is due to it for certain transgressions, three types of which are generally mentioned. The first is wrongly killing a fellow Muslim. Taking a non-Muslim life is a punishable offense that traditionally does not carry the death penalty. In either case, the victim's family has the option of receiving a blood payment in lieu of retribution, effectively forgiving the killer. The second is adultery. (It should be noted that conviction requires the highly improbable condition of four witnesses to the act of adultery, and a woman forced to commit sexually forbidden acts is in principle not subject to penalty.) The third is active effort to undermine Islam in public life, traditionally associated with cases of apostasy that result in harm to society. Other actions without *ḥaqq* include extremism in religion and the arrogant use of power to set oneself up as lord over fellow creatures. God as creator and revealer defines what is *ḥaqq*, including human destiny on Judgment Day. The concept of *ḥaqq* connects to that of justice in the sense of being in right balance with God and society; *ḥaqq* thus features in discussions of commerce, including contracts and trusts. In sum, God intends for humanity to be a balanced community, witnessing to righteousness and to goodness in a system of public morality grounded in the divine will.

Religious duties, such as prayer and fasting, are seen as a *ḥaqq* owed to God, but not to the point of wearing oneself down. The body no less than the soul has its *ḥaqq*, as do family members and friends. Public space, too, is not to be offended; one should lower one's gaze at unseemly conduct, remove annoyances

(such as a thorn in the road), return greetings, and uphold the moral life. Believers are to act kindly to neighbors and hospitably to guests and also to speak a good word or remain silent. (Idle talk and unnecessary involvement in others' affairs are not commended.) Taking land unjustly, breaking promises, and betraying trust are all offensive to *ḥaqq*, as is slander and backbiting, and even losing one's temper at times of disagreement.

Believers are to avoid enmity among themselves, being bound into brotherhood as fellow slaves of God. They are not to accuse one another of infidelity or insult one another's honor and sense of dignity. In sum, Islam is meant to be guarantor of public morality for Muslims and non-Muslims alike, but there is arguably little in the revealed texts on the specifics of rule. There is exhortation to obey rulers so long as they do not transgress *ḥaqq*. Ruling without transgressing *ḥaqq* has been variously interpreted as just rule, rule that does not offend religious sentiment, or at a minimum rule that does not prevent performance of religious duties (e.g. prayer and fasting).

The second of the above two concepts, *rahma*, mercy, expands the idea of justice as embodied in *ḥaqq*. Here, one is to be compassionate, charitable, forgiving, lenient, and forbearing. The goal is to maintain good relations, even if doing so requires foregoing one's *ḥaqq* (which is not actually given up since mercy is rewarded in the next life). In general, *rahma* is not as obvious as justice is, requiring a higher level of faith. Those who live by *rahma* are bound together in community more tightly than those who live only by justice. The quality of *rahma* belongs to God above all, and the Prophet Muhammad was sent as a *rahma* for the entire universe. The concept suggests the tight bond one feels to one's clan, that is, one's relation by the womb, *rahm*, which has the same root as mercy. However, in Islam, loyalty to the prophet takes precedence over all other relations, which will be of no use on Judgment Day. In other words, Islam seeks to extend the concept of clan-based solidarity to all those who submit to God as the true source of mercy, which is now the result of faith and not of blood kinship. This redefinition of mercy is rooted in the idea that all humans spring from a single soul. Indeed, even animals are to be treated compassionately. There are debates on the scope of divine mercy. It extends to all by virtue of being created by God, but a life of mercy-based solidarity is fully expressed only by believers who adhere to God's way in community. (Such solidarity could extend indirectly to all, even to unbelievers, who would witness it in the way believers embody it.) Mercy is shown by God to all who show it to others. No mercy will be shown on Judgment Day to those who, for example, had water but did not share it with the thirsty, to those who pledged allegiance to a ruler only for worldly gain, and to those who invoke God's name for ulterior motives. Indeed, merchants who lie in trade lose the blessing it is supposed to represent.

It is worth noting that the womb-based or kinship-based meaning of *rahma* is not lost in Islam. There is strong condemnation of those who break off good relations with others, especially with kin. One's mother is most worthy of reverence, even if a polytheist. Breaking off good relations with kin, seen as a cause of corruption in society, bars you from entering paradise. God preserves good relations with those who preserve good relations with others – and breaks off with those who break off with others. Charity is highly praised, and hellfire can be avoided by giving away in charity as little as a date or, if one does not possess even a date, by speaking a good word. One is encouraged to atone for bad deeds with good ones performed for God. Controlling one's anger wins entrance to paradise, and generosity is highly commended, especially to orphans, widows, neighbors, and the poor. Such generosity is a kind of jihad.

It should now be clear that ethics in Islam is not a simple function of obedience to *sharī'a*, however important that may be. The conceptualization of ethics as discussed in this entry is as fundamental to Islam's way of life as is conformity to *sharī'a*. It is in this sense that Muslims speak of nobility of character

(*makārim al-akhlāq*) as that which Muhammad was sent to fulfill. Such character allows one to perform *sharī'a* obligations non-hypocritically and is also the fruit of piety as the faith-oriented life. The concept of nobility of character is generally associated with a level of piety beyond both doctrine and law, where one is constantly aware of being in the presence of God. Thus, while believers recognize that the idea of good behavior predates Islam, they also look to the model of the prophet for the idea of a fuller realization of human ethics that flows from the monotheistic worship of Islam. Ethics in this sense is essential to the meaning of Islam no less than law. Thus, ethics in Islam is not at all about a departure from *sharī'a*. More primarily, it is about the cultivation of a rightly ordered relation with God, which, in turn, enables cultivation of rightly ordered relations with others in society, including selflessness that goes beyond the law without leading to its neglect. Excellent character is thus no less part of the calculation of divine favor than adherence to God's commands and prohibitions.

Muslims include character in the moral calculation because they have long noted a selfish motive in keeping God's law, namely, deliverance from divine wrath on Judgment Day. In this regard, one keeps the law not so much to please God as to save one's own skin from hellfire. But such a view reduces Islam to a transaction: paradise for obedience. Thus, ethical formation has been essential to ensure against the reduction of Islam to a transactional affair. Obedience to God's law may very well earn the believer paradise, but it will not necessarily win God's favor (*riqā allāh* or *riqwān allāh*), which scholars have described as a heavenly station beyond even that of paradise. Why would doing the law only for your own heavenly gain be pleasing to God?

The idea that divine favor is not a simple function of *sharī'a* obedience is reflected in discussions on the signs of divine favor. How does one know that one enjoys the favor and love of God? The ability to keep God's law is a necessary but not sufficient factor in knowledge of God's favor. Other indicants are needed, among them the love of others for you. People are ultimately attracted to one's ethics, making the love of others for you a sign that your ethical character is pleasing to God. Other signs include a love of listening to the Qur'an (suggesting a rightly ordered soul as part of the calculation of divine favor along with good character and good behavior) and a readiness to listen to advice (suggesting humility and harmonious relations with others). Finally, considerable weight is given to suffering as a sign that one enjoys divine favor. This is confirmed by a hadith that states that when God loves believers, He tests them. If they are contented with God amidst trial and tribulation, God is contented with them. If, however, they show discontent for God as a result of hardship and misfortune, then God is discontented with them. After all, as one saying puts it, should you not be ashamed to expect that God be contented with you when you are not contented with all that God has decreed for you – both good and evil?

In other words, it is adversity that demonstrates, even proves, one's true ethical colors. One might despair and curse God – as the wife of Job encouraged him to do after being afflicted by unmerited suffering – or find that one's faith in God is refined as a result of suffering. Some see such heavenly sent tribulation as God's way of distinguishing the obedient from the disobedient, but it is more accurate to speak of suffering in Islam as opportunity for those who worship God to display the extent of their love for God above and beyond a simple obedience to God's law. At a minimum, when one suffers, one should patiently endure without breaking the faith and abandoning worship of God. However, at a higher level, believers who do not merely put up with suffering but see it as a sign of God's love for them, as suggested in the above hadith, are pleasing to God because they are pleased with God even amidst the suffering God has decreed for them. They take delight in God even in their suffering. It is not simply a matter of

enduring it. The pleasure one might see in suffering trial and tribulation as God's decree is the ultimate mark of ethics in Islam: a display of character contentment in God come what may.

Such commitment of character in one's reverence of God is the signal par excellence of divine favor above and beyond the calculation of acts of obedience and disobedience that will earn deliverance on Judgment Day. How might God not love those who do not curse God even when suffering? The point is not just to keep the law but to live out of awareness of God at all times, patiently and even gratefully, out of a sense of God's mercy, even amidst hardship. It is this that prompts the human soul to take the greatest of pleasures in devotion to God irrespective of life's vagaries. God's law – *sharī'a* – is never out of the picture, and as God's delegate on earth, the human is to live in society in knowledge of God's will, a notion many today connect to the duty to steward the planet's resources and protect its peoples and, indeed, all creatures. In sum, the key point of ethics in Islam is that duties to God can always be performed hypocritically if not accompanied by a formation in ethics that puts the soul in a rightly ordered relation to God.

CHAPTER 98

Buddhist Ethics: Modes of Interpretation

Anne Ruth Hansen

Introduction

The starting point for this consideration of how Buddhists have produced and disseminated ethics is that “ethics” – what we might also refer to as ethical or moral values – are historically produced, situated not only in specific cultures and historical moments, but also shaped by the materials and technologies that people use to remember and convey them to each other. Our ways of thinking, and thus our knowledge systems, change depending on the media used to express them. For example, transitions from oral to manuscript cultures and from print to digital media usage have transformed not only the way we produce and disseminate knowledge but also our thought patterns and notions of how and with whom to communicate. This entry contends that the interpretation of Buddhist ethical values should be viewed as a dynamic process relative to specific historical contexts and tied to particular modes of production, expression, and dissemination. The media and technologies Buddhists have employed in producing values are important to understanding what those values are, and how they shape or guide peoples’ perceptions and actions in the world.

As an analytical category, “ethical values” is both broad enough to contain the continuum of peoples’ moral ideas, expressions and practices, and specific enough to point to the reality that people, including Buddhists, sometimes hold competing or ambivalent or inconsistent moral notions. In the discussion that follows, “ethical values” is used as a synonym for “ethics,” though oftentimes, the latter term can also be used to refer to the scholarly disciplines of philosophical or religious ethics, or to indicate a holistic or systematic moral framework or set of principles. Saying that a group of people such as Theravāda Buddhists share “ethical values” allows room for conceptualizing a messy, unsystematic, inconsistent “repertoire” of moral understandings and ways of acting and interacting that are drawn from diverse cultural sources and are applied selectively, depending on the situation (McDaniel 2011, 9–14).

This entry surveys modes of interpreting Buddhist ethical values in the context of Southeast Asian Theravāda Buddhist production and dissemination of different types of ethical media from the late nineteenth to the early twenty-first centuries, including written, ritual, visual, and aural sources. On the one hand, this period in the Theravāda world saw dramatic transitions in the technologies and materials used for producing and disseminating written ideas: from the highly ritualized monastic production of palm leaf and mulberry paper manuscripts to printed texts produced and sold by religious organizations led by lay people to digital materials curated by tech-savvy young monks and artists and widely available

on the Internet. On the other hand, while the contexts and motivations for some Theravāda ritual performances (such as novice ordinations) changed dramatically and other rituals (such as menstruation and postpartum rituals) have nearly disappeared over the past century and a half, many other rituals, including funerals, life-extension ceremonies, and recitations of the culturally important buddhological story of the *Vessantara Jātaka*, continue to have cultural and moral significance. Throughout this period, aural media have continuously produced “ethical soundscapes” through forms such as sermons, liturgies, story-telling, spoken epic poetry, and more recently, hip-hop (Hirschkind 2006). In the visual and material realm, Theravāda Buddhists convey ethical values through media that range from tattoos and amulets to temple architecture, paintings, photography, textiles, clothing, and art. One of the notable changes over time is a growing commodification and mass production of morally potent objects. Another is the blurring of boundaries between art and religious ethics, evident in the work of the contemporary artists discussed later in this entry.

Ethics and the Written Word in Manuscript Culture

In the mid- to late nineteenth-century Southeast Asian Theravāda world, followers of the Buddha looked to the teachings of the Buddha – the Dhamma or Dharma – as an authoritative source for shaping their moral decision-making and production of values. Their notion of Dhamma encompassed more than the canonical words of the Buddha, *buddhavacana*, and might best be translated, following Steven Collins, as “what is right” (Collins 1998, 604). Although written scriptures were not the only or perhaps even the primary medium for communicating ethical values in communities, they played an important role in transmitting knowledge of the Dhamma among monastic teachers who interpreted and disseminated the message of the Dhamma in a wide range of other ways that will be considered below.

The usual media for written scriptures as well as texts explicating and commenting on scriptures were hand-made manuscripts assembled from palm leaves or paper prepared from *khoi* bushes or mulberry tree fibers. While the Buddhist scripture, the *Tiṭṭaka*, was well known and revered, entire copies of the massive corpus of the canonical scriptures were not widely available, maintained only in a few libraries (especially royal libraries). Instead, manuscripts commonly combined short excerpts of different canonical and non-canonical texts such as localized versions of stories of the past lives of the Buddha before he was enlightened, ritual guides, and various texts promoting ethical values such as generosity and selfless giving attached to merit-making (*dāna*). Merit-making was (and still is) a central ritual activity for Theravāda Buddhists. Offering gifts such as food, robes and money to the *sangha* (monastic community) or sponsoring religious building or the creation of manuscripts accrued spiritual benefit for the donor that could be shared with others, including the donor’s deceased parents or other relatives. New manuscripts were often sponsored by a lay donor and copied out by a monk-scribe as part of a devotional practice. In other cases, scholar-monks traveled between monasteries to copy texts and carry them back to their home monasteries for educational and ritual purposes (Appleton, Shaw, and Unebe 2013, 1–9, 98–122; Hansen 2007, 80–89; Ginsburg 1989; McDaniel 2008: 83–91, 143–149).

Manuscripts were produced with great care, surrounded by rituals for preparing the palm leaves and ceremonies and regulations that had to be observed by the monks who inscribed them. Once completed, the manuscripts were presented to a monastery or abbot in a ritual ceremony that might include the presentation of specially woven cloth for wrapping the texts or a decorated box for storing them, sometimes

as part of a donation of robes to the monk-scribe in order to effect the passing of merit to the donor of the manuscript, or as the culmination of a merit-making ritual for a deceased spiritual teacher or parent. The value of the manuscript depended in part on its aesthetic beauty and the regularity of its written words, which in turn reflected the concentration and spiritual purity of the monk who inscribed it. Written syllables of the Buddha's teaching in manuscripts or other written materials such as *yantra* (protective diagrams inscribed on paper, cloth and thin sheets of metal or tattooed on skin) were considered as microcosmic representations of the moral power of the Triple Gem (the intertwined elements of Buddha, Dhamma, and Sangha), which could bestow protection and blessings besides generating merit. Thus, it was impossible to separate the ethical teachings of a given manuscript from its sheer materiality, aesthetics, and spiritual potency as a moral object (Ginsburg 2000, 118–119).

The *Phra Malai Sutta*, a narrative that emphasizes the importance of merit-making and other moral virtues and is resonant with Buddhist prescriptions for wholesome living (such as the five precepts and the eight-fold path), was a favorite manuscript theme in nineteenth-century Siam, often featured in illustrated manuscripts and used as a subject for sermons at funerals (Ginsburg 2000, 92–111; Brereton 1995; Sims-Williams 2013). The story tells of an especially accomplished monk named Phra (“Venerable”) Malai, who through his higher skills in meditation and concentration, was able to visit the hells and heavens to witness the conditions of life for beings reborn in those realms (*gati*). In the hells, he encountered beings tortured in horrible ways commensurate with their past misdeeds, and in the heavens, he perceived the rewards for those who lived virtuously, especially people who had made merit in past lives. From the text's narrative descriptions as well as from iconic and evocative paintings of Phra Malai's travels that appeared in illustrated manuscripts and large paintings displayed in temples, Thais learned about the workings of karma in visualizable form. As awful as hell was for adulterers, hunters, corrupt politicians, and others who violated the Buddhist precepts and created harm for others, even the humble but heart-felt gift of a poor laborer could produce magnificent rewards when mediated through the transformative power of a virtuous monk. In one often-painted scene, Phra Malai carries a pious woodcutter's simple gift of eight lotus blossoms to offer to the Chulamani stūpa – a funeral reliquary in the Tavatisma Heaven containing a relic of the Buddha – thereby endowing the woodcutter with all the merit accrued from a gift presented directly to the Buddha. One obvious intent of the story was to inspire generosity in listeners. In preaching it, monks might dramatically re-enact certain scenes or recite it with the manuscript's illustrations facing the audience so they could see the gory punishments in hells and the lavish life of heavenly denizens (Brereton 1995; Skilling and McDaniel 2012). But it is important to note that communicating the story was only part of the ethical work done by the manuscript. In Theravāda contexts, sensory encounters with a manuscript such as touching a page of written text or seeing the folded-up manuscript in a glass case, even for those who do not know or understand its content, is understood to yield spiritual benefits. Merely being in the presence of a Buddhist manuscript can help someone become a better person.

The values conveyed by a manuscript's written and painted content and its sacred materiality were also difficult to separate out from its ritual context. *Jātaka*, stories of the Buddha's past rebirths and popular subjects of nineteenth-century manuscripts, emphasized the future Buddha's cultivation of moral virtues as he coursed through rounds of existence before his enlightenment. In Southeast Asia, the stories of the last ten rebirths have been especially revered, known collectively as the *dasa-jātaka* (ten birth-stories). The *Sāma Jātaka*, for example, tells the story of a past rebirth in which the future Buddha was reborn as the child of blind ascetics, tenderly caring for them in the forest where they lived. One day, a

thoughtless and selfish king out hunting intentionally shot him with a poisoned arrow. Although badly wounded, Sāma miraculously revived (and his parents' sight was restored) through the power of his own goodness and the truth-telling vows made by his parents and a goddess perched in a nearby treetop who had been his mother in a previous birth. Depending on the monk who was preaching, the story might highlight a range of virtues displayed by the Bodhisatta such as filial piety, care, loving-kindness, and ascetic purity, while also offering a warning about the potentially immoral effects of the hubris of kings and politicians. At the end of some versions of the story, the Bodhisatta preaches to the king – often slyly depicted in paintings as a churlish ogre rather than a human being – about the duties of moral rulers and teaches him the five Buddhist precepts (Roveda and Yem 2009, 93). A Cambodian listener attending a recitation of the *Sāma Jātaka* by a monk holding a manuscript of the text may not have heard the exact words inscribed on that particular manuscript since the monk-preacher might take poetic license or choose to elaborate one scene and omit others. Furthermore, the ethical message conveyed by the monk-preacher was only part of its impact. The story worked hand in hand with ritual contexts in which it might be preached. A recitation of the Sāma story at a funeral conferred merit on listeners who could then transfer the merit they earned to their parents, providing care for them in their future rebirths as well as in the present. In this sense, the ritual recitation of the *jātaka* provided an opportunity for listeners to *become* like Sāma taking care of his parents not simply to hear about elder care as an abstract moral ideal.

New Ethical Media

Given the attitudes toward religious manuscripts and writing described above, it is not surprising that the introduction of print and the new technologies of knowledge production attached to it reflected and/or contributed not only to a shift in ethical expression but also a change in the focus of peoples' moral concerns. In urban areas such as Bangkok and Phnom Penh at the turn of the nineteenth century, younger reform-minded monks and literati embraced the printing press for its potential role in making scriptural texts more widely accessible. While printed Buddhist texts retained their revered status as sacred objects, these young intellectuals were focused on different categories of Buddhist moral teachings than the older generation of compilers of palm-leaf Buddhist *jātaka*. Modern "scripturalist" monks and educators wanted Buddhist monks and laypeople to learn to read and understand scriptures for themselves rather than relying on monk-preachers to interpret them (Tambiah 1976, 211–212; Hansen 2007, 83–84). At a time when methods of modern science and empiricism were taking hold in many parts of the world, reform-minded scholars emphasized the Buddha's scientific orientation and his method of self-verification for understanding religious truths. They cited the *Kālāma Sutta* as a demonstration of "Buddhist rationalism" and evidence of the compatibility between modern scientific approaches and the Buddha's wisdom. In the sutta, the Buddha urges his Kālāma listeners *not* to rely on oral traditions, received wisdom, scriptures, venerated teachers, or inference to decide whether something was true, but rather to "know for yourselves" through meditation, reflection and moral experimentation. Another favorite text of reformers was the *Sigālovāda Sutta*, a discourse that laid out an ethics of wholesome and beneficial ways to handle family and other relationships for lay people. For reformists, the text articulated their belief that lay people, like members of the sangha, needed to read and understand the Dhamma and take responsibility for purifying their moral behavior.

In championing the *Kālāma Sutta*, *Sigālovāda Sutta*, as well as other scriptures that dealt with codes of behavior for lay and monastic life, reformists were not rejecting older virtues (such as truth-telling and loving-kindness) attached to narratives of the Buddha's past lives in the *jātakas*. Rather, their focus on these kinds of texts reflected the shift in their modes of interpreting scripture to include understanding of Pali, philological commentary, and historical readings of scripture. Reformists wanted to downplay or filter out what they regarded as fanciful details in *jātaka* stories (such as the brahmin Jūjaka's stomach bursting open in the *Vessantara Jātaka*) and focus instead on understanding the Buddha's original intentions and cultivate purity of thought and action. While not fully abandoning the *jātaka* tradition, reformists began to turn their energy toward producing and publishing new critical editions of the scriptural texts and commentaries they found instructive.

As the historical context of Buddhist ethical reflection shifted again during the postcolonial Cold War period, the *Kālāma Sutta* remained important – but for different reasons. Responding to transnational circulations of Cold War ideologies, in their speeches and journal articles, Southeast Asian Buddhist intellectuals associated with the World Fellowship of Buddhists frequently cited the same passages in the *Kālāma Sutta* reformists had referenced decades earlier to demonstrate that Buddhism was compatible with democratic (as opposed to communist) values, and further, to point to the emancipatory significance of Buddhism as a world religion that advocated total freedom over any sort of “blind faith.” Statements highlighting Buddhism's valuing of freedom, including freedom to examine one's conscience, freedom of choice, freedom to practice religion, and freedom of allegiance became frequent motifs in writings by Buddhist intellectuals during the Cold War period. Burmese missionary monk U Thittila explained that in the historical moment of the post-World War II world, “now Asia is threatened with Communism and every Buddhist must frankly face the incompatibility of the Communist and the Buddhist way of life. ...” Among the many threats posed by communism, “[a]s proved by its record in Russia and in the countries brought under its sway, Communism... attacks religion – it is therefore anti-Buddhist [and] it attacks individual liberty of thought or deed. ...”¹ In a 1966 article in the newly established Buddhist magazine *Banlī Buddhacakkā* [*Illumination of the Buddha-wheel*], Cambodian Prince Sisowath Monireth wrote, quoting the *Kālāma Sutta*, that the Buddha's insistence on “freedom of thought” was unparalleled in the history of world religions (Sisowath 1966, 32–33, 43–45). Likewise, Thai Princess Pismai Diskul, in her capacity as president of the World Fellowship of Buddhists, argued that “...there is nothing compulsory whatever in the Buddha's doctrine. The Buddha's instruction to the Kālāma people may be cited as confirmatory evidence” (Poon 1975, 5). Explicitly and implicitly, such writings and speeches advocated for “freedom” and “liberation” as prominent Buddhist values at the same time that they situated these Buddhist actors' opposition to communist ideologies.

The post-independence period in Southeast Asia saw the development of new media that were used to consider and disseminate Buddhist values understood to be compatible with modern life, nation-building, and individual and social development through radio broadcasts, newsreel and film. Buddhist monk Bhikkhu Hat-Chak's 1954 address on Cambodian national radio, for example, aired soon after Cambodia gained nationhood, elaborating the *Dullabhā Sutta* on gratitude (*kataññū*) and connecting the importance of showing gratitude to teachers, parents and others who offered unconditional care for

1 Kurt F. Leidecker Archives, Leidecker Center for Asian Studies Collection, Mary Washington University: U Thittila (n.d.).

moral development of their children and students to the development of the nation. In his address, he explained that moral education was essential for “national progress” and “national unity” in a Buddhist nation like Cambodia.² Nineteen fifty-seven-newsreel captured the installation of a new relic of the Buddha as palladium of the nation, likewise associating national progress with Buddhist morality,³ while Khmer films based on local Buddhist folktales with moral themes were introduced in the early 1960s by film-maker Ly Bun Yim and became wildly popular with the public in Phnom Penh and elsewhere in the country (Li and Muan 2001, 150–151, 170–172).

Ethical Values in Ritual Performances

Buddhist ritual has served as another key medium for interpreting and communicating ethical values in the Southeast Asian Theravāda world. From small daily offerings that homeowners and farmers offer to the spirits of the land they occupy and ancestor spirits who watch over their behavior and health to lavish state-sponsored offerings to the Buddhist sangha, ritual performances are occasions on which ethical values are produced and prominently displayed and disseminated. As with written texts that can be interpreted differently depending on the context and subjective composer, reader, reciter, and audience responses, the ways in which people interpret the ethical values communicated in ritual performances are complex, contingent and fluid; no matter the intentions of the ritual officiants or sponsors of a given ceremony, participants can come away with a range of interpretations and reactions as well as a sense of shared purpose and collective values.

A young Cambodian friend recently spent an entire day at an elaborate merit-making ritual organized by his mother for the benefit of her deceased parents in their home village, a drive of several hours from the town where he and his mother live. She and her friends prepared food offerings for days in advance and she even hired a large bus to ferry relatives and friends to the ceremony. When I asked a few detailed questions about what had taken place, the young man admitted sheepishly that he had not paid the least bit of attention; he was just there to support his mother, with whom he was close. Even though he was in his thirties and lived independently, he explained, “she always washes my clothes and cooks food for me. I really appreciate her.”⁴ His attendance at her religious event was a show of support and gratitude toward his mother rather than coming from any sense of moral responsibility to the family village temple, monks or his grandparents, he explained.

This ethnographic story suggests that while individual understandings of the values created by rituals can be varied and ritual participants may hold multiple and even contradictory ideas about whether the values they are ritually enacting are valid, rituals – like texts – are situated within a larger world of interconnected religious ideas, actors, relationships, aspirations, practices, and so on that shape an integrated “moral universe,” allowing participants to interpret their own and others’ ritual actions

4 Author’s field notes, July 2018.

(Ladwig 2012, 137). Although the mother and son described above participated in the ancestor worship ceremony for different reasons – she out of filial piety and a desire to make merit for her parents, he out of good-natured appreciation for his mother – in both cases, the event displayed the importance they attached to gratitude, care and filial piety for parents and allowed them to enact their obligations to support their parents. It also shows us that the dynamic ethical values produced by ritual performances add up to something that can be examined ethnographically and historically by scholars. In other words, even though ritual ethics are slippery, by paying attention to participants’ multi-layered motivations, reactions, attitudes, emotions, and actions, we can learn something about what people value and how those moral values shape their decisions and behavior.

A few examples of common rituals show how these rituals produce and communicate ethical values concerning care for self and others. For Cambodian Buddhists, *sraoc dyk* (“sprinkling water”) is a simple protective ritual that might be initiated by a layperson who has lost her job or is feeling out of sorts or by her concerned family members who are worried about her change in fortune or mood. She heads to the local monastery to seek out her favorite monk-spiritual teacher who performs a ceremony in which he chants protective blessings and showers her with lustral water filled with flower blossoms. The performance of the ceremony, participants explain, helps them feel more assured, positive and hopeful, and better able to manage whatever challenges they are facing.

A more elaborate contemporary ceremony of care for “extending the life” of elders is *pun̄y camroen preah janm*. This life extension ceremony is organized on behalf of older people to help them enter into the last phase of life, typically around the time of their sixtieth birthday, to ensure their good health, long life and prosperity. In different local contexts and even among different families in the same area, the ceremony can vary in form, though like many related protective rituals, it involves presenting gifts and offerings both to Buddhist monks and spirits, chanting of *paritta* [protective prayers] by monks, pouring or sprinkling of lustral water and tying protective threads around participants’ heads or wrists – followed by a large communal meal for the participants and guests after the monks’ noon meal is over. There are wide variations in the performance of this ritual, which demonstrates that not every detail of a ritual needs to be enacted in exactly the same way in order to communicate ethical values. At the same time, it enacts and communicates an ethic of care for and respect toward elders that is recognizable across performances.

The record of a 1953 life extension ritual, held for the benefit of a provincial sangha dignitary named Venerable Īv-Duat on the occasion of his sixty-first birthday, explains his students’ motivations for organizing the ceremony. Besides his many accomplishments as a monk – such as sponsoring religious building and renovation projects, composing and commissioning scriptural manuscripts, writing books on the Dhamma, and starting schools – he always showed loving-kindness, compassion, sympathetic joy, and sincerity toward his monastic students. He taught and guided them in moral behavior and was never harsh in his treatment of them, not even with so much as a cross glance. He was someone who helped the populace with their troubles with no thought of gain for himself, a “fountainhead” of moral inspiration and a “force for creating unity (*sāmaggī*) and cohesion” among them.⁵ The ceremony provided the students with an opportunity to show gratitude and care to Īv-Duat, while also holding up the values they felt he embodied.

5 National Archives of Cambodia, Phnom Penh: *Pun̄y Camroen Preah Janm* [Life extension ceremony], Box 508.

Multi-year ethnographic studies of Buddhist rituals by Anthony Irwin and Patrice Ladwig, scholars of Southeast Asian religion, argue that one of the central values created by different types of collective rituals is care for the community, achieved through the creation of a sense of cohesion or “unity,” what the northern Thais studied by Irwin refer to as *samakkhi* or what Ladwig refers to as “communal karma” or “socio-karma” (Irwin 2018, 222–260; Ladwig 2012, 130). In his study of a collective Lao ritual called *boun khau padab din*, an annual festival in which the living extend care to the hungry ghosts of the dead, Ladwig observed the ways in which the ritual created a sense of “communal karma” among the temple community’s participants. Gathering at night outside of the temple, community members left specially prepared packets of food on the ground and lit candles for the dead, speaking to them with declarations such as “My family and relatives. Come to take the gifts and eat. May you be reborn in better circumstances and in prosperous conditions because of these gifts” (Ladwig 2012, 23). While care for the dead (and with it, associated values like social integration, compassion, protection, and fertility) is the primary stated aim of the ritual, Ladwig concludes that care for the deceased and spirits “is also a form of care of the community” (Ladwig 2012, 136).

Ethics in Objects and Art

Material objects and art have served significant roles as sites for ethical production and reflection in the Theravāda world. Buddhist material objects are sometimes not simply ethical media meant for symbolic, ritual or protective use, but, as Donald Swearer (1976, 1998), John Strong (2004), and Anthony Irwin (2018) have shown, they can exercise moral agency in and of themselves. Relics of the Buddha can travel to places that will benefit from their presence, stūpas and other sacred sites can summon people to them to perform religious offerings, images can exert an influence on those around them. If we are to take seriously the project of re-enchanting religion, Irwin argues, we also have to consider how ethics is enchanted. Numinous forces in the landscape, caves and religious ruins in northern Thailand seek to make people more reverent, respectful, unified, and pious (Irwin 2018, 45, 308–312).

Since scholars of religion and ethics have tended to associate ethical expression with *written* expression, this leaves to the side the production of ethics by people who are not literate or not highly literate but who nonetheless consider themselves to be good, moral people and who are capable of sophisticated moral expression. In Theravādin Southeast Asia where literacy was taught primarily in monasteries prior to the early twentieth century, boys could gain basic literacy during stints as novices or monks, but girls’ access to skills in literacy and writing was more limited since women’s ordination lineages no longer existed. Women, like men, participated in religious life as laypeople, hearing sermons, attending and sponsoring religious ceremonies and festivals, making merit, meditating, and consulting with monk-teachers about auspicious events in their lives such as marriage. Even if they were not highly literate, women were often the creators of textiles used in rituals, including such materials as funeral flags used to guide the spirits of the dead to rebirth, *sarong* fabric for wearing to festivals and funerals, and ceremonial cloths for display in the temple (Hall 2015, 358–362; Green and Chakrabongse 2008, 10–28).

Until the mid-twentieth century, ceremonial weavings known as *pidan*, used on occasions such as funerals, were made by Cambodian weavers for the explicit purpose of conveying moral values. The silk textiles were elaborately woven with intricate pre-determined pictorial motifs using a multi-step *ikat* dying technique. A *pidan* might for instance feature the scene from the *Vessantara Jātaka* in which

Vessantara is forced into exile in the forest. He is accompanied by his beloved wife Madi and their two children who choose to leave their comfortable palace life to follow him to the forest. Motifs of this brave act might alternate with the wrenching scene of Vessantara giving away his children as slaves to the cruel brahmin Jujaka. The repetition of these two motifs on the ceremonial textile, conveyed the weaver's understanding of ethical values such as love, loyalty and sacrifice, as well as the profundity of the path to enlightenment (Green and Chakrabongse 2008, 28–32).

Textiles involving this level of artistic complexity to produce were often commercial commodities as well as devotional objects. Some of the most elaborate pictorial *pidan* that have been preserved were probably commissioned by courtiers for special royal occasions or by colonial French officials for display in world expositions in the late nineteenth and early twentieth centuries (Green and Chakrabongse 2008, 140–145). Nineteenth- and twentieth-century weaving motifs were typically transmitted from mother to daughter, a tradition that was severely disrupted by the wars, bombing, dislocations, and political violence of the late twentieth century in Cambodia. In the 1990s and early 2000s, while it had become rare to see ceremonial *pidan* hanging in a monastery, with support from NGOs devoted to reviving “traditional arts” in Cambodia, weavers began to re-introduce *pidan* with Vessantara motifs for the tourist market (Green and Chakrabongse 2008, 145). On one occasion, when I asked a market vendor about the motifs in a *pidan* she was selling, she settled herself onto a low plastic stool in her stall to recap the entire *Vessantara Jātaka*, explaining the love between Vessantara's family members and conveying the joyfulness at the end of the story, when parents and children were finally reunited. This incident is noteworthy for showing us that even in highly commodified forms, ethical media can still serve as sites for communicating ethical ideas. For scholars of ethics, this incident also forces us to consider what happens once ethical media are removed from cultural and historical contexts in which many people are able to recognize, understand, and reflect on the ethical values and ideas they convey. Are the ethics conveyed in visual and material media as transportable as some of the objects themselves? In other words, once the tourist has taken her *pidan* home and hung it in her dining room, is the textile still doing ethical work?

There are different ways to approach this question. Given the moral and spiritual potency of Buddhist objects, as in the case of manuscripts discussed above, one answer is that from a Theravāda Buddhist perspective, simply being in the presence of the *Vessantara* imaginary depicted in the *pidan* affects viewers in morally beneficial ways. Furthermore, the weaver's own moral insights and experience is embedded in the object she wove; her own knowledge and interpretation of Buddhist imagery is part of what gives it value, even in the marketplace. A third answer, following anthropologist of visual ethics Kenneth George, is that the “material and affective dimensions” or qualities embedded in an object (such as a textile) that make it morally potent cannot be separated from it, no matter where it is displayed (2016, 57). Among the material qualities of silk fabric are its light-weight portability and flexibility. Far from being tied to a specific place (like a rock pillar or massive image), it can be easily moved, adapted, carried, or stored away. Another intrinsic quality might be described as its “intentionality”; it necessarily carries with it the meticulous foresight and consciousness required to plan and weave an *ikat*-style *pidan* in the first place. All of its scenes and patterns must be carefully pre-determined and dyed accordingly. The complexity of the design is consciously intended to inspire admiration and require further inspection; a *pidan* is meant to be a visual feat and as such cannot be comprehended with a glance. The fact that an object brings together specific material qualities such as lightness and flexibility, and that affective qualities such as admiration and appreciation of its complexity “stick” or adhere to it, George argues (drawing on work on materiality by Web Keane and Sara Ahmed), makes visual objects more than mere vehicles

for “conveying ethical values supplied by this or that religion or this or that ideology in visual form.” Rather, George sees the material and visual as *sites* for everyday “ethical and affective encounters, aspiration, possibilities, and dissent” (2016, 64). The *pidan*, like the story of Vessantara itself, does not convey a single or straightforward ethic but it supplies viewers with a means of encountering and formulating perspectives on homelessness, generosity, filial piety, kingship, and other morally charged ideas. Finally, following from George’s argument, then, another response to our question about the transportability of ethical values communicated in ethical media is that transplanting an ethical medium such as a *pidan* to a new context in which its viewers are not cognizant of the efficacious thought worlds in which it was produced, might well change the way it is experienced and understood, the ideas it communicates and the very reasons it is valued. Whether or not it remained an “ethical medium” would depend on the uses that its new viewers ascribed to it.

The contemporary art scene in Southeast Asia provides one further arena in which to consider these questions. As fewer people take up formal monastic life in Southeast Asia, contemporary multi-media art has become an increasingly important site for moral reflection. Contemporary art is produced for many reasons of course, including self-support and profit, creative and aesthetic self-expression, preservation of culture, social critique and resistance to political oppression, witness to injustice or trauma, and processing social change and new forms of expression. As a site for the production of ethical discourse, contemporary art poses further complications for our discussion in the sense that few contemporary artists identify themselves solely or primarily (if at all) as “Buddhist artists.” Nor do they produce art as devotional and soteriological labor, as anonymous scribes and craftsmen might have done in the past.

One of the most globally prominent artists to emerge from the Theravāda world in the recent decades, Thai artist Montien Boonma (1953–2000) often drew on decidedly Buddhist themes and imagery such as monks’ alms bowls in *Alm* (1992), temple bells in *Lotus Sounds* (1992), and meditative breath in *Nature’s Breath: Aryokhayasala* (1995). These installations were not intended to speak only or primarily to Buddhists or to act explicitly as “Buddhist art,” but rather to serve as part of Boonma’s exploration of “the meaning of life and hope.”⁶ Some of Boonma’s installations consciously used Buddhist iconography as sites for producing the kind of ethical interactions and affects that George describes in his discussion of visual ethics. In works such as *Sala of Mind* (1995), *House of Hope* (1996–1997), and *Melting Void: Molds for the Mind* (1998), Boonma created empty spaces into which viewers could move “inside” and “take refuge,” occupying and looking out from the head of a buddha image, a temple or a stūpa in order to see the world differently and cultivate feelings of calm, peace, healing, hope, and compassion (Bond 2004; Monthian et al., 2003).⁷

The ambiguity of artists’ relationships to Buddhist identity is made visible in *The Buddhist Bug*, a playful series of works by Anida Yoeu Ali, begun in 2009 in Chicago, in which the bug – inhabited by Ali who is herself a Cambodian-American from a minority ethnic Cham Muslim background – roams around the American and Cambodian countryside in an elongated saffron-colored segmented tube capable of stretching to 40 meters, simultaneously invoking the robes of Theravādin monks and *hijab*, a head cov-

ering worn by many Muslim women in Southeast Asia – inviting interaction from interlocutors (Ali, 2010, 2014, 2015). The work, Ali explained, uses religious aesthetics and iconography to bring people into conversation about religion, tolerance, and intolerance, and the very “in-between” identities that Ali herself inhabits as a transnational, diasporic Cambodian-American and Cambodian-Muslim. The bug seeks to interact with “ordinary people” and to occupy “ordinary moments,” wrapping itself around bridges, stairways, tables, and altars. In a particularly striking image of the creature in *Morning Prayers* (The Buddhist Bug Series, Digital C Print, 2014), the bug is statuesquely situated under the arched gate of a Cham mosque surrounded by amused and curious young children and a cautious-looking teen, vividly capturing the ambiguity and poignancy of Ali’s multiple hybrid identities and her use of art as a means to invite dialogue about issues that are both difficult and ordinary, like race, religious identity, belonging, and displacement. Reactions to the bug vary widely, Ali explained in a 2015 interview, from accusations of inappropriateness to hugs and embraces, but most viewers have reacted to it with humor, an affect that the work tries consciously to cultivate (O’Hara 2015, 5:00–6:01).

The impetus to make art that is ethically expressive and productive is not exclusive to global art figures like Boonma and Ali. At the local level, making art serve as a site for the production of “ordinary” ethics is represented in the work of the self-taught Cambodian hipster artist Phok “Bee” Sopheap, whose paintings have focused on themes like love and relationship (Glasser 2013, 2014; Vachon and Naren 2014; Nelson 2014). At one of his earliest exhibits, he showed me entangled figures in shades of red, with conjoined noses, hair, limbs, and sarongs. The entwined figures were all looking in different directions, which was intentional, he told me; they had their own individual lives, destinies and directions. But they were also interconnected and inseparable, depicting the nature of “family.” Another painting showed four figures who were obviously a family: two parents cradling their two tiny children, their genuine mutual affection evident through the manner in which they were touching. For me, the painting recalled Vessantara and Maddi and their children. No, said Bee. His imagery and ideas sometimes came from Buddhist (and Christian and Muslim) stories as well as Hollywood movies like “The Transformers” – but this was just an ordinary family. This was a painting about love, not religion.⁸ My perspective as a scholar of Buddhism shaped my reading of the painting, causing me to assemble images and ideas culled from my own Buddhist imaginary. But as a painter in provincial Battambang trying to adopt an aesthetic language he understood to be global and human, Bee’s own artistic and moral repertoire was not particularly concerned with interpreting Buddhism, though some of his images draw on Buddhist deities and other characters from Buddhist stories such as at the earth goddess Neang Thorani from the Buddha’s biography and Neang Maccha from the Khmer *Rāmāyāna*, who along with the Statue of Liberty and the Sphinx make up the painted figures in *The Wonderful Ladies with Wonderful Things* (2012).

There are an infinite number of ethical media since any kind of object or practice can be invested with ethical relevance and thus serve as a site for moral reflection and analysis. The history of Buddhist ethical media in Cambodia, Thailand, and elsewhere in the Theravāda world shows us clearly that there is no single Buddhist mode of interpreting ethics, and that the most resonant medium for ethical reflection depends on the materials, technologies of production, and aesthetic and moral repertoires available to individual producers and disseminators of ethics in a given historical context, the interactions this medium engenders, and the values, aspirations, and ideas that Buddhist individuals and communities use it to create.

CHAPTER 99

Modes of Interpretation (Indian Religions)

Shyam Ranganathan

Introduction

This entry contrasts two modes of explanation: *interpretation* (explanation by way of belief or truth) and *explication* (explanation by way of deductive inference, entailment or validity, in which case a conclusion of an argument is true if the premises are true). Much literature in the Analytic and Continental traditions of Western philosophy – through authors such as W. V. O Quine (1960, 59), Donald Davidson (2001, 101, 1986, 316), Martin Heidegger (2010), Hans George Gadamer (1990, 1996) – acclaims the importance of what I have called interpretation – often employing the term itself (Quine, Davidson) or an analogue such as “hermeneutics” (Gadamer) or “Auslegung” (Heidegger) that is readily paraphrased or translated as “interpretation.” It continues in the widely influential idea that reflection is about arriving at an equilibrium of considered judgments (Rawls 1971, 18). Following these leading figures of twentieth-century Western philosophy, I mean to use the term “interpretation” to cover *any* explanation reducible to what the explainer takes to be true; any explanation based on the explainer’s beliefs, and which ultimately the explainer has to believe. What I call “explication,” is just one alternative. Good explanations for the explicator are not entailed by their beliefs and they do not have to believe them. For instance, the explicator can render explicit the reasons of the interpreter, but for the explicator these reasons are false, and the theory is not worth believing. The interpreter in contrast is forced to understand by way of what they take to be true, and hence they will attempt to assimilate explication as some variant form of interpretation that they endorse.

Interpretation has deep connections to the standard account of thought in the Western tradition, which is traceable back to the ancient Greek idea of *logos*, which unifies thought, belief (account or story) and language in one idea. At base it is what we could call the *linguistic account of thought* – accordingly, thought is the linguistic meaning of what we say. The identification of thought and belief is not arbitrary: if thought is the same as linguistic meaning, then to deny a thought is to deny the meaning of what one says, which is absurd. And hence, to avoid this absurdity, one must believe every thought one entertains: *logos*. Or put another way, to treat the meaning of what one says as the content of one’s thought is to adopt the cultural vantage of one’s language, which is to say its beliefs, or perspective, as a matter of course in thinking. If thought and belief amount to the same thing, then every explanation by way of thought is an explanation by way of belief: interpretation. In the Chinese tradition, in the *Analects*

(XIII.iii.4–7) Confucius defends or assumes a linguistic account of thought while Taoists, such as Lao Tzu (in the *Tao Te Ching*), pour scorn on it. In the Indian tradition, no one took it seriously. Yet it is the default account of thought in the Western tradition. The main ground for challenging interpretation is logical. But as it is a theory of understanding that licenses the use of beliefs and tradition, given its Western heritage, one is also thereby taking stock of and criticizing a tradition traceable back to the ancient Greek idea of *logos*, which I call the West, which is not a geographic or ethnic notion, but a political force.

In part due to research in non-Western approaches to thought (such as Patañjali's Yoga) that have been applied to the challenge of cross-cultural moral understanding, inquiry into procedural questions of translation and abstract philosophical questions of propositional content (Ranganathan 2017, Ch. 4, 2018, Ch. 5), an alternative has been recently identified (Ranganathan 2017, Ch. 1, 2018, Ch. 2) – though as a procedure it is the bedrock of philosophical practice going back to Socrates. This is what we might call *explication*: explanation by way of validity, the property of logical entailment such that if the premises of an argument are true, the conclusion has to be true. To explicate is to render *explicit* reasons that logically entail (via validity) controversial conclusions (often by someone), and to further discern via entailment the concept at the heart of a debate as what competing explicated theories converge on as they disagree. Whereas interpretation routes explanation through our own beliefs as explainers, explication does not: at no point do we have to appeal to what we take to be true or believe in order to explicate. More importantly, logical validity (and all forms of reason) involves drawing a distinction between what one takes to be true, and the logical support of reasons for conclusions. To explicate is to hence forswear interpretation and to interpret is to render oneself incapable of explicating.

Interpretation and explication are incompatible. Even before we understand the logical reason for their incompatibility, we may observe their practical differences:

- Explication leads us to identify the common concept at the heart of a philosophical debate (such as a debate about ethics or dharma) as what competing theories (of ethics or dharma) in a debate converge on while they disagree (THE RIGHT OR THE GOOD). It is parsimonious.
- Interpretation proliferates concepts for terms (such as “ethics” or “dharma”) in proportion to the divergence of the beliefs of the interpreter and what is being interpreted. It is unparsimonious.
- Explication treats differences across perspectives and traditions as a matter of theoretical disagreements over common concepts, defined as the topics of disagreement. (In disagreements over ethics or dharma, this is THE RIGHT OR THE GOOD.)
- Interpretation identifies concepts as the proprietary constituents of perspectives, and has to help itself to the idea of competing “conceptual schemes” to explain differences across traditions. (For interpreters whatever the concept of ETHICS it is the proprietary part of their outlook, and alien traditions are better understood as operating with different concepts.)
- Explication can account for radical disagreement across perspectives.
- Interpretation treats disagreement across perspectives as a failure of explanation.

The main logical difference between the two approaches is their take on truth:

- Explication rejects that truth is determinative of rational explanation.
- Interpretation affirms that truth is determinative of rational explanation.

The decision of which procedure to choose is made easy by the observation that interpretation violates the basic constraint of all forms of reason by confusing what one takes to be true with what is reasonable.

For the study of religion and ethics, and the crossover of religious ethics, the distinction between interpretation and explication is of the first importance. If we interpret via the *West*, normative contributions *from* the European tradition will be acclaimed as rational and philosophical (as they can be derived from European beliefs) or relegated to its prehistory (Homer for instance) while everything originally non-Western (such as Judaism, Christianity, Islam, Zoroastrianism, Jainism, Buddhism, Hinduism, Taoism, Confucianism, Shintoism, etc.) will seem opaque and traditional, and mystical in proportion to their divergence from the European – they will not be counted as straightforward contributions to moral philosophy but identified as demarcating the outer boundaries of secular or rational philosophy – called “religion.” Indeed, Western interpretation gives rise to what we might call Secularism₂, where the secular is the non-religious and the religious is anything originally non-Western.

Explication in contrast focuses on theoretical disagreement and hence provides no grounds for distinguishing the secular from the religious. Indeed, the entire process of investigation via explication is what we might call Secularism₁ – undogmatic, unconstrained philosophical disagreement. Explicated, we not only observe that most “religions” are identifiable with a normative theory about the *right* procedure or the *good* outcome, Hinduism is shown to be continuous with the basic disagreements of moral theory (Ranganathan 2018, Ch. 3).

In the next section background distinctions necessary to make sense of the debate will be reviewed. In the third section differential outcomes of the two models in application will be examined. In the fourth section some objections will be considered. In the fifth section will be the conclusion.

Background Concepts and the Distinction

To appreciate the distinction between interpretation and explication, on logical grounds, some analytical distinctions are useful. The first is the distinction between objectivity and subjectivity. An object is something that can be perceived from differing perspectives: how it looks may differ depending on one's perspective but the thing in question (say a chair) is the explanation for the asymmetry of one's impressions relative to one's vantage. Objects are hence things we can disagree about from differing vantages. Our descriptions of the thing in question can be inconsistent, and we isolate the object as the explanation for this disparity. The subjective in contrast is what can be appreciated from one perspective only and it cannot be assessed from competing perspectives; the room for disagreement of the sort we find in the case of objects is curtailed. A mirror is a useful model for the distinction, for while a mirror is objective (it plays a central role in accounting for how it appears differently to us given the vantage we take relative to it), the reflections we see in a mirror are better explained by our perspective and vantage. Hence, the mirror is objective, and the reflections we experience relative to the mirror are subjective.

Another important distinction that is required to make sense of the distinction between interpretation and explication is the distinction between a proposition (thought, which I shall symbolize as “*p*”) and a belief about such a proposition. A belief (in the first instance) is a propositional attitude like fear, or

doubt: it takes a proposition as its object. But in the case of a belief, the attitude is one of assent to a proposition. Hence, the description of the belief *x* believes *p* is true if *x* believes *p*. Remarkably, if we understand that *x* believes *p*, we thereby agree with a description of the belief. Yet, *p* in this case could be false. For instance, I might believe *p* (it is raining outside) and the description of the belief is true if I believe it, but it might be false that *p* (it is raining outside). We may even disagree that *p* (it is raining outside), but agree that *x* believes *p* if *x* believes it. So while beliefs take on propositions as their objects, the truth of a belief and its embedded proposition are independent. Nevertheless in ordinary contexts, this seems to give rise to what Ludwig Wittgenstein (*Remarks on the Foundations of Psychology* §472) called “Moore’s Paradox”: there is something strange about saying “It is raining outside, but I do not believe it” (Moore 1944, 204). While this seems to present problems for understanding why someone would apparently have a belief at variant with the truth of the embedded proposition, this is not a contradiction as beliefs and thoughts are logically distinct.

The final distinction that we require in order to understand the difference between interpretation and explication is the distinction between validity, and invalidity. Validity is the essential property of good deductive inferences: if the premises (reasons) are true, the conclusion has to be true. For an argument to be valid is not the same as having true premises and a true conclusion. A valid argument may have false premises and a false conclusion. And an invalid argument may be comprised of true premises and a true conclusion. Hence,

- Truth is neither necessary nor sufficient for validity.

In the case of valid arguments with true premises, we call such arguments *sound*. Determining the soundness of an argument is a two-step process: we have to first determine whether the argument is valid, and this involves ignoring the question of the truth or falsity of the premises for validity is not determined by truth or falsity. We rather have to test the argument to see whether the conclusion would have to be true if the premises were true. If an argument clears this hurdle, we can determine whether the premises are true, and if they are the argument is sound.

Validity as something that comes apart from truth or falsity is objective: we can converge on the validity of an argument from different perspectives as we converge on a chair, for instance, while disagreeing about our description of the argument as we disagree about our description of a chair from differing perspectives. From some perspectives, the argument may appear sound, while from many others it may appear valid only, but we may further disagree about the truth or falsity of its premises or conclusion. Invalid reasoning, which attempts to promote arguments on the basis of the truth of premises, violates validity, but thereby also soundness.

Validity is a characteristic of deductive logic. But there are other forms of reasoning: induction and abduction. Interpretation sympathizers may wish to assimilate or explain interpretation by way of one of these alternatives. This is problematic.

An inductive argument is an argument whose premises support a conclusion, probabilistically. Inductive arguments can be strong but yet fail to be valid. Yet a distinction can be drawn between strong inductive arguments and the cogent arguments, which corresponds to the distinction between validity and soundness: strong inductive arguments are those whose conclusion are strongly supported by the evidence, but the premises in this case need not be true or credible – the cogent arguments in contrast are the strong arguments with true or credible premises. Abduction, or inference to

the best explanation, attempts to identify one explanation as superlative relative to the alternatives. But the best explanation need not be the true one, and in the end we may have to settle for identifying the best of candidate explanations relative to the known possibilities that in the fullness of inquiry, is shown to be mistaken. Both kinds of reasoning processes are used in the empirical sciences, and here too as in the case of validity, we see that:

- Truth is neither necessary nor sufficient for reason.

The objectivity of reason (that we can comprehend it and yet disagree about it) is predicated on a distinction between the truth of the premises and the credibility of the explanation. From these considerations, we can draw a generalization about reason:

- Efforts to make truth the primary marker of reason fail and moreover violate the objectivity of reason.

This violates the highest standard of reason – validity – but as noted, abduction and induction also respect this standard as neither *form* of reason expects that the merits of reason come down to truth. Put another way, neither *form* of reasoning entails that we should disregard validity as a standard of reason. But interpretation in contrast does, for if we have to restrict ourselves only to explanations that rely on what we take to be true (or is true), we disregard validity as a basic standard of reason. So on further consideration we can draw a distinction between forms of reason that fail to live up to the standard of inference (including abduction and induction) and a *form* of explanation that simply disregards the standards of reason: interpretation.

It may seem that interpretation is like abduction, for when we interpret we rely on beliefs, and it may turn out that an embedded proposition in a belief is false in the way that the best explanation on balance might turn out to be false, though we believe it to be the best. So, the problem with this analogy is that believing an explanation to be the best is not the same as believing it to be true. And, moreover, a belief is a propositional attitude that a proposition is true.

The Distinction

To explicate a perspective P – augustly called a “philosophy” – about topic t , is to E :

- Discern the reasons of P that constitute P , which explain P ’s use of “ t ” and to arrive at a systematization of P ’s reasons that explains the uses of “ t .” The systematization of P ’s reasons that entails P ’s t -claims is P ’s theory of t . The reasons of P may be what P explicitly says, or what is entailed by P .

This is the first step. This is when we look to a perspective to provide the reasons that entail its use of a controversial term, like “dharma” or “morality.” Its reasons are its theory of dharma or morality. Then there is the second step:

- Compare theories of t : what they converge on while they disagree is the concept T .

This comparative step also assumes validity in so far as the concept that constitutes the disagreement will be entailed by an aggregate of competing theories. We could call this second step the *consilience of perspectives*. In short,

- Explication is the explanation of a perspective in terms of its entailed theories that entail the perspective’s controversial claims.

We can see Socrates engaging in this activity in Plato's dialogues, especially the first step of explication, where he attempts to understand the theory of his interlocutor that would explain the kinds of claims the interlocutor makes with a controversial concept (whether *JUSTICE* or *KNOWLEDGE*).

Then there is interpretation. To interpret some package *P* is for the interpreting subject *S* to *I*:

- Use *S*'s reasons (or if you prefer, "premises," "assumptions," "beliefs," "truths," and even "tradition") r_s in the explanation of *P*.

In short,

- Interpretation is the explanation in terms of the beliefs of the interpreter.

The failure to identify the distinction between interpretation and explication is all the more remarkable as interpretation has two problems, which explication does not:

- it is subjective
- it violates validity (and all reason for that matter)

Interpretation is subjective for interpretations depend on the beliefs of the interpreter: change these beliefs and one changes the interpretation. But it is also irrational for interpretation is committed to violating the basic standard of reason that truth is neither necessary nor sufficient for reason, for it treats what one takes to be true as the basis of explanation. In effect, it consists in confusing propositions (which we can disagree about) with beliefs (which we cannot disagree about).

Interpretation and Explication in Action

If a Kantian who endorses Deontology (the idea that rights and duties are goods of moral theory to be justified by procedural considerations), were to interpret a Utilitarian (someone who thinks that agent neutral ethical ends, like harm reduction or the maximization of happiness, should justify moral action), the Kantian could only explain Utilitarian uses of "ethics" as meaning what the Kantian takes to be ethical when the Utilitarian uses coincide with the Kantian perspective. In every other case, the Kantian would be inclined to correlate Utilitarian uses of "ethical" with what the Kantian takes to be true in that case. Hence, when the Utilitarian uses "ethical" for "happiness" the Kantian would interpret this to mean "happiness" for this is what the Kantian takes to be true in this case. When the Utilitarian uses "ethical" to mean "harm reduction," the Kantian would similarly interpret it as meaning "harm reduction" for this is what the Kantian takes to be true in this case. In this way, meanings of "ethical" in the Utilitarian outlook are multiplied relative to the Kantian scheme. Similarly, if the Utilitarian were to repay the favor, the Utilitarian could only interpret Kantian uses of "ethical" as meaning ethical when the Kantian uses the term in a manner consonant with the Utilitarian outlook. In every other case, the Utilitarian would interpret the Kantian as using "ethical" to say whatever the Utilitarian takes to be true in the same cases. In effect, their interpretations of each other would not converge (for each uses different definitions of "ethical" as the basis of their interpretations), the meanings they attribute to "ethical" in each other's lexicon would be many, and they would have very different accounts of what the topic of contention is: each would use their own theory or outlook to define the topic. Further, if a Hegelian (following the *Philosophy of Right*) were to enter the picture, who draws a distinction between ethics (socially

encoded values) and morality (normative principles that arise from reflection) then yet another very different approach would ensue: likely the Utilitarian would appear to say nothing about ethics or morality on the Hegelian account, and the Kantian would apparently have views on morality but not ethics as Kant's moral theory is about generating moral principles from reflection.

Explication in contrast asks us to look to a perspective that logically entails a theory about a term such as “ethical,” “ethics,” “moral,” or “morality,” that entails all the perspective's controversial claims about ethics or morality – this would be the perspective's theory of ethics or morality – and further asks us to identify the basic concept of a debate as what competing theories about a term (“ethics” or “moral” as the case may be) converge on as they disagree. In the case of ethics or morality, if we apply this procedure, we discover that the basic concept of disagreement is about *right* procedure or *good* outcomes: *THE RIGHT OR THE GOOD*. In this case of explication, the Kantian and the Utilitarian would be able to agree about the proper explication of each other's theory of ethics, and moreover what the basic topic of disagreement is. Whereas interpretation multiplies meanings of alien term usage in proportion to its divergence from the interpreter, explication consolidates such usage, and accounts for it in terms of the common concept of contention, which in ethics is *THE RIGHT OR THE GOOD*. The Hegelian too would be understood as having two contrary descriptive views on *THE RIGHT OR THE GOOD*: one the Hegelian calls “ethics,” the other “morality” – and this is something that all would be able to converge on as they disagreed about theories about *THE RIGHT OR THE GOOD* variously articulated with terms such as “ethics” or “morality.” From the comparison of the two methods, it is clear that explication is the basic method of philosophical research for the following reason: philosophy is a discipline and disciplines allow us to disagree about various theoretical matters and explication allows us to not only understand each other's theories, but also disagree. Interpretation in contrast does not allow for understanding of the alien or disagreement as the interpreter uses their own outlook as the measure of all.

If we were to interpret the Indian tradition, from a conventional Eurocentric starting point, we would have to conclude that “dharma” is a term that has been used in a “bewildering variety of ways” (Larson 1972, 146) and that “*DHARMA* is a concept difficult to define because it disowns or transcends distinctions that seem essential to us” (Lingat 1973, 3). “It stands for nature, intrinsic [ontological] quality, civil and moral law, justice, virtue, merit, duty and morality” to name a few (Rangaswami Aiyangar 1952, 63). There is no exhaustive list of the various meanings of dharma, though it is widely acknowledged as having many irreconcilable meanings: what meanings “dharma” has depended upon the beliefs of the interpreter and what they are willing to say in the context that “dharma” is used by an Indian author. At this point it might seem helpful to acknowledge some thinker who especially embodies the interpretive approach to Indian thought. It is however sadly easier to acknowledge the critic of this approach (me) than an exemplar of the interpretive approach as it has been the default approach to the study of Indian thought in academia, and is to be found anywhere authors assume that a term such as “dharma” variously used across competing traditions has many meanings, disambiguated by what the explainer takes to be true about a range of substantive issues.

If “dharma” is the term that Indian philosophers used to articulate their theories of dharma and to disagree about *THE RIGHT OR THE GOOD*, interpretation would result in the conclusion that Indian thinkers were generally uninterested in moral theory and hence moral philosophy. This position, that Indian thinkers did not discuss what “we call moral philosophy,” was clearly articulated by the imminent Indologist, Bimal Matilal (1989, 5). But he was merely articulating common consensus among Indologists that is a function of Eurocentric interpretation and hence was (and in some corners continues to be) the

standard view: that Indian thinkers did not discuss ethics or moral philosophy extensively. Indeed, the unparsimonious approach to the meaning of “dharma” and the idea that Indian thinkers were uninterested in ethics go hand in hand (for a recent review of the literature, please see Ranganathan 2017, 52–55).

Yet, if we were to explicate every Indian *darśana* (perspective) we would not use our own perspective on controversial philosophical terms as a frame for the study of Indian thought. We would rather look to each perspective to entail its own theory of “dharma” that further entails the perspective’s controversial claims about dharma and what we would discover is that what these theories converge on as they disagree, is *THE RIGHT OR THE GOOD*. In short, we would come to *discover* that disagreements about dharma and disagreements about ethics or morality are disagreements about the same concept: *THE RIGHT OR THE GOOD*. This procedure can be applied to any body of literature. For instance, in explicating Chinese philosophy, we will discover correlatively that disagreements about the *tao* (the way) amount to disagreements about *THE RIGHT OR THE GOOD*.

By explicating traditions of philosophy, we would discover four basic ethical/moral/dharmic/tao theories:

- Virtue Ethics: The Good conditions or produces the Right.
- Consequentialism: The Good justifies the Right.
- Deontology: The Right justifies the Good.
- Bhakti/Yoga: The Right conditions or produces the Good.

On this way of dividing up the options, theism (which characterizes many familiar religions) is a version of Virtue Ethics: accordingly God is the paradigmatic virtuous agent, and right procedure and moral guidance follow from God’s essential virtue. But many other religions that give pride of place to virtue (such as Jainism) find a home here (Soni 2017). Other prominent religions, such as Buddhism, explicable as a version of *Consequentialism*, also fall into this list (Goodman 2009). A notable Orthodox Hindu option, known for its defense of Vedic ritualism, is deontological according to the above reckoning, namely Pūrva Mīmāṃsā. Classical authors in this tradition argue that the gods are not real, and we do not require them to take dharma seriously.

Bhakti/Yoga

Bhakti/Yoga, a very influential Indian theory, which is often conflated with theism, is the opposite of theism, which is a version of Virtue Ethics. Bhakti identifies the procedural ideal of Unconservatism and Self-Governance as the Lord – it is Right not Good – and approximating the Lord in practice brings about the good, namely our own Lordliness. Yoga/Bhakti is importantly distinct: it does not define the Right thing to do in reference to the Good, as we find in the other three competing moral theories. The Right is defined by the procedural ideal of personhood: the Lord. One approximates the Lord (the Right) in one’s own life by devotion to this intentional practice of personhood defined as the Lord: yoga. The good is merely the perfection of this practice. One can practice this devotion correctly without thereby being good at it and the goodness of the practice is irrelevant to its moral value as Right.

This position was formulated canonically in Patañjali’s *Yoga Sūtra*, and later defended by the extremely influential Rāmānuja. Whereas this work begins by defining Yoga as a conquering of waves of external influence by taking responsibility for thinking, later in Book 2, we find the practice

re-explained in terms of three procedural ideals: *Īśvarapraṇidhāna* (approximating the Lord), *tapas* (the practice of creating friction, going against the grain and being unconservative) and *svādhyāya* (self-study, which in the case of Yoga amounts to self-governance as studying consists in controlling objects of inquiry). So not only is the ideal of the Lord analyzed into two procedural ideals (*tapas* and *svādhyāya*) by virtue of the procedure of approximating the Lord, but (I have noted elsewhere) the entire model corresponds to the iconographic depiction of Ādi Śeṣa (the cosmic serpent) floating over waves of external influence by virtue of devotion to the deities, Viṣṇu (depicting himself as unconservatively transcending his own past choices as manifested presentations, or *aṁśas*) and Lakṣmī (depicting herself as someone who sits on herself and hence governs herself). The historical connection between the deity Vishnu and traditions of Bhakti/Yoga is hence analytical. Worth stressing additionally is the importance and role that *svādhyāya* (self-governance) plays in this account. According to Patañjali, the practice of self-governance reveals one's own chosen ideals (*iṣṭadevatā*) (YS II.44). This is to say that we are responsible for the ideals we set ourselves – including Yoga. Yoga and its ideals are hence not explainable by tradition, revelation, or faith, but by our own choice to set our own ideals as an exercise of our own Lordliness. But it also entails the historically liberal attitude that South Asians (and Hindus) have had to gods and philosophical freedom.

To be a person on this account is to be the kind of thing that has an interest in its own unconservatism and self-governance. The Earth and other animals are hence people on this account as they thrive given their own unconservatism (freedom not to be constrained by the past) and self-governance (freedom to move into a future suited to themselves). But understanding and practicing one's personhood is correlatively not a proprietary matter: it is by virtue of the abstraction of the Lord that people are what they are. And hence being devoted to the intentional practice of one's own personhood (yoga) involves an activist's approach to deflating harms of the external world to allow for a diversity of people sharing an interest in their own Lordliness.

Politically and ethically, Yoga/Bhakti in the *Yoga Sūtra* constitutes one of the earliest articulations of an inclusive politics of direct action that treats non-harm as the first political commitment: not merely as an negative action of avoiding harm, but also as a positive intervention in transforming social dynamics to make room for diversity (YS II.30–35). The theory was extremely influential on the thought of M. K. Gandhi who referred to Patañjali numerous times as originating the policy of nonviolent direct action (Puri 2015), and indirectly Martin Luther King. Modern environmental and animal rights movements of direct action with Bhakti like accounts of moral standing, that look back to Gandhi for support, can be traced back to the Bhakti/Yoga of the *Yoga Sūtra*.

Secularism

A political morality of Bhakti that encourages diversity and the importance of self-governance in setting one's own ideals may strike many as modern and Western. Ironically, this is not an approach to ethics that has any deep, historical roots in the West, which since Plato through to Hegel has emphasized the communitarian importance of shared goals and ideals defining definite societies. The first theorist typically associated with this brand of liberalism that emphasizes intellectual diversity as a constituent of healthy and thriving societies is J. S. Mill who was a colonial administrator of India. While *On Liberty* is well known for its racist depiction of brown folks as incapable of benefiting from freedom (I.10), Mill elsewhere recommended that we look to India to inform our political theorizing (cf. Mill 1861, 573–579).

Mill's orientation is unsurprising when viewed as a Westernized, continuation of elements of Bhakti, and the Indian tradition.

Explicated, the Indian tradition is a continuous disagreement about dharma, and such an explication reveals nothing like religion. Indeed, religious identities in India such as "Hinduism" had to wait for British colonialism. To generate religious identity, one must either treat the European tradition going back to Plato as the content of reason, interpret, and identify positions that fall outside of one's interpretive Eurocentrism as religion, or one must identify a criterion that defines the religious in contradistinction to the secular, and employ this in understanding, which would also be an interpretation. So contrary to the usual expectations, secularism as a free and open philosophical disagreement (Secularism₁) is indigenously South Asian, and religious identity requires interpretation, itself a historically Western mode of explanation. And, moreover, "Hinduism" a term coined by the British to identify all indigenous South Asian religion that is not Islam, is continuous with the disagreements of philosophy and hence we find within it the full range of basic ethical theories (for a tally, please see Ranganathan 2018, Ch. 3). Hinduism, explicated, is an example of Secularism₁.

Typical discussions of secularism rely upon the notion of Secularism₂ where secularism is what is not religious, and the religious is what is not interpretable via Eurocentric doxography. One of the challenges of Secularism₂ is accounting for how secular freedom is possible without paradoxically assuming certain basic liberal values. John Rawls in his famous *Political Liberalism* argued that the basic values required for a liberal and secular society had to be internal to perspectives compatible with a secular environment, and this, in addition to observations about South Asia and the European development of Secularism₂, has led to the charge that secularism cannot claim to be neutral as it itself is substantive and culturally arbitrary (Roover 2015). A solution to this problem is to treat the values that we require for a secular society as those we converge on as we are free to disagree (as opposed to the values we must already be committed to) made possible by adopting an explicatory approach to understanding. And these values that we converge on as we are free to disagree are those of Yoga (Ranganathan 2018): a devotion to Lordliness (in the abstract) and the constitutive responsibility to set our own ideals in a world safe for others to do the same.

Objections

The standard objection that explication elicits from defenders of interpretation is that explication, and any attempt to engage in objective reasoning, is naïve, and an attempt to ignore the inescapable: that all understanding is some version of interpretation and hence is itself historically conditioned by the tradition of the interpreter. This is a line of argument defended by Hans-Georg Gadamer in his *Truth and Method*, which has been especially influential in (European) Indology. Gadamer's conclusions about the inescapability of the (inter) subjective element of interpretation, and that we are always interpreting against the backdrop of our own tradition, are produced after a survey of salient intellectual options in the Western tradition, such as Historicism (the notion that we can appreciate how prior moments in history produced opinions that were a function of their circumstances) or J. S. Mill's enlightenment optimism about the scientific objectivity of reason, that Mill reduced to the laws of psychology. These movements and figures tried to transcend the contingencies of their era, but were themselves functions

of their times lacking historical awareness. Gadamer writes, “the naïveté of so-called historicism consists in the fact that it does not undertake this reflection, and in trusting to the fact that its procedure is methodical, it forgets its own historicity” (Gadamer 1996, 299) – and indeed, this criticism seems to be generalizable to any alternative. When we are trying to understand a text or what someone is saying, on Gadamer’s account, we are trying to understand “how what he is saying could be right” (Gadamer 1996, 292). More to the point, “A person who is trying to understand a text is always projecting” (Gadamer 1996, 266–267). Certainly if understanding is this exercise of sympathy where we try to understand how something could be right, our own biases and prejudices would play an indispensable role in our narrative, and Gadamer would be right that “all understanding inevitably involves some prejudice” (Gadamer 1996, 270). The uptake in all of this is that “The prejudicial character of understanding means that, whenever we understand, we are involved in a dialogue that encompasses both our own self-understanding and our understanding of the matter at issue” (Malpas 2018).

The explicator’s initial response is to point out that the very theory of interpretation – the attempt to understand how something could be right, which further entails that all understanding involves some prejudice – is itself an outcome of a historically and culturally contingent approach to understanding, and as I have noted, it is closely associated with the West’s historical model of thought as linguistic meaning. Yet, the interpreter exempts the theory of interpretation from being considered a historical bias: it is rather presented as a universal theory of understanding and is hence used to judge ethics from alien traditions. For the explicator, this constitutes a *reductio ad absurdum* of the theory itself, for properly contextualized it would be rendered exactly how it is explicated: as a contingent approach to understanding given a model of thought that, moreover, only yields an account that is consistent with the beliefs of the interpreter. It is hence doubly contingent – historically and personally.

Second, explication does away with the key feature of interpretation,

- treating explanation as something entailed by the beliefs of the explainer.

In adopting this, interpreters render explanation radically contingent upon their own biases and tradition. In rejecting this model of explanation, explicators reject that understanding is necessarily a matter of self-understanding. When we explicate the thesis and reasons of the interpreter for instance, we are free to endorse it or reject it: it is not entailed by our commitment to explication or even the belief that explication is the appropriate method of understanding. (In contrast, when the interpreter attempts to understand explication they, by virtue of their method, attempt to understand explication as an entailment of their own theory, which confirms in their view the inescapability of interpretation.) The methodology of explication in using logic to focus on the reasons and conclusions of the explicated (as opposed to misusing logic to generate explanations of third parties based on our own convictions) is *prescriptively* universal (in the sense of abstract). For not only does it respect the basic principle of logic (that reason is not reducible to truth or what we believe but inferential support) but it also helps transcend our cultural context, by allowing us to render explicit third-party explicated positions as *logically independent* of the explicator’s commitments. Hence the objectivity of the method requires no denial of the historical contingency of the explicator’s beliefs.

The third point of departure of the explicator from interpretation as Gadamer explores it is that the interpreter is committed to treating the event of understanding as characterizable by the truth. As

Gadamer concludes, “In understanding we are drawn into an event of truth and arrive, as it were, too late, if we want to know what we are supposed to believe” (Gadamer 1996, 490). This characterization of understanding as truth confuses two different varieties of claims:

- p (e.g. “interpretation violates basic standards of reasons”), and
- x believes p (e.g. “you believe that interpretation violates basic standards of reasons”)

The two claims are importantly different: p is true just in case p , and x believes p is true just in case x believes p – p may be false – or we may not know whether to believe p – and it may be true that x believes p . Distinguishing such claims is part of the basic practice of yoga, as the control (as opposed to the believing) of thought (YS I.2–3). Yet, by conflating these two varieties of claims, understanding p is about (someone) having some belief about p . This is in effect to engage in the fallacy of *begging the question*: it assumes (the inescapability of interpretation) what is to be proved (interpretation), made possible by equivocating two varieties of claims (also a fallacy). But this conflation is also to project on to critics who dissent from interpretation the charge that they too are engaging in interpretation. This is the fallacy of *tu quoque*. By departing from both formal and informal standards of reason, the interpreter is able to conflate the understanding of someone else’s argument with their own self-understanding and maintain that the process of understanding is characterized by the truth as a disclosure of what is understood. On the flip side, this conditions a worry that any understanding we have about past figures and their perspectives is flawed, for it would seem that any account of what they might have been committed to in this past form of life, such as p , is reducible to *our* historically disconnected belief they were committed to p (a worry that depends upon the conflation of p and x believes p). The explicator’s route engages in none of these errors (starting with the logic violating assumption that truth is the basis of explanation and ending with fallacies of *begging questions* and *tu quoque*). We may be entirely agnostic about what we explicate *because* we render explicit historical reasons that do not have to be endorsed to be understood. And as this process involves reason, which is independent of truth, understanding is not characterizable by truth. Moreover, having duly explicated interpretation, by our practice of yoga, we might also notice that it is unobjective and self-defeating for basic reasons of reason!

Future Directions

As noted by the editors of *The Encyclopedia of Religious Ethics*, “the very terminology. . . of “religion” and “ethics” is Western.” Does it follow that the conceptuality of ethics is Western? If we conflate linguistic meaning with conceptual content: yes. Then, we are down the path of interpretation. Alternative models of thought and their parts (concepts) are to be found in India, and no doubt elsewhere, that free us from having to understand concepts in terms of the cultural contingency of our language. In this entry, we have not explored these alternatives, but we have noted that the identification of moral theoretical disagreement across traditions does not depend upon the West’s intellectual tradition. Rather, it relies on a methodology central to philosophy but paradoxically peripheral to the West: explication. At present, this insight, made possible by the interpretation-explication distinction, has led to rethinking about Indian religions as simply Indian moral philosophy, interpreted by the West. Future directions can and will, no doubt, extend this insight to religion as such.

CHAPTER 100

Modes of Interpretation in African Religions – A Yoruba Axiological Perspective

John Ayotunde (Tunde) Isola Bewaji

Introduction

Yoruba civilization is one of the most ancient, advanced, and urbanized in the world. Because Yoruba society is trans-continental, though concentrated in Western Nigeria, it has radiated through various circumstances of dispersals and historical exigencies of forced and voluntary migrations to other parts of Western Africa, the Americas, and the Caribbean. It is well-nigh impossible to annotate a neatly homogeneous value system to which this community subscribes. An awareness of this signals a cautionary caveat, that as much as even a small community of humans may display individual value variations, when it comes to large segments of humanity, ascribing a common value system or tradition to an even larger community becomes even more challenging. Regardless, it is still meaningful to speak of a common value system from which most critical issues are understood, meaning made, narratives created, and decisions effected.

Our interest in this discussion is to appreciate as modes of interpretation the linkages between an overarching Yoruba ontology and the value members of Yoruba society display toward their environment (natural, social, political, moral, cultural, and so on). We will use Yoruba ontology (metaphysics), epistemology, and axiology to evince Yoruba intellectual modes of interpretation of reality, creating what we call Yoruba ecosophy. We will show that the Yoruba value systems are eco-respecting, eco-friendly, and geared toward sustainable human habitation in a world in which humans constitute one small fraction of sentience. Our discussion will respond to the following questions: a) What are values? b) How are values derived? c) Are there Yoruba values? d) What is the environment? e) How are concepts of environment derived? f) What is the relationship between values and the environment? g) What is the relationship between Yoruba values and the environment? h) Do these axiological orientations have implications for a holistic approach to the construction of modes of interpretations for geo-sustainable human future?

Modes of Interpretation and the Question of Values

Modes of interpretation are closely connected to the question of values. Human beings are language-using, concept-developing, and communicating animals. However, other forms of life also engage in communicative and other purposive activities even though we are unable to understand their modes of

interpretations (Fagunwa 1950). Functioning to present the modes of interpretations are symbols, images, and stereotypes which are special aspects of languages developed by human beings in attempts to convey ideas and maintain comprehension, apprehension, and drive certain attitudes and modes of behavior that conform with certain expectations.

It is the same way with other language-using sentient beings. Our ignorance of their languages and the diversity of their uses does not excuse our underestimation, even denigration, of these languages. Among humans the choice of symbols and images that enter into the representations speak volumes about beliefs, epistemes, expectations, fears, hopes, prejudices, and values embraced by persons making the representation. Largely, getting behind the representations to distil the presuppositions or the modes of interpretation that give them meaning is not always easy. In many instances the origins of the ideas have been lost in the milieu of socio-genesis of the ideas. However, we can make retroactive explorations which may not get at the intention of the ideas, but which may help understand the consequences of the ideas for Africans especially and humanity generally.

The need to appreciate modes of interpretation from different cultural perspectives is necessary even in appreciating the relationships that exist within and among peoples of the same hue and color. Consider for example the ideas, images, and perceptions between peoples of different ethnicities living within the same country such as Nigeria. Symbols and images are projections that capture attributes that are derived, at times based on observation, but at other times based on abstractions with little or no understanding of what is represented. They fill the gaps in cognitions and raise themes of characterization that may or may not have relation to any truth or reality. This opens the insidious possibility of manipulating the gullibility of the masses with pernicious narratives.

Values

In virtue of human dispositions, values undergird all aspects of human existence. Values have evolved in various ways, consciously and otherwise, to authenticate the processes of being. Evolving values are also reflections of the modes of interpretation of reality. Every society evolves values based on deliberate and accidental events in the lives of members of the society. The critical component of Yoruba values can be understood in relation to beliefs about collectivities that constitute the foundation of socioeconomic, political, religious, and other ideas. This accounts for why even in a monarchical system of governance there is allowance for gender equality, respect for the disabled, young, pregnant, elderly, foreigners, and those challenged one way or the other. The modes of interpretation weave together spiritual, moral, and social ideas in the minds of members of society backing social responsibility. And those who seek to take advantage of weaknesses, either of the system, or of other humans or natural elements are speedily dealt with in order to restore the equilibrium (*Efunsetan Aniwura – Iyalode Ibadan* and *Agbalowo meeri, Baale Jontolo* are instances, while the destooling of the king of Owo (Olagbegi), and Akure (Deji) reinforce the unnaturalness of anti-social, amoral, and spiritually reprehensible behavior. What, then, are values?

The concept of “value,” on the face of it, derives from human appreciation of worth, importance, or utility of some/thing, where “something” or “thing” could stand for a being, an idea, a material or resource, a location, and so on. To this end, “value” can be used to describe an ascription of intrinsic content not necessarily dealing with utility as such, but marking the interpretive ideas of objective integrity of things. In that case, value annotates the regard the item/thing/being deserves. To have value in these senses is to be important, to be of worth and to be useful. But that is not all: to have value also

means the principles, ideologies or standards by which one lives, relates to others, makes decisions or determines modes of existence.

From these ideas it would be clear that values suffuse all aspects of existence and moderate relationships between humans, animals, nature, and the un/mult/iverse. They become refined and reified over time, even projected to the supersensible to give it reverence and authority, thereby assisting in determining the modes of being which members of different societies exhibit in their spiritual and secular lives. This is often obscured by the fact that in many instances the values are not explicitly formulated. Humans may be too busy just living/surviving to have enough time to examine the metaphysical presuppositions that underlie the ways of being that make a people who they are.

Value determines conditions of being and non-being, determining relationships as well as goals and processes. Values determine how we see what we see, what actions are worthy and how these are to be pursued. This is where historical factors play important roles in the engineering of values in society. The engineered values are then regarded as cultures: they are enshrined in the stories, theories, technologies, arts, educational systems, religious practices, patterns of relations (economic, political, filial, relaxation, sexual orientations) for making peace, war, conflict management, and so on. They underwrite what society considers important to preserve, perpetuate by propagation, or jettison by rejection or destruction.

In a sense, what has happened to global humanity has been the capacity of segments of humanity to determine what would constitute values, not just for themselves, but for the rest of humanity. The fact of epistemicide and epistemic deficit in Africana societies have bred a generation of Africans who doubt whether their ancestors ever had any values or capacities for such abstract constructs. It has led to the *Black Skin, White Mask* or double consciousness that plagues African intellect and daily existence. The indignities that this has brought have been compounded by the double assault of poverty and ignorance of traditions to create the leverage for the destruction of indigenous knowledge systems in favor of pernicious imported fads and consumer items. While it may be difficult to recoup or excavate old values, traditions, and beliefs, there is nothing stopping us from at least recognizing what was, evaluating it, and determining whether there is still any place for them in our existential circumstances. The benefit will be the knowledge and even modified application of those values, ideas, and beliefs.

Sources of Yoruba Values

In order to understand Yoruba values, just like attempts seriously to understand American values, European values, Chinese values, or any other value system, one has to revisit the metaphysics/ontologies and epistemologies constructed by the people as explanations of reality, knowledge of reality, relationships, and so on. These are the grounding modes of interpretation that supersede even religion or politics. In terms of origins, there are two prevalent traditions of how the world came to be and how Yoruba people originated.

According to Stride and Ifeka (1971, 289),

The traditional history of Oyo goes back to the founding of Ile-Ife, the primary dispersal centre of the Yoruba people. One tradition of origin is a mythical creation legend which intimates that the Yoruba were the original inhabitants of the Ife area. At the dawn of time, the world was a watery waste. On the orders of his father – the supreme god, Olorun – Oduduwa climbed down

a chain from the sky. He brought with him a handful of earth, a cockerel and a palm nut. He scattered the earth upon the water and it formed land at Ile-Ife. The cockerel dug a hole in which Oduduwa planted the palm nut and up sprang a mighty tree with sixteen branches, each the ruling family of an early Yoruba state. To this day Oduduwa's chain is preserved among the sacred relics of the Yoruba.

There are various renditions of this story of creation. The constants are the agencies of Olodumare or Olorun, Orisha-nla or Oduduwa, a pigeon or cockerel, a palm nut, blending divinity with deity/god/humanity, "lower" animals and plants in the process of creation, thereby providing a representation of all that is – supra-terrestrial, terrestrial, humans, animals, and plants. The significance of the multi-agency collaboration in the creation (*ni igba Iwase*) of what there is will become evident when we examine the nature of values in Yoruba culture and how this determines relationships between supernatural beings, human beings, and all other things in nature.

According to Stride and Ifeka (1971, 290), Yoruba people also have another story, a migratory one, depicting their understanding that they originated from somewhere. They say,

Another tradition indicates that the Yoruba people were produced by inter-marriage between a small band of invaders from the savanna and the indigenous inhabitants of the forest. The story is that Oduduwa was the son of Lamurudu, sometimes described as a ruler from the East, sometimes as a prince of Mecca. When Islam was introduced into his homeland, Oduduwa refused to forsake the religion of his ancestors and he and his supporters were expelled from their native land. After long wanderings, they settled among the forest people and founded the state of Ife.

Oduduwa had seven descendants. Some traditions say they were his sons; others call them grandsons. These seven young men moved out to found the ruling families in seven new Yoruba states. These were named as Owu, Sabe, Popo, Benin, Ila, Ketu and Oyo.

Clearly, this myth of origin is rich in culture, civilization, humanity, and values. We find that all aspects of Yoruba existence, as individuals, in communities, within groups, relationally to the cosmos and even in the structuring of otherness, are governed by higher order rules.

We will return to a proper attenuation of the relationship between Yoruba conception of reality as the harbinger of a rich value system, which ensures the proper relationship to reality. For now, we will explore the other element of our discussion – the environment – before linking both to make our point that for sustainable preservation of the environment to ensue, there is the need to revisit and adapt indigenous traditions of Yoruba values.

The Environment

The common orthodoxy of Western education teaches that the "environment" is the totality of everything that is around us. In this conception, there is a distinction made between what is characterized by a false polarity of "living" and "non-living" beings. Strangely, this conception of environment only looks at the material aspect of the universe as elements in what humans are able to access for their gratification. Those that are classified as living beings are the only beings that "live" in their environment.

The reason for that is that they are in constant interaction with their environment consciously and unconsciously adapting to conditions of their environment. This remarkable bifurcation of beings into living and non-living enables one to privilege human beings and render in rank anthropomorphic terms the narrative of other existences in purely utilitarian and instrumental terms. The extent to which living beings are able to derive benefits from non-living beings is the extent to which the non-living are to be valued.

However, it is best to look at the holistic way in which the Yoruba creation narratives factor in all elements of reality to understand human relationships with each other, as well as with every being in the uni/multiverse, and the attendant values derivable from these ontologies and epistemologies. In Yoruba culture, the environment is *gbogbo oun ti o n be lajalaiye ati ajule orun*, which must be understood as the aggregate of surrounding beings, things, conditions, or influences. This includes the totality of the eco-sphere with all the various natural resources, the air, the minerals, the organisms, as well as the non-natural aspects emanating from our relations with each other in social, cultural, and other ways, to shape our relations with nature, all material beings, and non-material beings.

Extant Yoruba literature of all genres, written and otherwise, performed or otherwise point to the environment being seen in this all-encompassing way. The way Yoruba believe that the world was created, the agency of Olodumare, the Supreme Being; those of the divinities; those of the animals; the contribution of the plants and all things in nature; the way in which indigenous knowledge systems are generated; the position of all categories of humans – young, old, women, men, leaders, followers, abled, challenged, and so on – all conduce to an systemic appreciation of what constitutes well-being of all beings. This is encapsulated in various didactic lessons for all. It is not possible to conceive of any aspect of reality in singular terms, where the nature, the identity, the destiny of any one of them does not coalesce into the constitutive categories that empower each one. Let us see these concepts presented in the Yoruba understanding of nature, the environment, reality, and essence.

When it is said that Orisha-nla/Orumila or Oduduwa descended from the sky to carry out the instruction of Olodumare to create the universe, the rope has significance. If the rope had not played its part effectively and got broken in the process of the descent, then there would have been chaos. For this, it is said *bi itakun o ba ja, owo ko ni te okere l'oko*; that is, if the rope is not broken, there is no way the squirrel can be captured. It is also said that *adiye ba l'okun, ara o ro'kun ara o ro'diye*; that is, the fowl is perched on the rope, there is no peace for the rope, there is no peace for the fowl. In essence, it is the maintenance of the equilibrium in all circumstances and each thing performing as expected that lead to peace and harmony. When any aspect of reality is dislocated, for whatever reason, unless redress is done, by whatever means indicated, then the dislocation will affect all aspects of reality.

In the various stories about the tortoise, the stalking folk hero animal of Yoruba mythology, it is clear that the values of respect, diligence, accountability, truthfulness, honesty, devotion, loyalty, and so on, are never below the surface in human endeavors and interactions with others and with non-human others. And when it comes to ideas about knowledge, belief, truth and meaning, it is clear that Yoruba respect all humans, because no one can pre-empt the cognitive ability of any being unless given that opportunity to use what they know.

In D. O. Fagunwa's novels these metaphysical and axiological ideas are amply demonstrated. Whether in the tale of *Ireke-Onibudo* (1965) or *Additu Olodumare* (1964) or *Irinkerindo Ninu Igbo Elegbeje* (1961) or *Ogboju Ode Ninu Igbo Irunmale* (1950), there is the clear interlocking connection between all aspects of reality and the manner in which the values that Yoruba profess are enunciated. The various scriptural

texts on *Ifa* by Wande Abimbola (1976), *Ifa* by E. M. Lijadu (1972), *Esu* by Ade Dopamu (1986), *Awon Oriki Orile, Akojopo Alo Ijapa* by Adeboye Babalola (1983a, b), *Aye ye won tan* by Akinwumi Isola (2009), and other authors attest to this element of Yoruba understanding of reality and values. And the Yoruba epistemological stance is respectful of every perspective, be it from the young, the old, male, female, even the mentally challenged (because, *asiwere lojo tire* and *were ile la fi i koju were ita*).

Remarkably, the dichotomy between realms of being that suffused Western paradigms of polarities does not exist within Yoruba cognitive and metaphysical consciousness as well as the Yoruba value system. This does not mean that Yoruba does not separate good from bad, or right from wrong; it is the understanding that there is a continuum of natural and unnatural relationships which mean that the movement of things from one domain to the other is never as absolute as many may think. It is for this reason that the creation story of descent on a rope from the sky/heaven does not seem paradoxical. And in Ile-Ife, there is the belief that there is a spot you can actually go to, to travel to the world beyond. The story of Orunmila and his movement between heaven and earth is a clear example of this. According to Wande Abimbola (1968), in *Ijinle Ohun Enu Ifa – Iwe Keji*,

ALAYE DIE NIPA IFA

I IFA

Ifa je orisa kan pataki laarin awon Yoruba. Awon Yoruba Gbagbo wi pe Olodumare lo ran Ifa wa lati ode orun lati waa fi ogbon re tun ile aye se. Ogbon, imo, ati oye ti Olodumare fi fun Ifa lo fun Ifa ni ipo nla laarin awon ibo ni ilee Yoruba. “A-kere-finu-sogbon” ni oriki Ifa.

Awon Yoruba gbagbo pe in igba kan ri, Ifa gbe ode aye fun igba pipe ki o too pada lo si orun. Ni igba ti Ifa wa ni aye, o gbe die ni Ile-Ife, o sig be die ni Ado (Ado-Ekiti).

Sugbon ni igba ti Orunmila fi wa laye yii naa, o tun maa lo si ode orun leekookan ti ilodumare ba pe lati waa fi ogbon re ba oun tun ode orun se. Nitori naa, gbayegborun in Ifa ise.

Oirisiirisi itan lo wa nipa ohun ti o mu Orunmila pada si ode orun ti ko si fi pada wa sile aye moo. Okan ninu awon itan yii wa ninu iwe yii. Itan yi so fun ni wi pe omo mejo ni Orunmila bi nigba ti o wa laye. Nigba ti o di ojo kan ti Orunmila nse odun ni okan ninu awon omo yii tii se abikehin patapata ba se afojudi si Orunmila. Ni Orunmila ba binu fi aye sile lo si ode orun. Ni “Ifa ba rele Olokun ko de mo. O keni te e ba ri, e sa maa pe ni baba”.

Sugbon Orunmila fun awon omo re mejeejo naa ni ikin merindinlogun. “O ni be e ba dele, be e ba fowoo ni, eni te e maa bi nuun . . .”

Ikin merindinlogun naa ni a nlo loni lati beere nnkan lowo Ifa. (Abimbola 1968, 5)

In literal translation, this can be rendered as follows:

A LITTLE EXPLANATION ABOUT IFA

I IFA

Ifa (also referred to as Orunmila) is an important deity among the Yoruba people. The Yoruba people believe that Olodumare, the Supreme Being, sent Ifa into the world to assist in ordering the world with his infinite wisdom. The wisdom, knowledge and insights which the Supreme Being gave Ifa is responsible for his place of preeminence among the divinities. He is often referred to as “the small one with the incomparable wisdom” by way of cognomen.

The Yoruba believe that once upon a time, Ifa lived in the world for a long time before returning to the abode of the divinities. When Ifa was among human beings, he lived for a while in Ile-Ife

(the cradle of Yoruba race), and he lived for a while at Ado-Ekiti. But when Orunmila was alive, he often visited the heavens once in a while when Olodumare, the Supreme Being, requests him to come back to assist him in solving problems which require his wisdom. For this reason, he is often called co-resident of heaven and earth.

There are different stories about why Orunmila returned finally to heaven and did not return to the world. One of them is that Orunmila had eight children. One year, Orunmila was celebrating a festival the last born disrespected him. For this reason, he departed the world and did not return. For this reason, anyone can now be called father.

But before he left, he gave his eight children sixteen (ikin) divination nuts. “He said to them, when you reach home and you want anything, ask the nuts. . .”

It is these sixteen nuts that we use today to ask for wisdom and guidance from Ifa.

Yoruba people believe that all animals have their own traditions, their languages, their histories, their natures; hence, that all animals have their own cultures (Fagunwa 1950). These are what makes them distinct in their different species, and also ensure their capacity for survival as distinct beings. If humans were able to listen to the voices of animals and other beings in nature, we would be surprised at the kinds of discourses that take place between them. It may be that even the divides that take place between ethnic groups among humans are non-existent among animal species; and the same may be true of plants, rocks, rivers, seas, and so on. Maybe this explains why streams flow into rivers, rivers like to flow into seas, and seas like to flow into oceans. Maybe this is why the earth is round and everything relates to everything, and going constitutes coming, while dying constitutes the coming into being. It is even possible that this accounts for understanding aberrant behavior and choices.

Relationship between Values and the Environment

The Yoruba metaphysics/ontology has within it the malleability and instructibility required to ensure that Olodumare does not become a victim of His greatness, and that human beings never forget that whatever they have received in trust for use must be maintained for posterity.

If the creation of *terra firma* was a product of the agency of multiple entities – Olodumare instructing, Orishanla/Oduduwa descending through a rope, pouch of earth, pigeon or cockerel, palm nut, and so on – then the appreciation of process and product places a consciousness of value on everything concerned. There has to be the value of respect for the integrity of all that exists, past, present, and future. The creation of the human being is even more instructive. In the case of Yoruba, a divinity makes the body, another the head, and the individual is responsible for the choices of good and bad, right and wrong that he/she originates. Humans are not passive receivers of bounty for which no responsibility ensues. On the contrary, the human being contributes to the state of the world, a world in which there is no perfection, either in the extra-terrestrial realm or in the terrestrial realm.

In the Yoruba narrative, there may be times when the Supreme Being, Olodumare, gets befuddled with the affairs of his domain and needs to consult the divinity charged with wisdom, Orunmila, Baba Ifa, who traverses both the spaces of the divine as well as that of the material. Opele and Ifa divination is used to assist God and humans in navigating the variegated conundrums of existence. To show that charging any being with absolute wisdom, power, and truth is ludicrous, the Yoruba use the tortoise. The tortoise claims to assemble all wisdom in a gourd and tries to carry it to the top of a palm tree so that no

one will be able to access it, except himself. Yet he did not realize that the placement of the gourd on his belly would make climbing the palm tree well nigh impossible until a passerby pointed this out to him. He changes the location but still fails until another person pointed out that the location made his ascent impossible. The moral of the story is that no one can claim to know everything. This is even better reinforced in the belief that it is through the combination of the wisdom of all that Ile-Ife was founded – *omode gbon, agba gbon, la fi se isedale Ife* (children are wise, elders are wise, this the foundation on which the ancient city of Ile-Ife was built).

Yoruba values recognize that certain things remain valid even while everything continues to evolve. For example, human nature may indicate that certain activities and needs are constant, but there is recognition that how these needs are met and how the activities are carried out may vary. This is why they would say, *aye n yi lo, a n to o* (the world is changing and we are changing with it). This not only speaks to the rotation and revolution of the earth around the sun, but also the evolution of how humans have to live in a changing, interconnected, and shifting existential terrain. Certainly, the Yoruba people would have been shocked to see that there are people who would want to take everything for themselves and leave nothing for others because, for them, *agbedo, enikan ki i je, ki ile fe* (it is forbidden, when only one is rich there will be no peace).

This expression of Yoruba values can also be seen through the practice of democracy in Yoruba lands. Everyone is equally important and make contributions through self and other representations. While it may, on the surface, look like monarchy, autocracy, or other forms of power, the fact of the matter is that no king, chief, or leader in Yoruba land could survive as a dictator, because, after some time, *omi a gbe lehin eja oluwa e* (water dries in the fish pond, endangering the fish); *eniyani ni m be lehin agbon, oun la fi bu omi si ti ko fi jo* (when there are persons covering the basket, water will not leak from it); *agbajo owo, oun la fi n so aya* (one can thump one's chest with the fist, not with one finger). The value system does not allow for tyranny as each individual has an intrinsic worth, even while being seemingly challenged, as in the case of *a fo'ju, a di'ti, amukun, aro, abuke, tabi arara b'ori pete* (the disabled generally). In any case, they are all specially treated, because they are *eni orisa* – special persons to the divinities, thereby commanding special respect and provisioning.

There are also clear values relating to nature – all aspects of nature. In many communities, trees, rivers, caves, and other natural resources have assisted the communities to survive in the past. For this reason, everything in nature deserves respect, recognition, and attention, so that they can continue to be useful and sources of sustenance to future generations. When a herbalist goes to assemble leaves, roots, and barks of trees, but ensures that the sun is up before doing so, or speaks to the plants to seek permission to take some in the aid of nature's interconnected assistance to each other, the untutored may think this is superstition. So, the cognitive environment is not left out. Epistemic responsibility values the collective effort, memory, and ownership of knowledge, ideas, technologies, and so on.

Yoruba Values and the Environment

In the Yoruba cultural intelligence that we have explored, the question of agency is a universal one that pervades not just the domain of humans but also animals, plants, and other entities in nature (e.g. streams, rivers, seas, oceans, wind, clouds, rainfall, sunlight). Such a holistic reflective view of the uni/multiverse requires cognitive respect for all things, which in turn leads to care and attention to what is revealed through the agencies in entities envining our spaces. Thus, while Yoruba culture celebrates

wonder and inquisitiveness, encouraging evidence gathering efforts as means of gaining knowledge, there is no arrogation of intellectual supremacy of omniscience to any being, whether natural or supernatural: Olodumare consults his diviner (Orunmila) when confused or in need of an understanding of events past, present and future. According to Wande Abimbola (1976, 5),

According to the myths, there were occasions when, there being no physical barrier between heaven and earth at that time, Ifa was summoned by Olodumare (God Almighty) to heaven to use his great wisdom to solve problems for Him. Ifa finally returned to heaven in annoyance due to an insult given to him by one of his children. Shortly after this, the earth was thrown into great confusion. Famine and pestilence raged throughout the earth. So great was the calamity that the fertility cycle of human beings was disrupted.

Aboyun ko bi mo
 Agan ko t'owo ala b'osun
 (Pregnant women no longer delivered;
 Barren women remained barren.)

The supernatural has obligations of respect and responsibility, and the natural has obligations of attention and respect toward that which not only makes life happy but meaningful.

Hence, it is not strange for humans to learn from things around us; as humans observe the habits and behavior of animals, plants, and things in nature to gain insights into the use, tendencies, and the beauties of everything. Such a cognitive attentiveness and respect does (can) not lead to arrogance, nor does it translate into the appropriation of the intuitive beings of things that do not speak our language or that seem to be of lower rank. It is understood that if everything were to be uniform, the world would have been impossible to live in. Things would not have had the systemic interdependence which makes for the working of everything together for good and ill. The good has its own inner capacity to become ill, and the ill, if only there is patience to learn from nature to use the insights to correct and make amends, the inner capacity to yield good.

Modes of Interpretation and Values (Ethics) in Yoruba Religion

When the Europeans first came to the Yoruba lands, the narrative claims that they were received with sympathy, as family members who had wandered away in the very distant past, and who as a consequence had met a terrible mishap, which led them to suffer skin bleaching, to the point of their blood nearly leaking out of their bodies. This is the reason, according to mythology, why white people are called “Oyibo” – meaning literally persons whose skins have been removed by the terrible winter/Harmattan climate where they got lost.

They were received as distant members of the family and accorded deserved hospitality which such travelers, albeit inveterate wanderers, had suffered. They were not mistreated, because they were members of our human family. In any case, all sentient beings deserve respect; this even more so with persons who are our distant family members. The reasoning is that, if animals, plants, and things in nature are accorded their respect as part of our world, how much more the persons who are very much like us, but who have suffered some terrible mishap in the course of their wandering.

In Yoruba society there are records of strangers, foreigners, serfs, “slaves,” and poor people who have risen to positions of prominence and leadership, intermarrying with the people without any prejudice. This is what is meant when it is said that, *bi ewe ba pe l’ara ose, a di ose*. What determines the station of life that you create for yourself is your character, hard work, and respect. The obverse is that you may be born to royalty, yet become poor as a consequence of laziness, bad character, or disrespect.

The ultimate goal of life in Yoruba society is that of mutual survival. When you tap the palm tree for wine, you do it respectfully without cutting the shoot, even though it would have brought you more juice. And it is the height of abomination to uproot the palm tree, set fire to it at the bottom, to drain the juice from the top, even though what you get will be instantly more potent. These are practices that exist in neighboring cultures, but which Yoruba people abhor. When you fish, you do not catch the “children” or “babies” of the fish, and it is wrong to slaughter for delicacy the infant of the lamb or goat! When you farm, the prayer is that there be no hunger to make us eat both the yam and the seeds of the yam, or to start harvesting the yams before they mature. Such unnatural behaviors are regarded as killing the future of the various entities that surround us and which conduce to our welfare.

In the final analysis, the values which govern all aspects of existence are such that they come together to help promote the understanding that if those of us who live on the ground (*eepe, ile aye, agbalaaye*) are not healthy; those that live in the air (birds) and in the sea (fishes) cannot be healthy. When examined carefully, the ontology of respect and empathy, protection of the weak and vulnerable, whether humans, animals, plants, or other entities in our environment is predicated on the idea that our health is connected to the health of everything around us. Even morality of interpersonal relationships has much to do with the individual’s health, family health, community health, and global health.

Conclusion

One of the biggest issues facing Yoruba people, and indeed Africans, is the conscious and subconscious destruction and loss of the fundamental cultural values that support human social relations. There are myriad indigenous knowledge systems, values, and ideas enshrined in language, which are lost when the language is allowed to die. A corollary to that is the possibility that within a generation foreigners may have to be teaching Africans the languages of their ancestry. These foreigners are studying and mastering languages because of the intrinsic values of the cultures they enshrine. Even more significant are the indigenous social, aesthetic, and spiritual knowledges surrounding the living conditions of humanity in Yoruba society, not to mention those related to knowledge of plants, animals, rivers, seasons, etc. To sustain the one universal and inclusive health approach to global existence, it means there is a need for the rediscovering of those cultural intelligences encapsulated in Yoruba ontologies, epistemologies, and axiologies. These invaluable ideas can help guide the Yoruba relationship with the totality of our environment.

CHAPTER 101

Mode of Interpretation – The Chinese Tradition

Ellen Y. Zhang

The tradition of Chinese ethical thought represented by Confucianism, Buddhism, and Daoism (known as “the Three Teachings”) is centrally concerned with questions about how to lead to a good and meaningful life. Confucianism that plays a key role in shaping the basis of Chinese moral codes and ethical guidelines is focused around ideals of character building that constitutes virtues. Daoist ethics, in contrast, is more skeptical about systematizing moral codes and recommending concepts of right and wrong. It lays more stress on the value of “spontaneity” and the action of an “authentic person.” Buddhist ethics are traditionally based on the teachings of the Buddha concerning the question of suffering and path toward enlightenment. This entry will explicate how the Chinese ethical thought and moral judgment are formed in different ways by these three religious traditions. The entry will also address modes of interpretation and reconstruction that accommodate contemporary ethical concerns.

Religious Ethics Understood in the Chinese Context

Religious ethics are generally perceived and conceptualized as the moral principles that guide religions and that set the standard for what are right and wrong behaviors. Yet before our discussion of religious ethics in the Chinese tradition, we shall first take a look at the words “religion” and “ethics” involved in the term. For a long time in past decades, scholars in the West have raised the question insofar as how “religion” or “ethics” should be appropriated and understood in traditional Chinese thought.

The Chinese term *zongjiao* is a compound consisting of *zong* (an ideogram of an ancestral altar) denoting a “sect,” and *jiao* meaning “teaching.” *Zongjiao* thus carries the connotation of sectarian teachings. The original appearance of the compound *zongjiao* was identified with a sect of Buddhism in early medieval China, and by the late nineteenth century Japanese translators of European texts chose to retrieve the term to mean “religion” (for more information on *zongjiao*, see Company 2003 and Adler 2005). However, part of the problem arising from the modern coined term is that traditional Chinese religions under the rubric of the “Three Teachings” (*San Jiao*) since the fourteenth century, referring to Confucianism, Buddhism, and Daoism, do not put too much emphasis on doctrinal differences and religious exclusivity as monotheistic religions do. The essential character of religion in China is that the Chinese have never considered themselves exclusively “Confucianists,” “Buddhists,” or “Daoists.” As a common saying goes, “Every Chinese wears a Confucian cap, a Daoist robe, and Buddhist sandals.” In

addition, the definition of “religion” in its strict sense gives rise to the debate among Chinese scholars as to whether Confucianism should be viewed as a religion since it does not have a creation story, deities to worship, theories of afterlife and external transcendence, the system of priesthood, etc., things we often see in other religions. There are Confucius temples (*kongmiao*) across China, but people pay respect to him as a sage or great teacher, not a god. Those who regard Confucianism as religion argue that Confucianism, especially in its early form, emphasized rituals and rites in worshipping heaven and ancestors, which had a strong religious element.

Nevertheless, if we take religion in a broad sense as a form of “ultimate concern” (Paul Tillich) or “a means of ultimate transformation” (Frederick Streng), Confucianism, Buddhism, and Daoism all fit into such kinds of definition since all of them are concerned with a process that leads to self-transcendence or “transformation” (*hua*) in the face of the finitude and limitation of human condition. The notion of the “ultimate,” according to Joseph A. Adler, means that “the starting point, process, and goal are defined in relation to whatever the tradition in question believes to be absolute or unconditioned” (Adler 2005, 1582).

Similar to religion, the Western concept of “ethics” was first used by Japanese scholar Inoue Tetsujirō (1855–1944) who borrowed the Chinese term *lunli* (meaning the moral code of relationship) to translate “ethics” as *lunlixue* (*rinrigaku* in Japanese). Later, the word “moral” was adopted as well by ascribing to the Chinese compound *daode*, originally used in Laozi’s *Daodejing*, denoting the ideas of the “way” and “virtues.” The two ethical terms *lunli* and *daode* in the Chinese tradition are sometimes used interchangeably, indicating moral guidelines regarding a well-lived life, yet neither of them means the same as “ethics” usually understood in contemporary context. So far as Buddhism is concerned, there is not even a word for “ethics” in early Indian texts, as Damien Keown, one of the leading Buddhist scholars of Buddhist ethics, has suggested (Keown 2005).

If we take ethics as “normative ethics” or “philosophical analysis of moral norms,” concerned with the justification of right and wrong actions, then the Chinese moral teachings may not be viewed as ethical theories or ethical deliberations. However, it is quite obvious that there is a profound history of ethical thought in the Chinese tradition that is centered on issues about how one ought to live and what kind of person one ought to be. The ethical consideration covers a wide scope of human life, ranging from the personal and the familial to the communal and the societal at large. Therefore, it is significant to explore how “ethics” should be understood in the context of Chinese religious teaching and practice.

Religious Ethical Systems of China

Confucianism

Confucianism and Daoism represent major indigenous traditions of China whereas Buddhism is an “imported religion” rooted in Indian culture. Among these three religions, Confucianism plays the dominant role in shaping the basis of Chinese moral codes and ethical guidelines, and it has spread outside China to such places as Japan, Korea, and Vietnam. The term “Confucianism” or “Ruism” (i.e. the School of *Ru*) is a loose one, referring to a collection of teachings and doctrines that covers morality, rituals, politics, and history. Etymologically, the word *ru* means “weaklings” and related to the aristocratic class of antiquity, well known for their knowledge of history, rituals, music, archery, etc., and thus regarded as experts in the literary and cultural tradition (*wen*). Early Confucian ethics was based on the teachings of

Confucius or Kongzi (ca. 551–479 BCE) and Mencius or Mengzi (c. 371–289 BCE), both centrally concerned with the ideal of character building that constitutes virtues (*de*). Eventually, Confucianism or the School of *Ru* came to refer to the ethical wisdom of the past, transmitted by Confucius and later Confucians. Confucius believed that society could be transformed by the moral cultivation that starts from the personal to familial, ultimately to the state levels. In the *Analects*, the most frequently discussed ideal personality is that of the *junzi* being rendered as “gentleman” or “superior man” who represents the virtue of *ren* (humaneness, human-heartedness, love, or benevolence) (for debate among Confucian scholars regarding *ren*, see Slingerland 2003). Apart from *ren*, Confucius also spoke of the virtue of *shu* (reciprocity), submitting that “Not to do to others what you would not have them to do to you (*Analects* 15:23). This state is well known in the West as the “negative Golden Rule.”

Since the ethical system of Confucianism is marked by its emphasis on virtues and character development, most Confucian scholars see Confucian ethics as a form of virtue ethics. Recent studies have shown some disagreements. Roger T. Ames, for instance, argues for what he calls Confucian “role ethics” that is different from the virtue of the individual subject, since interactive relationships among individual, family, and society are key concerns to Confucianism. Rather than “What kind of person I should be?” says Ames, the Confucian looks for “specific roles for stimulating the forms that association takes within lives lived in family and community” (Rosemont and Ames 2016, 12). In other words, relationality is the base for Confucian ethics, and a person behaves morally in accordance with the role he or she plays in specific human relationships. It is true that relation and relational thinking are crucial for Confucian morality, just as the virtue *ren* suggests. The word *ren* with the combination of radicals of “human” and “two” indicates an emphasis on human relationships. For Confucians, ethical behaviors start with “five relationships” (*wuchang*), that is, the ruler-minister, father-son, husband-wife, the elder-younger, and friend-friend. Among these relationships, three are family relationships, while the other two are based on familial models. However, *ren* as the cardinal virtue in Confucianism is not confined to relational concern since the practice of *ren*, according to Confucius, requires a person to express concern for the well-being of others, which demands a virtue of love or humane understanding for all human conditions. To an extent, *ren* has a transcendent dimension that goes beyond specific behaviors in relationships. To put it otherwise, the Confucian concept of *ren* ultimately aims at the development of character rather than at the development of discrete behavior.

Ren is also closely related to *li* (ritual or propriety), referring to moral codes of behavior. It should be noted that Confucianism has been perceived traditionally by many as a kind of humanistic philosophy attractive to the literati or scholars rather than a form of religion. Nevertheless, Confucian moral teachings in terms of *li* have a religious dimension in that the ritual practice that was later transformed into proper behavior is linked to the Confucian notion of “mandate of *tian* or heaven” (*tianming*). *Li* has played such an important role within Confucianism that the tradition is also known as the “Teachings of the Ritual” or the “Religion of the Ritual” (*lijiao*). *Li* provides the forms through which one governs one’s own emotions, thoughts, and actions. According to Adler, the Confucian *li* “was not merely a means of enforcing social order, nor was Confucius’s innovation a turn from religion to philosophy; rather it was a philosophical deepening of a fundamentally religious worldview” (Adler 2005, 1585). *Li* not only reflects the ethical sensitivity of a person, but also the proper social role a person plays. If we say that *ren* describes the inner moral character then *li* refers to the outward expression of *ren*.

Like Confucius, Mencius was concerned about moral character and moral cultivation, and developed his idea of human nature and moral psychology. The Chinese word “human nature” (*xing*) is a compound

including the radical “heart-mind” and the radical of “growth” or “offspring.” According to Mencius, the human being is one who has received from the heaven the innate endowments of human nature with a faculty of moral discernment. Therefore, Mencius is best known for his argument that “human nature is good” (*xingshan*). Yet, instead of speaking of human nature at an ontological level, Mencius intended to argue that humans have a tendency to become good if raised in an environment that is healthy for them. As the word *xing* has suggested, nature does not indicate something static, but something that is subject to change. It is in this sense that Confucianism emphasizes the importance of moral education.

Mencius maintained that the human capacity for goodness is rooted in our nature, supported by the existence of moral sprouts (*duan*), that is, the inborn moral preferences or inclinations. He argued that moral virtue or proficiency could be cultivated through the nurturing of these sprouts through moral reflection (*si*), a process of analogical “extension” from paradigmatic moral situations to novel ones. His argument that all humans possess compassion, through the famous allegory of the child about to fall into a well (2A6), presents him as a natural opponent to psychological egoism.

When asked about his claim that human nature is good (6A6 and 6A15), Mencius replied, “As for what they are inherently, they can become good. This is what I mean by calling their natures [xing] good. ... Humans all have the feeling of compassion. Humans all have the feeling of disdain. Humans all have the feeling of respect. Humans all have the feeling of approval and disapproval. The feeling of compassion is benevolence. The feeling of disdain is righteousness. The feeling of respect is propriety. The feeling of approval and disapproval is wisdom” (Van Norden 2008, 149). Human nature is good, on this view, because becoming a good person is the result of developing our innate tendencies toward benevolence, righteousness, wisdom, and propriety. Mencius’ emphasis on the powers of human nature did much to shape the religious sensibilities of ethical thinking in China.

Based on his understanding of human nature, Mencius developed a sophisticated moral psychology as an elaboration of Confucius’ ethics of *ren* and account of the virtuous sage. His idea of “sagehood within and kingship without” has strongly influenced the Confucian vision of politics. The moral virtue of *ren* is extended to the political order where it is defined as humane government (*renzheng*), that is, a government of moral persuasion qua a sage-ruler. As P. J. Ivanhoe has pointed out, “Confucians strongly believed in the power of Virtue [*de*]. The example of the good person was thought to have a magnetic, motivating, and uplifting effect. It draws people to the sage-ruler and inspires them to be good – like the sage” (Ivanhoe 2011, 38).

The renaissance of Confucianism during the Song dynasty (960–1280 CE), known as “Neo-Confucianism” in the West, developed its own moral theories and ethical thought based on early Confucianism, and supplemented by its own metaphysics. Neo-Confucianism was perceived as a rationalistic revival of the various strands of Confucianism. The best-known Neo-Confucian school was *lixue* (i.e. the study of principle) or *daoxue* (i.e. the study of the way) represented by Zhu Xi (1130–1200) who established the standard Confucian curriculum that not only influenced the imperial civil service examination system but also Confucian moral discourse and ethical theory in the following dynasties. In Zhu’s Confucianism, a great deal of emphasis was placed on moral self-cultivation through reading and reflecting upon the true meaning of the Confucian classics as a form of meditative practice known as quiet-sitting. Meanwhile, Zhu advocated the method for examining external things and the principle, the pattern of the universe, in order to cultivate the essential goodness of the heart-mind. Zhu’s method of moral cultivation was questioned by another trend of thought known as *xinxue* (i.e. the study of heart-mind) represented by Wang Yangming (1472–1529) in the Ming dynasty. Wang promoted the idea of the

genuine realization of the self which, according to Wang, was identical with the pattern of the universe. His model of the mind-heart-cum-nature offered an alternative interpretation of Confucian teachings. Although Neo-Confucianism attempted to reinterpret the Confucian ethical system so as to respond to the challenge from Buddhism, it is quite obvious that both *lixue* and *xinxue* were highly influenced by Buddhism.

It should be noted that the politicization of Confucian moral principles after the Song dynasty made Confucianism a state ideology, which created a popular version of Confucianism such as the “cult of chastity” for women. Confucian virtues such as filial piety, chastity, and loyalty were promoted at the state level.

Daoism

The word “Daoism” refers to both philosophical Daoism (*daojia*) and religious Daoism (*daojiao*).

The key figure of Daoism is Laozi, a mythical sage known as the “Old Master,” the writer of the *Laozi*, said to have been an older contemporary of Confucius. Philosophical Daoism and religious Daoism are different from each other but also interrelated (e.g. common canonic texts, common veneration of Laozi and other real or mythological figures, and common jargon). The best-known book devoted to the early thought of Daoism is the *Laozi*, also known as *Daodejing* in which the meaning of the cosmic way (*dao*) and its power (*de*) are expounded. Unlike Confucianism, philosophical Daoism is not interested in promoting specific moral virtues, and is critical of the idea of regulating society with norms and standards of behavior. As such, Daoism has sometimes been dismissed as a mystical tradition or amoral philosophy which is seemingly indifferent, if not forthrightly hostile to the ethical system or the moral life (Creel 1970, 3; Moeller 2009, 29–39). It should be noted, however, that some Daoist scholars disagree with the idea that Zhuangzi as an amoralist who is unconcerned with moral values and indifferent to the world. For the representative work of such works, see Lee (2014). Daoist concepts of naturalness or self-so-ness (*ziran*) and non-action (*wuwei*) focus on self-authenticity, non-coercive action, and spontaneity (i.e. going with the flow of things). In chapter 38 of the *Laozi*, we read: “When Dao is lost, then arises the doctrine of virtue (*de*); When the doctrine of virtue is lost, then arises the doctrine of humaneness (*ren*); When the doctrine of humaneness is lost, then arises the doctrine of righteousness (*yi*); When the doctrine of justice is lost, then arises the doctrine of rituals (*li*)...” (*Laozi* 38). This passage with its structural negations describes a Daoist view that stands in marked contrast with the Confucian moral teaching. Such negative view on Confucian morality is even stronger in the *Zhuangzi*, another representative work of Daoist philosophy when it mocks Confucian virtues and rituals.

Nevertheless, Daoism has its own distinct language and moral vision that address the question of “how we should live.” Daoist ethics can be better understood as a form of “negative ethics” which, according to Hans Saner, can be explained in four aspects: (1) a radical renunciation of morality as a result of disgust with ethics and its failure; (2) a normative ethics that assumes that the good as such cannot be determined and that it therefore can only be explained negatively; (3) no general ethical guidelines or principles can be established since morality is always concrete and embedded in particular situations; (4) an ethics that does not believe in the primacy of action but rather in the primacy of refraining from intervention and thus advocates an ethics of “letting-be” (Saner 2005, 27–30). To a certain extent, we can see all these four aspects in the *Laozi* and *Zhuangzi*, although Daoism is neither skepticism nor relativism in a restricted sense. Daoist ethics is best characterized by negativity in terms of transcending positive

morality. In other words, Daoist ethics rejects categorization into any ready-made standard of right and wrong. Generally speaking, the Daoist ethics does not set out divine commandments or absolute principles but offers a guideline (*dao*), and very often in a negative way. Some Daoist scholars, however, consider Daoist ethics as therapeutic, a kind of a rhetorical or psychological device for the purpose of changing one's mind.

Early religious Daoism, the School of Celestial Master (*Tianshi Dao*) for example, did not follow philosophical Daoism in rejecting Confucian virtues and norms. Rather, they advocated “secret virtue,” that is, good works done secretly and known only to the gods. Yet in practice many Daoist sects regulated morality in a variety of ways, including requiring followers to confess their wrong-doings and petition the heavenly authorities for forgiveness. Religious Daoism “was characterized by a literate and self-perpetuating priesthood, a pantheon of celestial deities, complex rituals, and revealed scriptures in classical (literary) Chinese” (Adler 2005, 1580–1613). At the same time, religious Daoism fully accepted some key moral ideas in the Laozi and Zhuangzi, such as naturalness, compassion, humility, and simplicity. To a certain extent, religious Daoism also adopted Confucian ethical norms such as reciprocity, and loyalty as well as Buddhist precepts of self-discipline such as avoid harming animals and avoid lascivious or depraved thoughts. Livia Kohn, one of the leading scholars of Daoism, has observed that the members of the Daoist religious community traditionally follow societal norms in accordance with specific morals, values, behaviors, disciplines, and responsibilities to those in the community (Kohn 2004, 3). Nevertheless, instead of preaching virtues and morality to others, Daoists encouraged people to find their own ways as how to lead a meaningful life in agreement with the Dao. Meanwhile, the Daoist notion of community was beyond the family-based one accentuated in Confucianism, despite the fact that both traditions spoke of the common good of the community. According to Kohn, Daoist ethics focuses the connection between virtue, the community and the cosmos, and that the Daoist practitioner is concerned with resolving inner conflicts, creating good karma, and reaching the level of divine beings (Kohn 2005, 109).

Another aspect that requires special attention is the holistic view on body, mind, and soul in Daoist ethical thinking. Its belief in longevity (*shou*) and immortality (*xian*) is expressed through an explicit concern for the somatic dimension of self-cultivation. The Daoist meditative practice aims at returning the body to its primordial state of purity and power with its *yin* and *yang* in proper balance. Daoist religion has many gods that form the Daoist pantheon, yet those gods indicate the power of the organic microcosm of the human body or what Robinet calls “bodily gods” (Robinet 1993, 56) rather than powers that are external to humans and nature. Schipper in his groundbreaking work *The Taoist Body* conceptualizes the Daoist “image of the country” in light of the human body. What Schipper intends to point out is not only the Daoist holistic view on body, mind, and soul but also its holistic view on humanity, nature, and the universe. As Schipper puts it, the emphasis on country reflects the interdependence of the human being and his/her environment (Schipper 1993, 101). The idea that “the environment is within us” had a great impact on the ethical thinking in traditional China.

Buddhism

Compared to Confucianism and Daoism, Buddhism is an “imported religion” from India, which is primarily concerned with the question of suffering and path toward enlightenment. Buddhism has a clearer soteriological dimension than indigenous Chinese religions although it was Sinicized from the very beginning in that Chinese Buddhism, especially Ch’an (Zen) Buddhism, tended to be more

this-worldly oriented. Since the most important early Chinese Buddhist texts were translated by people who were either ex-Daoists or influenced by Daoist philosophy via the “method of matching the term” (*geyi fa*) as a translation technique, Chinese Buddhism was a conflation of Indian Buddhism with Daoism, and the result of which formed a unique view of life which combined the moral teachings of the Buddha with the intellectual vigor of the Daoist sages. The form of Buddhism which was introduced to China was predominantly Māhāyāna that emphasizes the idea of enlightenment for all.

Like Daoism, Buddhism acknowledges that life is complex and it does not therefore suggest that there is a single course of action that will be right in all circumstances. Rather than speaking of actions being right or wrong, Buddhism tends to speak of the being skillful (*kusala*) or unskillful (*akusala*) in a situation of moral judgment. This approach to ethics leads to a different understanding of what ethics is within the Buddhist tradition. Nevertheless, since the immediate focus of Buddhist concern is the problem of suffering, Buddhism has developed a tradition of theories to deal with the problem. While questioning if there is normative ethics in Buddhism, Damien Keown claims that Buddhism “shares many features with Aristotle’s notion of the good life and being one devoted to the cultivation of virtue and culminating in condition of happiness” (Keown 2005, 286).

Peter Harvey offers a systematic treatment of basic issues concerning Buddhist ethics. Harvey uses the term “ethics” to describe three related issues: (1) the Buddhist thought on the bases and justification of moral guidelines and on the meaning of moral terms; (2) specific moral guidelines, in other words, applied ethics; and (3) how people actually act based on moral guidelines of Buddhism (Harvey 2000, 2). Christopher Queen, on the other hand, speaks of fourfold categorization of Buddhist ethics: (1) the ethics of disciplines; (2) the ethics of virtue; (3) the ethics of altruism; and (4) the ethics of engagement (Queen 2000, 1–17).

To understand Buddhist ethics, the starting point is to look at the core teaching of the Buddha, that is, the five precepts that link with the monastic order, which can be rendered as saying that a person is prohibited from (1) taking life; (2) stealing; (3) sexual misconduct; (4) lying; and (5) taking intoxicants. For Buddhists, these five precepts are training methods for self-discipline rather than rules or commandments or what Harvey considers “moral guidelines.” Christopher Queen calls such an approach to moral life “the ethics of disciplines” (Queen 2000, 11). Yet from a broader perspective, the core of Buddhist ethical teaching cannot be fully comprehended without looking at the existential claims made by Buddhism, specifically speaking, the doctrine of “Three Marks of Existence” (*trilakṣaṇa* in Sanskrit, *san fayin* in Chinese) which provides us with the basic framework of Buddhist ethical thinking. “Three Marks of Existence” refer to impermanence, suffering, and no-self. They are important for Buddhism because it means wisdom is required for one to start to see things, situations as they really are. Inner wisdom (*prajna* in Sanskrit, *zhi* in Chinese) is a kind of virtue needed in the Buddhist path of enlightenment.

The Buddhist concept of *dukkha* (*ku*), often rendered in English as “suffering” is not simply an unpleasant feeling. Rather, it refers to a basic vulnerability of uneasiness due to misapprehending the nature of reality. Since the immediate focus of Buddhist ethics is the problem of suffering, and a conception of the self is at the core of the Buddhist response to that problem. The idea is significant in Buddhism, because it means we start to understand ourselves and the world by seeing things, situations as they really are. The doctrine of non-self (*anatman* in Sanskrit, *wuwo* in Chinese) entails two points: (1) Nothing has a self-nature; and (2) Everything is impermanence. While the first point indicates that everything in the world is interconnected the second point suggests that everything changes

and nothing stays the same. From an ethical perspective, it means suffering is suffering; it does not matter whether it is “my suffering” or “your suffering.” It also means that self as a substantial entity is the result of delusion.

For the basic moral teachings of the Māhāyāna tradition, Bodhisattva is the most revered image besides the Buddha because Bodhisattva signifies the moral concept of compassion. The word “compassion” (*karunā* in Sanskrit; *bei* in Chinese) is thought to dwell on the negative aspect of human existence, sharing the suffering and pains of others or a willingness to bear the pain of others; such kind of compassion is sometimes translated as “pity,” “mercy,” or sympathy.” But compassion also refers to “sympathetic joy,” that is, sharing the happiness of others. In both cases, compassion is not merely a feeling of mercy or sympathy, but is understood to mean “active sympathy,” that is, to do something with a helping hand. Then the question for us is: Does Bodhisattva or the idea of compassion represent a virtue? This question diverges in an ongoing debate among Buddhist scholars. Queen takes Bodhisattva as an example of “the ethics of ultraism” while others contend that there is a utilitarian aspect involved when a Bodhisattva asks the question “What should I do to benefit others?” which denotes the idea of bringing about good consequences rather than either doing one’s duty or cultivating one’s character. It does not matter how we appropriate Buddhist moral teachings in contemporary frameworks; compassion, along with wisdom, are two interrelated qualities that Māhāyāna Buddhism emphasizes in its ethical teaching.

Generally speaking, Buddhism appealed to Chinese intellectuals and elites and the development of “gentry Buddhism” was sought as an alternative to Confucianism and Daoism since Buddhism’s emphasis on morality and ritual practice appealed to Confucians and the desire to cultivate inner wisdom appealed to Daoists. At the same time, Buddhism was also in conflict with the Chinese culture and Confucianism in particular, for Buddhism focused on monastic life and individual salvation while Confucian filial piety stressed family duties. Nevertheless, there was far more integration than confrontation between Buddhism and Chinese traditions. The integration can be seen by the white-robed Guanyin, the female image of the Bodhisattva and the story of “Mulian Who Rescues His Mother”: the former represented syncretistic ideals of Buddhism, Confucianism, and Daoism while the latter fully absorbed the Confucian virtue of filial piety.

In addition, other concepts in Buddhism that have influenced the ethical thinking of the Chinese include *karma* (*ye*) and *samsara* (*lunhui*). The moral and ethical rewards/sanctions of *karma* and rebirth reinforced the Chinese folk belief in the idea that “good begets good; evil begets evil.” According to Buddhism, *karma* carries the meaning that every act one performs has repercussions in the present moment which also reverberates into the future. Are acts bad because they are punished by *karma*? Or are they punished by *karma* because they are bad? The ethical interpretation of *karma* remains contested because it seems to involve the notion of victim-blaming or indifference to others’ suffering in that the *karma*-consequence (*vipaka* in Sanskrit; *bao* in Chinese) aims at excusing or justifying suffering as a necessary good. However, to connect *karma* to victim-blaming misses the point since what karma really emphasizes is the personal moral responsibility.

To sum up, Confucianism, Buddhism, and Daoism as the “Three Teachings” have formed the basis of the Chinese morality and ethical sensibility. Apart from these three traditions, other “imported” religions such as Christianity and Islam have also played an important role in China and shaped Chinese ways of thinking in their own terms. Owing to the limited space of this entry, this point cannot be elaborated.

Mode of Interpretation in Contemporary Context

Over past two decades, Confucianism, along with Buddhism and Daoism, has progressively acquired a new visibility since China's reform and opening-up. With the emerging market economy and the collapse of communist ideology, China has been facing a moral crisis. The revival of traditional moral norms has been encouraged by the government to promote a sense of social responsibility amidst the rapid rise of individualism, consumerism, and economic competition. However, given the fact that China is still, officially, an atheist state, religious influences are quite limited.

Confucianism was harshly criticized as the biggest obstacle for China's modernization by the "New Culture Movement" initiated by Chinese intellectuals influenced by Western liberalism in the beginning of last century. After the Communists took power the anti-Confucian rhetoric only intensified. The revival movement based on Confucian teachings today known as "New Confucianism outside of mainland China" (*haiwai xin rujia*) became popular outside mainland China and then made the scene to the mainland after China's reform. The Confucian notion of cultivating one's own virtues was reintroduced and Confucian values such as harmony, meritocracy, humane authority, and civility were promoted and viewed by many as new values that could supplement, if not replace, the rigid (mainstream) ideology. At the same time, new Confucian scholars have been also deeply engaged in an active dialogue with Western philosophy and religion, and the effort of which is to reconstruct or "modernize" Confucian ethics to make it more relevant to the contemporary concerns such as democracy, human rights, and gender equality. Jiang Qing, a Confucian traditionalist, challenges the New Confucians, claiming that what they are doing is nothing but trying to tailor Confucianism to fit the garment of liberal democratic ideals. Jiang, instead, argues that Confucianism is a kind of all-embracing ethical system that embraces all dimensions of society: personal virtue, family values, social structures, and political order (Jiang 2012, 30–32).

At the same time, there was a "Confucius fever" at the popular level over past decades, represented by various kinds of popular series of TV lectures on Confucianism sponsored by the government and the rise of private "Confucian Schools" teaching children Confucian moral codes. Yet it remains unclear what the revival of Confucianism entails for China. It is certainly answering a hunger among the Chinese people for spiritual and cultural familiarity amidst tremendous change. Confucianism-inspired religiosity today might be more imaginary than real. Even less than Confucianism, the roles of Buddhism and Daoism in shaping the ethical life for the Chinese today are quite limited.

3 Global Interactions

CHAPTER 102

Christianity (Global Interactions)

Devaka Premawardhana

Introduction

Today, Christianity is growing most robustly far beyond the regions with which it has long been associated. Beginning in the late fifteenth century, European and, later, North American missionaries labored to evangelize populations of Latin America, Asia, and Africa. Yet it is in the postcolonial period that the greatest demographic expansion has occurred. With the globalization of Christianity beyond the West and the rise of secularization within it, the twentieth century saw a dramatic drop in the worldwide proportion of Christians residing in Europe, from two thirds to roughly one quarter. Observers speak of this as a shift in Christianity's center of gravity, from the Global North to the Global South. This entry explores some implications of that shift for the field of religious ethics. It considers the specificities of Christian ethics in the formerly colonized world, a world marked by legacies of political subjugation and economic exploitation, of racial domination and cultural derogation.

There can be no doubt as to why an investigation into the global dimensions of Christian ethics matters – certainly not after 2013. That is the year the archbishop of Buenos Aires adopted the name Francis upon being elected to the papacy. With that, the Roman Catholic Church came for the first time to have as its leader a denizen of the Global South. Pope Francis has become known, however, for far more than his geographic origins. He has famously and forcefully pronounced on a range of ethical issues. He has challenged the consumerism at the root of environmental degradation, for example, and critiqued the economic structures underlying global inequality. Yet Pope Francis's ethical engagements have gone beyond even such overt pronouncements. At the heart of his papacy is his choice of name, and what it says about his regard for a thirteenth-century moral exemplar. Also noteworthy is that, as a Jesuit, Pope Francis performs the Ignatian spiritual exercises each year, a series of self-evaluative meditations intended to connect practitioners to the ultimate exemplar, Jesus Christ (Molina 2013).

The case of Pope Francis raises numerous issues pertaining to Christian ethics. The two upon which this entry focuses include: first, the articulation of norms and values respecting the demands of justice; and, second, the formation and flourishing of the self, often through embeddedness in communities beyond the self. Historically and in the global scope of contemporary Christianity, these two orientations have overlapped in a variety of ways. This entry begins by considering the ethical dimensions of modern European missions, then turns to issues of colonization, class, race, culture, and religion addressed by contextual theologians of the Global South. While Christianity's geographic reach certainly extended

beyond the Mediterranean prior to the late fifteenth century, this entry addresses only the tradition's global interactions from the early modern period to the present. During that time, the demography of global Christianity changed tremendously, ushering along with it a far more global awareness of the scope of Christian ethics and the nature of Christian selves.

Christian Missions in the Age of Empire

The modern period, up to the twentieth century, witnessed two distinct waves of Christian expansion beyond Europe. The first, the so-called age of discovery (1492–1773), was primarily a Roman Catholic phenomenon; the second wave (1792–1914) was mainly Protestant. Assumptions about morality and personhood differ significantly between Catholicism and Protestantism, but across both periods and both traditions one ethical consideration outweighed all others: that of the relationship between Christianity and imperialism. Conquistadors and slave traders hailed from and worked in the same locales as Christian missionaries, a confluence that raises questions about complicity and collusion, and about the possibilities of critique. Yet inseparable from the relationship between religious mission and political domination are two subtler ethical problems also shared by Christian missionaries throughout this era, namely the interconnected problems of how to evaluate the moral status of the non-European, non-Christian other, and how to advance the ethical formation of the self.

Catholic Missions

Early modern expansion into the “new world” occurred through both the cross and the sword, the missions of the Catholic Church and the militancy of the Iberian states. With the expulsion of Muslims from the Iberian Peninsula in 1492, a new optimism and enthusiasm propelled Catholic missionaries – particularly Franciscans, Dominicans, and newly founded Jesuits – overseas. From the perspective of Spain and Portugal, the usurping of new lands and the baptizing of new converts constituted twin aspects of conquest. Some legitimized invasion by drawing a parallel between the violent takeover of Canaan by Israelites – manifest destiny in biblical times – and the Iberian conquest of unknown lands (Marty 2007, 145). Yet the domination and especially the enslavement of indigenous peoples in the Americas generated a rift when missionaries based in the Americas raised their voices in opposition to the abuses of empire. The Dominican Bartolomé de Las Casas, well-known for his account of the suffering of native populations at the hands of his fellow Spaniards (de las Casas [1552] 1992), earned for his efforts the title of “Protector of the Indians.” He devoted his life to arguing that colonial atrocities violated the rights of indigenous people as well as basic Christian ethical standards. Likewise, Jesuits frequently positioned themselves between slave traders and Amerindians by sheltering large numbers of their converts in Christian villages known in Spanish as *reducciones*. Defending the dignity of indigenous peoples and combating the brutality they saw around them, missionaries largely came to operate as the conscience of the crown (Bevans and Schroeder 2004, 175).

Underpinning it all were deeply held values and convictions regarding the moral standing of indigenous people. De las Casas's intellectual adversary, the Spanish theologian Juan Ginés de Sepúlveda, contended that dark-skinned natives were inferior to Europeans, invoking in reference to them Aristotle's category of “natural slaves.” De las Casas and others countered that Amerindians were created in God's

image, possessed immortal souls, and thereby deserved to be evangelized through peaceful proclamation. They should be free, not forced, to choose the Christian faith. There were, of course, limits to this ethic of care and compassion. Jesuits protected Amerindians through their *reducciones*, but treated them paternalistically within, never fully allowing them to shape their own futures. De las Casas opposed the enslavement of Amerindians but initially had no qualms with the enslavement of Africans (though late in life, he did). Early modern Catholic missionaries, even the most prophetic among them, remained products of their time. They fell short of their ideals, but remain noteworthy for their biblically based vision of human unity and equality, for their efforts to disaggregate cross and sword by working to curb the violent excesses of their fellow expansionist Europeans.

For Catholic missionaries working in the Asian outposts of the European empire, foremost ethical concerns centered less on physical freedom than on cultural and religious freedom. Earlier missionary models reflected the conquest mentality of Iberian imperialists; conversion to Christianity required the destruction, sometimes by force, of preexisting beliefs and practices. This *tabula rasa* approach was clearly rooted in ethnocentric assumptions of Western superiority. A different approach, geared toward accommodation rather than annihilation, developed through the work of such prominent sixteenth- and seventeenth-century Jesuits as Alessandro Valignano, Matteo Ricci, and Roberto de Nobili. Collectively, these missionaries concerned themselves with in-depth learning of the local languages, religions, cultures, and politics. By translating the Bible, catechisms, and prayers, and by respecting local norms regarding architecture, dress, and diet, they disaggregated Christian missions from European conquests and contributed to a more dialogical approach to intercultural and interreligious relations. Ricci and de Nobili went so far as to adopt the dress, study the texts, and embody the lifestyles of intellectuals and holy persons in, respectively, the Confucian traditions of China and the Hindu traditions of India. Underpinning this accommodational method were numerous philosophical and ethical factors: the principle of what Valignano called *il modo suave*, which elevated sweetness and gentleness over hostility and aggression as missionary virtues; the Renaissance humanist view of preexisting civilizations (whether the Greek and the Roman, or the Japanese and the Chinese) as potentially enriching allies rather than enemies of Christianity; and, finally, the program of ethical self-formation developed by founding Jesuit Ignatius de Loyola and known as spiritual exercises (Bevans and Schroeder 2004, 194–195). These exercises – comprising directives, meditations, prayers, procedures, and rules – offered to the Jesuits who practiced them a method of self-evaluation, self-reflection, and self-critical awareness. It enabled missionaries to reflect on any situation in ways that would lead them to challenge conventional wisdom, whether that of the Church or of the state. Not all Jesuit missionaries disavowed Eurocentric cultural hegemony, while many non-Jesuit missionaries did, but it was especially the Jesuit accommodation of ancestral rites in China that sparked an ecclesiastic controversy in Europe that culminated in the 1773 suppression of the Jesuit order. Thus ended a significant chapter in Catholic missionary encounters with the non-Western world, and along with it an exceptionally innovative period in the history of Christian ethics.

Protestant Missions

Newly formed Protestant mission societies took over from Catholic missionary orders in the late eighteenth century. During their first two centuries of existence (from the early sixteenth century on), Protestant churches remained mostly inactive overseas. That was due partly to their focus on developing identities and doctrines of their own, partly to the countries associated with the Reformation not initially

engaging in imperial expansion. That changed when Britain and the Netherlands became colonial powers, just about the time mission societies in those countries, beginning with the Baptist Missionary Society in 1792, were founded. Reflecting the individualism of Protestant conceptions of the self, these were voluntary societies, comprising self-selecting individuals and operating independently of institutional church authority and certainly of the state. With the birth of Methodism in the late eighteenth century and the Second Great Awakening in the early nineteenth, overseas missions became a Protestant priority. This was the period of high imperialism, when individual nation-states in Europe and North America considered themselves to be in possession of a unique calling, one that left them no choice but to spread to “heathen” lands the three “Cs” of Christianity, commerce, and civilization. Racism was rampant in European and North American attitudes of this period, missionaries themselves rarely questioning attitudes of Western superiority and often colluding with projects of colonial rule.

At the same time, certain aspects of Enlightenment thinking softened attitudes among some Protestant missionaries who touted such values as progress, efficiency, and human perfectibility. The Social Gospel Movement, forged in Gilded Age United States and grounded in a vision of God’s reign as a present ethical reality, influenced mission-founded churches and partially explains the imperative many missionaries felt to open schools, hospitals, and community service centers around the world. Tensions existed around whether missionaries should stress evangelism or humanitarianism, the saving of individual souls or the reforming of social structures, but equally part of the Enlightenment legacy that pervaded Protestant missions was the view of Western culture as uniquely advanced and unquestionably superior. This manifested as a retreat from early Jesuit accommodational practices, although the Protestant emphasis on vernacularizing scripture did afford opportunities to document if not, in fact, to preserve local languages and worldviews (Sanneh 1989).

In both Protestant and Catholic cases, it would be simplistic to conclude that missionaries were either wholesale philanthropists or agents of imperialism. Yet in the realm of informal politics, in conceptions of and experiences of the world and of the self, missionaries had a definite impact (Comaroff and Comaroff 1986). They introduced modern distinctions regarding agency, subjectivity, and religion. In determining, for example, which aspects of their host societies could be accommodated and which could not, missionaries dichotomized “religion” and “culture,” a dichotomy premised on a modern view of religion as an aspect of life rather than life itself. Likewise, by privileging belief over practice and meaning over materiality, Protestant missionaries, in particular, promulgated what anthropologist Webb Keane calls “the moral narrative of modernity,” one that construes the self as ideally possessed of individual conscience and unimpeded by physical and social entanglements (Keane 2007). Thus, while the relationship of Christian missions to Euro-American imperial politics was variable and indeterminate, the ethical impact of missionaries on the colonial frontier was clear. Western missionaries helped usher their converts, and even those who resisted conversion, into the epistemological and moral framework of Western modernity with its own ideas about self and society, culture and religion, moral agency and modern progress.

Theological Ethics from the Global South

If the story of Christian missions on the colonial frontier has, as so far presented, emphasized European agency, that is not because communities and cultures on the receiving end were passive and permissive. On the contrary, Christian converts never but adapted the faith to their political contexts, cultural frameworks,

and religious backgrounds. Acts of appropriation and negotiation are evident from the start, yet indigenous theologies came to be formalized and disseminated only quite recently – from the mid-twentieth century as the age of European imperialism began winding down. With political independence came a degree of ecclesial and intellectual independence, with which Global South Churches and theologians began challenging the hegemony and presumed universality of Western Christianity by revalidating and re-centering their own experiences. Theology came to be seen as contextual and multiple, reflecting the particularities of a people, rather than universal and singular. In every case, formally articulated contextual theologies encompassed profoundly ethical dimensions. They recast the Christian tradition as a resource for addressing and redressing some of the most enduring legacies of colonialism: inequalities of class and race, for example, and denigrations of cultures and religions. Latin American, African, and Asian theologians also pushed back against the West’s “moral narrative of modernity” by tapping into their own cultures’ more relational conceptions of what it means to be human, excavating thereby significant but buried elements of the Christian tradition itself.

Latin America

Latin American nations were the first of the Global South to gain formal independence from European rule, though poverty, domination, and dependency under global capitalist structures continued far beyond. An ever-expanding gulf between rich and poor, the rise of military dictatorships in the mid-twentieth century, and the Roman Catholic Church’s own adoption (via the Second Vatican Council) of a more accommodating stance toward the world combined to spark a radical turn in Latin American Christianity. The region’s Church leaders began a process of reevaluating the role of Christianity in their own contexts, to find ways of engaging politically and of challenging the Church’s conventional alliance with the status quo. This they did in a monumental bishops’ conference in 1968, in Medellín, Colombia, which ended up distancing the Catholic Church from institutions seen as too closely tied to political and economic power. Seeking to respond to the impoverished condition of most Latin Americans, these bishops condemned neocolonialism and institutionalized violence, declaring the Church to be in solidarity with the oppressed, based on what they considered God’s own “preferential option for the poor.”

In 1971, Peruvian theologian Gustavo Gutiérrez published *Teología de la liberación* (*Theology of Liberation*), which bestowed academic legitimacy on the fledgling movement (Gutiérrez [1971] 1988). Gutiérrez helped further redefine the mission of the Church, but he is especially known for articulating a new method of theology. From being a deductive enterprise, privileging the perspectives of the powerful, theology became far more inductive – arising as a second step that follows practical engagement in the social problems of a given community. Marxist assumptions and values underpinned much of Latin American liberation theology, particularly its emphasis on class struggle as the driver of history. This connection to Marxism drew scorn and rebuke from the Vatican, as well as from local economic elites. Yet liberation theologians defended their project on biblical grounds: the Exodus narrative that aligns God with the suffering and subjugated, the prophetic books that denounce injustice and inequality, and the New Testament critiques of wealth and worldly power.

While explicitly enjoining the Church to respond ethically to exploitative conditions, liberation theologians also reconceived basic theological categories to reflect a more expansive conception of the self. Rather than attributing social problems to individual failings or personal guilt, liberation theologians defined sin and salvation collectively, forcing attention on structures and institutions. Accompanying

this was also a critique of post-Enlightenment European views that cast religion as a private matter of individual conscience. Unabashedly, liberation theologians integrated religion with politics and society. In so doing, they successfully transformed the Church from a supporter of the wealthy and powerful to a force for democracy and human rights. Yet liberation theology failed to sustain itself as a widespread, popular movement. Tightened control by the church hierarchy and the rise in the 1990s of Pentecostal and Charismatic forms of Christianity have led many scholars to herald the demise of this once vibrant tradition. Others contest this narrative, arguing on the one hand that the economic and political thrust of liberation theology has simply become diffused into the Church and into non-ecclesial social movements, and, on the other hand, that the movement has simply taken a spiritual turn, wherein liberation theology retains its ethical imperatives but replaces the discourse of Marxism and macro-scale revolution with the language of spirituality and compassionate intersubjective relations. Pope Francis, the Latin American head of the Roman Catholic Church, illustrates both processes at work insofar as he speaks out against capitalism in ways that evoke the early days of liberation theology, while also embodying the preferential option for the poor in his everyday actions and interactions (Jacobsen 2015, 97–98). Regardless of how it manifests today, the ethical impulse behind liberation theology remains one of the most potent in postcolonial Christianity, not only for what it accomplished in Latin America, but also for what it helped inspire in other locales of the Global South.

Africa

Africa is one such locale, specifically South Africa where white settler populations introduced and sustained until as recently as 1990 a system of apartheid that segregated black Africans and denied them basic civil rights. Apartheid's supporters managed to find biblical justifications for the ideology of separateness and the politics of racial domination. Yet anti-apartheid advocates also drew from the Christian tradition, including black liberation theology, which arose in the United States together with class-based liberation theology in Latin America. Making race and racialized oppression its primary analytics, black theology argued that God, by identifying with the concerns of oppressed people, must be identified as black. This view supported and inspired resistance to institutionalized oppression, and church leaders – such as Desmond Tutu, the former Anglican Archbishop of Cape Town – became fierce antagonists to the white South African regime. The Kairos Document, written by an ecumenical group of South African theologians in 1985, distinguished three types of theology, arguing for the ethical imperative that Christians embrace the latter: state theology, which sanctifies the status quo; church theology, which by professing personal piety and neutrality helps sustain the status quo; and prophetic theology, which directly challenges the status quo (Chidester 2000, 534–535).

The ethical project of African Christian theology has taken another form within but also beyond South Africa: opposition to the disparagement and diminishment of African cultural traditions. Although European missionaries always needed, or were always forced, to translate Christianity into local idioms and beliefs, by the early twentieth century when almost all African nations were under European rule, white missionaries held disproportionate power in the continent's churches. They used this privilege to introduce Western theologies, values, and virtues, and promote them as more advanced than the “heathenism” and “primitivism” indigenous to Africa. This missionary paternalism did not go unchecked, though, particularly as Africans' own thirst for independence and knowledge of the Bible increased. African prophetic figures came to lead new churches designed to exist freely from foreign influences.

Known as African Initiated (or Indigenous) Churches, these churches emphasized aspects of African religion and culture previously ignored or invalidated: prophecy, healing, and spiritual power, for example. Theologians, for their part, began articulating an African theology of inculturation, one that sought to disaggregate Christianity from European cultural norms, and, by affirming local ways of being, to clarify that one may be proudly African while also being devoutly Christian.

Some of the most creative theological work coming out of Africa attempts a synthesis of these two theological strands – liberation and inculturation – seeing both as rooted in a common project of uplift and freedom, whether from foreign political rule or foreign cultural domination (Martey 1993). This more holistic approach resonates with a refusal, by most Africans, to separate religion from other aspects of life, an integrated view also reflected in an ethical principle most African intellectuals see as foundational to African subjectivity: the principle of relational humanism. Expressed in the Nguni word *ubuntu*, which may be translated as “humanity toward others,” leading African theologian John Mbiti elaborates its meaning with what has become a well-known aphorism: “I am because we are, and since we are, therefore I am” (Mbiti [1969] 1990, 107). As a communal conception of humanity and human flourishing, *ubuntu* provides the basis for a critique of Western notions of the self that privilege the sovereign autonomy of the isolated individual. African ethicists, theologians, and moral leaders ground *ubuntu* in both biblical Christianity and African tradition, arguing that the latter helps reawaken dormant truths of the former. Tutu in fact made it the guiding principle of South Africa’s post-apartheid Truth and Reconciliation Commission (TRC), which he, in light of his prominent moral leadership, was called to lead. Through the application on a national scale of Christian practices of confession, repentance, and forgiveness, the TRC brought healing and restoration to South Africa after the tumultuous and protracted fall of the apartheid regime. The notion of *ubuntu* also informs the relationship Africans by and large maintain with ancestors, those humans who have died but whose spirits are perceived as still present among the living. It is from the ancestors that ethical guidance is frequently sought. Neither abstract rules nor ethical imperatives allow one to negotiate the moral complexities of life. Since ancestors, before dying, had to, they are understood to have the wisdom and experience to provide proper guidance amid the ambiguities and uncertainties of existence (Jacobsen 2015, 67–70).

Asia

On the Asian continent, large and diverse though it is, some broad traits of Christian ethics cut across the countries and cultures. Asian theologians commonly write of the “triple dialogue” in which Asian Christians must engage: with the poor, with the cultures, and with the religions. Mahatma Gandhi, though never joining a Christian church, exemplifies this confluence of ethical concerns. His own choice for an ascetic lifestyle, his leadership of the Indian independence movement, and his activism on behalf of outcastes (Dalits) in the Hindu caste system were largely inspired by his readings of the Gospels. Gandhi held that Jesus Christ’s principle of unconditional love and its implications for nonviolence as a political philosophy were not the sole possessions of institutional Christianity. The measure of one’s faithfulness would be one’s ethical orientation, not one’s ecclesial affiliation (Chidester 2000, 466–469).

Gandhi’s Hinduism, as well as the Buddhist tradition present throughout South, East, and Southeast Asia, promote asceticism and thus frequently view Jesus Christ as exemplary for his ideals of simplicity and service. Yet, Dalit and feminist theologians warn against romanticizing poverty and self-denial; they emphasize instead the life-giving powers of Christ. Here, as seen also in Africa, lies a significant tension

between the dialogue with cultures and religions, on the one hand, and the concern for liberation from oppression, on the other. This tension most clearly manifests in India, given the complexities of the caste system. Entering into dialogue with Hindus has usually meant doing so with members of the priestly caste and their sophisticated philosophical schools. The question arises of how one does that while still showing solidarity with low-caste or outcaste communities. Nevertheless, India has proven itself a laboratory for the development of theologies of religions, of dialogical or interreligious theologies. Catholic theologians especially, after the Second Vatican Council, engaged and even adopted aspects of the non-Christian religions to such an extent that the Vatican expressed concern and condemnation on several occasions. Theologian Peter Phan has argued persuasively for the possibility, indeed the benefit, of “being religious interreligiously,” noting how, among Vietnamese Christians, such as himself, Confucian norms shape the reception of Jesus Christ, as do traditional cosmologies that position Christ as preeminent among the ancestors (Phan 2004). In Japan, likewise, some Protestant churches opposed the exclusivism of Western Christianity by regarding Asian religious scriptures as sources of revelation, and by adopting indigenous religious practices. In South Korea, where Protestant Christianity has especially flourished, the continued influence of shamanistic religions has been identified as one factor behind the popularity of especially the country’s more charismatic Christian movements.

Underpinning this willingness of Christians to engage and even incorporate other religions may be the simple demographic fact that Christianity throughout Asia (with the exception of the Philippines) is a minority religion. Christians generally are not, as they are in the West, free to encounter non-Christians on terms of their choosing. The ability to interact amicably with friends, neighbors, and family who adhere to other faiths constitutes the practical knowledge held by most Asian Christians. On a more philosophical register, feeding into this ethic of everyday engagement may be a widely shared principle of harmony and holism, conveyed most concisely by the Chinese yin-yang symbol, which models how opposite or even contrary forces are mutually dependent and essential for the larger whole. Religious traditions may be different and even opposed, but this does not negate the goodness and wisdom, even the necessity, of them. Also emerging as an ethical implication of this relational principle is the Korean theological concept of *han*, which refers to the experience of being harmed by others’ sinful acts (Park 1993). From an ideological stance that stresses harmony and relationality, the emphasis in Western Christianity on sin and the sinner comes across as one-sided. It potentially doubly harms the victims of injustice, as their experiences lack significance relative to those of sinners. By complementing the concept of sin with the concept of *han*, repentance comes also to entail reparation – absolution not only for the committer of sin, but for its victim as well.

Conclusion

This entry has explored two different aspects of Christian ethics in the Global South: European Christianity’s expansion into Latin America, Africa, and Asia, and the theologically inflected response of Latin Americans, Africans, and Asians to those expansions and their far-reaching consequences. While the relationship between Christian missionaries and imperial politics must be judged variable and indeterminate, nearly all contextual theological movements worked, in one way or another, to advance certain conceptions of freedom, justice, and rights (whether human, cultural, or religious). Questions about the ideal path to human flourishing – whether through autonomy and self-sufficiency, or in communities and

collectivities – permeate both aspects of the history explored here. While missionaries, particularly Protestant missionaries, helped universalize a modern, individualist conception of the self, Christian ethical concepts such as liberation (in Latin America), *ubuntu* (in Africa), and *han* (in Asia) suggest a far more embedded and embodied understanding of human well-being.

In recent decades, interactions and intersections between Euro-American and other forms of global Christianity have increased, a trend likely only to continue with time. Symbolically, one sees this most clearly in the presence within the European heart of Christianity – Vatican City – of a Pope from the Global South. More substantively, this trend manifests in the increased attention paid by Western churches, seminaries, and universities to the intellectual implications of Christianity's growth in the Global South, as well as in the migration waves that have brought Asian, Latin American, and African Christianities squarely into Europe and North America. These varied points of contact will surely come to constitute yet another chapter in the global history of Christian ethics. Suggested by this entry is that among that chapter's likely themes will be the potential for conflict – or perhaps conciliation – between what are currently competing conceptions of ethical selfhood.

CHAPTER 103

Global Interactions (Islam)

Muhamad Ali

In the contemporary geopolitics and culture, many scholars and other people are interested in knowing and understanding what the 1.8 billion person Muslim populations have said about controversial moral problems. Many have perceived Islam as a violent and God-submission-religion thus resisting the idea of Islam as being an *ethical and humanist religion*, whereas others seek to correct that misperception by emphasizing it as fundamentally the religion of peace and humanity. According to the Pew Forum 2013 global opinion survey, the majority of Muslims say it is necessary to believe in God to be a moral person, and that they say drinking intoxicants, sex outside marriage, homosexuality, and committing suicide are immoral, although they disagree on other moral questions such as those related to marriage, divorce, polygamy, and family planning. These Muslims and non-Muslims perceptions suggest the global impact of Islamic ethics, and a better understanding of the factors and impacts may be had by considering three-fold dimensions: text and context, theory and practice, and religion and secularity.

Text and Context

In the post-Muhammad era, Muslims everywhere, generally hold to depend on the Qur'an and the textual tradition attributed to the Prophet Muhammad known as the Hadith, for their moral and ethical guidance. For example, a Muslim would cite the Qur'anic text "We sent thee not but as a mercy for all the mankind" (Q. 21:107), and be publicly committed to follow Muhammad as the embodiment of moral behavior (Q. 33:21). They would also cite the Qur'anic message to invite people to the path of God with wisdom, good teaching, and the best possible debate when necessary (Q. 16:125). Through preaching, teaching, and interactions, they are aware that God's mindfulness and piety is the standard by which God will judge the actions of diverse human beings, rewarded or punished in the hereafter. They see Muhammad as the living Qur'an whose main message is to improve morality of all mankind. For them, Islam is both faith and action. Muslim elite and ordinary people in Indonesia, Saudi Arabia, Turkey, Africa, and China, cite Qur'an 2:83 "those who believe and do good deeds shall be the inhabitants of Paradise, to dwell therein forever." Quoting God's words written in the Qur'an, Muhammad in the hadith, and in other cases, citing Muhammad's cousin and son-in-law Imam Ali ibn Thalib (d. 661), or Muhammad Al-Ghazzali (d. 1111), Jalaluddin Rumi (d. 1273), or any other Muslim scholars considered authoritative, are characteristics of moral training, debates, and practices across the contemporary Muslim world. Contemporary Muslims

have employed the various different hermeneutic and discursive strategies to examine and negotiate the problems associated with modernity and globalization (Afsaruddin 2015).

Qur'anic and hadith references are abundant in the Declaration on Human Rights in Islam in Cairo, Egypt, formulated on August 5, 1990, by the leaders and scholars of the Organization of Islamic Conference (OIC), as a response to the 1948 Universal Declaration of Human Rights. The Cairo formulation stipulates each article with a restraining statement "so long as it doesn't contradict the Islamic law." The right of religious freedom and women's rights, for example, have been particularly scrutinized and revised. They have asserted that human rights exist only in relation to human obligations to God and others, and the idea of freedom belongs to the community rather than individualism. This trajectory, considered mainstream and popular is in contrast to the progressive scholars and activists who value human rights not in their disregard of obligations and who emphasize individual autonomy over conformism to the community. Another less mainstream position but not a less important one, is a more liberal intellectual standpoint that stresses the universality of human rights beyond faith and culture. They disagree on how to interpret God's will, His commands and prohibitions scattered in the Qur'an, hadith, and pious scholars and teachers.

The diverse trajectories seek to take guidance or to justify their moral judgments on old and new moral issues. Muslim scholars cite the Qur'an verses, such as Q. 60:8, "Allah forbids you not, with regard to those who fight you not for (your) Faith nor drive you out of your homes, from dealing kindly and justly with them: for Allah loveth those who are just," which invites the community of believers, to show kindness to those people as long as they do not attack them nor drive them out from their homes, and to act justly toward them under any circumstances. They are commanded to act justly so that they be near righteousness (*taqwa*). The life of suffering in many forms: the crisis of faith, the loss of hope, this integration of the Muslim community (*umma*), and the lack of sense of purpose, have conditioned many Muslims to reflect and find practical answers to God, Muhammad, and religious authority. Many follow Islam primarily as a source of identity, and fight for a just social, political, and economic order. They treat justice as a practical norm rather than an abstract concept, although there have been studies of justice and other ethico-religious concepts derived from the Qur'an.

The idea of justice has been discussed and evaluated in many domains of life, including the family, focusing on Muslim women's powerless condition and their empowerment. Therefore, there have emerged global movements for gender justice and equality in the family and society, such as the *Musawah* network (musawah.org). The network was originally launched by Sisters in Islam in Malaysia, and then has advanced connection to more than two hundred Muslim women and organizations around the world. For this network, the provisions of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) are more compatible with the Islamic legal principles than family law provisions in many Muslim countries and communities. But they have to cite and contextualize the Qur'anic teachings on men and women (Q. 30:21; 2:187; 9:71; 2:222; 4:2, 34). They also revive the objectives of the Islamic law formulated by classical and medieval scholars, in light of their knowledge about the international discourses and laws of human rights as well as their reading of the realities of the lives of Muslim women locally and around the world. One of the organizations in their network, Rahima (which stands for "compassion") in Indonesia, reinterprets the Qur'anic concept of the natural state of being (*fitrah*) by considering social construction of gender roles in history and restressing the balance of rights and responsibilities, and the complementary relationships between husbands and wives. They seek to tackle the issue of domestic violence and

divorce as well as the prevalent female circumcision, by engaging the texts, traditions, modern ethical and legal vocabularies, and contemporary problems and challenges.

In contemporary Egypt, grassroots Muslim women have organized themselves to fight for gender justice, from within their pre-Islamic and Islamic patriarchies, and selectively appropriate modern notions of liberation and gender justice learned from mosques and their social environment (Mahmood 2005). In contemporary Indonesia, the traditionalist Muslim women and Sufis, seek to rise to power and authority challenging and negotiating normative Muslim patriarchy while establishing their local Muslim authenticity, a contemporary practice examined by using local discourses and vocabularies beyond the Middle Eastern feminist and Western discourses. To study these Islamic social movements engaging Islamic texts and local and global contexts is to enrich the existing interpretative studies on women and sexual ethics drawn from the Qur'anic, Hadith, and legal interpretative traditions. Recent studies discuss Islamic textualism and contextualism in terms of modern terms and concepts, such as the examination of the tension between masculinity and femininity, egalitarianism and hierarchy, and justice and power. Islamic ethics of sexuality has been inclusive of the various sexual and gender orientations, utilizing literary, historical, and anthropological approaches, offering even more diverse and innovative ways of knowing, doing and being a Muslim (Cesari and Casanova 2017).

Women, gender, and sexuality issues have not overshadowed the other issues. Abortion, euthanasia, organ donation, and other body-related issues, continue to be discussed and debated, sometimes theoretically in light of the classical and medieval textual Muslim traditions on health, suffering, life, death and dying, but more often now in light of the modern advancement in organ transplant, cosmetic enhancement, contraception, and reproductive technology (Brockopp and Eich 2008; Sachedina 2009). The Indonesian Muslim religious scholars council, formed in 1975, issued numerous religious rulings (*fatwa*) related to contemporary moral problems, including a religious ruling in 2000, in response to the increased number of cases of abortion in the society. The ruling prohibits abortion after the beginning of God's insertion of the soul in the embryo in the womb, except for medical reasons, such as saving the mother's life. The fatwa makes reference to the Qur'anic passage on the development of the embryo (Q. 12:14), another Qur'an passage on the illegitimacy of killing the souls, except for good reasons (17:33), such as during the war for defending Muslims' lives, and to the hadith regarding the beginning and development of the human soul and the medieval jurisprudential scholarships on the parallel or analogous issues. The ruling makes a reference to the Islamic medieval principle of beneficence: "To avoid harm is preferred to providing benefit," and another principle "emergency conditions overcome prohibition" (Majelis Ulama Indonesia 2011). Other Muslims look to common sense and their doctors without explicit recourse to scriptures and past scholarships. There are various different Islamic ideas and theories of being good, but there is also a gap between theory and practice.

Theory and Practice

There is always a gap between theory and practice on Muslim ethics. On the issues of climate change and ecology, for example, the lack of action for a sustainable ecology in Muslim countries has often been attributed to Muslims' theology and cosmology centering God and human submission toward God, rather than humans and the natural environment. The mainstream fact is that many Muslim leaders and

communities are preoccupied with their immediate and pressing economic and political problems. Muslim leaders, scholars, and activists have held local, regional, and international conferences, workshops, and many have created curricula to include ecology, connecting scholars, activists, journalists, teachers, and often producing books, articles, and fatwas on Islamic eco-ethics. In educational and scholarly circles, Muslims' normative approaches to the natural environment have changed. There are now more studies in the elaboration of the unity of God, the unity of humankind and creation, the balance in nature of humans' vicegerents of God on earth, and humans' responsibility not to destroy the world, in terms of environmental justice. There are more efforts to produce Islamic environmental law and authoritative legal opinions on key environmental issues. Muslim scholars and activists have created a distinctly Islamic environmentalism, different from the European and American ones, while other Muslims emphasize the universality of the ecological values and activism (Foltz, Denny, and Baharuddin 2003). Many Muslims have joined green movements, faith or secular-based, or else they have created their own environment-friendly spaces within their mosques, schools, and communities. Many Muslims have engaged the environment for the sake of Islam, and others have reinterpreted Islamic texts and tradition for the sake of the environment. In light of this, scholars of the humanities have called for the study of Muslim theories of the environment as developed in the Qur'anic interpretation, Sufism, art, science, and diverse community engagements across global contexts (Gade 2019). But the most important challenge remains in socialization and implementation. Deforestation, overexploitation, wastes in private and public spaces, overconsumption, pollution, and flooding in many urban areas, have become the prevalent facts in many Muslim-majority environments.

Another important yet understudied topic in scholarship has been the Muslims' ideas and experiences of charity, philanthropy, and humanitarianism both at local and global levels. The ethics and act of almsgiving (*zakat*) and its inseparability with prayer is well-known (Q. 9:16) but the ways it is interpreted and implemented have been examined only in few studies (Clark 2004; Fauzia 2013). The rise of the Islamic humanitarian organizations such as Islamic Relief, the Red Crescent, and Muslim Aid, as well as local Islamic organizations, has been linked the increased awareness among Muslims of their ethics of charity, compassion, voluntarism, and activism. In contemporary Indonesia, for example, the modernist organization Muhammadiyah has created a charitable body combining the religious ethics of charity and entrepreneurship and recently established a disaster management center, originally in response to the earthquakes, but developed into a wide range of activities including relief efforts across Indonesia. At the same time, international Islamic and secular humanitarian organizations, such as the United Arab Emirates' Asian Muslim Charity Foundation and Qatar Charity, and the International Islamic Relief Organization, have worked in collaboration with them and other local religious and secular organizations in Indonesia. For another example, from Turkey and then America, Fethullah Gülen, from around 1999 onwards, has led a global Islamic movement with some non-Turkish and other religious affiliations, coordinating schools in over one hundred and eighty countries and humanitarian aid in many of them. The movement claims it is based on an Islamic ethics of peace and service, although its practices and developments have been subject to domestic and global debates. There are few more, but smaller global movements such as the World Congress of Muslim Philanthropists, a network of individuals, foundations, and corporations. They seek to advance effective and accountable acts of giving, in response to the prejudice, suspicion and negative publicity regarding Islamist charity movements. There has been an increased global concern among Muslims for balancing business profits, through the creation of Islamic banks and charities emerging in the 1970s, and humanitarianism, developing from 2000 onwards. They

wish to coordinate the available resources in the efforts to reduce poverty, illiteracy, natural degradation, and disease. These developments are opportunities for scholars and students to study the concepts and practices of Islamic philanthropy and humanitarianism, normatively and empirically, locally and globally. One can study, for example, to what extent postcolonialism, nationalism, capitalism, and socialism shaped Muslim actions (and inaction) of giving and doing good to people regardless of faith, gender, class, ethnicity and political orientations. One can focus on the relation between religious and secular vocabularies, institutions, and practices of humanitarianism in both theory and everyday practice.

Religious and Secular

Islamic ethics has often been framed in terms of religion and secularity. Muslim studies of ethics combine *din*, religion and *dunya*, the worldly. In theory, to be a Muslim is to seek for the hereafter but to never forget the part in this world and to do good as God has done good to him (Q. 28:77). In practice, one needs to locate the religious and the secular dimensions of a Muslim idea or act. One can examine if, how, and why the religious was meant for the worldly and how the worldly was interpreted and acted upon for the sake of the religious. For many Muslim intellectuals, politics is the secular domain that Islam provides only a universal guidance, but for other Islamic political thinkers and politicians, Islam is a political symbol and system in the struggle for Islamizing the society if not the state.

Hence, political ethics and culture is one of the most plural and polarized in the Muslim world. In the postcolonial era, even though most Muslim countries have conformed and lived in the nation-states, all being members of the United Nations, and mostly members of the OIC, they are more concerned with their domestic political and economic problems, and only occasionally and ineffectively have shown a global Muslim solidarity as in the cases of the Arab-Palestinian-Israeli conflicts and the Muslim Uyghur-Chinese regime problems. Scholars have argued for Muslim political exceptionalism (religion and politics being always integral), but others have studied more dynamic and diverse ideas and practices. The progressive and the Islamist, broadly categorized, have shared the political ethics of justice, peace, and prosperity, but they interpret these differently and apply and do not apply it in real politics. The old ethics of war, peace, and diplomacy has been reinterpreted in relation to the international laws and regulations, but local politics has always involved the majority vs minorities problem, abuse of power and corruption vs good and clean government, political and legal justice vs discriminations and persecution, as well as global faith communalism versus nationalism and citizenship. Scholars study how religious orientations do not have a systematic relationship with their political preferences, as in Indonesia (Pepinsky, Liddle, and Mujani, 2018), whereas others have tended to single out religious identity (although not necessarily religious ethics) in making political choices.

An alternative to or alongside the state players, many Islamic organizations are part of non-governmental or civil society, where Muslims are the only or joint members. In their various visions and missions, many have promoted what is called a global ethics. Some invoke the idea “the common word,” taken from the Qur’anic *kalima sawa*, a common word particularly between Christians (and other peoples of the book) and Muslim believers. Others use the terms “Abrahamic sacred ground,” “interfaith harmony,” “a dialogue of civilizations,” “friendship,” and “common humanity.” The Fathulleh Gülen movement from Turkey, Muhammadiyah and Nahdlatul Ulama from Indonesia, the Ahmadiyya from India, the

Muslim brotherhood from Egypt, Hizbut Tahrir from Palestine, the Tablighi Jama'ati, the Salafi movements with countless figures and networks, as well as the Al-Qaida, the Jama'ah Islamiyyah, and the Islamic State of Iraq and Syria (ISIS), regarded as radical and terrorist by the mainstream Muslims, are movements and networks which present diverse and contradicting ideals and practices of justice and goodness. Transnational, global, regional, and home-grown terror and violent acts in many parts of the world, have led Muslim leaders, scholars, activists, and ordinary people, to respond, albeit in the various different ways. Reinterpretation of the Islamic texts containing the notions of leadership and consultation, re-exploration of classical and medieval concepts, have flourished in the schools, universities, and the Internet. Some scholars have emphasized the ethics of peace, tolerance, pluralism, and more recently moderation, in response to the challenges from Muslims and non-Muslims alike (Kamali 2015). Other Muslim scholars feel the need to react to anything related to an act committed by a Muslim regardless of the intention and condition. In response to the lack of studies of Islamic peace ethics, authors have formulated a distinctly Islamic ethics of nonviolence and peace building from the texts and traditions, either the Sunnī, the Shi'a, or beyond (Mahallati 2016).

One of the few studies of Islamic principles of nonviolence and peace building explores Qur'anic verses pertaining to the pursuit of the ideal of justice, social empowerment by doing good, the universality and dignity of humanity, equality, the sacredness of human life, the quest for peace, knowledge and reason, creativity and innovation, forgiveness, patience, collaboration and inclusivity and participation. Others elaborate a political ethics as informed by Islamic texts in the context of domestic politics and international relations, elaborating such concepts as justice, democracy, diversity, and human rights. Still others present the practical ways Muslim groups have used Islamic texts and tradition for justifying either good or evil in the globalized world (Hashmi 2002; Abu-Nimer 2003; Kelsay 2007). Some of these studies show that the question is not whether Islam is for or against violence as such, but when and why particular Muslims justify violence as either legitimate or illegitimate. The fact that Islamic texts allow multiple interpretations, the absence of a unified global power and authority, the higher degree of literacy and education, the greater access to information, and the movements of peoples and ideas, have contributed to the more diverse and more active participation of Muslim men, women, old and young, traditionally trained ulama and modern intellectuals, activists, preachers, and ordinary individuals, in expressing and debating what counts as morally acceptable political ideas and actions.

In many cases, Muslim activists considered hardliners, have taken public ethics and law into their hands, while others depend on and work with the secular state apparatus. On applying the Qur'anic command "enjoining the good and forbidding evil" Q. 3:110–114.), the modernist Muhammadiyah, emphasizes enjoying the good, by building schools, universities, hospitals, orphanages, and the traditionalist Nahdlatul Ulama focuses on Islamic boarding schools in the villages and accommodates medieval scholarship and Indonesian local cultures such as the uses of Hindu epics of Ramayana and Mahabharata and the shadow puppet, to convey the Islamic moral message. The contemporary hardliner group calling themselves the Front of the Defenders of Islam, have stressed the act of forbidding of evil, often by sweeping locals and foreigners from consuming alcohol and other Muslims not fasting in the month of Ramadan. Studying a contemporary case of Muslim practice will enrich the theoretical study of commanding right and forbidding wrong in Islam (Cook 2003). Another study has argued that in contemporary Indonesia, Muslims show more tolerance toward Christians and Hindus than other Muslims such as the Shi'as and the Ahmadis (Menchik 2016). But in the former-Dutch colony, Indonesia, the mainstream organizations, Muslim and other religious communities, have endorsed the common ground

called *Pancasila* (a Sanskrit phrase literally meaning “five pillars”), consisting of monotheism, civilized and just humanism, nationalism, democracy, and social justice, whereas the former British colony Malaysia and the Islamic Republic of Pakistan state Islam as the official religion. Many Muslims in these two countries contend that these state philosophies are influenced by Islamic principles and ethics as well as local and global histories and cultures.

Beyond politics, to many Muslims, Muhammad and his wife Khadija were also a model for business conduct because they were merchants themselves. To be morally authentic and outwardly up-to-date, Muslim individuals and communities in the urbanized areas have participated in business and economic activities deemed more in compliance with Islamic legal and business ethics, not only with the universally shared norms of hard work and discipline, but also with the text and tradition-based interpretations of profit and loss sharing, usury-free banking system, although most Muslim individuals and foundations continue to benefit from conventional economic transactions based on interests, set nationally and globally. Muslim foundations established interest-free banks first in Egypt and the OIC set up an international Islamic bank in 1974, and more Islamic banks have been established in Pakistan, Malaysia, and Indonesia as well in other countries. Many of the same Muslim individuals and groups, however, have both interest-free bank accounts as well as conventional bank accounts, and most still engage in interest-bank transactions contending that interest and usury are two different practices. Other Muslims, including those regarded as the conservative Salafi refrain from engaging in both systems altogether, using instead their autonomous economic activities. They feel the need to balance religious considerations regarding usury and harms, and the demands of a modern economy for profit and accumulation of wealth. Still other Muslims have engaged both traditions and modernities, such as the local and global phenomenon of *halal* food markets. The notion of *halal* food has crossed the religious, political, ethnic, national, class, and time boundaries, but has also blurred religious conservatism and economic and political liberalism (Bergeaud-Blackler, Fischer, and Lever 2016). Global capitalism, international trade and regulations, state policies, and religious networks have contributed to the different ways in which Muslims think and act locally and globally in the economic domain.

The family, politics, and the economy, are some of the important domains of Muslims’ moral conduct described in Arabic and Islamic studies as *akhlaq*. There is another related, yet also pervasive concept called *adab*. This Arabic pre-Islamic norm has become Islamic and globalized, and has become increasingly a cosmopolitan ethical practice shared by non-Muslims and the secular as well. In South Asian and Southeast Asian Muslim societies, with their Hindu mainstream histories and cultures, Islamic imperial past, and British legacies on their political, educational, legal cultures, the proper moral conduct or *adab* has become a pervasive and comprehensive ideal norm. The concept *adab* reveals the relation of the inner self and outer expressions, and the relation between knowing, doing, and being, which becomes the central mode in the diverse domains of life or becomes challenged in other contexts. In Southeast Asia, particularly Indonesia and Malaysia, moral behavior is often framed and discussed in terms of morality and etiquette, using Arabic and other foreign (including English and Dutch) terms as well as Sanskrit, Javanese, and other local vocabularies and cultures found in the literature, in the everyday interaction, schools, organizations, political parties, and social media (Metcalf 1984; Rozeznal 2019). Islamic texts, including the legal and the Sufi, European colonial organizations, and postcolonial and global transformations, play a changing and dynamic role in shaping the process and identities of being morally Muslim in this region, other parts of Asia, the Middle East, Africa, and Western countries where Muslims are in a minority. The fact that there is no centralized global authority and no one

center of learning in contemporary Islam, contributes to Muslims' multiplicity of moral voices, ideas, aspirations, and practices. Revelation has become textualized, but textual and contextual modes of reasoning and theoretical and practical, and religious and secular factors have shaped individual and collective Muslims' approaches to the revelation in guiding them in how to live in this world and prepare for the world to come.

Future Directions in Research

In Muslim schools and colleges, ethics remain persistently understood as an integral part of Islam, and its study takes place either as a topic in an Islamic theology, philosophy, mysticism, jurisprudence, and education, or as a science of ethics (*akhlaq*) and of the related concepts of virtues and manners, such as *adab*. The rich classical, medieval, and modern ethical intellectual traditions continue to be studied to explore the rich Muslim ethical thought (Oh 2007; Ayubi 2019). The tension between reason and revelation, the ideal of perfect man, and human obligations toward God, and human beings, are typical subject matter. Muslim thought is primarily taught as carrying a moral authority, not merely as a starting point or a primary source for an intellectual history or comparative studies. In modern educational institutions, scholars have focused on practical or living Islam, touching the modern questions of women's rights, terrorism, ethnic and religious conflicts, ecological disasters, and many more. Such studies present Islam either as an independent or a dependent variable, using the historical, anthropological, sociological, and other approaches in humanities and social sciences. Some scholars seek to incorporate both normative and practical, both prescriptive and descriptive methods as a way to understand diversity but also to promote particular interpretations over others. These are mostly case studies, and sometimes interdisciplinary and cross-cultural.

Contemporary religious ethics scholars have rightly pointed out that the study of Islamic ethics has focused on cases and concrete actions rather than on general principles, and on communalistic rather than individualistic, in contrast to Western deductive and individualistic ethics (Reinhart 2003). In a recent study, Bucar and Stalnaker (2012) have suggested that comparative ethics has benefited from new methodologies, such as textual studies, ethnography, and case studies, and from new frameworks of power relations and social context, descriptive and constructive inquiry, adjudication between diverse religious claims, belief and ritual in context, moral relativism versus universalism, and a fusion of diverse horizons. The recent study of Muslim women's dressing describes modesty as the salient ethic, drawn from Islamic texts and traditions, in the context of Tehran, Yogyakarta, and Istanbul, analyzing it in relation to aesthetics, selfhood, and community (Bucar 2017). We can add to the list the tension between a Muslim's inner intention in ritual and social interaction and publicity of his or her pious prayer, pilgrimage, and almsgiving; the act of spreading false and true information in social media, and commodifying Sufi spiritual discipline by marketing it to the public.

The future of scholarship in religious ethics depends on the pursuit of normative and empirical studies, with monodisciplinary, interdisciplinary, and comparative studies, with collaborations of Muslims from diverse schools of thought and traditions and non-Muslim scholars and activists. The normative studies may be well advanced by considering the old and new production of an ethical thought and theory with now more accessible Muslim and non-Muslim, Arabic and non-Arabic references, thus contributing to the

advancement of Muslim ethical theories, its multicultural origins, its rich intellectual tradition, its varied dimensions touching the diverse domains of life, and its diverse impacts on the Muslims and beyond. A comparative study of the notion of God's command in classical and medieval Jewish, Christian, and Islamic traditions (Hare 2015) is a welcome contribution to a comparative religious ethics, but the global and contemporary studies will be no less important. No less crucial are edited volumes of religious ethics which include an Islamic perspective, are welcome contributions to Islamic studies and comparative religious ethics. In a recent influential work on the importance of being Islamic (Ahmed 2016), Islam needs to be conceptualized as "the theoretical object and analytical category that maps meaningfully onto Islam as a human and historical phenomenon" (p. 542). For Ahmed, "all acts and statements of meaning-making for the self by Muslims and non-Muslims that are carried out in terms of Islam . . . should properly be understood as Islamic" (p. 544). This reconceptualization paves the way to even more diverse and dynamic understandings and practices of Muslim ethics in the past and the present, in the local and global context.

One of the important challenges for the scholars, students, and practitioners is how to avoid an Islamic exceptionalism on the one hand and a humanistic universalism yet approached in hegemonically and particularly Western ways. Muslim and non-Muslim apologetics and critics alike have often situated Islam essentially in its communalistic and practical forms, while other scholars have treated Islamic ethics as essentially individualist and abstract. Bringing Islamic studies into a comparative religious ethics should also mean bringing comparative religious ethics into Islamic studies as both ways can be equally enriching if concepts are comparable and made meaningful to a broader scholarly audience, Muslims and non-Muslims, with some humble awareness of one's moral biases and their questions, theories, methods, and even objectives. We need to recognize the fact that although ethics is about the good and the bad, it is in most cases not an either/or domain of life. Human beings, including Muslims, have faced moral dilemmas, ambiguities, and contradictions in their individual and social circumstances, despite their continued search for moral certainties and predictabilities drawing from the texts and their traditions. The most important challenge may not be simply to formulate a continuity and engagement with our own intellectual moral underpinning but to remain open-minded to the new possibilities of new theories, approaches, methods, and even objectives of doing a study of Islam and comparative religious ethics.

CHAPTER 104

Buddhism: Global Interactions

Francisca Cho

Globalization in the Buddhist Mode

An accurate assessment of Buddhism's global presence needs to look beyond temples and monasteries and focus on the way Buddhist ethical principles are fanning out into contemporary civil societies. The Buddhist concepts of mindfulness, compassion, and interdependence are commonly invoked in discourses about social justice, environmentalism, and the treatment of anxiety and stress. These social issues are now Asian as much as they are Western, and the language of mindfulness, compassion, and interdependence are also present in Western contexts that are not explicitly Buddhist or religious. The concepts are disseminated by well-known Asian monastics such as Thich Nhat Hanh of Vietnam and the current Dalai Lama of Tibet, Tenzin Gyato, but their conversation partners and audiences are Western intellectuals, scientists, doctors, activists, and philosophers who are not necessarily tethered to formal communities of Buddhist practice.

Secular appropriations of Buddhist words and principles can be distinguished from Buddhist religion, properly speaking. For example, mindfulness meditation has been turned into a clinical therapy known as Mindfulness Based Stress Reduction (MBSR) that is used in hospitals and schools, and it is different from traditional Buddhist meditation practices aimed at the goal of nirvana (Kabat-Zinn 1994). Different institutional contexts suggest different levels and objectives of practice, but it is not fruitful to distinguish between more or less genuine forms of Buddhism. Buddhist thought and practice have always stratified between clerical and lay versions, but even more importantly, as Buddhism spread around the world it introduced new seminal ideas into the general population. The transmission of the karma principle into East Asia is a case in point. Karma has been understood both mythologically as rebirth in human, animal, and fantastical realms, and morally as the principle of individual responsibility. But karma is not a “doctrine” in the sense of a creed necessary for religious membership, but rather a cultural mechanism for creating ethical meaning that gives basic shape to Asian life-worlds. To this day, Asians who do not even identify as Buddhist make sense of their moral world in the language of karma.

In a similar manner, secular adaptations of Buddhism such as MBSR can be seen as a significant measure of Buddhist presence. The dissemination of Buddhist thought into general worldviews – to the point where the explicit Buddhist affiliation is eclipsed or forgotten – is a sign of its impact rather than its subversion. Starting from ancient contemplative practices and moving through modern MBSR, the idea of practicing non-judgmental mindfulness of one's thoughts and impulses is now a

cross-cultural meme – even if it is simply for the purpose of reducing stress and the symptoms of particular pathologies. The word “global” can be taken to mean a movement beyond overtly religious spaces to broadly cultural ones, in addition to the movement into new geographical regions.

Presently it is the concept of interdependence – with its emphasis on connecting individuals and environments on a worldwide scale – that is emerging as the global Buddhist ethic. The term “interdependence” is rooted in the Theravāda Buddhist concept of dependent origination (*pratītyasamutpāda*), which is often described as the Buddhist theory of cause and effect. But it also draws on Mahāyāna Buddhist concepts of emptiness (*śūnyatā*), which favor images of a synchronic and all-encompassing web of mutual relationality. The language of interdependence emphasizes that the well-being of all peoples is connected, and it encourages an ecumenism that affirms a fundamental unity underlying religious and cultural differences. Hence the idiom of interdependence downplays even explicit Buddhist identity to address moral issues in a non-denominational manner. This is not only a trait of Western Buddhism; it is evident in Asian contexts as well, and it is consistent with the fact that being Buddhist in the past has rarely been a matter of exclusive religious adherence and identity.

For Western denizens, the appeal to mutual reliance rather than religious identities reverberates with the growing ranks of those who call themselves “spiritual but not religious.” The elective affinity between Buddhism and this kind of spirituality goes back to the nineteenth century when Buddhism was initially introduced to the West. Americans describe Buddhism as “a way of life” rather than a religion, which correctly apprehends that the presence of Buddhism cannot be limited to the number of temples, monks, or those professing confessional allegiance. Buddhism now embodies a global ethical discourse that is both traditional and new, reflecting its continuity and expanded reach in the contemporary era.

Asian Buddhist Movements and their “Secular” Tone

Lay Buddhist movements have grown in Asian nations, particularly those that have undergone economic liberalization and political democratization. Even in Communist China, where the party confines religions to restricted spaces outside of the public sphere, Buddhism is propagating in the form of “traditional culture.” This entails intellectualized forms of Zen, kung fu movies, martial arts literature, and *qigong* practice that are infused with positive images and symbols of Buddhism. The term “lay movement” encompasses diverse social phenomena, from formal organizations like NGOs, on the one hand, to popular cultural trends measured by box office receipts and tourism revenue, on the other. While these movements display the full spectrum of organized to unorganized phenomena, they are united in their penchant to deemphasize explicit Buddhist identity and allegiance in favor of the secularizing rhetoric of “culture” and “humanism.”

Comparing the situations in contemporary Taiwan and China illustrates this unity despite the disparity of their political systems, which directly affect the formal structure of their respective Buddhist communities. Taiwan has emerged as a fertile ground for “humanistic Buddhism” (*renjian fojiao*), a phrase identified with the Chinese monk Yinshun (1906–2005) and the reformist vision of his teacher Master Taixu (1890–1947). Yinshun spent the last fifty years of his life in Taiwan where the impact of his teachings went far beyond its national borders. The Vietnamese monk Thich Nhat Hanh read Yinshun’s work in the 1960s and translated *renjian fojiao* into Vietnamese (*nhap gian phat giao*), which has in turn been rendered into English as “socially engaged Buddhism.” This nomenclature is now used to describe Buddhist movements across Asia that share common characteristics: (1) critiquing institutions perceived

to cause social harm, (2) assimilating the ideals of science, liberty, and democracy, (3) de-emphasizing supernaturalism, (4) promoting lay participation, and (5) embracing ecumenism across the world's religions. This modern Buddhism also includes reforming the sangha (the monastic order) by eliminating centuries-old rituals concerned with death, rebirth, and devotion to otherworldly Pure Lands. Instead, the present world is said to be the Pure Land that can be brought about by mobilizing mass action to protect the environment and provide relief to the poor and vulnerable.

Taiwan and Buddhism under Democracy

After the Taiwanese government lifted martial law in 1987, Buddhist organizations emerged into the public sphere and rivaled the state in providing social services such as disaster and poverty relief, education, and medical care. In the context of a young democratic nation, Buddhist groups have created a civil society based on the concept of interdependence and a social structural interpretation of suffering and its alleviation. One of the most successful is the Ciji (Compassion Relief) foundation, which was established, quite unusually, by a nun rather than a monk. Zhengyan (b.1937) was ordained as a nun by Yinshun in 1963, and she instituted Ciji just three years later as a charitable rather than religious organization. It is presently the largest NGO in Taiwan and *Business Week* featured it as a model of the post-1990s Asian economic recovery that “show[s] governments better ways of delivering needed services” (July 24, 2000, 59). Although there is a monastic community at its heart with Zhengyan as its moral visionary, Ciji is a wealthy and complex organization with branches in thirty countries. Its primary movers are laypeople and professionals who oversee the operation of the foundation's schools, hospitals, and international relief activities. Lay members carry out the day-to-day work and a board manages the foundation's considerable assets and operating budget (about US \$800 million in 1998).

Ciji's emphasis on social services and volunteerism renders Buddhism into a social movement that is broader than a religious denomination. Ciji board members are not necessarily Buddhists but rather successful businesspeople interested in philanthropy. This pattern of bridging the divide between the Buddhist temple and civil society is evident across Asia. In Korea, the Jungto (Pure Land) Society, founded by the monk Pŏmnyun (b. 1953) in 1988, is fully staffed by laypeople. They administer social programs like global disaster relief, and advocate for ecological awareness and human rights. The Indra's Net Community, founded by the monk Tobŏp (b. 1949) in 1999, is a farming cooperative that trains independent farmers in ecologically sustainable practices. It has spawned two NGOs (in 2001 and 2003) to restore farming villages and establish markets for their produce in the cities. In addition to mobilizing lay action, “the two movements share the same foundation of Buddhist beliefs of interconnectedness among beings, including nature” (Park 2010, 43).

Sarvodaya Shramadāna in Sri Lanka is a grassroots movement begun in 1958 by A. T. Ariyaratne (b. 1931) that fosters economic development in rural villages. Ariyaratne is a science teacher rather than a monk who looked to Gandhi for his inspiration, but as a practicing Buddhist he describes Sarodaya Shramadāna as “Buddhist economics in practice” (Ariyaratne 1999). Santi Asoke in Thailand emerged in the 1970s when its founder Samana Bodhirak (b. 1934) broke with the monastic establishment and created an alternative community. Departing from traditional practices, the movement rejects the worship of Buddha images, and emphasizes strict morality and everyday work as a form of meditation (Essen 2004). The group's values reflect the philosophy of the influential Bhikkhu Buddhādāsa (1906–1993) of

Thailand who, like Yinshun in Taiwan, criticized the traditional sangha and translated abstract Buddhist principles into action in the world.

Most of these lay-centered movements were founded by monastics, and therefore it is no surprise that contemporary Buddhist temples also sponsor activities that blur religious and civic functions. Foguangshan in Taiwan, founded by Xingyun (b. 1927), began as a monastic order in 1967 and added a lay foundation (Buddha Light International Association) in 1991. Xingyun was also inspired by Taixu's idea that the present world is the Pure Land, and Foguangshan runs hospitals, medical clinics, organ drives, an orphanage, and a home for the elderly. Foguangshan is most noted, however, for its highly theatrical religious ceremonies that are open to the public. Although some feature traditional liturgical elements such as chanting, votive candles, and the beating of the wooden fish, others veer into mass spectacles with fireworks, dry ice, and laser shows. There are critics who accuse Foguangshan of vulgarizing Buddhism, but Xingyun states that his aim is to bring Buddhism out of the religious cloisters and into the public sphere. As a Foguangshan nun states, "This isn't a religion, it is our cultural tradition" (Madsen 2007, 58). Large-scale ceremonies are a way of performing a social service in the wake of significant national events, such as the September 1999 earthquake, which create social unity.

Korean Buddhist temples have also flourished in tandem with the nation's democratization and economic growth beginning in the mid-1980s. Urban mega-temples, or *sŏnwŏn* (meditation centers), provide social services such as daycare, medical clinics, banking, and organic markets. Mountain monasteries offer meditation retreats and religious festivals that appeal to urbanites seeking vacation get-aways as well as spiritual training. Japanese Buddhist temples, on the other hand, have suffered declining memberships, and 70 percent of the population report no religious affiliation (Nelson 2012). But the Japanese exhibit religious behaviors nonetheless, such as belief in rebirth and participation in religious festivals. In Kyoto, caring for local shrines to the Bodhisattva Jizo is undertaken by neighborhood associations, which define the task as a civil duty for the benefit of the community. The Gion festival in Kyoto, which venerates ancestors and protective deities, is a large-scale tourist and commercial event as well as a religious one (Porcu 2012). Surveys about religious affiliation count only formal membership and overlook the ways in which religious thought and action saturate society. Soka Gakkai, which is the largest Buddhist new religious movement in postwar Japan (founded in 1975), formed its own political party (the Kōmeito) for the purpose of shaping public life according to its modern Buddhist ideals of peace and interfaith dialogue. Similar to mainline Protestant churches in America, the diffusion of Buddhist values into broader society can result in declining membership rolls, but this should not be mistaken for the diminution of the religion.

Buddhism in Communist China

Mao Zedong's radical policies of the late 1950s culminated with the Cultural Revolution (1966–1976), which was catastrophic for religions. Virtually every place of worship was closed down and holy orders were abolished. But after Mao's death (in 1976), the party issued "Document 19" (March 31, 1982), which admitted past errors and reformulated official policy on religion. It proclaimed the protection of religious belief and reinstated the system of the early 1950s when five recognized religions (Buddhism, Daoism, Catholicism, Protestantism, and Islam) were established and made to organize via central associations that report to the government. Presently, the growth of religions in China is accelerating and prompts

comparisons with the Great Awakening in the United States in the nineteenth century (Johnson 2017, 17–18). But again, this growth cannot be measured by institutional membership alone.

Religious organizations still operate in a restrictive environment where public proselytizing is forbidden. Faith is limited to officially sanctioned temples, churches, and mosques that are state-patrolled “islands of religiosity” (Fisher 2014). The 1999 suppression of the Falungong movement – an amalgam of Buddhism, Daoism, and physical cultivation practice – displays the party’s determination to neutralize mass movements that might challenge the state’s monopoly on public discourse. Falungong was a part of the broader *qigong* movement, which is a “body technology” that arose in the 1980s. Attracting enthusiastic practitioners even among party cadres, *qigong* was classified as a secular therapy and became the subject of scientific conferences about its ability to cure diseases and confer supra-normal abilities. *Qigong* averted the restrictions that came with the “religion” label, even though it gave rise to charismatic “grand masters” who claimed mystical experiences and supernatural powers. Although *qigong* has been effectively suppressed in the aftermath of Falungong, the impulses that fueled it remain. The first is the need for a value system that Marxist ideology and even the more recent cult of economic prosperity cannot provide. The second is the party’s strategy of turning traditional religions into the ingredients of a “cultural renewal,” which allows religions to fulfill their functions under a new label.

During the 2012 National People’s Congress that transferred power from Party Secretary Hu Jintao to Xi Jinping, the ceremonies included a call for cultural renewal in order to create a more stable and moral society. The 1990s already had birthed the *guoxue* (“national studies”) movement, in which Confucian classics were reprinted and popularized in the media. Universities offered weekend workshops on Confucian philosophy, and the government gifted Western universities with “Confucius Institutes” to promote Chinese studies around the world. *Guoxue* has been criticized by Chinese and Western observers as an arm of party propaganda, but it follows the pattern of re-appropriating religions as a secular heritage. If *qigong* was categorized as science-backed medicine and therapy, Confucianism is now China’s great cultural tradition rather than a vestige of backwards feudalism. Even folk religious rituals and music are now designated as “intangible cultural heritages” rather than the “superstition” they were denounced as beginning in the Republican era (1912–1949).

Although Buddhism is an officially licensed religion that is subject to state control, it too bleeds into the gray zone of a cultural heritage that is allowed a broader public presence. Parallel to the *guoxue* movement and the renaissance of Confucian studies, *foxue* (“Buddhist studies”) signifies the rebirth of Buddhist studies in a secular guise that is attractive to the intellectual class. The roots of *foxue* go back to the late nineteenth century when Chinese literati responded to Western learning by turning to the philosophical, historical, and logical aspects of Buddhism. Its revival in the 1990s served an additional function, however: secular studies of Buddhism produced by lay authors could be disseminated in bookstores and public libraries where monastic publications are forbidden. The “academicization” of Buddhism is the result of state directives to renounce superstition and serve socialism, but this has strengthened Buddhism’s public presence in China.

It is striking that the demands of Communist party ideology have created a secularized Buddhism parallel to the humanistic Buddhism flourishing within Taiwan’s democratic regime. Both versions entail a greater social structural presence than Buddhism exhibited in the premodern era. To be sure, the Buddhist Association of China (BAC) must report to the party, and it is not allowed to exercise public moral discourse or shape social action like Ciji in Taiwan. But BAC is the first unified national Buddhist organization in Chinese history, and although it was formed as a tool of political control, it has become

a strong church-like apparatus and a national representative of the Buddhist community that can negotiate with the state on its own terms (Ji 2011, 253). In the classic American model of secularism, religion is confined to the private sector of society, but the Asian Buddhist version tends towards greater institutionalization (whether an NGO or a central state apparatus). In an interesting contrast, American religiosity is beginning to look more like Buddhism's highly privatized and unorganized past in East Asia, with church membership declining in favor of individual and pluralistic forms of spirituality.

Buddhism on the Global Stage

The history of Buddhism in the West begins in the mid-nineteenth century when the studies and translations of Orientalist scholars drew the attention of broader audiences and impacted cultural movements. American Transcendentalism is associated with literary figures such as Ralph Waldo Emerson and Henry David Thoreau, and social reformers such as Bronson Alcott (1799–1888) and Margaret Fuller (1810–1850). Transcendentalists revolted against institutional Christianity, embraced intuitive and authentic religious experience, and explicitly invoked Asian religious inspirations. Their embrace of spirituality through aesthetic expression – both Asian and their own – connects Transcendentalists to German Romantics as their immediate predecessors and the American Beat generation as their subsequent legacy. Despite the attraction felt by Western literati and philosophers, the cultural foreignness of Buddhism limited the feasibility of actual religious conversion. Buddhism's attractiveness has been more broadly intellectual and spiritual rather than institutional, but this has engendered new thought-worlds that have in turn impacted large cultural discourses.

One prospect Buddhism presents is that of reconciling romanticism and rationalism – two significant movements that are in tension in modern Western culture. If romantics see Buddhism as fostering a deep personal experience of unity with nature and the cosmos, rationalists are also drawn to Buddhism for its nontheistic ethics and “science-friendliness.” But it is the possibility of marrying rational science with romantic sentiments that is novel. In current conversations about Buddhism and science, concepts from quantum mechanics, epigenetics, and the cognitive sciences are indexed to the language of interdependence and compassion to underscore the importance of human consciousness and agency in the world (Cho 2017). Additionally, the widespread embrace of MBSR in secular contexts normalizes the idea of the mind-body connection (which makes headlines), and science can now embrace talk of morality and spirituality. In a recent book, a University of California (UC) Berkeley economics professor describes how the Buddhist teaching of interdependence can move this “dismal science” away “from the free market zero-sum approach, where additional resources to one person must come from another person, to a collective approach, where everyone's well-being is connected” (Brown 2017, 24–25). The dialogue with Buddhism reinforces movements away from mechanistic and reductive worldviews in the sciences and lends the explicit vocabulary of compassion and inter-relationality.

The way Buddhist thought supports the rethinking of scientific paradigms is an example of how its presence in the West is best measured by its impact on civil discourses. A 2012 *New York Times* article claims that Buddhism is now the fourth largest religion in the United States (June 16, “Buddhists' Delight”), but as in Asia, counting Buddhists is a tricky business. For one thing, its greatest sympathizers are mistrustful of organized religions and unlikely to become formal adherents. Thomas Tweed observes that in the nineteenth and early twentieth centuries, “Buddhism managed to attract so much attention

but, finally, failed to build enduring institutions or inspire even more seekers to embrace the religion exclusively and fully” (1992, xxiv). It is still the case that more Americans think with Buddhist concepts and even meditate than formally convert. This cultural diffusion, however, is in line with traditional Buddhist religiosity. The Dalai Lama does not encourage his large Western audiences to convert to Buddhism, telling them instead to do their best as Christians, Jews, and so forth. Different religions are affirmed as culture-specific paths leading to the same spiritual and ethical goals. The sentiments of the Chan Master Shengyan (1930–2009) of Taiwan’s Dharma Drum Mountain (Fagushan) are typical:

We believe that the religious faiths of all the world’s peoples each have their own historical and geographical background. Therefore, we must accept the fact of religious pluralization and believe each religion is taking up the task of purifying the spirit and society for the sake of humanity.

(2008, 13)

This kind of ecumenism and emphasis on personal cultivation (“purifying the spirit”) rather than institutional affiliation appeals to Americans turned off by religious exclusivism and intolerance. A 2008 Pew Research Center survey shows a significant rise in the religiously unaffiliated, who poll at 16 to 20 percent of the overall population (equal to the percentage of mainline Protestants), and 25 to 30 percent of young adults. This does not mean that religion has declined in America; instead, it is structurally altering towards the “spiritual,” a term that signifies disenchantment with institutional religion and a longing for personal experiences of connection to larger forces and principles. The history of religious revivals in America demonstrates that anti-institutionalism and personal spirituality is nothing new. But the Great Awakenings also signify periods of successive cultural transformation: each constitutes a “fundamental social and intellectual reorientation of the American belief-value system, behavior patterns, and institutional structure” (McLoughlin 1978, 8). Increasing religious pluralism has been one significant marker of such cultural change, and the current period evinces a transition to a new kind of pluralism in the form of multiple religious belonging.

Since the 1960s, the rise of new and pseudo-religious movements (occultism, Scientology, Marxism, Hare Krishna, native American spirituality, etc.) has been diluting the nation’s Judeo-Christian identity, but even more distinctively, a “cafeteria spirituality” has emerged in which people construct private practices cobbled from various religions. A famous example of this do-it-yourself spirituality is the National Basketball Association (NBA) coach Phil Jackson, who combined Zen meditation, Christian ethics, and Lakota Sioux mythology to produce champion teams in the 1990s and 2000s. It is a challenge for clergy and scholars alike to take this kind of eclecticism seriously as real religion, seeing it instead as a vacuous religious consumerism that lacks discipline and commitment to any tradition. But the pursuit of personal religious experience over and against fidelity to established theologies began with the first Great Awakening in the eighteenth century, when evangelicals proclaimed that the experience of being “born again” was necessary to faith. In the current era, Buddhist leaders broadcast the message of underlying religious unity, which encourages a trans-denominational openness similar to the way in which the Chinese have participated in Buddhist, Daoist, Confucian, and folk religious rituals according to their individual preferences.

Modern Buddhism is often described as being influenced by Western rationalism and social activism, which is accurate, but a fuller view suggests a global, back-and-forth dynamic of mutual influences. The secularization of Buddhism in Communist China, for example, is the result of political necessity but also broader global forces as well. In the mid-1980s, Chinese translations of D. T. Suzuki (1905–1971), the Japanese intellectual who wrote in English to spread Zen to the West, sparked a “Chan fever” among

young intellectuals who reconceptualized Chan as a culture and lifestyle in tune with modernity. In 2010, a Chinese translation of *South of the Clouds*, a book about Chinese Buddhist and Daoist pilgrims by the American author Red Pine (b. 1943 as Bill Porter), catapulted him to fame in China. In South Korea, Western Zen masters have sparked renewed interest in Buddhism, particularly meditation and the clinical practice of MBSR that was developed in America (Joo 2011). But the roots of MBSR in turn go back to Buddhist reforms in Burma, particularly the monk Ledi Sayadaw (1846–1923), who is credited with instigating the modern lay meditation movement. Ledi's efforts were driven by anti-colonialism and nationalism, but the mechanism of lay meditation has become a global phenomenon. These Asian-Western transcontinental crossings are pervasive, and they fuel a global Buddhism that appeals to modern citizens across national boundaries.

Contemporary Asian Buddhism has certainly been shaped by encounters with Western knowledge forms, particularly science and Christianity, but globalization works on multiple levels. Modern Asian Buddhists go back to their scriptures to find what they describe as an original, essential Buddhism that has been eclipsed over the centuries. The fundamental concepts of dependent origination, non-self, and emptiness are enjoying a renaissance among Buddhist intellectuals because of an intra-Buddhist dialogue that has become possible only in the modern period. The Chinese Yinshun drew from the Indian Āgamas and the philosophy of Nāgārjuna, and the Theravadin Buddhādāsa drew from Zen. These cross-cultural moves promote the ability to rise above regional differences and distill the common points of Buddhism. In Buddhādāsa's case, "this emphasis on the broader principles of Buddhist teachings rather than on scriptural details ... has allowed him to reinvigorate the theoretically stagnant Theravāda tradition by introducing views and concepts from other Buddhist traditions" (Jackson 2003, 178). In the same vein, Taiwanese Buddhist movements shaped by Yinshun claim to recover the original meaning of Buddhism in the "affirmation of the fundamental interdependence of all things and a call to cultivate one's moral life so as to be in accord with that interdependence" (Madsen 2007, 150). The features of this reconceived Buddhism allow it to transcend Asian regionalism and it also transports easily to Western cultures.

Modern Buddhism occupies numerous modern social containers that integrate the religious with the secular. This is consistent with traditional Asian forms of religiosity, which offered little in the way of systematic theology and ecclesiastical structure. Instead, religion was "spread over every aspect of life like a fine membrane that held society together" (Johnson 2017, 19). Buddhist devotion, belief, and ritual now happen in academic institutes, museums, the cinema, and even Buddhist-themed amusements parks. If these modern containers sustain traditional ways of being Buddhist, the contemporary West is also embracing culturally diffuse religiosities in a way that subverts its entrenched distinction between the sacred and the secular. These trends challenge traditional ways of thinking about religion, but the manner in which global religious realities are evolving on the ground suggests that the study of religion needs to expand its own definition of and approaches to its subject matter.

CHAPTER 105

The Prophetic, Priestly, and Servant Roles of Religion in Public Life in South Africa

Nico Koopman

Introduction

This contribution focuses upon the role of religion in African contexts. The focus is on South Africa as an African country. Some inferences can be made for other African countries. The focus is upon the Christian religion, but inferences can be made for the public role of other religions as well.

The confession of the threefold office of Christ provides a good structure for discussing the public role of religion in public life.¹ From the threefold office of Christ as prophet, priest, and royal servant, we can infer the threefold task of religious faith in public life, namely the prophetic, priestly, and royal-servant tasks.²

The Prophetic Role of Religion in Society

Drawing upon, adjusting, appropriating, and extending the work of American ethicist James Gustafson³ five modes of prophetic discourses in contemporary public life can be identified, namely prophetic envisioning, prophetic criticism, prophetic storytelling, prophetic analysis, and prophetic policymaking.

A Prophetic Vision that Undermines the Old

Dutch theologian Harry Kuitert⁴ who is normally very reserved about the public role of religion, makes space for the visionary and inspiring role that religions can fulfill in public life. James Gustafson, argues that the prophet has the twofold task of envisioning and criticizing.

1 For a discussion of the threefold office of Christ, see Koopman (2015). My work on the threefold office is strongly influenced and informed by the work of American theologian, Geoffrey Wainwright (1997).

2 This author has written extensively on this theme in the past. This entry therefore relies heavily upon earlier works, and strives to re-organize, systematize, extend and freshly utilize these earlier works.

3 The most important works of Gustafson in this regard are: Gustafson (1988a). For an article in which Gustafson also discusses these discourses, see Gustafson (1988b). For an article in which Gustafson applies these discourses to medical questions, see Gustafson (1990).

4 Kuitert (2008).

Prophets as visionaries, according to Gustafson,⁵ portray an alluring vision of the future. They see a new world in which the strife and suffering that we currently experience is overcome. This vision may indict the contemporary broken reality, but its main function is to allure and attract people to act concretely and to attempt to approximate the vision. The prophet as visionary uses utopian language, symbols, analogies, similes, and metaphors that move us. Their speeches are not technical moral arguments or policy statements. Hearers are moved by aspects like passion of the speaker's voice, the cadences and figures of speech, many drawn from the Bible, that are employed, and also the moral authenticity of the speaker. Such visionary language moves us from indignation with the present to aspiration for the future.

South African theologian John de Gruchy⁶ argues that democracy cannot flourish without a vision of a new society.

What occurred in ancient Athens was only the first step into an unknown future in pursuit of a vision of a transformed society in which all people are equal and their differences respected; free and responsible as citizens, but also liberated from oppression and poverty and therefore living in a society where justice prevails. This vision ... derives as much, if not far more, from the prophets of ancient Israel than it does from Athens, the Enlightenment, or the French Revolution.

The vision of a new society should be spelled out as long as that society is not fully actualized for all people and all of creation. The vision of the new requires no justification there where people suffer, and may I add, there where there is solidarity with those who suffer. Envisioning does not imply a flight from the world, but rather a commitment to be empathically involved in the affairs of the world. Vision mobilizes people, nurtures hope, and prompts action.

Prophetic Criticism that Calls the New into Being

According to Gustafson the second dimension of prophetic speaking is that of courageous criticism. Besides annunciation, prophets have the task of denunciation. Besides the task of announcing the vision of a new society, prophets perform the task of denouncing the reality that is in conflict with the vision of a new society. The prophet as critic, according to Gustafson,⁷ addresses what is perceived as the root of the problem. The problem is not merely viewed as a matter of policies that are inadequate and wrong, but it is a matter of religious, moral, and social waywardness. The critic names the devil, which presumably underlies the various wrongs in society. Prophetic criticism gets to the roots of problems that pervade institutions and cultures, or that pervade the actions and behavior of individual persons. On the basis of statistical indicators and social analysis they expose the causes and roots of social and personal wrongs. Prophets as critics do not engage in detailed policy recommendations, and matters of strategy and tactics. The indictments of the prophet as critic construe the human condition in deep and broad proportions. And these prophetic indictments lead to conviction of guilt, and constitute a call to a fundamental repentance and a radical turn from unfaithfulness to faithfulness.

⁵ Gustafson (1988a, 13–14).

⁶ de Gruchy (1995, 38–39).

⁷ Gustafson (1988a, 7–11).

During apartheid the notion of apartheid as a heresy was employed to expose the theological causes and roots of what went wrong in our society. The notion of empire is currently employed to express what is going wrong in contemporary societies in local, regional, and global contexts.

The globalization research initiative of the *Evangelisch Reformierte Kirche* in Germany and the Uniting Reformed Church in Southern Africa offers a helpful definition of empire. This research collaboration, which is hosted by the Beyers Naudé Centre for Public Theology, is one attempt among many to advance the reception of the Accra Declaration on global justice by so-called northern and southern churches.

We speak of empire, because we discern a coming together of economic, cultural, political and military power in our world today, that constitutes a reality and a spirit of lordless domination, created by human kind yet enslaving simultaneously; an all-encompassing global reality serving, protecting and defending the interests of powerful corporations, nations, elites and privileged people, while imperiously excluding, even sacrificing humanity and exploiting creation; a pervasive spirit of destructive self-interest, even greed – the worship of money, goods and possessions; the gospel of consumerism, proclaimed through powerful propaganda and religiously justified, believed and followed; the colonization of consciousness, values and notions of human life by the imperial logic; a spirit lacking compassionate justice and showing contemptuous disregard for the gifts of creation and the household of life.⁸

The definition of these churches focuses on empire not only as specific nations, corporations, or institutions. This definition is deeper, wider, and more inclusive than attempts to attribute the notion of empire only to such clearly definable institutions. It implies these institutions, but also unmask the spirit, gospel, and ethos that it is constituted and nurtured by, and that it in turn reinforces.

This definition of empire helps to unmask the spirit of empire in the practices, policies, and institutions in all walks of life, at the local, regional, and global levels. Moreover, it helps to unmask the spirit of empire in the hearts of humans and in the life of churches as well. Notions like empire are not famous. One often feels that it might be better to avoid such controversial and potentially divisive concepts. On the other hand, concepts like these enable us to pay attention and to become conscientized about what is going on around us and in us. These concepts shock in order to restore. And prophets are called upon to, among others, shock in order to restore.

Prophetic discourse as prophetic criticism also entails self-criticism. For various reasons churches and other religious institutions should engage in constructive self-criticism. We should, however, guard against a form of self-criticism that does have pacifying effects, a self-criticism that serves as an excuse to terminate public involvement, because we are ourselves so very imperfect. What is required is a self-criticism which shows that we are aware of our sinfulness and fallibility as human beings. Because we are imperfect, sinful beings even our best efforts as churches and other religious bodies might be contaminated. Without constructive self-criticism we cannot speak legitimately in the world.

Besides the self-criticism with regard to justice in racial and class matters, churches need to practice prophetic self-criticism with regard to various other justice matters, among others sexism, misogyny, heterosexism, patriarchalism, homophobia, nationalism, handicappism, ageism, ecocide, exclusion, and exploitation.

8 Boesak et al. (2011).

This brief discussion makes it hopefully clear that the practice of prophetic criticism is not destructive and negative. On the contrary, it is informed and inspired by the vision of a new reality. Exactly this focus upon the vision of the new prompts a stance of courageous and constructive criticism and self-criticism that opposes negativity and self-withdrawal, and that seeks the new in individuals and institutions, in churches, and in broader society, including the natural environment.

Civilizing Prophetic Narratives From The Margin

Gustafson identifies three functions of stories in communities, especially Christian communities. Stories form the ethos and identity of a community and its members. They inform and guide the moral choices of people. Stories, thirdly, perform a prophetic function.

Stories form moral identity by rehearsing the community's history and traditional meanings as it is portrayed in Scripture and other sources. The living tradition and truth transmitted through narratives, liturgies, rites, and other concrete terms and symbols, shape the ethos, vision, virtue and character, the values and outlooks as well as the moral interests and determining moral convictions of the moral and religious community.⁹

By referring to the ethical methods of Jesus and the rabbis, Gustafson¹⁰ argues that narratives can illuminate casuistic moral argumentation. They do not provide single, clear, and argued answers to specific moral cases, but they do provide nuanced and subtle illumination of the challenges that are faced and of possible outcomes. They show us features of life that are somehow excluded from technical abstract casuistry. Narratives do not offer distinctions and arguments, but they evoke imagination and stimulate our moral sensibilities and affections. And although they do not give clear and decisive conclusions, they do enlarge one's vision of what is going on. Where casuistic moral arguments call us to act in conformity with them, narratives invite us to act in the light of the vision they convey.

Stories do not only use biblical or theological material. They do not offer theories of justice or injustice. But they do have a moving prophetic effect.¹¹ African theologian John Mbiti uses African prayers, poems, idioms, and sayings to tell in a narrative way how African people deal prophetically, hopefully, and with resilience with the various plights that they face, especially the plight of poverty.¹² These narratives are also conveyed through songs. That great son of Africa who recently passed on, Archbishop Emeritus Desmond Mpilo Tutu,¹³ perfected the use of narrative, song, metaphors, images and humour in addressing public concerns and challenges. In his classic work on the Truth and Reconciliation Commission in South South Africa, he employs this approach throughout. He, for instance, explains the process of forgiveness and confessing with this rich image.

The victim may be ready to forgive and make the gift of her forgiveness available, but it is up to the wrongdoer to appropriate the gift – to open the window and draw the curtains aside. He does this by acknowledging the wrong he has done, so letting the light and fresh air of forgiveness enter his

⁹ Gustafson (1988a, 19–20, 22–24).

¹⁰ Gustafson (1988a, 20–22).

¹¹ Gustafson (1988a, 20).

¹² See amongst others Mbiti (1975).

¹³ Tutu (1999, 220).

being. In the act of forgiveness we are declaring our faith in the future of relationship and in the capacity of the wrongdoer to make a new beginning on a course that will be different from the one that caused us the wrong.

(Tutu 1999, 220)

Stories specifically reveal the plight of people living at the margins of our societies. The level of civility and dignity of a society is measured by how we care for the poor and vulnerable, the marginalized and vulnerable. The narratives of vulnerable people are determinative for the type of society we strive to be. Their stories provide the epistemologies and knowledges without which civilizing democracies cannot flourish.

The focus upon these stories from the margin does not take place in an exclusive manner. South African theologian John De Gruchy¹⁴ argues that the conviction of God's special identification with the poor and the marginalized is a Reformed notion, which sadly became neglected. Liberation theologies helped us to re-value the importance of this conviction for faithful living. This notion was prominent at the birth of the Reformed tradition. This was the case because many of the earliest Reformed theologians and pastors, as well as congregations, were persecuted, and much Reformed theology was conceived in exile, in poverty, amidst adversity, and in the struggle against social and ecclesiastical tyranny. He cites the famous address of John Calvin to King Francis I of France in which he describes his fellow refugees as the "off scouring and refuse of the world."

The wellbeing of the marginalized constitutes the acid test for the level of dignity and civility of our societies.

Prophetic Analysis

Gustafson¹⁵ describes the analytical, ethical, technical, or philosophical moral discourse as follows:

Ethical discourse provides the concepts, the modes of appropriate argumentation, and important distinctions which lead to greater precision and stronger backing for what Christians and other religious communities think is the right thing to do, the good thing to do.

Gustafson¹⁶ admires the constant attention to the ethical moral discourse in the Roman Catholic tradition. He argues that since the second part of the twentieth century Protestant ethicists started to give attention to the ethical, technical, or philosophical moral discourse. He mentions that the ethical writings of his teachers and of his pupils differ significantly in this regard. Ethical discourse, under the influence of especially Anglo-American moral philosophy, encourages a more precise use of concepts like justice, virtue, rights, and duties. It offers more careful distinctions between concepts and classes of moral issues. It requires stronger logical arguments in support of moral prescriptions or moral condemnations.

Also drawing upon the work of James Gustafson, US theologian B. V. Brady¹⁷ mentions that the ethical discourse is drier and less exciting than the narrative and prophetic discourses. Ethics can be tedious.

¹⁴ De Gruchy (1991, 1998, 71–93).

¹⁵ Gustafson (1988a, 42).

¹⁶ Gustafson (1988a, 31–32).

¹⁷ Brady (1998, 146–147).

Wording must be painstakingly accurate. Concepts need to be defined in a clear, comprehensive and concise manner. Clear thinking, precise use of words, and compelling reasoning facilitate the engagement of theology with public life. The ethical discourse helps to make narratives public and to translate the passionate pleas of the prophet into rationally defensible public positions. And by assisting these discourses to be more vocal and public in credible and constructive ways, an impact is made on the formation of public opinion, public ethos, public *Zeitgeist*/thinking and eventually on public policy.

Accompanied by such thorough technical analysis of various public challenges the prophetic task can be accomplished with intellectual sophistication, authority, and credibility.

Prophetic Policymaking

To impact on public life and to affect the course of events, churches need to participate in policy discourse.¹⁸ The policy mode distinguishes itself from the other discourses in two ways, according to Gustafson. People who have the responsibility to make choices and to carry out the actions that are required by those choices conduct this discourse. Visionaries, critics, storytellers, technical analysts can all function with the external perspective of an observer, but policymakers function with the internal perspective of persons and agents who are responsible to make choices in quite complex and specific circumstances that constrain their possible actions.¹⁹

Gustafson refers to a second distinguishing characteristic of policy discourse. Policy is to be developed in particular conditions that both limit and enable the possibilities of action.

The first question of the policymaker is likely to be “What is going on?” and not “What ought we to do?” Or, at least, both of these questions have to be kept in mind in a tandem and finally integrated way. The policymaker has to know what is possible, as well as what is the right thing to do, or what the most desirable outcomes are. What is desirable is always related to what is possible; it is always under the constraints of the possible. And a critical factor of judgment is precisely *what is possible*.²⁰

The ethical should give direction to policy, but more is required for final decisions and policies: estimates and assessments of what is possible with the help of sociological, economic, and other concepts; information on how to move the institution with efficiency from where they currently are to where they could be and ought to be within a specific time frame. For the policymaker the ethical is not the only consideration, but it is just a dimension of the economic, social, personal, and historical.²¹

Within the framework of limited space, time, information, and possibilities policymakers are challenged to make compromises, and even decisions that might seem morally wrong or morally inadequate to the storytellers, critics, and visionaries.²² Brady’s elaboration on and application of the work of

18 Gustafson (1988a, 52).

19 Gustafson (1988a, 43, 46).

20 Gustafson (1988a, 47).

21 Gustafson (1988a, 49–51). For a discussion of the potential of Christian realism and middle axioms for policy discourses, see Koopman (2010, 41–56).

22 Gustafson (1988a, 51).

Gustafson is helpful. He argues that in policymaking the variety of vulnerable people need to be given priority, among others children, women, oppressed racial groups, poor people, and exploited workers. This notion of the priority of the most vulnerable will help that the unavoidable compromises will not impact negatively on them. This notion of the option of the most vulnerable serves as a benchmark with regard to policymaking and especially the adoption of compromises.²³

The enabling dimension of policy discourse resides in the fact that policymakers do have sufficient power to implement decisions and policies.²⁴

A few years ago the church leaders' forum in the Western Cape and the provincial government of the Western Cape had adopted a document that will serve as the basis for the collaboration of churches with regard to policymaking, policy-implementation, and policy-monitoring processes. This document reveals the commitment of churches to partnership, collaboration, and to practice a policy discourse that is informed by the vision of a civilizing democracy, on the one hand, and that is open to making compromises without betraying the aim of the vision of a new society, especially the aim of civil and dignified living for the marginalized.²⁵

The Priestly Role of Religion in Society

In his contemporary hermeneutic for the priestly office Wainwright²⁶ argues that Christ the Priest replaces our pain and suffering, which are expressed in alienations, with reconciliation, and He replaces our sin and guilt, which are expressed in estrangement, with atonement. Christ restores us to divine communion and to communion with each other. Wainwright²⁷ spells out the concrete and public forms that cry out for this reconciliation, atonement, and restored communion:

... oppression is political alienation, for the disenfranchised are deprived of the privileges and responsibilities that go with the human vocation to live in society; poverty is economic alienation, for the impoverished are cut off from their share in the fruit of the earth that humankind is charged by God to cultivate; sickness is physical alienation, and a troubled mind is psychological alienation, and both remove the sufferers from the flourishing existence which God envisioned for his human creatures; slavery is alienation of identity, the profoundest infraction of the dignity of every child of God; bereavement displays death as the alienation of humankind from the life of communion for which it was made.

Jesus Christ, the Public Priest, entered into this human condition of alienation and estrangement. This estranged humanity is the humanity that Christ consumed, and in the words of the famous theologian Hans Urs von Balthasar²⁸ “what had not been assumed would not have been healed.”

23 Brady (1998, 48–153).

24 Gustafson (1988a, 51).

25 For a reflection on this collaboration see Koopman (2011).

26 Wainwright (1997, 150–153).

27 Wainwright (1997, 150).

28 Quoted by Wainwright (1997, 151).

The priestly role of religion challenges, invites, and inspires churches and other religious institutions to overcome this variety of alienation.

Works needs to be done to overcome political alienation. The young South African democracy has a good democratic vision and policy documents in place. We, however, need to work for social solidarity, social cohesion, and the joint building of social capital. Works needs to be done to overcome socioeconomic alienation, especially as expressed in the big gap between rich and poor. We have sound macroeconomic policies and practices in place, but the benefits did not reach the poor, and South Africa still is one of the countries with the biggest gap between rich and poor in the world. Besides our noble human rights principles of access to basic necessities millions still are excluded from physical and mental health care. We still hurt each other on the basis of racial, national, tribal, gender, and socioeconomic identities, and on the basis of identity of sexual orientation, age and disability. We even hurt nature.

The priestly office calls us to work for overcoming these alienations, hurts, and violations of dignity, and to work, therefore, for the actualization of dignity, health, healing, and for restitutive reconciliation and reconciling justice.

The Royal-Servant Role of Religion in Society

Wainwright²⁹ argues that the royal servant office teaches contemporary societies about authority, freedom, power, and hope. In a world that seeks autonomy and, in the process, aims to become deistic and eliminate any idea of divine action and rule, the plea is not to burn down the house of authority, and not to bring down the Scriptures, creeds, liturgies, and institutions of the admittedly imperfect historic church.

In societies hungry for cultural freedom and an absolute right of self-expression, this office calls for recognition that my neighbor is, negatively put, the limit of my freedom, and, positively put, a personal call to service. He lastly mentions that this office assures us of ultimate hope in the exalted Lord and King.

In the South African context, this office might be employed to decontaminate imperialistic notions of power that seem to threaten the idea of the servant power that is characteristic of power in the democratic vision with its central words like *minister*, which literally means servant, and the word *president* which means the one that presides, that one serves as an example among the servants, the servant *per excellence*. More than that, the *Christocracy* tells of a Lord, a King who is Shepherd and the most humble of servants. Simultaneously this office calls disciples to fulfill their calling as citizens to a public life of respecting authority, and living responsibly, in the church and in all walks of life.

The royal-servant calling also entails that the life of freedom be defined as a life of freedom from bondage and freedom for a life of service. This view of freedom provides appropriate guidelines and parameters for developing a human rights culture, specifically to advance freedom and justice rights, and also to obey the call to freedom and justice responsibilities.

The royal-servant office also prompts a life of hope. Hope can be described in a threefold manner. Hope is realistic hope because it is founded in the biggest reality of all, namely the cross and resurrection, ascension, and *parousia* of Jesus Christ, which is the fulfillment of the promises of God. Against this

29 Wainwright (1997, 169–171).

background hope is responsive hope. Hope therefore pays attention, functions pro-actively, and is expressed in concrete involvement in the matters of life. Hope is resilient hope. Despite the most difficult circumstances Christian hope perseveres with patience and fortitude.

And based on this calling, authority, and hope churches are moral communities for the formation of disciples and citizens of character and virtue. According to American theologians, Bruce Birch and Larry Rasmussen,³⁰ an etymological study of the word character indicates that character has to do with the engraving of particular principles into a person. They refer to the Greek roots of the word which means engraving tool, and by extension the marks made by an engraving tool. Character, hence, has the notion of values which are engraved into a person, over time, so that it becomes assimilated, incarnated, and embodied in the person. Character, like the virtues, therefore, develops over time in communion with God and other human beings.

The North American ethicist J. Philip Wogaman³¹ offers a valuable description of virtue. He describes virtue as “a disposition of the will toward a good end, as a tendency to think or behave in accordance with goodness, as a habit of the will to overcome a threat to our ultimate good.” A virtue is a predisposition, a tendency, an intuition to be and to act in a specific way without prior reflection. It almost happens instinctively. It to some extent has an element of unavoidability. The Greek word for virtue, *areté*, refers to the divine power that we do have to be and to act in accordance with goodness. Virtue also has the dimension of *habitus*. This implies that virtue is acquired in a process of consistent and collective habitual behavior.

Greek philosopher Aristotle has identified four so-called cardinal virtues. Cardinal is derived from the Latin word *cardo*, which refers to the hinge of a door. The four cardinal virtues are, therefore, the hinge on which all virtues turn. These virtues are justice, moderation/self-control, discernment/wisdom, and courage/fortitude. Centuries later Thomas Aquinas added three theological virtues to these four, namely faith, hope, and love.

Social and political scientists in various parts of the world argue that democracies with human rights cultures that serve the common good cannot become a reality without leaders and citizens of civic virtue and character. Societies hunger for people of public and civic virtue: public wisdom in contexts of complexity, ambiguity, tragedy, and *aporia* (dead-end streets); public justice in context of inequalities and injustices on local and global levels; public temperance in context of greed and consumerism amidst poverty and alienation; public fortitude amidst situations of powerlessness and inertia; public faith amidst feelings of disorientation and rootlessness in contemporary societies; public hope amidst situations of despair and melancholy; public love in societies where public solidarity and compassion are absent.

Islam and African Traditional Religions

Although this contribution that is written by a Christian scholar focuses on the Christian tradition, acknowledgment and high appreciation for the role of other religious traditions in transforming public

³⁰ Birch and Rasmussen (1989, 124).

³¹ Wogaman (1989, 29).

spheres in Africa, is expressed. Other major religions on African soil indeed make significant contributions to the transformation of public life on the continent.

A recent publication of a Muslim sociologist of education and public intellectual, Aslam Fataar, serves as an example of a work in the field of Public Theology and Ethics, from an Islamic perspective.³² In this publication he illustrates the transformative potential of Islamic faith for different challenges and concerns of public life. Fataar discusses Islamic perspectives on themes like the Reconstruction and Development Program that Nelson Mandela launched in 1994 as a framework for socioeconomic liberation, poverty, education in schools in South Africa, building of democracy, globalization, city life, fasting in the context of poverty and inadequate electricity supply, environmental challenges, plurality and complexity, decolonization, sociological and religious sectarianism. He consistently suggests practices that can be launched on the grassroots level to transform the desperate situations of the poor and unemployed. In the Afterword of this book appreciation was expressed for the contribution of Fataar's work to religious beliefs and practices that pass the acid test for healthy religion, namely advancement of dignity, openness to intellectual scrutiny from within and from outside the tradition, and the advancement of an ethos of tolerance and embrace amidst a diversity of even conflicting points of view – and the consequent opposition and rejection of both radical relativism and nihilism, on the one hand, and absolutism, populism, demonization, and annihilation of the other, on the other hand.³³

The role of African Traditional Religions on the continent also needs to be acknowledged. Jacob K. Olupona³⁴ explains that despite opposition and accusations from other religions that they are pseudo-religions that practice superstition, magic, and fetishism, and although some members of the African social, cultural, economic and political elite, view these religions as a major hindrance to social and economic development, and also to modernization, the ATRs keep their status on the continent and have also obtained transnational and global reaches. In the context of globalization and the increased use of social media, ATRs are booming in Africa and globally in the twenty-first century.

Although the ATRs reflect, like all religious traditions, ambivalence, which is witnessed to in some questionable practices, it is nevertheless a positive force for the transformation, dignifying, and healing of a continent with high levels of dehumanization, violence, discrimination of all sorts, and other major concerns. These religions, with their emphasis on rituals and ceremonies and even playfulness, dance, music, and decorative arts are for their adherents, sources of cultural memory, for example for people who were taken from Africa to be slaves. They are sources of strength, healing, political legitimacy, and economic liberation. They also serve as parallel communities in societies and provide communion, social cohesion, cultural cohesion, and care. This happens also in countries outside Africa. In that situation, however, some differences in the practices of ATRs do develop. Women, for instance, enjoy a stronger leadership role than their counterparts in Africa.

³² Fataar (2019).

³³ This work of Fataar reflects the spirit and ethic of dialogue and cooperation amongst different religions in South Africa, and elsewhere on the continent. For a discussion on the cooperation of different secular and religious traditions on building ethical citizenship and ethical leadership, see Dames (2008).

³⁴ Olupona (2014, 105–121).

Conclusion

South Africa and the rest of the continent experience high levels of religiosity. Religion can be good news to society if it fulfills a prophetic, priestly, and royal-servant role as this entry attempts to describe. Without engaging in religion for ulterior motives and without instrumentalizing religion, one can state that this continent with all its immense challenges needs all its rich economic, human, cultural, and religious resources to advance a life of dignity for all. Africa and the world need religion that prophetically envisions, that is critical, that tells stories of pain and hope, that embraces intellectual analyses, that engages constructively in policymaking, that priestly reconciles and heals, that in royal-servant fashion serves society, nurtures hope, and builds ethical citizenship and leadership.

CHAPTER 106

Indian Religions: Global Interactions

Gardner Harris

A discussion about the effect of global interactions on Indian religious ethics can go a number of different directions. Given the impact of British colonialism, this entry focuses on how economic, political, and social power structures of the colonial administration mediated British and Indian, specifically Hindu, interpretations of religion during the late eighteenth and nineteenth centuries. The British produced a body of knowledge on India's past as a means to control the present. This metanarrative ultimately influenced the way Indians perceived themselves. Central to this dialogical process was the question of religious ethics. British colonialists publicly derided their Indian subjects as devoid of morality and touted Protestant Christian ethics as the code one should aspire to follow. This elicited a number of strong rebukes from Indian religious and social reformers who advocated for a Hindu religious ethos based in a singular divinity that shared many elements with Christian ethics. It is the friction between these opposing positions that is of interest here. In focusing on one aspect of a much broader and complex topic, many voices, events, and historical contexts also worthy of consideration are missing from the following comments.

Colonialism and the Production of Knowledge

The British East India Company, established to trade in the Indian Ocean, received a royal charter in 1600 and began trading operations with Mughal India. Initially, the company was not concerned with empire building; however, by the late 1750s it dominated European powers (Dutch, Portuguese, French) at sea and captured Bengal, an economically and culturally rich region of eastern India. Once Bengal was under administrative and military rule, the company began to expand its control over other regions in India. By the mid-nineteenth century, it either directly or indirectly ruled most of the subcontinent. In 1857, an uprising of Indian soldiers in the company's army – which the British refer to as the “Sepoy Mutiny” but Indians refer to as the “First War of Independence” – forced the British Crown to take control of India in 1858, which it ruled until partition of the subcontinent in 1947. The British East India Company lost its charter after the insurrection and was completely dissolved by the early 1870s.

A basic mission of British colonialism was the extraction of India's natural resources and the creation of additional revenue streams through taxation, trade, the opening of new markets, indentured labor, military plunder, and so on. A second goal was the moral and religious uplift of what was deemed a corrupt and backward civilization. As it turned out, the two went hand-in-hand. Many believed that the way

to fend off social disorder and make economic and political progress was to instill an ethical code to civilize the Indian population. In 1790, Charles Grant (1746–1823), an Anglican missionary and director of the company, submitted a proposal to a member of parliament to establish Christian missions in Bengal and Bihar. Grant wrote, “In fact, the People are universally and wholly corrupt, they are as depraved as they are blind, and as wretched as they are depraved, and to govern them and render them obedient and orderly upon right principles, is no easy Work ...for they are lamentably destitute of those Principles of Honesty, Truth, and Justice which are necessary to the Well-being of Society.”¹ Such a remark embodied the prevailing sentiment of the time, namely that India needed to be saved. As Grant indicated, such a task would be no easy work. One means to accomplish this goal was to create a body of knowledge about India’s past to understand the most expedient means to govern and uplift their new subjects.

It was also no easy work to reach consensus on what this body of knowledge should contain or what methods should be used. Two opposing positions emerged in the late eighteenth century as the company rose to power. The term “Orientalist” was used to refer to a group of officials and scholars who learned Indian languages, studied ancient texts in Sanskrit – India’s sacerdotal language – made comparative religio-cultural analyses, believed the subcontinent should be governed, not by English law but by local law and custom, and advocated for the inclusion of Indian languages in local education. A founder of the Orientalist position was Sir William Jones (1746–1794), a supreme court justice in Kolkata (Calcutta) and brilliant polyglot, who “discovered” the Indo-European language family. Many Orientalists, and Jones in particular here, saw that India had much to offer Britain, even if it was an inferior civilization. “[A]lthough we must be conscious of our superior advancement in all kinds of useful knowledge, yet we ought not therefore to condemn [*sic*] the people of Asia, from whose researches into nature, works of art, and inventions of fancy, many valuable hints may be derived for our own improvement and advantage.”²

The Orientalist appreciation for India was not shared by the group referred to as “Anglicans” or “Utilitarians.” Members of this group believed, in the name of progress and modernization, that English law should rule India. They also sought to spread Christianity, believed education should be conducted in English only, and were far less enthusiastic about Indian languages, traditions, and customs. This view is thoroughly articulated in the three-volume *History of British India* that James Mill (1773–1836), a Scottish philosopher, historian, Presbyterian minister, and father of John Stuart Mill, published in 1817. Mill’s *History* was popular reading for neophytes embarking on a career in the colonial administration. It was the first attempt at a comprehensive “historical” analysis of the subcontinent and a critique of the colonial administration’s policies. Despite its popularity at the time, by today’s standards it is a troubling read. To begin, Mill argued that learning Indian languages or being in situ for ethnography were wholly unnecessary. “[T]he mental habits which are acquired in mere observing,” Mill opined, “and in the acquisition of languages, are almost as different as any mental habits can be, from the powers of combination, discrimination, classification, judgment, comparison, weighing, inferring, inducting, philosophizing in short...” (xii). Overconfidence in his intellectual prowess led him to conclude that one could learn more in “one year in his closet in England, than he could obtain during the course of the longest life, by the use of his eyes and his ears in India” (xii). Despite the obvious absurdity in Mill’s declaration, there is a simple reason for it: India was barbaric, unlettered, and irrational compared to civilized, erudite, and enlightened Britain. Reason and scientific positivism were all that one needed to

1 Henry Morris (1904, 111–112).

2 Sir William Jones (1807a, 12).

arrive at objective truth. While Mill's position echoes the sentiment of Grant's comment above, one might question whether analysis of translations and observational reports was actually necessary before passing judgment. Mill was certainly privy to invectives about the moral depravity of Hindus that Christian emissaries had unleashed before the House of Commons and in church congregations over the many decades leading up to the publication of *History*.

Regardless of the sentiment, Orientalists and Anglican-Utilitarians agreed on several issues. As a starting premise, India was fundamentally Hindu, and specifically the Hinduism found in ancient religious texts; other religious traditions (Jains, Buddhists, Sikhs) were offshoots of Hinduism or foreign traditions (Islam). Furthermore, in regard to a religious ethos, there was none; or rather, what constituted an ethical system in the distant past – in a “golden age” – had eroded due to misinterpretation or disuse of ancient religious texts and influence from foreign invaders, notably Muslims. As Jones remarked, “nor can we reasonably doubt, how degenerate and abased so ever the *Hindus* may now appear, that in some early age they were splendid in arts and arms, happy in government, wise in legislation, and eminent in various knowledge.”³ Some colonial scholars, such as Mill, however, denied the “golden age” theory and suggested India had never been civilized. Third, the backbone of the ethically abased society was the so-called Hindu caste system that the Brahmin priests, the highest caste, maintained out of self-serving, avaricious interests. As Mill wrote, “And we have seen that by a system of priestcraft, built upon the most enormous and tormenting superstition that ever harassed and degraded any portion of mankind ...despotism and priestcraft taken together, the Hindus, in mind and body, were the most enslaved portion of the human race” (Vol II, 132). As we shall see, much of this perspective on caste was rooted in a racial theory that emerged with Jones' discovery of the Indo-European language family.

One foundational flaw in colonial knowledge was that it posited a monolithic Hinduism as found in ancient Sanskrit sources. Hinduism is not nor ever has been a unified religious tradition. In fact, the term “Hindu” as a label is a British construction that arose out of this body of knowledge. Nevertheless, colonial scholars recognized an early monotheism in the monism of ancient Sanskrit texts, specifically in the *Upaniṣads* (ca. 700–100 BCE), also referred to as Vedānta (Conclusion of Knowledge or Vedas) – philosophical interpretations of the four *Veda-Saṃhitās* and intricate ritual program of Vedic fire sacrifice. While there is no theological unity in the *Upaniṣads*, as they were composed over some 600 years, the general interpretive scheme that Śaṅkara, the eighth-century Hindu theologian, made popular was that they articulate a single reality – Brahman – that was impersonal and from which all creation arose. The individual soul (*ātman*) was identified as Brahman, and the matter that constitutes human forms and the phenomenal world was regarded as illusion and unreal. The soteriological goal was to identify with Brahman, the inward divinity, and eschew attachments to sensual pleasures and the material world. It was this interpretative scheme that pointed colonial scholars toward seeing an early form of monotheism.

Reconciling this with polytheistic tendencies and idolatry that colonial officials observed in ritual practice was no easy work. Such belief and worship was regarded as profligate and a devolution from a once superior tradition. One cause for the slide into immorality, it was argued, was reliance on a genre of secondary religious literature known as *Purāṇa* (“Ancient”; ca. third century–eighteenth century CE), a collection of eighteen encyclopedic texts that address, among other things, the mythological exploits of the gods. Colonial officials believed that the esoteric nature of early monotheistic teachings forced religious specialists to use *Purāṇas* as an alternative way to communicate with the wider population. It was

3 Sir William Jones (1807b, 25).

agreed that over time Brahmins became lazy and led followers astray for monetary gain with the polytheistic tendencies in *Purāṇas*. As Mill opined, *Purāṇas* are a “set of legends, more absurd and extravagant, more transcending the bounds of nature and of reason, less grateful to the imagination and taste of a cultivated and rational people, than those which the fabulous history of any other nation presents to us. The Brahmins [*sic*] are the most audacious, and perhaps the most unskilful [*sic*] fabricators, with whom the annals of fable have yet made us acquainted” (Vol. 1, 99).

Through academic and popular publications, translations of Sanskrit texts, administrative reports, photographs, and so on this body of knowledge became an authoritative metanarrative on India’s past and present. In hindsight, it is clear that much knowledge produced in the nineteenth century was flawed. In addition to navigating dissimilar cosmologies and religio-cultural taxonomies, which many did not fully understand, often colonialists could not escape their own sensibilities and worldview. The historical record reveals that what passed for objectivity was agreement first in the superiority of all things British – literature, language, religion, customs, morality, science, architecture, and so forth – it was the standard by which everything was measured. One need only consider the perspective of Thomas Biggs (1822–1905), a military officer assigned to photograph temple architecture. Biggs was disgusted with the perceived immorality of sensuous bodily forms of temple sculpture, claiming that they were evidence for “the early date at which the morals of India assume such a headlong and downward decay.”⁴ He was wholly uninformed about the form and function of temple sculpture and used British artistic and moral standards to evaluate and judge it. While this is just one example, it points to the fact that colonial knowledge reflected British biases and opinions more than an “objective” knowledge of India.

It was these sorts of assumptions that influenced the colonial administration. In many cases, their policies disrupted social and economic orders and implemented rigid social hierarchies that did not reflect lived reality. Eugene Irschick (1989), for instance, traced how in south India in the late eighteenth and nineteenth centuries a caste of agriculturalist landlords (*vellala*), playing into the British belief of a “golden age” and timeless village existence, convinced local officials and tax collectors that they were the traditional landlords with rights to the land in Tondaimandala, an area near Chennai (Madras) in Tamilnadu. The British, wishing to preserve the traditional social order – despite empirical evidence to the contrary – implemented policy that favored their claim and prevented non-*vellalas*, many of whom were underprivileged, from owning land and thus impeding their chances of upward economic mobility.

It is not the case that all of the knowledge produced during the late eighteenth and nineteenth centuries was erroneous; however, many of the foundational assumptions were. The belief in an ethical “golden age” and a timeless, sedentary India girded by the caste system forced scholars and administrators to make inaccurate judgments and disruptive policies. One leading culprit for these assumptions was the formation of a theory on race that grew out of Sir William Jones’ discovery of the Indo-European language family.

Racial Theory of Caste

The British regarded the Hindu caste system as the defining feature of Indian society. Not only was caste central to their critiques of Indian ethics – as it was religiously ordained exploitation at the hands of despotic Brahmin priests – it was also an institution used in comparison to champion the moral superiority

4 Cited in Vidya Dehejia (2009, 11).

and enlightenment of British society. As Mill remarked, “the division of the people into castes, and the prejudices which the detestable views of the Brahmans raised to separate them, a degrading and pernicious system of subordination was established among the Hindus, and the vices of such a system were there carried to a more destructive height than among any other people” (Vol II, 131–132). As Ronald Inden (1990) has detailed, while the Orientalists and Anglican-Utilitarians agreed that caste stripped individuals of agency, they did not perceive caste in the same way. The distinction was between *varṇa* (“class”) and *jāti* (“birth”). The Orientalists argued that society was ordered according to *varṇa*, the four-fold system outlined in Sanskrit literature, namely Brahmin (priests), Kṣatriya (nobility/warriors), Vaiśya (populace), and Śūdra (servants). Based on empirical evidence, such as racial features or division of labor, the Anglican-Utilitarians, on the other hand, argued that society was organized according to *jātis*, a complex system of social classes that has numerous sub-divisions. Inden (1990, 74) writes that “[t]he hard-headed empiricist has seen caste as an obstacle to progress, while the dreamy idealists (i.e. Orientalist) has considered it the embodiment of a holistic, organic vision of human community” Either way, both camps agreed that it was “anti-individualist and ...opposite of the West’s civil society.”

The caste system that colonial administrators and scholars perceived, however, was a product of what they wanted to perceive; they wanted an ordered, compartmentalized world that was easy to govern, and the belief in an unchanging, timeless India galvanized caste as the central institution. The position should not be overstated here. Caste existed prior to the British but it was not as rigid or uniform as what they posited. Gita Dharampal-Frick (1995) has shown that observations of Indian society from European travel writers from 1500 to 1800 did not conform to the caste system colonialists described. She argues that for early observers caste was not the foundation of society and nor were Brahmins necessarily the pinnacle of the social hierarchy – some mercantile and low-caste groups carried more influence than Brahmins. Both Anglicans and Orientalists largely dismissed these accounts.

The crux of their position was not merely about inadequate methodology (i.e. the lack of scientific positivism) but rather about British theories on race. In 1786, Jones delivered “The Third Anniversary Discourse, On The Hindus” to the Asiatic Society he co-founded in which he drew attention to the similarities between Sanskrit and European languages. “The *Sanscrit* [*sic*] language,” Jones remarked, “whatever be its antiquity, is of a wonderful structure; more perfect than the *Greek*, more copious than the *Latin*, and more exquisitely refined than either, yet bearing to both of them a stronger affinity, both in the roots of verbs and in the forms of grammar, than could possibly have been produced by accident” (Jones, 34). This monumental discovery not only ushered in recognition of the Indo-European language family and the discipline of linguistics, it also suggested that the British and Indians were of similar ancestral stock in some distant past, a proposition both celebrated and criticized.

Language, then, became equated with race. The descendants of the Āryans (“nobles”) who entered India early in the second millennium BCE and brought with them the Sanskrit language, then, were perceived as upper castes. The speakers of Dravidian languages in south India were as seen as descendants of the conquered indigenous people and were low-caste. As Thomas Trautmann has pointed out this racial theory reflected then current ideas of race in Britain rather than ancient India. The result was that the British used notions of race to interpret ancient texts and order the society they governed. Trautmann has shown that the evidence scholars used to construct this theory was flimsy at best. What it did do, he argues, was provide moral support for civilizing people who were regarded as ancestral kin (Trautmann 1997, 215).

The body of knowledge that the British produced to understand how to govern India largely reflected their own religio-cultural categories, not those of India or Hinduism. One important outcome of this was

that it caused Hindu leaders to reflect on their own tradition and respond to colonial critiques. In this dialogical process, India and Hinduism underwent many substantial changes.

Hindu Religious and Social Reformers

Modern Hinduism is largely a product of the colonial encounter. By the early nineteenth century, Hindu leaders were responding to the colonial master narrative that deciphered India's past to understand how to rule in the present. While Hindu leaders remained staunchly pro-Indian, they weaved aspects of the narrative into their counter-narrative. They too sought to uplift the Indian population but not to create, in the words of Thomas Macauley, an historian and council member of the company, "...a class of persons, Indian in blood and colour, but British in taste, in opinions, in morals, and in intellect."⁵ Hindu leaders pursued a path to instill pride in the population by revitalizing the ethical spirituality of Vedic and Vedāntin monism and condemning polytheism and idolatry. One way of imparting this was to expose what they believed was the ethical inferiority of Christianity. While there were many religious and political leaders who participated in this broader struggle, two figures of note are Rammohan Roy (1772–1833) and Swami Dayananda Sarasvati (1824–1883), both of whom are widely regarded as the progenitors of modern Hinduism and India.

Rammohan Roy was born to a Brahmin family in Bengal and received an excellent education. He knew Sanskrit, Persian, Arabic, and English; he also studied Hebrew, Latin, and Greek. For more than a decade, he worked for the company and developed a belief that some Western influence, such as education, could benefit India. Roy's interest in religious and social reform led him to a comparative study of monotheistic traditions. He was influenced by Islamic mysticism and Christian Unitarian interpretations of the Bible; however, he remained faithful to his rationalist understanding of Vedānta. Roy published translations and interpretations of key *Upaniṣads* in English and Bengali to counter the emphasis on the *Purāṇas*, combat abuses of the Brahmin priests and the practice of idolatry, and instill an ethical spirituality that centered on an ineffable and incomprehensible God. He also attacked such religiously ordained practices as *satī* – the immolation of a widow on the deceased husband's funeral pyre – the caste system, child marriage, and advocated for women's rights. In 1828, Roy established the Brahmo Samaj ("Society of Brahman") in Kolkata (Calcutta), a society that sought to transform Hinduism and India through a return to Vedic religion. He placed a high premium on reason. Through reason a universal ethics could be actualized, he argued, because all religions, when stripped of irrational dogma, such as miracles, articulate the same message. This belief instilled in Roy a tolerance that Sarasvati did not share.

Swami Dayananda Sarasvati was born to a Brahmin family in Gujarat. At a young age, he questioned the practice of idolatry after witnessing mice eating the food made as an offering to an icon of Lord Śiva. He embarked on a religious life that began as a wandering holy man searching for truth and, after visiting the Brahmo Samaj in 1872, ended as a religious and social reformer. Like Roy, Sarasvati sought to return Hinduism to its Vedic roots and criticized polytheism and idolatry. He also criticized treatment of women and widows, arranged and child marriages, and reinterpreted the caste system not as structure one is born into but rather as dependent on one's character. In 1875, Sarasvati founded Ārya Samaj ("Society of Āryans/Nobles"), first in Mumbai (Bombay) and later in the Punjab region, a society to uplift Hindus through Vedic knowledge. Unlike Roy, he was openly anti-British, opposed English-style education, critical of sectarian

5 Thomas Macaulay (1835) 1919.

religions, specifically Christianity and Islam, that did not center on the immutable and impersonal deity of the *Veda-saṃhitās*, and wanted to weaponize Hinduism against the unjust rule of the British.

Like the British, Roy and Sarasvati believed India was experiencing an ethical crisis and sought to return to the morality of a “golden age” when religion was monistic, as laid out in the *Veda-saṃhitās* and *Upaniṣads*. They too saw Brahmin priests as the source for ethical decay. For these leaders the singularity of the divine was truth, not the polytheism and idolatry that priests encouraged as a result of focusing on *Purāṇas*. Roy, for instance, was not shy about his disdain. In the introduction to English translations of the *Upaniṣads* in 1816, he advanced the notion that Brahmins should not be the sole arbiter of one’s religiosity, a precept reminiscent of the Protestant reformation. He scolded them for claiming to be the only ones capable of interpreting scripture and for hiding the singular divinity behind the complexity of the Sanskrit language, the cloak of polytheism, and encouragement of idolatry. The latter, he argued, originally emerged as an “allegorical adoration of the True Deity” but became official doctrine to the degree that discussion of a singular deity became heretical.⁶ In addition to attacking popular Hinduism, Roy and Sarasvati also turned the tables on colonials by interpreting the Bible and Christian beliefs. They utilized similar methodologies to reveal that British were guilty of the same affront to reason that they accused Hindus of being.

The Ethical Superiority of Rational Hinduism

As colonials raged about the moral devolution of Hinduism, Roy and Sarasvati pointed to a similar trend in Christianity. They argued that Christian morality was overshadowed with belief in miracles, faith in Jesus Christ’s divinity, and anthropomorphic conceptions of that which is incomprehensible. Roy and Sarasvati accused the British of failing to understand their own scripture and not holding themselves to the same rational standard to which they held others.

In the preface to *The Precepts of Jesus, the guide to peace and happiness, extracted from the books of the New Testament ascribed to the four evangelists* (1823), which he also translated into Sanskrit and Bengali, Roy adopted the colonial strategy of interpreting religious scripture and explaining the ethical content to his reading audience. He advanced the idea of belief in one God, disputed the divinity of Christ, and rejected accounts of “fabricated tales” or miracles (both in Christianity and the religions of “Asia”) as contra to the natural order of the world (xviii–xix). For Roy, once the belief of Christ’s divinity was abandoned (as this amounted to polytheism), the ethical doctrine in the New Testament would create harmony among humanity writ large and obviate the recalcitrant from prejudice and partiality (against those who denied the divinity of Christ) so they may understand “what is most consistent with the laws of nature, and conformable to the dictates of human reason and divine revelation” (xviii). True to the title, Roy extracted moral lessons in the four Gospels and compiled them into a narrative. He highlighted ethical qualities such as good works in praise of the unity of God, honoring one’s mother and father, abstaining from adultery and murder, honesty, and temperance, to name a few. These precepts, Roy believed, struck at the core of Christian soteriology – not the belief in Christ’s divinity – and were common among all monotheistic traditions.

It should come as no surprise that Roy was defamed in a newspaper as a heathen for his interpretative tract. Roy published two rejoinders. In *An Appeal to the Christian Public, in defence of the “Precepts of*

⁶ Rammohan Roy (1901, 5).

Jesus,” Roy accused his critics of violating Christian ethos. “I say unchristianlike [*sic*] manner because the Editor, by making use of the term heathen, has, I presume, violated truth, charity, and liberality, which are essential to Christianity in every sense of the word” (1825b, 101). What followed was a point-by-point repudiation of the published critique and a renewed defense for extracting moral doctrine over theological mysteries and dogma and of his belief of the unity of God. He defended the *Upaniṣads* from accusations of promoting atheism because the morality accorded to God in Christian scripture was absent in these ancient texts. Roy, in turn, criticized Christian anthropomorphic depictions of God, which he deemed irrational. At the close of *An Appeal*, he writes, “No one capable of sound reasoning can for a moment imagine that these or any other descriptions of God are intended to convey literal notions of the unsearchable incomprehensible Being” (1825b, 130). Without anthropomorphic qualities, the deity of the *Upaniṣads*, he asserted, and that of the Bible were represented in the same manner (125b, 130). This was apparently insufficient, as Roy composed the *Second Final Appeal to the Christian Public, in defence of the “Precepts of Jesus”* in the same year. Much of the argument in the first appeal is found in the second, but the latter delves into greater specificity. He argued that the Christian God’s anthropomorphic qualities were similar to the depictions of gods in the Hindu *Purāṇas*, which had been roundly criticized as responsible for India’s ethical decline. Roy revealed the duplicity of the colonials for engaging in the very same belief and practice for which they derided Hindus.

Sarasvati also critiqued Abrahamic scripture but he was much more hostile than Roy. He too emphasized reason over faith and the truth of monism over the falsity of monotheism. Although Sarasvati claimed objectivity, his commentary on the Hebrew Bible, New Testament, and Qur’an was far less tolerant than Roy’s project of positing a universal ethics. In *Exposition of Truth’s Meaning* (1875), he used a rational Vedic interpretive lens to reveal the fallacy and superstition of all Abrahamic scripture and to prove the superiority of the Vedas as the primeval religion. For example, in discussing the episode in *Exodus* in which Moses kills an Egyptian for beating a Hebrew laborer, Sarasvati characterized him as a slave to his passions and a murderer who wanted to hide his crime as any common thief would do. He concluded by stating, “Hence all the chief prophets of the Christians from Moses downwards were all uncivilized ...and devoid of culture” (608). In a commentary on the Gospel of Matthew when Christ claims that to enter the Kingdom of Heaven one must convert and become like children, Sarasvati argued the claim was irrational. He stated, this “shows that most of the teachings of Christ were opposed to the dictum of knowledge and contrary to the laws of nature, and he also wished that people should accept them like children without questioning their validity ...Plenty of Christians have blind faith like children, otherwise why should they believe in such thing as are opposed to reason and science. It is also clear that had not Christ himself been destitute of knowledge and understanding like children, he would not have taught others to become as children, since a man always wants to make others like himself” (625).

These are only two of the numerous examples of Sarasvati’s fiery rhetoric in *Exposition of Truth’s Meaning*. He expressed surprise that Europeans claim to be cultured and enlightened and yet had not adopted the religion of the Vedas. Many of the Christian stories, he claimed, were “more absurd” than those found in the *Purāṇas* and those that believe them as truth are the “very embodiment of ignorance” (638). Sarasvati also directed his criticism toward Islam and the Qur’an, basically labeling Muhammed a con artist. This did not sit well with India’s large Muslim population and sowed seeds for the discontent witnessed between Hindu and Muslim communities during the twentieth and twenty-first centuries.

In different ways, Roy and Sarasvati rescued Hinduism from the colonial narrative and gave Hinduism back, as it were, to Hindus. They accepted aspects of the criticism, particularly regarding the degenerate

nature of Brahmin priests and idolatry; however, through the use of similar exegetical strategies that colonials used to create their body of knowledge, Roy and Sarasvati countered the relentless attacks through highlighting the hypocrisy of the colonial critique. In order to transform and uplift Hinduism, they seized on the notion of a golden age and highlighted the ethical spirituality of ancient Hinduism. In this process, they transformed Hinduism. Roy and Sarasvati replaced allegiance to the uncritical orthodoxy of Brahmin priests with rational and ethical inquiry that instilled patriotism and pride in the Hindu population.

Notes on Contributors

Regina Ammicht Quinn, Professor of Ethics, is Executive Director of the International Center for Ethics in the Sciences and Humanities as well as Executive Director of the Center for Gender and Diversity Research, University of Tübingen. Having been denied the “*nihil obstat*” by the Catholic Church, she is not allowed to teach theology at German universities. Her works include “A Mighty Fortress Is Our God”: Necessity and Limits of Security,” *Concilium* (2018), “Artificial Intelligence and the Role of Ethics,” *Statistical Journal, of the IAOS* (2021), and “Handle with Care: Fragile Humans, a Pandemic, and the Legacy of the European Enlightenment” in *Jeevadhara. A Journal for Socio-Religious Research* (2021).

Svend Andersen is Professor Emeritus of Ethics and Philosophy of Religion in the University of Aarhus, Denmark. He was a member of the Danish Council of Ethics 1988–1993 and also President of *Societas Ethica*, European Society for Research in Ethics 1999–2003. He is the author of *Ideal und Singularität. Über die Funktion des Gottesbegriffes in Kants theoretischer Philosophie* (1983), *Sprog og skabelse. Fænomenologisk sprogopfattelse i lyset af analytisk sprogfilosofi med henblik på det religiøse sprog* (1989), *Bioetik* (co-editor, 1999), *Løgstrup* (2005), *Einführung in die Ethik* (2005), *Macht aus Liebe. Zur Rekonstruktion einer lutherischen politischen Ethik* (2010) and *Gud* (2015).

Maria Antonaccio is Professor of Religious Ethics and the Director of the Humanities Center at Bucknell University. Her books include *A Philosophy to Live By: Engaging Iris Murdoch* and *Picturing the Human: The Moral Thought of Iris Murdoch*. Her current research focuses on the dilemmas of human agency in the Anthropocene and the prospect of fashioning a critical humanism in conversation with posthumanist and new materialist alternatives.

H. David Baer is Pastor Gerhard A. and Marion Poehlmann Professor in Theology at Texas Lutheran University in Seguin. He is the author of *Recovering Christian Realism: Just War Theory as a Political Ethic* (Lexington, 2014), *A vallasszabadság védelmeiben / Essays in Defense of Religious Freedom* (Wesley János Kiadó, 2014), and *The Struggle of Hungarian Lutherans under Communism* (Texas A&M University Press, 2006).

Eric Bain-Selbo is Dean of the School of Humanities and Social Sciences at Indiana University Kokomo. His research spans the disciplines of philosophy and religious studies, focusing primarily on social ethics, political philosophy, comparative religion, sport and religion, cultural criticism, and higher

education. He has authored numerous articles, book chapters, and books. His most recent book is entitled *The End(s) of Religion: A History of How the Study of Religion Makes Religion Irrelevant* (Bloomsbury, 2022).

Jana M. Bennett is Professor and Department Chairperson of Religious Studies at the University of Dayton. Her current areas of research include the place of contemplation in moral theology, disability theology, and technology and ethics. She is a co-editor of the *Journal of Disability and Religion*. Her recent publications include *Naming Our Sins: How Recognizing the Seven Deadly Vices Can Renew the Sacrament of Reconciliation* (Catholic University of America Press, 2019, co-authored with David Cloutier), and *Singleness and the Church: A New Theology of the Single Life* (Oxford University Press, 2017). *Naming Our Sins* received first place in the 2020 Catholic Press Association book awards in the sacraments category.

Damon T. Berry is Assistant Professor in the Department of Religious Studies at St. Lawrence University in Canton, New York. His work focuses on the relationships between religious discourses and bigotry. He has published in *Security Journal*, *Journal of Hate Studies*, and in a volume published by Equinox titled *Fabricating Difference*, edited by Steven Ramey. He is author of *Blood and Faith: Christianity in American White Nationalism*, published by Syracuse University Press.

Jean Bethke Elshtain (1941–2013) was the Laura Spelman Rockefeller Professor of Social and Political Ethics at the Divinity School, University of Chicago. She was the recipient of many awards and the author of many books, including *Democracy on Trial* (1995), *Augustine and the Limits of Politics* (1998), *Jane Addams and the Dream of American Politics* (2002), and *Just War Against Terror: The Burden of American Power in a Violent World* (2003).

Joe Blosser is the Robert G. Culp Jr. Director of Service Learning, Associate Professor of Religion and Philosophy, and Director of the Civic Responsibility and Social Innovation Program at High Point University in High Point, NC. He is author of numerous articles in the fields of Christian ethics, the history of economic thought, and civic engagement. His recent articles have been published in *Journal of Religious Ethics*, *Journal of the Society of Christian Ethics*, *Research in the History of Economic Thought and Methodology*, *Journal of Practical Theology*, *Michigan Journal of Community Service Learning*, and others.

Elizabeth Bucar is Professor of Religion and Dean's Leadership Fellow at Northeastern University. She writes and teaches about gender, sexuality, and politics in everyday religious practice. Bucar's books include *Creative Conformity: The Feminist Politics of US Catholic and Iranian Shi'i Women* (Georgetown University Press, 2011), *The Islamic Veil: A Beginner's Guide* (Oneworld Publications, 2012), the award-winning *Pious Fashion: How Muslim Women Dress* (Harvard University Press, 2017), and *Stealing My Religion: Not Just Any Cultural Appropriation* (Harvard University Press, 2022).

Frank Burch Brown is Frederick Doyle Kershner Professor Emeritus of Religion and the Arts at Christianity Theological Seminary and for three springs was Alexander Campbell Visiting Professor of Religion and the Arts at the University of Chicago Divinity School. Author of five books, including *Religious Aesthetics* (2014) and *Good Taste, Bad Taste, and Christian Taste* (2003), he is editor of the *Oxford Handbook of Religion and the Arts*. He is the composer of over twenty commissioned musical works.

Charles Camosy grew up in the cornfields of Wisconsin, but he is now Associate Professor of Theology at Fordham University in the Bronx, where he has taught since finishing his PhD in theology at Notre Dame in 2008. Among other places, his published articles have appeared in the *American Journal of Bioethics*, *Journal of Medicine and Philosophy*, *Journal of the Catholic Health Association*, *The New York Times*, *The Washington Post*, *Los Angeles Times*, *New York Daily News*, and *America* magazine. He is the author of five books. *Too Expensive to Treat?* (Eerdmans), was a 2011 award-winner with the Catholic Media Association, *Peter Singer and Christian Ethics* (Cambridge University Press) was named a 2012 “best book” with ABC Religion and Ethics, and *For Love of Animals* (Franciscan) was featured in the *New York Times*. *Beyond the Abortion Wars* (Eerdmans), was also a 2015 award winner with the Catholic Media Association. His most recent book, *Resisting Throwaway Culture* (New City), was published in May 2019. In addition to advising the Faith Outreach office of the Humane Society of the United States and the Children’s Hospital of New York, Camosy received the Robert Bryne award from the Fordham Respect Life Club and received the 2018 St. Jerome Award for scholarly excellence from the Catholic Library Association. He has four children, three of whom he and his wife Paulyn adopted from a Filipino orphanage in June of 2016.

John D. Carlson is Associate Professor of Religious Studies at Arizona State University where he also directs the Center for the Study of Religion and Conflict. A scholar of religious ethics, his research explores how religious and moral inquiry informs and invigorates our understanding of political life. He has co-edited three books, including *From Jeremiad to Jihad: Religion, Violence, and America* (with Jonathan Ebel). He is currently completing a monograph on justice and an edited volume on religion and global citizenship.

David A. Clairmont is Associate Professor in the Department of Theology at the University of Notre Dame. His research and teaching focus on comparative religious ethics, religious accounts of professional ethics, and the relationship between ethics and spirituality. He is the author of *Moral Struggle and Religious Ethics: On the Person as Classic in Comparative Theological Contexts* (Wiley-Blackwell, 2011) and *Religious Ethics: Meaning and Method* (with William Schweiker, Wiley-Blackwell, 2020). His articles have appeared in the *Journal of the Society of Christian Ethics*, the *Journal of the American Academy of Religion*, the *Journal of Religious Ethics*, and the *Journal of Moral Theology*.

Ron Cole-Turner is the H. Parker Sharp Professor of Theology and Ethics Emeritus at Pittsburgh Theological Seminary, where he taught from 1996–2021. He is a founding member of the International Society for Science and Religion, serving on its Executive Committee. His research focuses on the significance of science and technology for Christian theology and ethics. Recent publications include *The End of Adam and Eve: Theology and the Science of Human Origins* (2016) and *Transhumanism and Transcendence: Christian Hope in an Age of Technological Enhancement* (editor, 2011). He is currently working on the relationship between psychedelic drugs and mystical experience.

Joshua Daniel received his PhD in Theology from the University of Chicago Divinity School with a dissertation comparing H. Richard Niebuhr and Paulo Friere on moral education. His book *Transforming Faith: Individual and Community in H. Richard Niebuhr* was published in 2015, and he co-edited two volumes, *Renegotiating Power, Theology and Politics* with Rick Elgendy and *God and the Moral Life* with Myriam Renaud. He now works as a chaplain at the University of Chicago Medical Center after a few years of teaching and publishing journal articles.

Celia Deane-Drummond is Director of the Laudato Si' Research Institute, Campion Hall, University of Oxford. Her research interests include environmental ethics, bioethics, animal ethics, and the intersection of science and religion. She has been chair of the European Forum for the Study of Religion and Environment (EFSRE) since 2011. She is co-editor of the journal *Philosophy, Theology and the Sciences*. Her most recent work includes *Religion in the Anthropocene*, edited with Sigurd Bergmann and Markus Vogt (Wipf and Stock, 2017) and *The Evolution of Human Wisdom*, edited with Agustín Fuentes (Lexington, 2017), *Theology and Ecology Across the Disciplines: On Care for Our Common Home*, edited with Rebecca Artinian Kaiser (TT Clark/Bloomsbury, 2018), and *Theological Ethics Through a Multispecies Lens: The Evolution of Wisdom Volume 1* (Oxford University Press, 2019).

Shannon Dunn is Associate Professor of Religious Studies at Gonzaga University. Her research focuses on gender, violence, politics, and religious communities. Some of her most recent work has been published in *Journal of Religion* and *Journal of Religious Ethics*.

Christine Firer Hinze is Professor of Theological and Social Ethics, Chair of the Department of Theology, and former Director of the Curran Center for American Catholic Studies at Fordham University, New York. Her teaching and research focus on foundational and applied ethics, especially the dynamics of social transformation, Catholic social thought, and economic and work justice for vulnerable women, families, and communities. Her publications include *Comprehending Power in Christian Social Ethics* (Oxford, 1995), *Glass Ceilings and Dirt Floors: Women Work, and the Global Economy* (Paulist, 2015), and *Radical Sufficiency: Work, Livelihood and a U.S. Catholic Economic Ethic* (Georgetown, 2021).

Darlene Fozard Weaver is Associate Provost for Academic Affairs and Professor of Theology at Duquesne University. Weaver specializes in ethical theory, moral anthropology, and social ethics. She is the author of *The Acting Person and Christian Moral Life, Self-Love and Christian Ethics* and co-editor and contributor to *The Ethics Embryo Adoption and the Catholic Tradition: Moral Arguments, Economic Reality, and Social Analysis*. Weaver has published dozens of scholarly articles in venues that include the *Journal of Religious Ethics*, *Concilium*, *Studies in Christian Ethics*, and the *Journal of the Society of Christian Ethics*.

William French is Associate Professor in the Theology Department of Loyola University, Chicago and Director of Loyola's Peace, Justice and Conflict Studies Program. He is also affiliated with Loyola's School of Environmental Sustainability. He has written widely on war and peace concerns, religion and ecological ethics, and gun violence issues. He serves on the advisory board of the National Catholic Center for Holocaust Education.

Kenneth M. George is Professor of Anthropology in the College of Asia and the Pacific at the Australian National University. A specialist on the cultural politics of religion and art in Indonesia, he is the author of *Showing Signs of Violence: The Cultural Politics of a Twentieth-Century Headhunting Ritual* (1996), co-editor of *Spirited Politics: Religion and Public Life in Contemporary Southeast Asia* (2005), and author of *Picturing Islam: Art and Ethics in a Muslim Lifeworld* (2010).

Robin Gill, Emeritus Professor of Applied Theology at the University of Kent, chaired the Archbishop of Canterbury's Medical Ethics Advisory Group for thirteen years. He is a member of the Medical Research

Council's Stem Cell Bank Steering Committee and, formerly, of the BMA's Medical Ethics Committee and of the Nuffield Council on Bioethics. Editor of the journal *Theology* and Cambridge University Press's *New Studies in Christian Ethics*, he has written most recently: *Christian Ethics: The Basics* (Routledge, 2020), *Moral Passion and Christian Ethics* (Cambridge University Press, 2017), *A Textbook of Christian Ethics* (4th ed., T&T Clark, 2014), and *Sociological Theology* (three volumes, Ashgate, 2012–2013).

M. Christian Green is Senior Editor and Senior Fellow at the Center for the Study of Law and Religion at Emory University, where she is a General Co-editor and Special Content Editor of the *Journal of Law and Religion*, published in cooperation with Cambridge University Press, as well as an Associate Editor and Solicitations Editor of *Canopy Forum*, the CSLR's digital journal on the interaction of law and religion. Green is also editor and publications manager at the African Consortium for Law and Religion Studies.

Amy Laura Hall is Associate Professor of Christian Ethics at Duke University. Select publications include articles in *Annual of the Society of Christian Ethics*, *Journal of Religious Ethics*, *Modern Theology*, *Christian Bioethics*, *Journal of Medicine and Philosophy* and chapters in *The Oxford Handbook of the Trinity* and *The T&T Clark Companion to the Theology of Kierkegaard*. She is the co-editor, with Daniel E. Arnold, of *Toward a Moral Consensus Against Torture*, a special edition of *The Muslim World* (2013). Her fourth book is *Laughing at the Devil: Seeing the World with Julian of Norwich* (Duke University Press, 2018).

Jeffrey Haynes is Emeritus Professor of Politics at London Metropolitan University. His areas of expertise are religion and international relations, religion and politics, democracy and democratization, development studies and comparative politics and globalization. He is the author or editor of fifty-five books. The most recent is *Trump and the Politics of Neo-Nationalism. The Christian Right and Secular Nationalism in America* (Routledge, 2021). Haynes received the International Studies Association Religion and International Relations Section's Distinguished Scholar Award in 2016. He is Co-Editor-in-Chief of *Democratization*, Editor-in-Chief of the *International Journal of Religion* and Series Editor of the book series, "Routledge Studies in Religion and Politics."

Michael S. Hogue is Professor of Theology, Ethics, and Philosophy of Religion at Meadville Lombard Theological School. His research and teaching explore the intersections among theology, religious ethics, political theology, and the environment. His most recent book is *American Immanence: Democracy for an Uncertain World* (Columbia, 2018).

Simeon O. Ilesanmi is the Washington M. Wingate Professor of Religious Studies at Wake Forest University. He holds a BA from the University of Ife, Nigeria, now Obafemi Awolowo University, a PhD from Southern Methodist University, and a Juris Doctor from Wake Forest University School of Law. A Fellow of the Nigerian Academy of Letters and the Aspen Institute, he writes and teaches in the areas of comparative ethics, political theory, and religion and law. His numerous publications include *The Rule of Law and the Rule of God*, edited with Win-Chiat Lee and J. Wilson Parker (2014).

Rosemary Kellison is Associate Professor of Philosophy and Religion at the University of West Georgia. She studies religious ethics from a feminist perspective and is the author of *Expanding Responsibility for the Just War: A Feminist Critique* (Cambridge University Press, 2019).

John Kelsay is Distinguished Research Professor in the Department of Religion at Florida State University. His research and teaching focus on issues of political ethics in Christian and Muslim traditions; publications include *Islam and War: A Study in Comparative Ethics* (Westminster/John Knox, 1993) and *Arguing the Just War in Islam* (Harvard, 2007). Kelsay served as Co-editor of the *Journal of Religious Ethics* from 2001–2011.

Michael Kessler is Managing Director of the Berkeley Center for Religion, Peace, and World Affairs at Georgetown University, an Associate Professor of the Practice of Moral and Political theory in the Department of Government, and an Adjunct Professor of Law at Georgetown Law. Kessler's research and writing focus on theology, philosophical and religious ethics, and social, political, and legal theory. Kessler received his PhD focusing on religion and moral and political theory from the University of Chicago and a JD from Georgetown University Law Center.

Sallie B. King is Professor Emerita, James Madison University. In the area of Engaged Buddhism, she is the author of *Being Benevolence: The Social Ethics of Engaged Buddhism* (Hawaii, 2005), and *Socially Engaged Buddhism* (Hawaii, 2009). She is co-editor (with Christopher S. Queen) of *Engaged Buddhism: Buddhist Liberation Movements in Asia* (SUNY Press, 1996) and editor of *Buddhist Visions of the Good Life for All* (Routledge, 2021).

Loren D. Lybarger is Professor of Classics and Religious Studies at Ohio University. He is the author of *Identity and Religion in Palestine: The Struggle between Islamism and Secularism in the Occupied Territories* (Princeton University Press, 2007) and *Palestinian Chicago: Identity in Exile* (University of California Press, 2020). He is also co-author of the forthcoming book, *Commemorative Literacies and Labors of Justice: Resistance, Reconciliation, and Recovery in Buenos Aires and Beyond* (Routledge, 2021).

Gerard Mannion holds the Amaturio Chair in Theology at Georgetown University, where he is also a Senior Research fellow of the Berkley Center for Religion, Peace, and World Affairs. Much of his work focuses on social ethics, institutional morality, and ecclesiology, including the church's interaction with secular and pluralist societies, as well as ecumenical and interreligious dialogue. He has published widely in these fields and in wider questions in systematic theology and philosophy. He is the Founding Chair of the EcclesiologicalInvestigations International Research Network, and the current president of the International Network of Societies for Catholic Theology (INSeCT).

Terence J. Martin is a retired Professor of Religious Studies residing in South Bend, Indiana. He is the author of *Truth and Irony: Philosophical Meditations on Erasmus* (Catholic University of America Press, 2016), as well as recent essays on the humanistic ethics of Erasmus of Rotterdam addressing issues of tyranny and terror, holy war, and the persecution of heretics.

Gerald P. McKenny is Walter Professor of Theology at the University of Notre Dame. He is the author of *To Relieve the Human Condition* (1997), *The Analogy of Grace* (2010), *Biotechnology, Human Nature, and Christian Ethics* (2018), and *Karl Barth's Moral Thought* (2021). He is co-editor of *Altering Nature* (2008), *Darwin in the 21st Century* (2011), and two other volumes. His current project is on virtue and moral law in Christian ethics.

Neil Messer is Professor of Theology at the University of Winchester. His research interests are concerned with the intersections of Christian theology and ethics with health care and the biosciences. From 2013–2018

he served on the Expert Group on Ethics of the Community of Protestant Churches in Europe, and is currently a member of its working group on sexuality and gender. His publications include *Selfish Genes and Christian Ethics: Theological and Ethical Reflections on Evolutionary Biology* (2007), *Respecting Life: Theology and Bioethics* (2011), *Flourishing: Health, Disease and Bioethics in Theological Perspective* (2013), *Theological Neuroethics: Christian Ethics Meets the Science of the Human Brain* (2017), and *Science in Theology: Encounters between Science and the Christian Tradition* (2020).

Bonnie J. Miller-McLemore is Professor of Religion, Psychology, and Culture, Vanderbilt University, a national and international leader in theology, widely recognized for work on families and practical theology, and recipient of a Henry Luce III Fellowship in Theology. She is author and editor of numerous publications, including *Children and Childhood in American Religions* (Rutgers University Press, 2009), *In the Midst of Chaos: Care of Children as Spiritual Practice* (Jossey-Bass, 2006), *Let the Children Come: Reimagining Childhood from a Christian Perspective* (Jossey-Bass, 2003), and *Also a Mother: Work and Family as Theological Dilemma* (Abingdon, 1994).

Irene Oh is Chair and Associate Professor of Religion at the George Washington University in Washington, DC. She is the author of *The Rights of God: Islam, Human Rights, and Comparative Ethics* (Georgetown, 2007) and numerous essays in peer-reviewed scholarly journals. Irene currently teaches courses on peace studies, ethics, and world religions. She has been elected to the board of the Society of Christian Ethics, is a founding member of the Society for the Study of Muslim Ethics, and serves on the steering committee for the Comparative Religious Ethics Group of the American Academy of Religion.

Atalia Omer is a Professor of Religion, Conflict, and Peace Studies at the University of Notre Dame. She is also Dunphy Visiting Professor of Religion, Violence, and Peacebuilding at Harvard. Omer received an Andrew Carnegie Fellowship (2017) and has published broadly. Among other contributions, Omer is the author of *When Peace is Not Enough: How the Israeli Peace Camp Thinks about Religion, Nationalism, and Justice* and *Days of Awe: Reimagining Jewishness in Solidarity with Palestinians* (both with the University of Chicago Press). She is a co-editor of the *Oxford Handbook of Religion, Conflict, and Peacebuilding* (Oxford University Press, 2015).

Eugene F. Rogers, Jr. is Professor of Religious Studies Cross-appointed Women's and Gender Studies in the University of North Carolina at Greensboro. He is the author *Thomas Aquinas and Karl Barth, Sexuality and the Christian Body: Their Way into the Triune God*, *After the Spirit: A Constrictive Pneumatology from Resources Outside the Modern West*, and *Aquinas and the Supreme Court: Race, Gender, and the Failure of Natural Law in Aquinas's Romans*. His most recent books are *Blood Theology: Seeing Red in Body and God-Talk* and *Elements of Christian Thought: A Basic Course in Christianese*.

Susan A. Ross is Professor Emerita of Theology and a Faculty Scholar at Loyola University Chicago. She is the author of *Extravagant Affections: A Feminist Sacramental Theology* (Continuum, 1998), *For the Beauty of the Earth: Women, Sacramentality and Justice* (Paulist, 2006), and *Anthropology: Seeking Light and Beauty* (Liturgical, 2012). She is a past president of the Catholic Theological Society of America and a former board member of *Concilium*.

Jonathan Rothchild is Professor of Theological Ethics in the Department of Theological Studies and Associate Dean of the Bellarmine College of Liberal Arts at Loyola Marymount University (LMU). His

research addresses the relationship between law and religion, with particular emphasis on contemporary issues in criminal justice. He is the author and co-editor of *Value and Vulnerability: An Interfaith Dialogue on Human Dignity* (University of Notre Dame Press, 2020), *Doing Justice to Mercy: Religion, Law, and Criminal Justice* (University of Virginia Press, 2007) as well as numerous articles addressing issues such as juvenile life sentences, felony disenfranchisement, and voting rights. In 2013, he co-directed an international forum on restorative justice at LMU.

Jonathan Schofer is Associate Professor of Religious Studies at the University of Texas at Austin, with affiliation in the Schusterman Center for Jewish Studies. Schofer has written *The Making of a Sage: A Study in Rabbinic Ethics* (University of Wisconsin Press, 2005) and *Confronting Vulnerability: The Body and the Divine in Rabbinic Ethics* (University of Chicago Press, 2010).

William Schweiker is Edward L. Ryerson Professor of Theological Ethics at the University of Chicago. His scholarship and teaching engage theological and ethical questions attentive to global dynamics, comparative religious ethics, the history of ethics, and hermeneutical philosophy. A frequent lecturer and visiting or guest professor at universities around the world, he has been deeply involved in collaborative international scholarly projects. His books include most recently *Religion and the Human Future: An Essay in Theological Humanism* (2008, with David E. Klemm), *Dust that Breathes: Christian Faith and the New Humanisms* (2010), and *Religious Ethics: Meaning and Method* (2019–2020, with David Clairmont). He is also Editor-in-Chief of the *Wiley-Blackwell Encyclopedia of Religious Ethics*.

Timothy F. Sedgwick is Professor Emeritus of Christian Ethics at Virginia Theological Seminary. He has served on the boards and councils of the Episcopal Church, including serving as representative to the board of the National Council of Churches of Christ and as a member of the Anglican Roman Catholic Theological Consultation in the United States (ARC-USA). His most recent publications include *Sex, Moral Teaching, and the Unity of the Church* (2014) and *What Does it Mean to be Holy Whole?* (2018). His research and other publications are on Anglican thought and in moral theology, including *Sacramental Ethics* (1987/2008) and *The Christian Moral Life* (1999/2008).

Tobin Miller Shearer is Professor of History at the University of Montana where he also directs the African American Studies program. He has written widely on issues of race, religion, whiteness, and the civil rights movement. His most recent book is *Two Weeks Every Summer: Fresh Air Children and the Problem of Race in America* (Cornell University Press, 2017). His next book is *Religion and Social Protest Movements* (Routledge, 2021).

Devin Singh is Associate Professor of Religion at Dartmouth College, where he teaches courses on religious thought in the modern West, philosophy of religion, and social ethics. He is the author of *Divine Currency: The Theological Power of Money in the West* (Stanford University Press, 2018), as well as articles in journals such as *Journal of Religious Ethics*, *Harvard Theological Review*, and *Political Theology*.

Max L. Stackhouse (1935–2016) was the Stephen Colwell Professor of Christian Ethics at Princeton Theological Seminary. He was the primary author of *On Moral Business* (1995), *Creeks, Society and Human Rights* (1984), and the new series *God and Globalization* (2000–). He argued that Christian ethics required a “public theology” to address the common life. He was a former President of the Society of Christian Ethics.

Laura Stivers is Professor of Social Ethics at the Dominican University of California. Her areas of research and teaching are economic, environmental, and feminist ethics. She is the author of *Disrupting Homelessness: Alternative Christian Approaches* (2011), *Earth Ethics: A Case Method Approach* (co-author, 2015), *Christian Ethics: A Case Method Approach* (co-author, 2020), and *Justice in a Global Economy: Strategies for Home, Community, and World* (co-editor, 2006).

Sandra Sullivan-Dunbar is Associate Professor of Christian Ethics at Loyola University Chicago, where she teaches and researches in feminist social ethics, economic ethics, sexual ethics, and reproductive justice. She is the author of *Human Dependency and Christian Ethics* (Cambridge University Press, 2017).

Elizabeth Sweeny Block is Assistant Professor of Christian Ethics at Saint Louis University. Her current areas of research include moral anthropology and conscience, as well as the ethics of technology.

Rebecca Todd Peters is Professor of Religious Studies at Elon University. Her work as a feminist social ethicist is focused on globalization, economic, environmental, and reproductive justice. Her books include *In Search of the Good Life: The Ethics of Globalization* (Continuum, 2004), which won the 2003 Trinity Book Prize, *Solidarity Ethics: Transformation in a Globalized World* (Fortress, 2014), and *Trust Women: A Progressive Christian Argument for Reproductive Justice* (Beacon Press, 2018).

Cristina L. H. Traina is Avery Cardinal Dulles Chair of Catholic Theology at Fordham University. She has written on ethics of sexuality, touch, reproduction, childhood, migration, economics, and environment. Relevant publications include “Between a Rock and a Hard Place: Unwanted Pregnancy, Mercy, and Solidarity” in *Journal of Religious Ethics* (2018), “Commodifying Sex: A View from the Margins” in *Concilium* (2014), and “Compatible Contradictions: Religion and the Naturalization of Assisted Reproduction,” Chair and Lead Author, with Eugenia Georges, Marcia Inhorn, Susan Kahn, and Maura Ryan in *Altering Nature, Volume II: Religion, Biotechnology, and Public Policy*, edited by B. Andrew Lustig, Baruch A. Brody, and Gerald P. McKenny in *Philosophy and Medicine* 98.

Jonathan Tran is Associate Professor of Theology and Ethics at Baylor University, where he holds the George W. Baines Professor of Religion. His is author of *Asian Americans and the Spirit of Racial Capitalism* (Oxford University Press, 2022) and edits the American Academy of Religion book series, *Theory and Reflection in the Study of Religion* with Oxford University Press.

Ernesto Verdeja is Associate Professor of Political Science and Peace Studies at the Kroc Institute for International Peace Studies, University of Notre Dame. His research is primarily on the causes and prevention of genocide and mass atrocities, and on the politics of justice and reconciliation. Verdeja has published widely on these topics and is the co-editor of *Wicked Problems: The Ethics of Action for Peace, Rights, and Justice* (Oxford University Press). He is also Executive Director of the human rights organization *Institute for the Study of Genocide*, and he regularly consults on genocide and atrocity prevention with governments and human rights organizations around the world.

Roger A. Willer is the Director for Theological Ethics in the Office of the Presiding Bishop of the Evangelical Lutheran Church in America. His dissertation (University of Chicago, 2009), “Conscience in Theological Perspective: An Emergent Account Beyond Dualism or Reductionism” explored the question of conscience theologically in light of developments in the natural sciences, especially the cognitive

sciences. His scholarly contributions to anthologies and journals at the intersection of theology, science, and ethics have included writing on genetics, bioethics, posthumanism, and ecology.

Katherine K. Young, Professor Emeritus, has been a Professor in the Asian Studies Department of the Institute of Religious Studies at McGill University where she held the James McGill Chair and specialized in the religions of India, especially Hinduism, but also comparative topics such as religious ethics and gender and religion. Since retirement, she has been an Associate Fellow at the University of Victoria's Centre for Studies in Religion and Society in British Columbia, Canada. Her most recent book is *Turbulent Transformations: Non-Brahmin Srivaisnavas on Religion, Caste and Politics in Tamil Nadu* (2021), which combines her specializations in Hinduism and religious ethics.

Preface to Volume III – Moral Issues

Elizabeth Bucar

The *Encyclopedia of Religious Ethics* introduces readers to basic issues in moral inquiry, a selection of moral traditions, and surveys a range of moral issues. Each of the three volumes covers one of these three elements of religious ethics, with Volume III focusing on moral issues.

What distinguishes “religious” ethics from other approaches to ethics is, first and foremost, its connection to the religions. While there is much debate in modern scholarship about the precise meaning of the term “religion” there is at least a widely shared conviction that there are such things as religions, by which is meant social groups and traditions of thought and practice that are in one way or another about the deepest human questions and the ultimate goal(s) of human life, including but not limited to reverence for a divine being or beings. Thought about or practice in relation to what is ultimately important and real seems to be a longstanding feature of human life across historical periods, geography, and cultural traditions.

Volume III addresses a range of moral issues in the study of religious ethics in order to clarify how the discipline of religious ethics helps us think through the concrete effect of religion on the moral life. The entries contained in this volume provide conceptual resources for understanding the structures, conditions, and/or challenges of specific moral issues across a wide range of human life. Accordingly, the volume is divided into three parts: (1) Persons, (2) Systems, and (3) Communities. Each of these parts is further divided into two sub-categories, Structures and Conditions, or Challenges, in order to indicate if the entries address the religious and ethical context of a specific moral issue, or the specific challenges that issue poses for human life.

Taken together, the entries in this volume are intended not only to provide an accessible overview the wide range of moral issues that religious ethicists have engaged, but also to reflect specific scholar’s distinctive contribution to the field of study. No attempt has been made to impose on the contributors any particular view of the topics on which they were invited to contribute. Rather, the diversity of topics and approaches contained in this volume reflects the vitality of religious ethics as a field of study. We encourage readers to make use of Volume III not only to seek information on the particular topics contained herein, but also to gain a broader understanding of the shape of religious ethical reflection as a complex and dynamic enterprise that takes place within and among persons, through systems, and within communities over time and space.

In his entry “On Religious Ethics” that introduces each volume of the *Encyclopedia*, William Schweiker speaks of religious ethics as a field of study that undertakes three interrelated *tasks* – critical, comparative,

and constructive – from what he describes as a hermeneutical *standpoint* and with respect to interlocking *dimensions* of reflection: descriptive, normative, practical, fundamental, and metaethical. These dimensions of inquiry arise from the persistent questions that surround human existence – questions, Schweiker notes, that “demarcate a space of human existence determined by the problem of how one ought to live religiously.” The *Encyclopedia* as a whole enacts this multi-dimensional approach insofar as the three volumes present for scholarly reflection “the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide conduct.”

While the editors of the three volumes of the *Encyclopedia* support, to varying degrees, a hermeneutical approach to religious ethics, to view the field of religious ethics as presented in these volumes as proceeding from a hermeneutical standpoint is less a prescriptive than a descriptive statement – and even an invitation. Readers are invited to engage in the critical, constructive and comparative tasks themselves as they consider the entries in each volume of the *Encyclopedia*. The entries in the present volume introduce readers to the constructive reflection on practical moral problems in ways that engage religious belief and practice. These entries draw on the major concepts, categories, and theoretical approaches in the study of moral issues explored in Volume I and intersect with topics of comparison of moral traditions in Volume II.

INTRODUCTION

On Religious Ethics

William Schweiker

The publication of the *Blackwell Companion of Religious Ethics* in 2005 represented a defining moment for religious ethics. Happily, this new *Encyclopedia of Religious Ethics*, incorporating and updating the entirety of the *Companion* and published fifteen years later, continues the work of defining the meaning, task, and forms of religious ethics. Ethicists, historians of religion, theologians, philosophers, political theorists, and other experts have explored the moral outlooks and practices of the world's religions. Drawing on and revising religious resources, basic themes in Moral Theory as well as a host of contemporary moral and political problems are treated. The *Encyclopedia's* three volumes mirror the structure of the *Companion* but now greatly expanded: Volume I on issues in Moral Theory; Volume II on Moral Traditions; Volume III on Moral Problems. Throughout the volumes, topics will be explored in depth and in most cases comparatively even as the individual authors express their reasons and judgments on the topics.

Given the comprehensive nature of this work, the purpose of the present entry is not to provide a detailed "introduction" to the volumes. Such an introduction is not possible given the sheer size of these volumes and insofar as this is a collective work rather than a single line of argument. This entry is meant to provide orientation to the range of questions and kinds of thinking found in the various parts of *The Encyclopedia of Religious Ethics*.

Religious Ethics?

Anyone who works in religious ethics confronts an immediate and obvious problem. "Ethics" or "moral philosophy" is not indigenous to the world's religions. Inspired by Socrates and other sages, Greek and Roman thinkers engaged in the rational analysis and justification of norms, practices, forms of character, and ways of life believed to secure human happiness or well-being (*eudaimonia*). The inspiration of Socrates, and the memory of his conviction and execution on the charge of impiety, meant that ethics was also a challenge to the authority of religious and traditional moral beliefs. What is more, the conception of a good human life advocated by Hellenistic philosophers is foreign to the religions. Religious traditions obviously sustain reflection on human well-being, happiness. However, these accounts are set within an order defined by beings, realms, ideals, purposes, and practices not limited to human life and flourishing.

The scope of concern found in the world's religions is thereby wider than the discourse of ethics and Hellenistic ideas about human well-being. It is quite unremarkable, then, that the world's religions have generally not used the idea of ethics to specify the character of their outlooks on what defines a good life, right conduct, noble character, and proper social relations. For scholarly purposes, *ethics*, as used in this *Encyclopedia*, is the term for a discipline of thought that interprets, critically assesses, and, often, applies the *morality* of a religious community or tradition. *Morality*, accordingly, is the actual rules, duties, goods, rituals, practices, and values of a community used to orient life.

Similar problems surround the idea of “religion.” None of the historical legacies explored in this *Encyclopedia* initially defined themselves as a religion. The term seems to have arisen from the Latin *religare*, meaning to tie or to bind. Religion specified how one was bound to the origins of the city of Rome as itself a sacred reality. Other ideas of religion developed, especially during the seventeenth to twentieth centuries, in order to facilitate the study of the beliefs, practices, values, and histories of human communities. As explored in the following volumes, definitions range from religion as belief in gods or one God, claims about sacred power, ultimate concern, to the charge that religion is about concealed mechanisms of domination.

Most contemporary scholars agree that a religion includes several features: convictions about what is most important in life (experiences like birth and death, sex and sorrow) in relation to what is believed to be ultimate, sacred, holy, or divine, ritual actions, beliefs about the whence and whither of existence, codes of conduct, communal life and its structures, and also experiences of transcendence (e.g. enlightenment, redemption, mystical insight), religious leaders. However, these features of religion are disputed and bear different meanings in diverse cultures and traditions. Again, for scholarly purposes, this *Encyclopedia* holds that the distinctive feature of *religions* from other human sociocultural forms is that they are about what is ultimately important and real for some community of people. That is to say, the referent or object of religious devotion and/or practice is not just what is important or valuable to people, but it must also, in some way, be real, defined in many ways. Likewise, what is real (however defined) is not the referent or object of religion if it is not ultimately important to some human community. While variously conceived, some social and cultural form or practice is not *religious* if it does not bind together importance with something, someone, or some condition that is held to be real.

The idea of “religion,” just like “ethics,” is a scholarly invention. As rightly noted in the various parts of this *Encyclopedia*, these ideas are not native to traditions, much less necessary categories of the human mind. They are tools for inquiry and reflection. What is more, one must keep distinct, if sometimes related, the morality or ethics of a religion (the actual ways of life, beliefs, values, norms, and outlooks of a people) from the intellectual labor of scholars and thinkers called “ethics” and/or “religious ethics.” What is sought in these volumes and this entry is an account of the intellectual enterprise of religious ethics ever mindful of complex connections to ways of religious and moral living.

Given the conceptual problems surrounding religion and ethics, it is not surprising that one finds different options in the intellectual pursuit of religious ethics. Some distinct approaches have typified the field, although there are manifold subtypes and variations (see Schweiker 1998; Twiss and Grelle 1998, 11–33). First, some religious ethicists have sought to specify a unique concept, phenomenon, rational structure, or set of practices called religion more or less manifest in what are conventionally seen as the “religions.” Often called the *formalist* approach to religious ethics, the task is to show the place and import of religion for the moral life (see Green 1978; Gamwell 1990). Others adopt, second, a *sociolinguistic* approach. These thinkers explore specific action guides recommended by communities and/or

how communities specify through ritual, myth, discourse, and belief often incommensurable ways of life (see Little and Twiss 1978; Stout 1988). Third, there are scholars who develop versions of *ethical naturalism*. This approach is concerned with the particularity of moral outlooks, but also “treats a system of beliefs as a whole and refuses to isolate moral propositions for analysis from propositions about how things are in the world and how they come to be that way” (Lovin and Reynolds 1985, 3). More recently, a group of scholars, headed by Elizabeth Bucar and Aaron Stalnaker, have written about a third wave of work in Comparative Ethics focused especially on cultural and moral diversity (Bucar and Stalnaker 2012). This has opened the field to cultural and ethnographic studies without loss of a normative purpose. Each of these approaches in religious ethics, as well as various permutations on them, can be found in this book. No attempt, thankfully, has been made to demand agreement among them.

Another way of conceiving religious ethics is now in view and it finds expression throughout this *Encyclopedia* and other works (see Schweiker and Clairmont 2020). The remainder of this entry gives an account of this *hermeneutical* and *multidimensional* option alongside other approaches to the field. Like formalists, a multidimensional approach specifies a structure for ethical thinking necessary to examine specific traditions, but is not reducible to their distinctive languages and practices. Yet, as shown below, it moves beyond most formalist proposals in terms of how knowledge and disciplines are conceived. With the sociolinguistic and naturalistic options, a hermeneutical approach to religious ethics examines the distinctive outlooks of traditions. However, precisely as hermeneutical in character, religious ethics labors between and among traditions rather than focuses on the incommensurability of language-games, distinct action guides, or even moral worldviews. And with more recent accounts of Comparative Ethics, a hermeneutical approach insists on understanding the cultural and social location of the religions even as it seeks to draw on them as resources for constructive ethical and religious ethics. “Religious ethics,” on this account, is defined in terms of critical, comparative, and constructive *tasks* of moral inquiry into religious resources undertaken from a hermeneutical *standpoint* and with respect to interlocking *dimensions* of reflection. My contention is that this account captures something of the scope and spirit of this *Encyclopedia of Religious Ethics*.

Of course, it must be stressed that what follows is a proposal for religious ethics, developed in view of this work. There is no assumption that every author or editor will agree or even ought to agree with this depiction or, for that matter, any other depiction of religious ethics. As a field of inquiry, part of the vitality of religious ethics is precisely that it must constantly engage in appraisals of its purposes, methods, and criteria of adequacy. In fact, this *Encyclopedia* must partly be seen as engaged in that kind of appraisal.

We turn next to the question of how to characterize the *tasks* and *dimensions* of religious ethics in order that the full import of these volumes can be grasped.

Tasks and Multidimensional Inquiry

There are many ways to define ethics and also many ways to carry out ethical reflection. Contemporary scholarship in *religious ethics* undertakes to a greater or lesser extent several related *tasks*.

Religious ethics entails the *critical* inquiry into complex ways of religious and moral life, but often also indicates the *constructive* use of religious sources in meeting current problems. Each of those tasks, the critical and constructive, is often bound to the work of *comparison*. As found in Volume II, a scholar

critically explores a tradition by comparing its expressions through time and/or seeing it in relation to other cultural and social dynamics, including other religions. Constructive work, like that undertaken in Volume III, compares accounts of how to live with other proposals in order to assess duties and values binding on people. The question – explored in Volume I of this *Encyclopedia* – becomes: how ought we to define religious ethics as a discipline, an intellectual practice?

With the rise of the modern Western world there were extensive debates about what constituted a discipline of thought. There emerged the conviction that any genuine discipline must have a distinct, or unique, subject matter, even as there was the need to define a “system of the sciences” around a fundamental principle or scientific method in order to ensure the coherence of knowledge. The core of the modern project was to understand the world and free human beings from ignorance and illusion. One did so by specifying the method, purpose, and criteria of various disciplines in such a way that each was *autonomous* and yet consistent with all others because they shared a *rational* structure. As Stephen Toulmin has noted: “In the underlying European worldview, then, the value of a single all-embracing system of theories, into which phenomena of all kinds could eventually be fitted, was taken for granted right up until the twentieth century” (Toulmin 2001, 87). Ethics, for instance, had to be about a distinctive domain of human conduct, say, about obligation or utility, which was different than other sciences, and yet founded rationally or empirically in the same way as other sciences. This led to the radical distinction between ethics as a *normative* discipline and other *descriptive* approaches to human behavior even if they shared similar cognitive commitments. One finds, interestingly enough, residues of this modern outlook in formalistic approaches to religious ethics. Even those who reject the modern enterprise, from the Romantics to some sociolinguistic thinkers and ethical naturalists and the cultural turn in ethics, assume that definition of a discipline only to deny it. They often contest the modern account through ad hoc or unsystematic approaches to inquiry.

This *Encyclopedia* aptly shows that the aspiration to isolate one formal structure of reason built on a single principle or to specify one scientific method as alone adequate for research is insufficient given genuine moral, religious, and cognitive diversity. Still, as formalists have long seen, there is also the need to define and characterize the discipline of religious ethics as an intellectual pursuit. Further, the modernist desire to establish the autonomy of ethics around some *sui generis* dimension at action (e.g. the moral “ought” or obligation or virtue) fails to indicate how moral reflection can and must interact with other intellectual practices in order to address exceedingly complex problems and phenomena. A crucial aspiration of much contemporary discourse is to move beyond the formal rationalism of the modern project as well as its denial by Romantics and others. It is to grasp a more humane, practical form of reasonableness. Yet in order to be apt for religious ethics, this construal of ethics must also, as naturalists, sociolinguistic, and cultural/ethnographic approaches show, explore the connections among “moral” beliefs and actions and other convictions and practices of actual living communities.

There is an important turn of late in providing an account of knowledge that bears promise for religious ethics. This is what can be called *multidimensional* thinking. What is rejected by a range of thinkers in various fields is a depiction of knowledge gained and justified through autonomous disciplines tenuously held together by *one* formal rational structure or method of inquiry. As the moral philosopher Mary Midgley has astutely noted:

We exist, in fact, as interdependent parts of a complex network, not as isolated items that must be supported in a void. As for our knowledge, it too is a network

involving all kinds of lateral links, a system in which the most varied kinds of connection may be relevant for helping us to meet various kinds of questions.

(Midgley 2003, 25)

In this light, the burden placed on any intellectual practice aimed at knowledge is to specify those points at which it is linked to other disciplines given shared interests, norms and even values. Knowledge is a complex, reflexive network; it is a space of warranted intelligibility or reasonability.

This depiction of knowledge is important not just for addressing shared interests. It is basic to the determination of the cogency, scope, and integrity of a discipline. Rather than focusing on the *autonomy* of a “discipline,” one will be interested in the *lateral links* wherein reflection and information move in and out of an intellectual practice (see Gustafson 2004). *Scope*, rather than *autonomy*, will be essential in deciding the validity, the truth, of claims. Accordingly, a discipline is best defined in terms of the basic questions it seeks to answer. When carefully examined these basic questions naturally pose other questions that, if answered, implicate a form of reflection in other modes of inquiry pursuing their own questions. A method must be devised not on one formal model of rationality but in order to match the problems and questions that need answering.

A multidimensional account of rational inquiry seems particularly apt for religious ethics. In very different ways, what scholars call the *religions* provide guidance for human living through rituals, myths, exemplars, doctrines, and teachings that answer a range of questions surrounding human existence. These questions demarcate a space of human existence determined by the problem of how one ought to live religiously – say, live as a Protestant Christian, a Shi’ite Muslim, or a Tibetan Buddhist. *Morality*, the religious ethicist can insist, is a term for the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide conduct. From the perspective of actual traditions, religious ethics must be conceived as examining various features of how the moral space of life, as we can call it, is conceived and enacted in life. Viewed as a whole, this *Encyclopedia* can be seen to enact just this kind of examination of religious moralities.

If one takes seriously recurring questions found in the legacies of religions and formulates them at an appropriate level of generality, it is possible to adduce the multidimensional shape of religious ethics (see Schweiker 1995; Schweiker and Clairmont 2020). At least five deeply interrelated questions ground the dimensions of inquiry used to engage in its comparative, critical, and constructive tasks. What is more, each of these dimensions of ethics probe various tensions, or *aporia*, in order to isolate analogues among religious outlooks. The questions that found the dimensions of ethics are not related in a sequential or deductive manner; they are not a check-list to be applied to thinkers, texts, or practices. They arise out of tensions in human life and constitute the interacting “dimensions” of ethics that aim to explicate a religion’s account of and directions for orienting existence and conduct in the moral space of life. And insofar as religions use stories, rituals, and exemplary characters in order to guide life, these dimensions explicate and analyze the moral meaning of these phenomena. Further, the dimensions are important for the reader of this work in order to understand what specific questions a scholar is answering, even as the religious ethicist is held accountable for questions not answered but which are in the background of a religious outlook.

This account of moral inquiry articulates an approach for religious ethics that labors alongside *formalists* and those working *sociolinguistically*, *naturalistically*, and *cultural/ethnographic* approaches to reli-

gious traditions and communities. The account admits with formalists that a construal of ethics is an intellectual construct, but it denies that one dimension alone defines ethics and it specifies, like the other approaches, questions and answers of ethics from within the resources of real traditions. In this way religious ethics escapes the modernist reduction of a discipline to one rational principle or method, while also avoiding relativistic forms of postmodernism. What, then, are the multiple and interacting dimensions of ethical inquiry that represent a distinctive option for religious ethics and can provide orientation for reading these volumes? Recall, these are not ordered in any hierarchical way; they are mutually interactive and informative.

Dimensions of Ethics

The Descriptive Dimension

Human beings live and act in specific places, times, and sets of relations. How a situation is described, defined, and interpreted has implications for the possibilities and limits on actions and relations. In its widest compass, some construal is given of the moral context of the entirety of human life, often enough through myths, ideologies, or a moral worldview. Specific moral situations will be described, defined, and interpreted with reference to the wider outlook.

So when, for example, a Buddhist practitioner must decide in a situation what to do, there is the need to answer a basic question, “what is going on?” This is a difficult question not only because of the complexity of any situation, its openness to multiple interpretations, and the limitations of human perception and attention. The question is rendered all the more difficult because someone (authority figure, practitioner) must sort out what reality or perspective on reality is at issue, one marked by conventional truth or one rooted in *Dharma*. A devout Muslim too must determine “what is going on” in a specific situation. This requires not only a description of that case, but also knowledge of how Allāh is acting, the import of *Shari’a* on a case, and also specific reasoning skills. Behind these religious teachings is a basic human perplexity: how is genuine insight into a situation related to and blocked by human “blindness” to what is the case? Importantly enough, the religious often explore the dialectic of blindness and insight.

While each tradition provides answers to the question “what is going on?” they do so in wildly complex and different ways. Ethics has a *descriptive* dimension that is linked to other interpretive or hermeneutical disciplines, aimed at genuine insight, ranging from studies of myth to specific analyses of events and situations that provide ways to construe and understand moral situations. Religious ethics draws on a range of resources, experiences, types of discernment, and even beliefs about reality. These resources provide the means to describe and analyze a situation in terms of its moral meaning.

The Normative Dimension

Deciding “what is going on” in any concrete situation is never a disinterested activity. The descriptive dimension of ethics is necessarily related to some norms and values that orient thinking and action. These norms and values allow some realities to appear within moral perception; they also can conceal realities, and hence the tension of blindness and insight. Christian ideas about neighbor love, for instance, might allow a perception of human worth and vulnerability even for those deemed enemies. This

depends, of course, on how neighbor and love are normatively understood. “What norms and values ought to guide human life?” That too seems to be a basic question asked repeatedly in the legacies of religious traditions. A religious ethics has a *normative* dimension.

A bewildering diversity is found among the religions on the normative question. In many traditions there are distinct and sometimes conflicting *sources* for defining what norms and values ought to guide life. One source is the native intelligence of human beings struggling to live together; it is reason and intelligence. Another source is the ultimate binding claims and teachings, the revelation, of the community. Consider aspects of Jewish thought. Rooted in the so-called Noahide covenant, Jewish thinkers have long insisted that every person can at some level grasp moral principles. Yet, for the Jewish community, this knowledge is rudimentary in light of the revelation of the divine will in Torah. Not surprisingly, there are debates within religious traditions about the relative authority of the various *sources* of norms and values and how these ought to relate in living religiously. The sources drawn upon in moral thinking also link to other intellectual practices, especially ones interested in human valuing, social norms and goods, and debates about moral intelligence.

Disputes about the sources of moral norms and values also turn on the *content* of and *relations* among norms and values. Generally speaking, religious traditions acknowledge and seek to sustain a range of goods, like bodily integrity, family, education, art, and, at the highest level, moral excellence and righteousness (see Finnis 1983; Nussbaum 2000). How these goods are understood differs between traditions and even within a tradition; they constitute another link to disciplines, from economics to anthropology, which explore basic goods. Classical Hindu accounts of caste show, for example, that the meaning of bodily integrity shifts between the warrior caste (Kṣatriyas) and the priestly caste (Brahmans). Nevertheless, some domain of goods or values is protected and promoted by living morally. There are also debates about the norms for deciding how to respect and enhance goods. African beliefs about what is owed ancestors as the norm for human choice are decidedly different than, say, the Ten Commandments in the Hebrew and Christian Bibles. In each case, norms protect and promote goods within religious living.

However, matters are more complex. Just as the descriptive dimension of religious ethics probed the tensions between blindness and insight in human moral thinking, normative reflection has to address the question of whether or not the divine, sacred, or ultimate is beyond our conventional distinctions of good and evil or not. In fact, most religious traditions, despite their profound differences, hold that the sacred, ultimate, or divine somehow transcends or exceeds the common sensical distinctions of good and evil. And if that is so, then, normative and descriptive dimensions of inquiry are reflexively related at the level of perception and decision-making. They link ethics to other ways of articulating, describing, and valuing human actions and relations. Adducing these dimensions from widespread questions in no way shields us from the stark differences between and within traditions. Attention to these dimensions facilitates critical, comparative, and constructive work.

The Practical Dimension

When people ask about what is going on and what are the norms and values that ought to orient their living, they do so for practical rather than merely theoretical reasons. Whatever else we want and must say about the religions, they are first and foremost ways of orienting human life. They are ways of addressing the tensions, the *aporia*, of perplexity and wisdom in human life, fighting perplexity in the

name of wisdom. While the ethicist or religious thinker will develop complex epistemological theories or debate the nature of value and the validity of some conception of a norm, this is not the concern of most people. For example, as the Bhagavad Gītā opens, Arjuna, standing beside Kṛṣṇa, watches a bloody battle unfold between members of his family. Should he join the battle? In the struggle of decision, a host of forces might be active, the advice of a god (Kṛṣṇa), duties bound to class or social role, bonds of love. Here too is a basic question: “what ought I or we to do?” Where is wisdom to be found?

Religious ethics has a decidedly *practical* dimension, no matter how theoretical and speculative moral inquiry becomes. It is related to other disciplines that focus on decision-making and judgment. Little wonder that so many religions link their ethics to law as well as the demand to imitate moral saints or to participate in practices of divination or study and commentary. Traditions develop complex and subtle patterns of moral reasoning in order to answer the practical questions of life. Confucian teachings about how to live the scholarly life are decidedly different than Jewish patterns of *Halakhic* reasoning. Each is, nevertheless, a response to the practical question “what ought I or we to do?” Of course, it might be illuminating to explore how *Halakhah* throws light on Confucian practices of moral reasoning and vice versa. Comparison is always possible in religious ethics.

It is also clear that this “I” or “we” is never some kind of isolated and ghostly being, but someone in relation to others. What I ought to do is related to what we ought to do. Who we are is related to other communities, who speak of “we.” While certain traditions have emphasized a radical individualism in moral action, by and large there is profound awareness that moral quandaries find people amid others. Therewith develop patterns of communal reasoning and judgment; that is, the formation of a political ethics. The point is that some form of practical reasoning and judgment will be found. The work of scholars in other fields (law, social analysis, rhetoric) can aid the religious ethicist. Noting the practical dimension of ethics facilitates, rather than delimits, critical, comparative, and constructive thinking.

The Fundamental Dimension

Insofar as individuals and communities confront questions about how to orient life, something is asserted about the moral structure of reality and human beings as creatures with the power to act and choose in concert with others and thereby influence reality, themselves, and others. That is, ethics is about the proper conduct of agents, human and otherwise. Human beings can be and ought to be aware of themselves in relation to others, the context of life, and with respect to norms and values about how rightly to live. But, ironically, human beings confront here too a tension, the one between freedom and bondage. We are – to some extent – freely acting beings but in a world and universe that constrains our freedom even as we can be (and usually are) in bondage to powers beyond ourselves, say, addictions, or political forces, genetic makeup, family structures, or economic necessity. Any ethics aims, thereby, to answer a question seemingly presupposed in other moral questions: “what does it mean to be a moral agent within the wider compass of reality?” From philosophy to neuroscience, religious ethics is linked with other fields of inquiry into human being and doing and the nature of reality itself.

Religions present fantastically complex accounts of agency and the moral context of life. This is what is meant by the subject matter of the *fundamental* dimension of ethics. A good deal of modern Western ethics defined an “agent” as a being with reason and will, who can act intentionally, bring about changes in reality, others, and the agent’s self, and have accountability for actions imputed and/or ascribed to him or her (see Gewirth 1978). The scope of the moral world is determined by the interactions, cooperatively

or not, among these agents. Each of the defining attributes of agency has of course been hotly debated. What do we mean by reason or will or intentionality or accountability or moral ascription? How do we best understand the formation of moral character, say through the virtues? There has been reflection on the limitations of agency, the nature of corporate agency, and questions about moral self-understanding.

Work in religious ethics is challenging and amending modern Western conceptions of agency by attending to non-human agencies and also the wider realms of reality. Human beings can be – and often are – in bondage to powers beyond themselves even as they also retain a measure of freedom. In the Christian tradition, what it means to be an agent is defined not only in terms of the power to act and to be held accountable. It is also defined by patterns of relation in which the self exists in God and in others through faith and love before God's kingdom. Further, faith and love are understood with reference to the divine activity, and this means, paradoxically, that at least two agents, the human and the divine, act in any genuinely good action. Sin, or a broken relation to God and others, is marked not just by wrong acts, but, more profoundly, by an estrangement in which one must act alone and for one's own purposes and good. God's judgment on sin is really the withdrawal of the divine presence such that the agent is left to his or her own devices. In traditional African ethics what it means to be an agent is rendered complex by the fact that the ancestors are operative agencies in the world. This is also why, as noted above, practical and normative issues in Buddhism hinge in part on the distinction between conventional and Dharmic truth and so on a distinction between "self" and "person." Insofar as the root problem is craving that gives rise to suffering, one can only speak of an agent or person through conventional terms. In the light of the teachings of the Buddha, ultimately, there is no-self.

In the religions, forces other than self, insofar as we can speak of a self, are at work in the world and in the individual. Each of the religious traditions, furthermore, examines complex psychological and sociological mechanisms that lead to moral failure, delusion, and conflict – mechanisms like inordinate craving (Buddhism), distorted loves (Christianity), ritual impurity (Hinduism), violation of ancestral bonds (African and Native-American ethics), and systemic, social distortion. An agent is set amid forces that must be considered in attaining valid understanding. Inquiry into what it means to be an agent within these rich accounts of moral reality is the fundamental dimension of religious ethics simply because these ideas are presupposed, and so *fundamental*, in all other moral questions.

The Metaethical Dimension

If one looks at the legacies of religion, there seems to be one further general question that helps to constitute the shape of religious ethics. It arises from the tensions between truth and illusion in human experience. The Buddha insisted that anyone could test the truth of his teaching in actual life. Jesus is reported to have said, "I am the way, the truth, and the life." Hindu ways of life claim to accord with the truth about the cosmos and also the specific tenor and form of individual life. Muslims believe that the Qur'an gives the final and ultimate revelation of the will of God. Every religion, despite what modern critics hold, purports to be truth seeking and truth teaching. Communities and traditions implicitly pose the question and provide some account of the truth of their morality and their picture of how to orient existence in the moral space of life. Of course, claims to truth differ and so too the means for showing their validity (experience, teaching, revelation, etc.). To enter into this kind of reflection is to engage in what is often called by scholars, somewhat unhappily, "metaethics." Reflection centers on clarifying moral concepts, strategies of validating claims, and forming judgments about the relative weight the

evidence and interpretations from other fields of inquiry can and ought to have in guiding life. This is meant to sort out truth from illusions the confusion of which too often befalls human life. The question of validity or truth is posed from within the religions. This too is a dimension of religious ethics, both about a religious morality and about the discipline of religious ethics itself.

The question of the truth of a moral outlook is without doubt one of the most vexing issues for religious ethics. While the ethicist might explore dimensions of a tradition's morality, how does one judge the truth of an entire religion? How does one show that a constructive religious ethics is true? On one level, the religious ethicist can address this question comparatively and critically. In Volume II of this *Encyclopedia*, readers will see scholars examine the ways in which one or several traditions go about showing the truth of their moral beliefs and practices. Further, if the religious ethicist is working within a specific tradition, say, Shi'ite Islam or Zen Buddhism, then, presumably, its strategies of validation will be in play, a matter also explored in parts of this *Encyclopedia*. Finally, when a thinker attempts to offer a constructive religious ethics, comparatively or not, then some account of how the position is validated must be given.

When the ethical task is to speak critically, comparatively, and constructively across traditions about shared human problems, matters become pressing. It poses a question implied in the very undertaking of religious ethics: from what *standpoint* is inquiry carried out and what criteria of adequacy or truth pertain to its work?

Hermeneutical Standpoint

The *dimensions* of inquiry gleaned from persistent questions and perplexities of human life aim to provide a coherent way to undertake, singularly or collectively, the comparative, critical, and constructive *tasks* of religious ethics. They also signal the kinds of questions engaged by scholars represented in every part of this work. Moral knowledge is thereby depicted as a network of intelligibility, a space of reasons, about how rightly to orient life that is held and enacted by some tradition or community and examined by scholars and religious leaders through multidimensional reflection. The religious ethicist might also make constructive claims about how rightly to live. This is, a proposal for the orientation of conduct and life that is responsive to the complexity of the "religions" and also shifts in the way knowledge and disciplines are conceived. The account of the scholarly labor of religious ethics in this *Encyclopedia* does not prejudice one set of moral beliefs over another, say African over Confucian; nor does it specify only one kind of ethics, say virtue ethics or deontology, as best for a normative understanding of the religions and meeting present-day challenges. It is an inductively developed *method* for, or *approach* to, religious ethics. Working alongside other options in the field, this proposal is, hopefully, subtle enough to facilitate the examination of the moral outlooks and practices of the world's religions. Through its dimensions, religious ethics interacts with many fields of inquiry.

However, we have been led to the thorny question of the standpoint and criteria of religious ethics. For those who take a *formalist* approach, the contention is that despite empirical differences among religions one can discern or articulate philosophically a basic structure shared by the religions that facilitates critical, comparative, and constructive work. One seeks to develop an ethics outside of substantive connections to any tradition or the surrounding life-world (see Benhabib 1992). The criterion of adequacy must be determined with respect to moral rationality itself and/or through a metaphysical vision. Those who

pursue a *sociolinguistic* approach in the discipline insist that the sheer diversity among religions and cultures means that material differences rather than formal similarities must be basic to method in religious ethics. Moral rationality, on this account, is tradition-constituted rationality (see MacIntyre 1990). The means to validate a position are internal to a tradition or they emerge at the intersection of competing traditions. *Ethical naturalists*, for their part, insist that norms and values must be grasped and evaluated in terms of their place in a whole outlook on life. And those who adopt a *cultural/ethnographic* approach grant the sheer differences in moral outlooks. The standpoint of the religious ethicist, thereby, is to engage in the examination of a community's moral worldview even while acknowledging the substantive outlook that backs her or his inquiry.

Shifts in how to describe moral knowledge enable one to conceptualize religious ethics in a new way. Similarly, there are developments afoot that demand a standpoint in religious ethics somewhat different than the other approaches in the field. While the method of religious ethics is aptly described as *multidimensional*, its standpoint can also be conceived as fully *hermeneutical* in character conjoined to specific criteria of adequacy. The importance of this standpoint is found in the moral significance of recent global developments that parallel shifts in the construal of human knowledge.

Recent Developments

Developments that characterize the present age warrant a hermeneutical standpoint in religious ethics. These recent developments, and others too, are charted throughout these volumes. A prominent one is the growing awareness around the world of the diversity of religious and moral beliefs, practices, and convictions. A good deal of modern Moral Theory seemed to efface the particularity of outlooks out of a concern to isolate general features of human existence deemed of universal ethical relevance. The need nowadays is to understand and to explain the moral vision of communities and cultures on their own terms without an initial judgment of truth or goodness. This requires interpretive engagement with the forms of thought, types of texts, practices, rituals, and organization of religions and societies.

The present awareness of global diversity has spawned the critical and comparative tasks of religious ethics, both in formulating more adequate categories of thought (Volume I), by exploring the legacies of traditions (Volume II), and in order to address shared moral problems (Volume III). However, understanding beliefs and practices, no matter how critical that might be, is not the same as justifying them, determining their truth. In a world in which the religions too often and too readily sanction violence and hatred of others, neglect or denigration of the environment, and also back excessive preoccupation with one's religious condition, judgments about what counts as a valid policy for living are required. Present worries about moral diversity provoke inquiry into how one is to establish norms that transcend particular systems of authority in order to address shared human concerns. This seems to require that the standpoint of religious ethics be neither so formal as to efface differences nor so historically particularistic that normative judgment across moralities becomes impossible.

The awareness of moral and religious diversity is just one development in the current situation that challenges how one conceives of the standpoint of religious ethics. The age of "globality," as it is called, is marked by multiple forms of reflexivity, ranging from economic processes to cultural and informational flows (see Schweiker 2004). Reflexivity is the ability of an acting entity to respond to information coming from elsewhere and to adjust its self-understanding and actions in this light. Human persons can

respond to recommendations and judgments on their actions, say, from others, a sage, moral saint, or a god, and then seek to live and act better. Reflexivity is then a kind of self-examination. Increasingly, one is aware of the ways in which social systems, cultures, and religious traditions are, analogically, reflexive or learning and self-testing beings. Global reflexivity works through economic, cultural, imaginary, and legal mechanisms shaping human and non-human life.

The reflexive dynamic of global flows has brought with it new and unexpected developments. During the twentieth century, many scholars of religion defined their work in terms of secularism. The modern world was supposedly a time in which ideas and experiences of religion or transcendence or the sacred were being effaced by the pressure of differentiated social structures and the march of science to demystify the world. Similarly, the legacies of colonialism demanded that peoples around the world adjust their lives and cultures to the secular order (see Appadurai 1996). Throughout this *Encyclopedia*, and especially Volume II, one can trace the ways religious traditions have responded to secularism, colonialism, and modernism.

The noonday of the secular world never really came, or it only appeared in faint glimmers. The present age is characterized by nothing so much as the force and movement of the religions on the global scene. Global reflexivity, the ways in which communities appear in the “gaze of the other,” is of great moral import. One can witness the transformation of traditions in and through interactions with and resistance to other global forces, including other religious traditions, rather than the pressure of secularization. This also seems to require a hermeneutical standpoint in religious ethics insofar as hermeneutics examines the dynamics of human understanding through encounters with divergent claims to meaning, encounters in which transformation of life as well as conflict are possible.

The awareness and worries about moral diversity and global reflexivity arising out of the contours of the emerging age are deeply intertwined with shifts in moral sensibilities. These shifts in sensibility are other developments that impinge on the standpoint of religious ethics. The modern world from the seventeenth to twentieth centuries saw the apotheosis of human power in technology, political organization, the media, and economic systems, and with these developments an exclusive concentration on human flourishing. Ironically, modern anthropocentrism turned against itself. Holocausts, genocides, terrorism, grinding poverty, and horrific wars scarred the twentieth century and now too the twenty-first century. Massive suffering and violence have sparked deeper sensitivity to the vulnerability and preciousness of persons (see Gaita 2000; Glover 2000). Conjointly, there is growing awareness of the interdependence of every form of life on this planet. People around the world are imaging the scope of moral value to include but also to exceed human well-being. This ecological sensibility has challenged long-standing beliefs about moral value and standing. In various ways, moral sensibilities for the worth of all realms of life are spreading around the world. This is sorely needed insofar as the religions continue to take violent expression and to foster ignorance and the neglect of finite, planetary resources. Emerging sensibilities can and must aid in the transformation of the traditions that spawn but also thwart moral aspirations.

The realities of moral diversity, global reflexivity, and emerging moral sensibilities are obviously inter-related developments. Taken together, these demarcate some of the contours of the current moral space of life. In order to understand and respond to them, religious ethics must carry out critical, comparative, and constructive work. Because of the deeply interrelated nature of current dynamics, religious ethics obviously needs to be defined beyond modern conceptions of what constitutes a discipline or an intellectual practice. Furthermore, something important is at stake in an account of an ethical standpoint once

the reflexive dynamics of cultural interactions amid human diversity in global times is seriously considered. The religious ethicist does not simply exist within or outside actual traditions. She or he is always thinking at the *lateral connections* among communities, traditions, and intellectual practices. What does this fact mean for the standpoint of religious ethics?

Standpoint and Criteria

In order to specify the standpoint of religious ethics in the light of current global developments, one can reclaim terminology from the Hellenistic world that arose within its religious and cultural imagination prior to the development of “ethics.” The standpoint of religious ethics is *hermeneutical*. Derived from the Greek god Hermes, hermeneutics is reflection on the possibilities and limits of understanding ambiguous meanings won through the act of interpretation and thereby how meanings are conveyed from one realm to another. In the Homeric texts, the virtual sacred literature of that culture, Hermes conveyed meanings from the gods to mortals. Other religions, as found in this volume, explore the conveyance of meanings across boundaries in revelations, divinizations, rituals, exegetical strategies, and mystical insights.

The point is certainly not to reclaim Greek ideas in order to define the standpoint of religious ethics! The insight is that religious ethics conceived as a hermeneutical enterprise moves between traditions or among expressions of one tradition, seeking understanding and the orientation of conduct and life. No doubt that movement will always be marked by the ethicist’s “home tradition,” religious or secular. One remains a Chinese or Japanese Buddhist religious ethicist or an African Christian or a postmodern European Aristotelian. No one (thankfully) must necessarily sacrifice their identity for the sake of undertaking religious ethics. Yet the standpoint, the posture of thinking, takes place at the reflexive connections of traditions and other forces working in the world. The religious ethicist on this picture enacts the lateral links among the dimensions of ethics and other forms of inquiry into the moral beliefs and practices of the religions. In the process some degree of knowledge and understanding is attained, a shared world of meaning is partly disclosed, even as identities can be confirmed or tentatively transformed. The religious ethicist participates in the enacting of a complex network of moral knowledge, never complete yet nonetheless attained. This hermeneutic action is achieved by undertaking the adventure of thought signified through the various dimensions of religious ethics.

How then are we to judge the validity or truth of the work of a religious ethicist? This is a question hotly debated in the pages of this *Encyclopedia*, particularly in Volume I. Generally stated, two *criteria* bear on a hermeneutical standpoint in ethics. First, any adequate ethical claim, whether about the beliefs and practices of a specific tradition or a proposal for meeting a current moral problem, must prove its great adequacy to relevant material in argumentative exchange with other accounts. A position is truer than some other insofar as it answers more comprehensively and coherently the range of questions specified in the dimensions of ethics. It must, accordingly, meet demands entailed in the act of multidimensional inquiry, as well as be error reducing with respect to rival positions or interpretations (see Taylor 1990). Again, scope rather than autonomy is basic to the adequacy of an ethics. This is a *procedural* criterion. It means that a religious ethics is never justified prior to lively engagement with other positions. Additionally, a position must afford some advance in thinking by provoking or providing deeper insight into a moral problem or way of life. This second *heuristic* criterion is more illusive than

the procedural one. What counts as insight, let alone “deeper” insight? Nevertheless, a moral position can claim greater adequacy, greater truth, if it enables one to apprehend, understand, and respond to factors really pressing on human lives but missed by other moral positions. *Heuristic* and *procedural* criteria are applicable to the scholarly labor of criticism and comparison as well as to constructive ethics. These criteria can, of course, be elaborated in much greater detail, a task not needed in this Introduction but one explored throughout the *Encyclopedia* as a whole (see Schweiker and Clairmont 2020).

There are good reasons within the religions as well as those found in global dynamics to adopt a hermeneutic standpoint in moral inquiry. The religious ethicist can isolate and articulate these various reasons as backing for her or his work. Abiding by the criteria of a hermeneutical standpoint within multidimensional inquiry, religious ethics can, but need not, aid in the reconstruction of religious identities around criteria of ethical truth, rather than subjecting the question of truth to communal identity. In this way, a thinker critically and comparatively releases the resources of traditions and communities for constructive thought about how rightly to orient human life.

Conclusion

This entry has sought to address terminological, methodological, and also criteriological issues within the ongoing work of religious ethics. It has sketched an approach to the discipline working alongside others in terms of *tasks*, *dimensions*, and *standpoint*. This proposal is meant to aid the reader in exploring the richness of the thought represented in this *Encyclopedia*, as well as to outline a new possibility for religious ethics itself. One should not expect all scholars represented here to use this proposal, nor is that needed. As noted before, part of the vitality of the field is to keep constantly in play the appraisal of its work and adequacy. Yet by enlisting a vast range of renowned scholars from various disciplines, traditions, and cultures, the labor of religious ethics now crosses disciplinary boundaries that have for too long inhibited its development. *The Wiley-Blackwell Encyclopedia of Religious Ethics* presents an exciting vision of moral inquiry engaged with the fantastic resources of the world’s religions, open to other fields of reflection on the human adventure, and dedicated to understanding and addressing moral challenges and possibilities emergent in our global times.

1 Structures and Conditions

CHAPTER 107

Health

Katherine K. Young

Sickness destabilizes routines and undermines common assumptions. This view from the edge of experience makes people radically question life's meaning and purpose, bringing the spiritual dimension into clear focus. Something has been broken or disrupted – relationships with deities, ancestors, ghosts, demons, or just ordinary people – and must be fixed so that health and harmony are restored. The world is now scarred by massive human suffering: violence and war, widespread poverty and hunger, and also the spread of diseases such as AIDS and SARS on a global scale. Can religious resources help us to deal ethically with these medical challenges today?

Religion, Health, and Ethics in the Premodern World

The religions of small-scale societies (hunters and gatherers, horticulturalists, and pastoralists), now called “primal,” were often characterized by the perception of a shared life force, or power, which was common to people, ancestors, spiritual beings, and even objects of nature, thereby integrating society with both the natural and supernatural. This harmony was based on the kind of behavior (duties, services, and gifts) required for social order and for respecting the environment. If social harmony were not maintained, or if natural disaster were to strike, the result would have been disharmony. Although behavior was guided by sanctions based on collective experience, these sanctions were not formalized as “morality” in terms of commandments, decisions, or principles. When disease struck, people pondered broken taboos and tried to reestablish normal relations with the offended or disturbed powers. Sometimes, the cause of disease or death remained inscrutable. It was attributed to people, ancestors, or spiritual beings who were jealous, capricious, malicious, or aggressive.

Large-scale societies developed more complex views of space and time (many realms and cycles of time). Some deities became supreme creators, providing the energy for cosmic renewal and prosperity, although they could be jealous and cause harm (such as disease and death), especially if they received no offerings. People believed in their need to sustain the deities by sacrifices (which recycled the power of death to provide health and life) and other rituals.

Gradually, religions developed soteriologies (the idea that ultimate destiny lies in a realm beyond ordinary space and time). Ethics was now related to the welfare of individuals beyond this life and not only to that of the group in this life. People believed that they would be rewarded for their good deeds

or punished for their bad ones in another realm. In addition, these societies were more stable than earlier ones; people no longer worried that the sky would fall down if rituals were ignored or covenants broken. They produced more material resources than did earlier societies. This led to specialization, which led in turn to an explosion in knowledge based on observation, classification, and experimentation. The development of empirical medicine was part of this explosion. The ancient civilizations of Egypt and Mesopotamia were characterized by empirical interest in the physical body and its diseases (see the Egyptian “Smith” papyrus, the “Ebers” papyrus, and the Mesopotamian tablets). By the fourth century BCE dramatic advances were made in empirical medicine by the Greeks (the Hippocratic corpus), by the Indians (described in the Hindu Ayurvedic corpus and the Buddhist Pali Canon), and by the Chinese (the Yellow Emperor’s Classic of Internal Medicine). These texts classify diseases in ways akin to modern ones (internal medicine; diseases of the eye, nose, ear, and throat; surgery; toxicology; psychology; pediatrics; infectious diseases; surgery; and so forth). Somewhat later, Islamic scholars made major contributions. Ibn Sina (Avicenna, d. 1037), for instance, wrote a monumental encyclopedia on medicine.

Religious communities recognized the effectiveness and power of empirical medicine. They trained physicians and nurses, became custodians of medicines and medical libraries, and eagerly sought out the expertise of other traditions. Greeks borrowed from Egyptian and Mesopotamian medicine, Romans from Greeks, and Hindus and Buddhists from each other. So did Christians, Muslims, and Jews. In the early Middle Ages, for instance, Jewish and Muslim physicians were trained in Alexandria, Constantinople, and some surviving Roman cities of Italy and southern France. Abu Ya’qub Ishak ibn Sulaiman al-Israeli (ca. 855–955) wrote on medicine. His works were then translated from Arabic into both Hebrew and Latin. Other Jews translated and wrote commentaries on Ibn Sina’s *Al-Qanun fi al-Tibb*. Maimonides (1135–1204) was not only a philosopher and legal authority but also the personal physician of Sultan Saladin, his family, his harem, and his officials in Egypt.

The development of empirical medicine challenged religious explanations of disease and religious treatments and cures. Religious explanations, for example, often said that illness was divine punishment for sin and health the reward for observance of religious rites and moral precepts (although the latter was sometimes internalized as in the Hindu law of karma, which stated “as you sow, so you reap” or the biblical phrase “those who sow the wind shall reap the whirlwind”). By contrast, empirical medicine generally focused on the body and gave material explanations for disease, such as improper diet. There were other conflicts between medicine and religion. In medieval Christianity, for instance, the church considered confession a potential means of cure, so physicians were obliged to call priests. But what could physicians do if patients refused to see priests? And what were patients to think if they realized that their physicians could offer them no hope?

People tried to avoid clashes and to gain the benefits of both approaches, because everyone recognized that medicine had its benefits and its limits. One approach was *metaphoric and practical appropriation*. The practical interest in empirical medicine in Buddhist monasteries, for example, was closely linked with basic Buddhist teachings. The Four Noble Truths were the four principles of medicine: cause, symptom, cure, and non-recurrence. The five basic medicines were the Buddhist concepts of faith, energy, mindfulness, concentration, and wisdom. And enlightenment was the permanent cure for life itself. The spread of Mahāyāna Buddhism into East and Southeast Asia in the first several centuries of the common era was related to its knowledge of empirical medicine. Despite its early emphasis on spiritual healing, Christianity had by the fourth century integrated rudimentary hospitals under the

supervision of local bishops. Healing shrines were like hospitals; attending priests had medical skills ranging from rudimentary to expert.

There was also *compartmentalization* – placing a specific medical procedure in a larger religious context of incantations, prayers, rituals, astrology, and so forth. Supreme deities were the ultimate power that defined life and death; the ultimate cause of health and sickness, and the ultimate source of therapies and cures; physicians were agents or servants of the deity. That said, medicine was allowed to operate semi-autonomously.

Yet another approach was *complementary functionalism*. This was used in ancient Mesopotamia and Egypt, Greece, India, and elsewhere. It was based on a functional division between two types of medicine. Empirical medicine dealt with visible, proximate, or natural causes, whereas religious medicine dealt with invisible or supernatural ones. The two were complementary.

Closely related to this approach was *pragmatism*: recognizing all healers and types of medicine as potentially useful. There are many accounts of people seeking both empirical and religious cures.

Finally, there was always *hermeneutical adjustment*: interpreting religious passages by allegory (as Maimonides and Falaquera did in the thirteenth century), simile, levels of meaning, and so forth. In religiously controlled societies, nonetheless, religious approaches trumped empirical ones. During the medieval period, for instance, Christianity – through its clergy, sacraments, and saints – created a chain of dependence for spiritual/miraculous healing. Sacraments became the means by which God's superabundant grace and power were channeled to protect and heal patients. Baptism and exorcism repelled evil spirits that caused sickness. Confession and communion purified people and thus protected them against disease. In medieval India as well, empirical medicine receded to the background as religion came to the foreground.

Attempts to prevent serious conflict between empirical medicine and religion were successful, by and large, in the premodern period. Although both medicine and religion had tried to marginalize magic, it did not disappear completely. Many Christians, Jews, Muslims, and other Near Eastern groups continued to believe in demons or demonesses as causes of illness. Therefore, they continued to use incantations, amulets, magical mirrors, dream interpretations, or astrological, palm, or magic bowl “readings” for cures. Hindus, Buddhists, Taoists, Confucians, and others maintained similar beliefs and practices. These became especially important during individual, familial, or social crises, when all else failed.

It is striking that most of these civilizations considered harmony a key concept of health and well-being. The Greeks, Hindus, and Buddhists, for instance, all believed that good health required a balance of fluids in the body, which in turn had to be balanced with the mind and the environment. The Chinese version was a system of correspondences, harmony requiring the health not only of the body but also that of the state.

Closely related to the topic of health and religion is that of medical ethics. As early as Egypt's Old Kingdom (3400–2474 BCE), problems were debated in the Memphite Drama and the Proverbs of Ptahhotep. Physicians from this time had to deal with both the power and the precariousness of medicine. This involved four basic problems.

First, should physicians offer treatment or not? The common answer was yes, but only for cases that could probably be alleviated or cured; involvement in hopeless cases would make medicine appear ineffective, after all, and thus a form of quackery, or even dangerous. Epidemics were particularly troublesome in this respect: Should physicians flee or stay and care for the sick?

Second, how could physicians distinguish themselves from quacks (of which there were many)? The common solution, both Western and Eastern, was the development of semi-religious professional guilds.

These established and monitored standards of education (a good knowledge base, critical approach, precise memory, and perseverance); personal behavior (virtues such as truth, peace, charity, spirituality, and control over anger, envy, and pride); practice (decorum to protect the reputations of women or the privacy of the household); and visible symbols of dress. Finally, they instituted rites of initiation and oaths such as those of Hippocrates (Greek), Asaph (Jewish), Caraka (Hindu), Ahwazi (Islamic), and Enjuin (Japanese Buddhist). One important function of the oath was to check violence (by condemning assisted death, including abortion) and to uphold the foundational principle of the sanctity of life and non-injury (*ahimsā*, for instance, in Hinduism and Buddhism) aside from the few permitted exceptions.

Third, what could be done about the arrogance and greed of physicians? They were warned directly against these vices and taught virtues such as restraint and humility in texts such as the Egyptian Proverbs of Ptahhotep, the Greek Precepts (which advised physicians not to begin consultations by discussing fees, because that would hurt their reputation), and the Buddhist Pali Canon (which eventually prevented the public practice of medicine by monks and nuns because of charges of greed).

Fourth, how could patients be assured of access to medicine? Quite apart from the unwillingness of physicians to treat the dying in order to protect their professional reputations, there were other reasons for denying people access to medical care. Sometimes this was for religious reasons, such as notions of impurity. And sometimes this was for secular reasons, such as punishment of social deviants and political enemies or indifference to the poor. Many states tried to overcome the latter. According to the Mesopotamian Code of Hammurabi, for instance, physicians should charge patients according to type of procedure, economic class, and likelihood of success or failure. The Hippocratic Precepts advised physicians to consider the ability of patients to pay them and extend care to strangers and paupers even if they could pay nothing. And the Hindu *Susruta* exempted fees from groups such as elders, ascetics, and teachers; moreover, it encouraged care of the indigent out of compassion. Religions encouraged or mandated charity, requesting physicians to treat the poor for minimal costs or without charge, and to look for eternal rewards rather than merely material ones. Religions structured by universalism (Buddhism, Christianity, Islam) sometimes advocated universal medical care (the *bodhisattvas* in Mahāyāna Buddhism, for instance, were examples of compassion *par excellence*, in the disguise of physicians extending medical care to all or kings building hospitals to help the poor). Though promoted, universal access to medical care was hard to accomplish. By the twelfth century in the West, for instance, despite the admonitions by both ecclesiastical authorities and guilds to treat all patients, many physicians still did not do so. Universal religions increased access also by offering medicine to potential converts, including those of low status.

Any discussion of medical ethics requires some account of gender. Women were usually barred from the profession of empirical medicine (as physicians or nurses) and often had less access to medical treatment as well. This was probably due to at least four factors.

First, because elite women in traditional societies were often sequestered, they lacked opportunities for education in empirical medicine. Some women had expertise in folk medicine, and some women became midwives, but they are not mentioned in medical works, although we have a few works by men on the medical problems of women. But there were some exceptions to the exclusion of women. Buddhist and Christian nuns were often educated women and interested in medicine; sometimes, they carried the practice of medicine into the secular realm. When Christian women came to India during the colonial period, for instance, many practiced nursing and trained their Indian female converts to do the same, because Hindu women had been restricted by purity and seclusion regulations.

Second, because elite women were often sequestered, in their homes, they could not practice empirical medicine if that involved moving about in public. As a result, male physicians and nurses treated women – but only in the presence of their guardians, to avoid charges of impropriety (which might have made them reluctant to attend to women at all).

Third, because women seldom controlled finances, they lacked the means to obtain medical help for themselves (and their female children). Even when concepts of charity existed, elite women could not access it because of their status.

Fourth, in some societies, women probably received less medical care than boys and men because of “son preference,” an idea with religious authority, which might have originated as a way to compensate for the greater loss of male life in pregnancy and early childhood. This still occurs in the rural areas of countries such as India and can have a profound effect on the health (and lives) of girls and women.

Hence, we see both the problem of “access” and the question of the “good physician” found throughout the history of religion and health. Although these premodern civilizations were strikingly similar in some ways when it came to the interaction between religion and health, they were strikingly different in other ways. Two patterns stand out. One is that of “ethnic religions” such as ancient Judaism, Shinto, and elite Hinduism – especially their priestly traditions. These defined identity by birth and by degree of purity. As a result, insiders (those who followed the norms or laws) were separated from outsiders (those who did not). In the context of medicine, this meant that ritual sites or temples were defined as pure, and so the sick or deformed were prevented from defiling them. Priests were carefully distinguished from physicians. In Hinduism, “priestly physicians” who catered to the elite were of ambiguous status because of their contact with the impurity of disease. All this has had profound impact on access to medical care, although most of these religions have either changed to become more accommodating (rabbinic Judaism and bhakti Hinduism) or have developed complementary relations with other religions (as Shinto has with Buddhism, which focuses on “impure” death and dying).

Another general pattern in premodern civilizations is that of “universalistic religions” such as Hellenistic religion, Islam, Christianity, Buddhism (especially Mahāyāna), and Taoism. These emphasized virtues such as charity, love, mercy, or compassion. They often proselytized among marginal groups, including women and the sick, offering access to medical care as a perk of conversion. Consequently, their holy places were sites of healing that provide access to empirical and/or religious cures and therapies. Their religious leaders were often healers.

But these distinctions often blurred in these premodern, complex traditions, because most developed both ethnic and universal traits. In general, we see that as human beings develop more control over life, they worry less about the capriciousness of deities or demons and rely less on magic, although that often changes in periods of warfare, societal breakdown, or natural disasters. Some archaic ideas remain (such as the idea of harmony as health, disharmony as disease), but others gradually decline (viewing sacrifice as a way to tap the power of death to provide health and life).

Religion and Health in the Modern Period

Many themes and challenges found in the premodern world – suffering and human meaning, the relation between empirical medicine and religion, and medical ethics – have continued and intensified in the modern period. This is certainly the case with empirical medicine. The scientific revolution of the

seventeenth century emphasized knowledge based on observation, description, classification (which led to new disciplines), reason, experimentation (with verifiable results through repetition), and prediction. But it resulted also in a new worldview, because facts, theories, and truth became separated from ethics, philosophy, and teleology (ultimate human meaning and purpose). The body became only a natural system or, thanks to the Industrial Revolution, a “machine”. Good health was indicated by a well-functioning body, in other words, and disease or pathology by a malfunctioning one; medicine was now strictly a science and technology, not the functional complement of religion. All this contributed to the view that nature, religion, and society were distinct spheres. Only in nature, however, was truth to be discovered.

Once again, religions tried to come to terms with the conflicts between medicine and religion, even though the conflict was now so extreme that the very value of religion itself was challenged. Many Protestants accepted the virtual autonomy of modern medicine by supporting medical advances and the professionalism of physicians apart from the church, practicing medicine with a general sense of “calling” but without much ecclesiastical control. They understood this new scientific medicine as a way to express the healing ministry of Christ. (Other Protestants, especially those called Charismatics, rejected many claims of modern science and revived the idea of spiritual healings and gifts of the Holy Spirit, which had its basis in the healing ministry of Jesus.) Roman Catholicism accepted a multi-level conceptualization (the reality of scientific explanations but also the idea that God permeates all biochemical and biophysical processes). Religions such as Islam, Hinduism, Buddhism, and Confucianism faced even more problems with modernity in general and the scientific revolution in particular, because these were foreign developments introduced into their countries by colonial powers and their missionaries, who criticized their cultures as scientifically backward, socially unjust, and religiously too other-worldly.

The initial response of most Asian religions was to compartmentalize the two domains under the dictum “Western science, Eastern religion.” Hindus – who had already learned about Western medicine under Islamic rule (Muslims, remember, had preserved and refined Western medicine through several centuries) – took other approaches as well. One was syncretism, long a Hindu strategy of dealing with cultural contact and challenge. Another was reconciliation, arguing that Hindu religion and philosophy had prefigured modern science. Still another was that Ayurveda, the traditional medicine, should be kept pure and isolated from foreign influences. As a result, Ayurveda is still practiced in the villages of India and learned in traditional schools. It is professionalizing and modernizing with government support, however, integrating aspects of Western medicine (called allopathy) such as antibiotics, and growing in popularity because of its traditional fluidity between empirical medicine and religion, mind and body, psychology and physiology, physicians and religious healers. Even those Westernized urban and educated Indians who have access to the more expensive allopathy sometimes turn to Ayurveda for chronic and terminal illnesses and culturally specific problems – a modern version of complementary functionalism. The Indian system today is best characterized as pluralistic (Ayurveda and allopathy along with homeopathy and naturopathy).

Contemporary Buddhists, too, have also responded to criticisms. Socially engaged Buddhism has emerged along with a renewed interest in empirical medicine. Some Buddhist countries have developed pluralistic approaches like that of India, whereas others (such as Sri Lanka) have officially chosen Western medicine after independence. As for China, in 1929 the Guomindang government restricted traditional Chinese medicine. But during the Long March of 1934–1935, Mao Zedong, the leader of the

new communist movement, and his army had to rely on traditional medicine in the countryside. Impressed with its effects, Mao later championed native medicine, which led to research. China operates today with several medical systems (some of which maintain religious explanations for diseases, such as sin, demonic attacks, deviation from norms, or malevolence from the living or the dead).

Religions and Contemporary Challenges in the Period of Globalization

Although it seemed for a while in the West that religion was being marginalized from modern ideas of health and disease, we now find growing interest in religious views. Chronic and terminal illnesses still remain beyond the capacities of modern medicine to “fix,” reminding people that life is still finite and therefore raising again perennial questions about its purpose and meaning. Additionally, many secular people want orientations that are personal, holistic, and spiritual, rather than institutional. They see this in some traditional religio-medical practices. This signals a renewed appreciation of religious notions of harmony and integration with nature (often associated with primal religions) and premodern notions of “integral” paths (be they the Shari’a of Islam, the Halakhah of Judaism, or the many yogas of Hinduism and Buddhism) which place health and ethics within a larger context of meaning and concept of harmony. If this trend continues, then the relation between religion and medicine will be a thing not only of the past but also one of the emerging global, interdependent world.

The ethical question that remains is how to mobilize religious resources to ensure universal access to healthcare. In this context, it is important to remember that, even in societies that were hierarchical in the past (such as Hinduism), there are resources for concepts of reciprocity and human rights (the law of karma, for instance, recognizes capacity for self-determination, agency, and impartial justice); there is a general rule of equal distribution (*sarvam syadasrutitvat*) in the absence of express provision to the contrary; there is a limit to autonomy in the need to prevent harm to others (*ahimsā*); and there is a recognition that rights and duties are correlative (although Hinduism, like most premodern religions, prefers to focus on duties and a middle path between radical autonomy and extreme collectivism).

Because suffering and death pose the ultimate questions, which must be given meaning, there will likely always be an attraction to religions and ways will continue to be found for some kind of mutual respect and functional complementarity between religion and empirical medicine, especially in the area of palliative care. Because ethics will always be at the interface of religion and medicine, moreover, the need for creative cooperation between the two will continue. And because most of the world’s population still have religious identities and the continuity of identity is important in a postcolonial age of globalization, we can predict that the connection of religion, health, and ethics will remain for this reason too.

CHAPTER 108

Body Culture

Regina Ammicht Quinn

Life Imprisonment

“Plotinus, the philosopher of our day, was a man who was ashamed of being in the body” (Weischedel 1974, 82–106). The founder of the Neoplatonic school of philosophy, Plotinus, we are told, never mentioned his origins, parents, or birthday, the day when the soul entered the body, so that nobody would be tempted to celebrate this unfortunate day. As far as possible he tried to ignore his body and his bodily needs. In consequence, at the end of his life his students left him because his body, putrid and festering, nauseated them.

In the history of philosophy, Plotinus embodies a third-century renaissance and to some degree a simplification of Platonic ideas. True reality and real truth cannot be found in the material world but only in the realm of the spirit. Plotinus, for his part, was a highly respected teacher; even the emperor and his spouse attended his lectures. He must have put a finger on the pulse of his time. And his time was the crucial constituting time for the Christian church. At about the same time, the Christian thinker Origen states: “God created the present world and he chained the soul to the body for punishment.” Origen formulates an early Christian version of what is later called *anthropological dualism*. Anthropological dualism teaches not only the gap between body and soul, matter and immateriality, but also an active state of war between those two, with frequent surprise attacks: ascetic attacks on the body by the soul, ecstatic attacks on the soul by the body. The victory is an uncertain one, not finally decided until after death. For the soul is imprisoned in the body.

Contempt of the body can lead to the dissolution of human community. This dissolution is only part – and the lesser part – of a whole conception of life that views bodily life as life imprisonment. The soul only lives behind the body’s bars, doomed without domicile. The other, material part of existence is part burden and part threat, sometimes only strange, but normally hostile territory.

Body Project

From the point of view of the Western industrialized world, Plotinus appears strange. It is not only our obsession with hygiene which makes us mentally step back from him. Our time’s *zeitgeist* seems to require the opposite to what the third century’s *zeitgeist* suggested. In a historically unique way, today the

body has shifted to the center of a person's and a society's life plan. In contemporary Western urban culture, churches and museums have been superseded by fitness studios. They are now the privileged places of a self-improvement doctrine which one dutifully visits even if those visits are bound up with troubles and inconveniences (Shusterman 1995, 242).

One of the main features of a contemporary lifestyle is being occupied with the body. This occupation not only generates a whole (media, beauty, and health) industry, but is also inclined to serve needs that traditional religious or secular institutions (churches and museums) increasingly fail to satisfy: needs for wholeness, beauty, salvation. All bodies, not only female bodies, are status symbols. To be young, to be beautiful, and to be fit are the goals for "good," "successful" embodiment. This represents an essentially new step towards an interpretation of the body. Bodies no longer just exist: they are good or bad, successful or unsuccessful. The body is no longer simply fate, better here, worse there; the body is a result of what I have done or what I have not done but could or should have done, a result of action. In this way the body as a whole becomes an essential moral issue. The body demands not just attention but also action. It is this action which leads to a body culture, the body culture generates a body cult, and the body cult establishes the body as a project.

This body project has one goal: perfection – specifically, a perfect design. Like every design project, the body design project is concerned with two issues: function and aesthetics. These two basic questions which determine the body design project have a clear gender component: (1) the aesthetic design problem refers, not exclusively but predominantly, to the female body; (2) the functional design problem refers, also not exclusively but predominantly, to the "neutral" body, which is in perception the "normal" and thus the male body.

The Functional Design Project: Bodies Presented as Neutral/Male

In 1956 Günther Anders talked about the "Antiquiertheit des Menschen" (antiquity of mankind) (Anders 1956). More than a half-century later he seems to be totally up to date. The human, living, fallible and mortal body proves to be highly inadequate, in need of improvement and with the chance to be improved. The biotechnological goal to diminish human suffering often is suffused with a not-so-explicit goal: human perfection, primarily seen as a body's perfection.

In transportation and communication, the body has been marginalized; in leisure culture the body is centralized: in sports, fitness, wellness, body-based therapies. When the task is important, prostheses as artificial replacements of body parts take over the body functions (Virilio 1994). These are the well-known prostheses of muscular strength, machines and vehicles; these are the prostheses of our sense organs, say microscopes or seismographs; and these are the prostheses of the brain. This prosthetics of the brain occurs when we delegate our ability to calculate and to remember to the computer. It occurs more radically when organic and artificial nerve systems are neurologically combined, in DNA-based computers or silicon brain implants.

In this extensive prosthetic effort the difference between subject and object, between those who act and their auxiliary means, is becoming more and more vague. The body, dependent upon prostheses, can imperceptibly change into a part of the prostheses.

One of the pioneers of theoretical cybernetics, Norbert Wiener, used the formula "one man – one message" (Wiener 1958). This formula is an expression of the idea that there is an "essence" of persons which is based not in the body but in independent bodiless information, stored in genetic material or simply in the brain. This equation of man and unembodied message takes on a new form in cyberspace. "There is

no matter here. Our identities have no bodies,” wrote John Perry Barlow in his *Declaration of Independence of Cyberspace* (1996). The independence of cyberspace refers especially to one fact: an independence from the unreliable and inadequate meatware. The next and highly desirable evolutionary step will be “to download the brain into the computer and thus liberate it from the weakness of human flesh” (Jastro, cited in Meier-Seethaler 2001).

Sixty years after Wiener, more than 20 years after Barlow’s declaration, the everyday handling of digital technologies enhances and replaces memory, sense of orientation, language abilities and more. With machine learning and AI technologies pervading our lives, the bodies are seen as dividable into medical data and vanish behind bloodworks, brainscans, and blood pressure values. The quantifiable proportions of human life and body are constantly reinforced. The non-quantifiable proportions lose their significance.

The distant Plotinus seems to be near. The immortal soul has changed into the spirit floating in the web, accompanied by the numbers for AI diagnostics, liberated from the inadequate, embarrassing body.

The Aesthetic Design Project: Bodies Presented as Female

The question of aesthetics has become relevant for male bodies, too. The focus, however, remains with female bodies. Beauty as an (exchange) value on the market, traditionally on the marriage market but today also on the employment market, is a historically new development in the West, dating back to the late eighteenth and the nineteenth centuries. Before the Industrial Revolution, beauty was not simply neglectable, but had a different function in a society’s communication. Beauty was an adornment, a pleasant and enchanting ornament that was added to the usual criteria for judging women, such as the ability to reproduce, the ability to work, and place in the social hierarchy which indicates the extent of the dowry. Beauty is added to these criteria but does not replace them. Such replacement always has been the fabric that novels and fairy tales are made of.

The more the public and the private sphere are divided since the eighteenth century, the more a new culture of homemaking develops with a cult of beauty. This beauty cult is supported and enforced by the new possibilities of reproducing ideal female images on daguerreotypes, ferrotypes, and photographs – and by the fact that at the end of the nineteenth century middle-class homes were equipped with mirrors. The beauty cult is based on the presupposition that there is such a thing as a universal and objective quality named beauty. For women, striving after this quality named beauty is equally a public task and a natural inclination. Beauty as currency functions when women strive to possess beauty and other people or institutions strive to possess women who possess beauty.

In consequence, the function of what Naomi Wolf (1991) calls the “beauty myth” is neither exclusively nor primarily aesthetic. The beauty myth developed together with the new achievements of middle-class women of the nineteenth and early twentieth centuries, like education, leisure, and relative freedom from material needs. The myth acts as counterpart against those potentially dangerous achievements. The endless Sisyphus-like activity of earning a living and working in the house is replaced or complemented by the endless Sisyphus-like activity of maintaining one’s beauty. Thus the energies of educated women who cannot at all or only incompletely participate in public life are successfully absorbed.

During the 1920s a new image of the female body emerged in European and Anglo-American cultures: the body became thin. At the same time, in most Western countries women were granted the right to vote. A new part of the world opened up for them. And yet a new and highly individualized prison was established: their bodies. One’s own body is not able to achieve the normative standards that become ever more strict.

The numbers during puberty are alarming: at age 13, 53 percent of the girls are unhappy with their body; at age 17, 78 percent. A 1984 survey of 33,000 women says that 45 percent of the women between 18 and 35 who were underweight thought of themselves as too fat. A majority of the women said they would prefer to loose 10 or 15 pounds rather than have success at work or satisfaction in love (Wolf 1991, 185–186). These numbers have not declined. On the contrary. A 2011 survey of women undergraduates in Great Britain found that 16 percent of young women queried said they'd trade a year of life for their ideal body weight and shape. Ten percent were willing to trade two to five years, and 2 percent were willing to trade up to 10 years of life away. One percent said they would give up 21 years or more (Pappas 2011).

What does “aesthetic” mean in the current body project? Female fat, for a good part of human history a sign and symbol of female eroticism and female sexuality, has become in the industrialized countries a question of morality. Female fat is associated with dirt. The struggle for purity used to take place in the home and in the soul; now it takes place in the body. The body becomes a privileged place for feelings of guilt. As the quest for genital chastity has become weaker, this quest has shifted in a regressive way from the genitals to the oral area. “I’m a girl who just can’t say no,” says a model in a commercial for a low calorie dessert. Salvation is asked for – and salvation is promised by two of the large women-oriented growing businesses: dietary products and cosmetics. To achieve salvation, quasi-religious rites have to be performed with and on the body. A diet cycle imitates the Christian Easter cycle – or other religious rites of renunciation – with acts of critical self-reflection, self-flagellation, penance, and liberation. The cosmetic industry playfully uses associations of victories over mortality and damnation, promising rebirth and eternity. One of the presuppositions is the ritual anointment with oils whose actual ingredients cost 10 percent of the actual price (Wolf 1991, 107–121). The superfluous value that suggests a certain holiness of those products is a question of belief; overall, the products seem to be new editions of letters of indulgence because in both cases, guilt is settled with money.

Plotinus, and with him some of the early Christian theologians, could not feel more strange than in our department stores’ cosmetic departments or with the rapidly growing amount of beauty videos on the Internet. And yet there seems to be a subliminal relationship. The aesthetic design project of the body claims, not unlike Plotinus, that the body itself is bad. But it doesn’t help anymore to neglect it; instead, it has to be severely disciplined and tortured, with the slim hope that the results might be deemed “good.” The functional design project of the body claims, not unlike Plotinus, that the body in itself is inadequate and useless. Its functions have to be enhanced – or the body, as mortal substance, has to be replaced.

In these ongoing efforts to perfect the body, however, the body cult becomes ambivalent. The body cult whose god is the body that you worship and to whom you sacrifice easily shifts into body contempt or body hate because the body will never succeed in maintaining the standards of a normative aesthetic and, being fallible and mortal, never will achieve the desired standards of functionality. Thus the body cult finally declares the body a handicap.

Uncertainties: Non-Normative Bodies

The binary and heteronormative view on the body is inadequate. People are falling outside the categories of male/female, and they are falling outside normality. This normality constructs the need for consistency: how the body and its genitals look must match the way I define myself and match the person I desire: this person needs to have sex organs that are different from mine. Body, identity and desire are seen as stable throughout a lifespan.

This simple form of imagining and dictating the “right” body, the “right” identity, the “right” sexual orientation and their lifelong stability produces similar metaphors as Origen used. Origen saw the body as prison of the soul. Rikie Wilchins, transgender theorist and activist, talks about cages: “(1) there are only two cages; (2) everyone must be in a cage; (3) there is no mid-ground; (4) no one can change; (5) no one chooses their cage” (Wilchins 1997, 56). The gendered body needs to fit into these cages. And this proves to be destructive.

The widespread Christian view of the divine creation thus can be described like this: *If men won't be men and women won't be women, it would mean that God has made mistakes. As God does not make mistakes, all this does not exist.*

Non-normative bodies thus become blasphemous in themselves. In this view, they are not only a handicap, but a sin.

The Christian Body: Despised and Healed

Visible behind all the worship and all the sacrifices which shape the actual body cult is a profound contempt of the body that allows comparisons to religious traditions and their disciplinary practices. Here we will explore strands in Western Christianity. Emerging in late antiquity, there was a primal fear of the human drives; in those human drives sin itself is incorporated. The visible, touchable, and understandable locus of this struggle with sin is the body. The means and possibilities to act against that sin are based in the body.

Fasting, self-flagellation, practices of mortification, all with a history, are aimed against the individual body and its willful desires. The struggle, however, is not only a struggle *against* something but also a struggle *for* something; namely, the life of the soul. Thus, one level of Christian tradition produces a decided contempt and repression of the body. In order to achieve a higher good, the victory over the body has to be won, in every case a moral sort of victory.

Most post-religious societies know body practices that show a strange similarity to Western practices in Christian tradition, frequently repressing and despising the body. Fasting has become part of an industry and a way of living; certain forms of self-torture are called “exercise” or “fitness.” In modern secular societies this structure leads to a circular argumentation. The battle against the body in order to achieve some sort of a higher good is no longer a battle in favor of the soul, but a battle in favor of the body – in favor of the new and perfect body. This new and perfect body bears expectations for salvation that formerly belonged to the soul. The postmodern secular body cult seemingly views the fallible, aging, and coveting body as an object of loathing and rejection, as enemy. The body must be controlled, tamed, toned, and upgraded in order to become a new, quasi-reincarnated body. The struggle against the body in favor of the body is a never ending one, a never ending story of remorse, penance, and new beginnings based on a far away utopia of a better and finally good life.

This Christian tradition that perceives the body as a soul's dungeon is not the only Christian tradition we have, nor is every form of asceticism to be perceived as repressing or despising the body. It is time to reconsider the strong connection between asceticism and pleasure. The question is why the structure of a body-repressing tradition has emerged in the postmodern culture – and not other, equally or more important structures.

Living in a culture that has established a body cult and within that body cult a view of the body as handicap, we might be able to read biblical texts in a new way. Only on a second reading do we discover

how deeply concerned the biblical texts are with the integrity and the well-being of bodies. For instance, 31 percent of the text of the gospel of Matthew (209 out of 660 verses) speaks of miracles and those miracle stories are mostly healing stories. Our modern Western difficulties with healing stories as miracles often overshadow the picture that seems to be central for the texts themselves: Jesus healing people.

Jesus' healings take place amid a culture where such healings and such healers are common. The healings achieve their specific meaning as they combine apocalyptic thinking and miracle charisma, the apocalyptic expectation of future salvation and this salvation's episodic realization (Theißen 1974, 276). "If I cast out devils by the Spirit of God [Lk.: with the finger of God], then the Kingdom of God is come unto you" (Mt. 12:8; Lk. 11:20). This logion is in historical critical research widely considered as authentic (Bultmann 1964, 174). More interesting, however, are its rhetorical implications: the logion provides the reader with an interpretation of the act by the actor. Deciphering this hermeneutical "code," it becomes obvious that the connection between healing and the Kingdom of God, healing and salvation, is a direct and a necessary one. Healings are the manifestations of God's kingdom which has begun now and which is revealed in who Jesus is and in what he does.

The *context* which makes the *text* of Jesus' healings understandable is an eschatological context. And inversely this eschatological *context* is specified, stamped, and concretized by the *text* of the healings. Healings and the salutariness which they provide are the concrete and body-based aspect of the promised salvation. That there is a concrete and body-based aspect of salvation at all might be no surprise for those whose faith is rooted in an Exodus tradition; for a Christian tradition colored in large part by an anthropological dualism, it is surprising news until today, immediately evident maybe only for those who are – then and today – blind and bent, lame and leprous, deaf, sick, bleeding, and possessed with demons.

This shows a characteristic feature of the healings' text: healings are not forced or violent acts, but a specific answer to a specific question. They do not create faith, but they presuppose faith. Already in the New Testament we discover a tendency to split *text* and *context*, healing and teaching and therefore healing and salvation. If we look at the healings no longer as the apocalyptic restoration of the creation in and for persons, but primarily as miracles, the hermeneutical point and the possible understanding are changing. The Kingdom of God, as the *context* for the teaching, loses its body-based aspect and its bodily roots and tends to present itself in an abstract way. The *texts* function as proof and legitimation and tend to be functionalized beyond men and women's bodies.

Body Ethics

On this background and in this horizon of meaning the question about body and ethics reappears in a new way. On different levels this is a central question, far beyond in Western societies there is a precarious social and cultural development. We experience the functional deficiency and the resulting marginalization of the body in many fields of everyday life, while at the same time the body cult strives for perfection. This is – in theory and practice – a fragile construction: the search for perfection can easily end in destruction. Massive somatic and psychosomatic disorders result from an almost epidemic discontent with the body. On another level compassion with another's fallible and mortal bodily life can easily – by means of politics, research or simple, social pressure – be outdated

and replaced by a despising moral reproach: You – or your parents – could have known and done better; nobody to blame but yourself.

In this situation ethical reflection is confronted with unsolved questions which ask for reflection, critique, and projection of new images of embodied human life. At the metaethical level we discover that the body always was central in moral praxis and ethical reflection. The central ethical questions are the questions of what stimulates life and what destroys life. If this central status of the body in ethical reflection is recognized we regain basic ethical categories which are bodily categories: birth – pleasure – pain – death. These coordinates of embodied human life are not only phenomenological but also ethical categories. They are ethical categories insofar as they increasingly become the focus of individual and social action with an increasingly louder question: Do we need those categories to describe human life or could it be nicer, more convenient, more promising, if humankind would succeed in severely controlling and finally abolishing them? Birth, pleasure, pain and death are ethical categories because they reveal something about us; they “talk” about the locus where humankind has to decide what is human, and they “talk” about the price human societies and human individuals would have to pay in denying them.

The urgent actual ethical questions are in a vast part connected with and related to the body. This is true not only for problems of sexuality, the beginning and ending of life, and all bioethical questions, but also beyond these, questions about work, technologies, and communication, and the question of justice and distribution.

Within a situation where the cause of insecurity and profound unhappiness is – in Western contexts – increasingly seldom moral repression and quite often moral arbitrariness or relativism – relativism that can present itself as cultural sensibility – we have the chance to preserve ethical universalism without denying the postmodern context if we take recourse to bodily ethical categories. Moral responsibility is no longer bound to the question: “Do you look how I think you should? Do you function how I assume?” And not even to the question: “Do you believe and desire what I believe and desire?” The crucial question to take regarding moral responsibility would be: “Are you suffering?” (Rorty 1989, 198).

What is the Ethical Task?

Ethical reflection on the body and bodily life is an exercise in ambivalence. One cannot outrun the ambivalence because it permeates personal experience, social analysis, moral and theological reflection, a tradition's past and present. Thus the exercise in ambivalence can't be an exercise against ambivalence; it is rather an exercise in giving meaning to ambivalence and therefore being able to live with ambivalence.

The Christian tradition provides us with a strong guiding idea. Christianity's basic truth, its essence, is incarnation. God becomes man – or, more precisely, God becomes flesh. Only when one removes the haze, the aestheticizing filter from centuries of theological and liturgical speech about this word can one rediscover that it is an offensive, even shocking word. First of all, it was said during a time when the surrounding cultures emphasized the spirit, immateriality. During Jesus' time, “salvation” would have been expected to overcome the world, the body, the material. Salvation was to be experienced in overcoming everything worldly. Secondly, the word is drastic. The center of the gospel tells us not – like some later theologians – that God puts on a body and takes it off again like some piece of useful but discardable clothing. God does not put on a bodily cover in order to temporarily meet humankind in a human way.

God becomes flesh. The occidental Christian suspicion and mistrust toward the body seem to be the huge and tragic misunderstanding in Christianity.

This is especially true for non-normative bodies and non-binary gender. Non-normative bodies and non-binary gender are presented as the crisis that destroy the God-given order of creation. We could however, recognize the colorful diversity of creation, that is breathtakingly beautiful. We could realize that there is no need to fear that non-normative bodies destroy God's creation. The adequate question would be: Why is it so unsettling for us that God does not adhere to man-made laws?

Today, the ethical task is to outline new images of gendered bodies that include non-normative bodies, images which are alive, not machine-like and not eternal, not hurt, not damaged, not disabled by aesthetic or functional myths, but healed. If we realize the actual body cult's theological background it would no longer be necessary to stylize fitness studios as new churches of self-improvement, to reactivate the questions of sin, repentance, atonement, and resurrection using diet recipes and beauty myths. In theological terms, salvation would not take place beyond our heads and not beyond our bodies. The old and new shame of being in the body could gradually give way, despite and because of our mortality, to the pleasure of being in the body.

CHAPTER 109

Aesthetic Experience

Frank Burch Brown

Aesthetics and Experience

Aesthetic experience, while not restricted to a particular time or place, was first identified as such in the eighteenth century by the German philosopher Alexander Baumgarten. Coining the term “aesthetic” on the basis of the Greek adjective *aisthetikos* (meaning “perceptible”), he defined aesthetics as inquiry into knowledge that is conveyed perceptibly through the senses and feeling rather than through abstract concepts. The idea of aesthetic experience was refined and extended by Immanuel Kant and others (including, to a lesser extent, Baumgarten himself) to cover judgments of taste, experiences of the beautiful and the sublime, and matters of poetics, fine art, and imagination. Although aesthetics as a concept is modern and European in origin, it has antecedents in classical antiquity and has parallels outside the West – most notably in Indian *rasa* theory, which concerns the essential “juice” or “taste” of aesthetic experience in different modes. The question of how aesthetics relates to ethics, experientially and theoretically, can best be introduced by looking at several instances in which moral convictions and aesthetic judgments conflict or possibly converge.

Aesthetics and Ethics in Action: Case Studies of Conflict or Convergence

In 1565, the year after Michelangelo died, one of his best known paintings was altered. In the *Last Judgment* (Sistine Chapel, 1534–1541), the most controversial of the many nude figures were touched up and given what were humorously called “breeches.” That flagrant “desecration” (some would say) of the art and of the artist’s aims was an outgrowth of the Council of Trent’s recent condemnation of nudity in religious art. Even in Michelangelo’s lifetime, certain voices had been raised against what was judged to be the impropriety and immorality of exposing the saints (and Christ) in this very large and highly visible fresco, and in the very chapel of the Pope.

The painting’s so-called glorious restoration between 1980 and 1994 made no attempt to undo much of that cover-up – a decision due at least in part to technical difficulties. Still, one might ask: on the one hand, what would have been gained by a full restoration of those specific details, assuming that most people today no longer have such moral squeamishness about the body? Was there some overarching moral and artistic purpose served by how much Michelangelo had chosen to reveal, originally, in that vision of the Last Judgment? On the other hand: could there be some merit to misgivings, either then or

possibly now, regarding how the body is displayed in certain religious art – or, indeed, in other art? Finally: In such a work, can the artistic purpose be separated from the religious and the moral? This is ultimately a painting about divine judgment and the human condition stripped of everything inessential, after all. It is a work that seems to call for religious ethics to engage in aesthetics.

In a modern context, unlike that of the Counter-Reformation, there is normally a strong tendency to shield aesthetic expression from ethical criticism, although a church setting invites special considerations. The importance of respecting the relative autonomy of art and its aesthetic appraisal plays an especially prominent role in the world of so-called high art. At a Sotheby's auction in 2018, an abstract painting by Pablo Picasso depicting his mistress wearing a beret and robe was sold for almost \$70 million. Hailed by a knowledgeable art collector as “fantastic,” that 1937 painting bore the title *Femme au Béret et à la Robe Quadrillée (Marie-Thérèse Walter)* [Woman in a beret and checked dress]. It happens that the woman named in the title, whose capped head and robed shoulders are represented in the painting, had been intimately involved with Picasso for the previous decade (from the time she was seventeen, though mostly in secret). In 1935, Marie-Thérèse, who remained unwed, had become the mother of the first of Picasso's two daughters, Maya. During the pregnancy, Picasso had finally left his wife Olga Khokhlova for her. Then, in 1937, the same year in which Picasso painted Marie-Thérèse with a beret, Picasso produced another visually striking painting, *The Weeping Woman* (one of a series). The model for that painting was a different woman – Dora Maar – who in the previous year had begun supplanting Marie-Thérèse as Picasso's muse and lover. Evidently the moral quandaries at work in these paintings, or behind them, did not, for the respective buyer and gallery representative, undermine either their aesthetic value or their value as investments.

Even so, tastes can change, along with factors influencing aesthetic judgement. Over the years, in the light of probing biography and critical scrutiny, the aesthetic appreciation of Picasso's art has tended to be affected negatively by heightened perceptions of elements of cruelty and misogyny not only in Picasso's personal behavior but also in many of his depictions (however abstract) of women. This shift away from formalist criteria that had been so prominent in high modern criticism reflects the increasingly prevalent contemporary view that ethics and aesthetics, while indeed separable at times and in principle, are not always – and seldom totally – separable in experience (Gaut 2013). A similar shift toward bringing ethical issues together with aesthetic or artistic ones can be seen in recent social and “ideology” critique, which strives to expose dubious biases (often patriarchal at core) in artistic and literary representations of gender, class, race, and ethnicity.

None of this is to imply that moral considerations can only be negative or can only detract from the enjoyment of art. Picasso's celebrated painting *Guernica* (likewise created in 1937, in a process documented in detail in the photography of Dora Maar) is widely regarded as among the greatest artworks of the twentieth century. And that is partly because it is also recognized, simultaneously, as a powerful moral protest against war – and, indeed, an outcry against a particular war with many innocent victims.

Such considerations, taken together, are interpreted by some theorists to mean that aesthetic experience cannot be contained by a frame neatly separating the aesthetic from everything else (Derrida 1987). Indeed, it has been argued that aesthetic experience is best understood as existing on a continuum. At one pole, aesthetic experience is appreciated simply in itself, as purely formal design. At the other pole, and to some extent in between, aesthetic experience is wed to vital considerations of morality and perhaps of religion as well. When combined, the ethical and the aesthetic potentially involve mutual transformation (Brown 1989).

With such issues and views having been identified, a sketch of historical and recent developments in both aesthetic theories and artistic practices will further explore how aesthetics and ethics, while having a considerable degree of autonomy, do often touch or even converge. It will also indicate why sorting out these issues is no simple matter. The final aspect of the discussion, examining key concepts in aesthetics, will take into consideration not only art but also nature.

Aesthetics in Relation to Ethics: Modern Themes and Developments

Aesthetic experience relates to ethics in often subtle ways. The contours of this relationship, however varied, can be seen in certain key developments in aesthetic theory and criticism in the West, and in the arts associated with those ideas.

Many of the most pertinent issues surface in the influential philosophical theories of Immanuel Kant ([1790] 1951), who argued that beauty in its purest form (free beauty as distinct from dependent beauty) is “purposive” but without any purpose outside itself. For Kant, the judgment of beauty, strictly speaking, has to do not with the object itself but with the way an object is pleasing. Since something we call beautiful is pleasing simply in being contemplated, the judgment of pure beauty is an exercise in taste that does not entail questions of what is morally good or what, conceptually, is understood to be true. The pleasure taken in beauty is “disinterested” in the sense that it is not motivated by utilitarian interests nor by sensuous gratifications – unlike the taste for food, for example, which Kant considers something “agreeable.”

The creation of beauty, which requires imagination and genius, is not susceptible to rational dictates and preexisting rules. Nor, in Kant’s view, is any particular judgment itself based on communal opinion or response, even though the intersubjective and (in principle) universal validity of judgments of taste promotes social communication and testifies to a *sensus communis*, or “shared sense.”

It is significant that, in Kant’s eyes, the beautiful, experienced in a “free play” of our cognitive faculties – yet beyond the compass of concepts and cognition as such – is nevertheless connected indirectly with morality. Ideal beauty can be regarded as a symbol of the morally good, which is an end in itself in the fullest sense. Furthermore, Kant claims that the enjoyment of “aesthetic ideas” develops habits that are good for morality even though aesthetics is morally engaged only when it is a response to the kind of beauty he calls “dependent beauty,” within which Kant includes experiences of the sublime.

Extending and modifying Kant’s ideas, the subsequent German aesthetic tradition, influential also in England and even in the United States, tended to ascribe genuine cognitive value to the arts – but as insight conveyed through symbols rather than in abstract ideas. The Romantic artists and poets elevated imaginative expression and artistic genius, as well as the experience of the sublime. Moreover, the Romantics favored organic or even fragmentary beauty, in contrast to classical norms of balance and symmetry and ideals of mathematical order. That love of wildness often accompanied a freer interpretation of morality as well. Even so, the Romantics generally had a high view of the importance of art to society, as when the poet Shelley declared that poets (artistic creators) are the unacknowledged legislators of the world.

During the Victorian era – which drew on the legacy of Romanticism – the English poet and literary and social critic Matthew Arnold would even go so far as to look to culture and literature to save us at a time when religious dogma was becoming, in his eyes, increasingly untenable. Arnold, in looking to the “sweetness and light” of the intellect and beauty found of culture at its best, had ethical intentions

behind his aesthetics. Similarly, the art critic John Ruskin, in his most influential phase, combined ideals of morality with religious feelings in promoting the virtues of Gothic revival architecture and in expounding the seven lamps of architecture as essentially moral.

The idea that art has lofty ethical ambitions was greatly modified or even abandoned, however, by the movement known as art-for-art's sake and by other "decadent" art of the late nineteenth century. During the heyday of high modernism and of formalist theories prevalent through the middle of the twentieth century, the import of art for life was treated as, at most, oblique. Expressive form came to matter more than beauty. The expressionist, surrealist, and abstract impulses in avant-garde art movements of the twentieth century broke free of both social and artistic conventions, as did much of the more experimental music and fiction. And in their own way, the grittier realist movements in modern fiction and art challenged bourgeois taste and morality with their daringly down-to-earth styles and confrontations with the ugliness of life.

Despite occasional utopian visions, confidence in the socially redemptive powers of art was further undermined by the pressures of two devastating World Wars and by genocides on a scale historically unprecedented. Existentialism, among other trends, turned intensively toward the inner life and freedom of the individual as the source of meaning in an otherwise absurd world.

Exactly how art matters was something of a puzzle posed increasingly, if often unintentionally, by the high art of the twentieth century. Although open to a wide range of expression, high art and its institutions not only lost touch with popular culture but became increasingly disengaged, isolated, and often elitist, even in formerly popular forms such as jazz or the novel. At the same time, however, many leading artists – such as Wassily Kandinsky and, later, Mark Rothko in the visual arts, or Arnold Schoenberg in music – could still revere art, paradoxically, as a vital spiritual refuge or as revelatory of what cannot otherwise be expressed, though estranged from traditional religion.

In subsequent developments, postmodern theory and art, displaying audacious eclecticism and pluralism, gradually erased any clear distinction between high culture and popular culture while treating the very distinction between aesthetic and non-aesthetic as unstable and misleading. Postmodernism sees truth and aesthetic judgment in terms of social and political construction rather than in terms of revelatory imagination. When ironic and detached, it has often favored aesthetic surface over depth of meaning. Yet postmodern conscience at its most engaged has aimed to unmask oppressive ideologies such as those embedded in canonical classics of art and literature, exposing unexamined biases of class and gender, and of race and ethnicity, as well as the self-serving powers and privileges of residual colonialism. At a more popular level, an ethical dimension of artistry today is evident in the widespread use of rap music for social and political protests around the world, as well as in the proliferation of new social media employing photographic imagery and imaginative "memes" and "tweets" to target "fake news" or, indeed, fake politicians.

It can come as a surprise, in the midst of all this, that there has also been something of a turn toward "re-enchantment" (Kosky 2013; Taylor 2012). One can see the re-imagination of spirituality in contemplative modes. A virtually luminous quiet, for instance, pervades the "holy minimalism" of the music of Arvo Pärt (influenced by Eastern Orthodoxy) or visualized in the long, meditative photographic sequences in the movies of Terrence Malick – such as *The Tree of Life* (2011) – with their close attentiveness to the earth and to the creatures living in and from it. Across the globe, moreover, new-style pilgrims and tourists, sometimes restoring ancient rituals, explore sacred environments meant to attune lives to higher values, not least when those places are felt to be precarious and under threat. It could

even be said that a sense of wonder and sometimes quizzical curiosity pervades the photography and the often hushed but astonished narrative of David Attenborough in his video series for the BBC best known for the many episodes of *Planet Earth* (2006) and *The Blue Planet* (2001). Here again, aesthetics, ethics, and spirituality merge.

Such examples suggest that in the twenty-first century, aesthetic experience and creation may not only help make for new worlds of possibility, and make new worlds possible, but also may enter newly, and more widely, into the enterprise of human flourishing. That may be connected now not only to the sense of human community that Kant associated with a sense of beauty but also – if given time – to a more diverse sense of the ecology of life and world. In the process, the cultivation of ethics may be joined freshly to aesthetic creativity, allowing not only for new kinds of discernment into moral principles and responsible applications but also the release of freely responsive imaginations.

The Ethics of Aesthetics and the Aesthetics of Ethics

The preceding review of certain key moments in the development of aesthetics and arts in theory and practice should make it plain that aesthetic experience, like aesthetic theory, is multifaceted and comes in different forms. Some of those are more integrally related to ethical theory and moral practice than others.

To bring into clearer focus particular ways in which aesthetic experience can be related to ethics, this final section examines a cluster of aesthetic concepts: beauty, sublimity, expression, and imagination. Reflection on these features of aesthetic experience in art and nature will also call attention to aesthetic features of ethics itself.

Beauty

The experience of beauty has often been regarded as the epitome of aesthetic experience, if not identical to it. Traditionally, the form of beauty exhibits order, proportion, symmetry, and the integral relation of parts to the whole, the total effect of which is characterized by radiance. In what has been called the “great tradition” of aesthetics, beauty takes an important place as one of the “transcendentals,” along with goodness and truth (with unity sometimes included). In traditional theological terms, going back to Neoplatonic and medieval thought but resurrected most notably in our day by the Catholic theologian Hans Urs von Balthasar (1905–1988), the transcendentals are united in the being of God, in whose unity they are said to be mutually convertible. Central to what gives pleasure in the perception of beauty is the harmony of diverse parts with the whole. From the time of the ancient Greeks, the beauty of the cosmos itself, which is also expressed mathematically and in musical harmony, became paradigmatic of the highest beauty discernible to human beings.

Where art and morality fit in with this picture of beauty is more problematical, even from the start. In the *Symposium*, Plato traces a “ladder of love” from physical beauty upward, culminating in a vision of the idea or form of beauty (regarded as quasi-divine). But Plato does not see art as functioning in the same beautifully uplifting way. Instead, most notably in the *Republic*, Plato criticizes various kinds of art and poetry for excessive emotion and for reliance on fanciful fictions as well as on the physical senses, all of which Plato sees as untrustworthy. He treats those kinds of *mimesis* (or

imitation) as morally inferior compared with the higher beauty apprehended through the intellect. Whereas Plato is devoted to beauty, he is not devoted to art (despite his own artful Dialogues). And that legacy supplies a recurrent theme in aesthetics.

The “great tradition” of beauty was perpetuated in the Neoplatonic thought, especially Plotinus, on through the thought of Augustine, then revived with medieval thinkers such as Aquinas, continuing on through the Renaissance. While modified, it even survives in the eighteenth century, when the American Calvinist theologian Jonathan Edwards (1703–1758) created a theological and ethical variation on the theme. For him, artistic beauty is secondary, as is the harmony, proportion, and fitness of creation. Primary beauty, for Edwards, consists in a “consent” to being: an unbounded benevolence of a generous heart disposed to the good as found in all things, but above all in God’s supreme beauty, which is simultaneously the highest good.

Later in the same century, Kant wrote his famous three critiques – *The Critique of Pure Reason* (1781, 1787/2011), *The Critique of Practical Reason* (1788), and *The Critique of Judgment* (1790), which included much of his aesthetics. Again, the structure of those critiques bore a discernible resemblance to the venerable triad of the true, the good, and the beautiful. In Kant, however, those were treated as autonomous spheres, though related indirectly. Even so, by regarding the judgment of beauty as conducive to habits that are good for the moral life, Kant came close to David Hume at the point at which that British philosopher treated the sense of beauty and the moral sense as analogous – although Hume gave a more integral role to the communal aspect of taste itself.

The afterglow of the “great tradition” lingered in the Romantic period, such as when Keats, in his “Ode on a Grecian Urn,” concludes with the famous declaration that “Beauty is truth, truth beauty.” And in our day, despite a period of decline following Romanticism, a resurgence of beauty in relation to goodness is evident, for instance, in Elaine Scarry’s influential book *Beauty and Being Just*, in which she sees a symmetry between beauty and justice, and argues, in fact, that beauty assists us in our attention to justice (Scarry 1999). Significantly, the theologian John W. de Gruchy likewise presents what amounts to an extensive new reply to Plato by linking the arts – partly in the specific context of South Africa – to the struggle for justice and to what he calls redemptive beauty (de Gruchy 2001). At the same time, feminist thinkers scrutinize criteria, varieties, and ideals of beauty, not least with regard to physical beauty and the social and cultural determinations of beauty in a global context (Brand 2013).

With the understanding that ethics in the classical sense is a matter of seeking what is good for the flourishing of life, and not only following moral principles and rules or divine commands, various thinkers have argued for the high ethical value of aesthetic experience in which beauty is enjoyed as an intrinsic good in itself, and as inherently good for life. The ethical import of beauty as a value in itself is implied in abundant appeals to preserve wild creatures and natural wonders partly because of their beauty and not only for their possible ecological utility (Brady 2003; Kemal and Gaskell 1993). That, in turn, suggests taking seriously the recent claim that even the animal world is motivated by attraction to intrinsic beauty (Prum 2017). Frank Wilczek, a Noble laureate scientist, has gone farther, arguing for the view that the universe itself embodies beautiful and elegant forms – a deeper order of beauty that is nevertheless at the heart of what we ourselves seek, and what we find pleasing and inspiring. Wilczek identifies that deep beauty, from which our own flourishing in some way proceeds, as being in accord not only with the ancient Greek idea of the music of the spheres but also with a spiritual cosmology (Wilczek 2015).

Sublimity

It is widely agreed that not all art is beautiful, nor is everything in the natural world. There are other aesthetic values, moreover, including the grotesque. But because beauty is still the most encompassing concept in aesthetics, the remaining aesthetic concepts discussed here can be treated succinctly.

The major aesthetic concept that goes beyond the bounds of the beautiful is the “sublime.” The word “sublime” (whether noun or adjective) connotes awe, and possibly an exhilarating feeling (though also uncomfortable) of being overwhelmed by a powerful force such as being caught up in a storm. Or it can apply to the unimaginable and infinite extent of something, such as galaxies or the sea. Kant described the latter form of the sublime as mathematical, and the former as dynamical. But, in a characteristic move, Kant says that, even when our imagination is overwhelmed by what seems endless, our reason reassures us in being capable of conceiving of the very idea of something veritably infinite. In doing so, our reason rises to a “supersensible” level superior to the numerical immensity that overwhelms the imagination. Again, in experiencing the dynamical sublime, in which we confront potentially fearful powers beyond our control, we have the capacity to recognize that our worth as human beings is invulnerable in the face of volcanoes or hurricanes. That allows us to overcome the revulsion posed by the physical threat. Thus, according to Kant, we realize our superiority to nature.

Although Kant refrained from applying the idea of the sublime to art, other thinkers – Hegel for example – did so. In postmodern thought, however, beginning with Jacques Derrida, the sublime marks something else: that which is beyond the unending effort to contain the uncontainable, or to delimit the unlimited, by means of reason or conceptual boundaries that are always arbitrary and constructed (Derrida 1987). Postmodern thinkers would say, in contrast to Kant, that the sublime unsettles reason and decenters our transcendent sense of moral superiority because the sublime is not, after all, anything that reason can even conceive of as a definite idea. To believe in such encompassing powers of reason or moral invulnerability, as Kant would have us do, is illusory and makes for false comfort.

Some other thinkers in our time would argue, nevertheless, that this kind of postmodern sublime verges on nihilism and misses something important about the experience of the sublime in other ways – something expansive and edifying. That contrasting present-day sense of the sublime, which precedents in the Romantic era, experiences art and nature as something mysterious and beckoning, and celebrates wildness and wilderness as affirming transhuman values. That experience can be exhilarating not because it reinstates our existing sense of worth (as in Kant) but because it expands the sense of who we are and who we can become, as well as our sense of others and the world – possibly even of God, whether or not one says, as some would, that the beauty of the divine absorbs the sublime (Hart 2003). This decentering but awakening sense of the sublime can be conducive to care for the earth and to humility or reverence in the face of what, in some circumstances, can be imbued with an aura of the holy.

Expression

For much of the modern era, aesthetic expression displaced beauty – and sublimity as well – as central to the goal and activity of artistry. In being expressive, art can sometimes aim at experiences and possibilities that are not balanced and symmetrical and whole, but agitated and painful and fragmentary – and elusive of serenely well-wrought language and craft. Tragic literature and drama, for example, can be experienced as

expressive of something more sublime than beautiful, and at times more disturbing than sublime – regardless of the cathartic effect Aristotle attributed to tragedy. And when in modern times the tragic dissolves into the grotesque and ugly in art, but nonetheless seems all the more authentic and true of ordinary life, a persuasive way of describing the creativity of that kind of artistry is to call it expressive. At an extreme, Tolstoy essentially equated good art with sincerity of the artist's expression, the “fruit” of the life that the artist had lived. And art that is good in that way, according to Tolstoy, is also morally good (Tolstoy [1896] 1960).

The ethics of artistic expression is not necessarily about the self-expression of the artist, however, which is never fully available to the audience in any case. In more recent times, it is attentive, instead, to the expressive power inherent in the form and qualities of the artwork itself. The ethical component of artistic expression is closely related to the art's capacity to express an array of emotions, whether pleasing or disturbing (Gaut 2007). For some philosophers – most notably John Dewey – the experience of art and the experience of life itself are closely connected, with the major difference being that artistic expression is disengaged from the immediate concerns of life. Even so, art shapes experience in such a way as to provide *an* experience of a special kind: integrated, emotional, and “consummate.” As such the medium of art becomes a special means of communication – although distinct from moral instruction (Dewey 1934).

Thinkers active more recently have again attended to the philosophical significance of the “felt” qualities and communally expressive bonds characteristic of the arts: of music and literature – and movies – in particular. Thinking in terms of ethics, Martha Nussbaum has emphasized the intelligence of emotions (Nussbaum 2001). Accordingly, she examines works of literature as vital to attaining a normative sense of historical experience and of life (1995). In that respect, Nussbaum follows the example of the critic Wayne Booth (1988), who looks to narrative fiction to cultivate insight into the qualities and character of human relationship. This line of thought points toward a growing realization that narrative form and artistic metaphor are not merely a base on which to build abstract principles, but also play a significant part in reflection itself at its most nuanced, sophisticated, and life-changing.

Imagination

Like expression, what we have come to call imagination is not confined to aesthetics. It constitutes a large and complex topic in itself. Having already treated elements of imagination under other rubrics, what needs to be unscored in the present context is something already hinted at – that is, the awareness that ethical vision and moral deliberation require not only basic principles or commands, but also creative imagination and artistry. Imagination, although potentially destructive, can be exercised constructively not only in the form of what we call the arts, but also in the acts of observing, savoring, empathizing, and deciding – all of which require attunement to “felt” qualities of life and to particulars in their uniqueness as well as in their variety and multiplicity. These functions of imaginative literature help explain why a philosopher such as Alasdair MacIntyre turns to the novels of Jane Austen when exploring a complex emotion and social force such as “regulated hatred,” and when he declares that Austen provides the “last great effective imaginative voice” of the virtues and vices he is wanting to identify (MacIntyre 1981, 240).

The upshot of much recent thought is that acute imaginative awareness transcends generalities and makes a vital difference for envisioning and even enacting love and justice in particular ways. Appropriate compassion and judicious empathy are potentially enlivened through imaginative art. And that is so despite the sobering reminder from George Steiner that those who committed the greatest atrocities in

German concentration camps were ones who read Goethe or Rilke in the evening, or played Bach and Schubert. Even so, many of the critics already cited would argue that virtues and moral habits are exercised and developed in the arts and in aesthetic appreciation and criticism, even when free of explicit moral designs. Aesthetic judgment thus enters, at least indirectly, into what Francis Hutchinson and others of a former era would have called our “moral sentiments.” Dewey, as a pragmatist, arrived at this by insisting that the moral value of art is closely connected to its capacity to express and envision new possibilities, although only hypothetically – a claim later advanced in other ways by Richard Rorty.

This is not to say that creative imagination has no limits or risks. Some things elude the powers of narrative and metaphor. Following the Holocaust, many argued that art had no available response beyond silence. And yet there came the poems of Paul Celan, for example, and the stories of Elie Wiesel and others, which formed a kind of testimony, along with the art of Holocaust memorials. Accordingly, Richard Kearney represents an important line of thought when he argues that there can be a postmodern imagination, in the wake of catastrophic loss – a poetics that is somehow responsive to the critical dimension of things, even things abysmal (Kearney 1994).

Not everything real can be imagined. Nor is everything imaginable now that may someday be envisioned. But, in religious and ethical terms, one could say that the life of justice, love, hope – even of faith – revives now and survives into the future in the creation and discovery of what can be glimpsed, or held only briefly, in imaginative forms.

CHAPTER 110

Children

Bonnie J. Miller-McLemore

All cultures and religious traditions distinguish children from adults, even though societies differ over the parameters of childhood and the chief moral characteristics and obligations. Children are distinct from adults because they are fresh, new, and small; less developed; more dependent and vulnerable; uniquely open to imagination and manipulation; greatly amenable to learning; sensitive to the transcendent; wise in ways that adults often lose with age; and sometimes harmed by adult action and inaction (Miller-McLemore 2003, 2017). Many of these traits create unique ethical issues for children and adults.

At the same time, it is important to note that children are no more a “moral issue” than adults, even though they present singular challenges and gifts to moral thought and religious communities. Ethicists should be cautious about bracketing them as a separate topic, as research in childhood studies suggests. Theoretically at least, almost every encyclopedia entry in this volume should consider children as active agents and subjects, not just this entry. Children comprise a third of the global population – a striking statistic that underscores the necessity of counting them. Even though children are not often on the minds of adult scholars, they are regular and important participants in religious communities and contemporary society.

Children merit a special entry, nonetheless, precisely because prominent scholarship in religious ethics often ignores them (Wall 2010). Greater inclusion of children has the capacity to reorient the study of religious ethics in fresh and even dramatic ways. Moreover, a great deal can be learned about the core beliefs and practices of religious traditions by asking how they regard children and childhood (Browning and Miller-McLemore 2009; Browning and Bunge 2009). Secular society itself would benefit from greater understanding of the inescapable role of religion in children’s lives.

Social Context: Children’s Ambiguous Status

An entry on children might not have appeared at all in the mid-twentieth century in an encyclopedia on religious ethics. Children appear more regularly in premodern religious texts and scholarship than in modern theology. Premodern theologians and leaders dealt forthrightly with children as they regulated religious practices of families and faith communities and addressed concerns about forming people in faith traditions and protecting, rearing, and educating children.

By contrast, until the last few decades many modern theologians and ethicists simply did not consider children a worthy subject. The academic study of religion followed the modern industrial division of

labor that drove a wedge between work and love, public and private, delegating work to men, love to women, and children to the female-restricted domestic sphere. Study of children, if it was considered at all, was regarded as trivial, sentimental, and second-rate (Miller-McLemore 2003). Women, families, and religious communities continued to worry about children's nurture, and people in religious education and pastoral ministry created curricula, organized social ministries for needy and marginalized children, and sometimes wrote books on children. But until the 1990s, religion scholars focused largely on adults without even noticing the adult-centered nature of their assumptions. Theologians and ethicists made sweeping claims about human nature and ethical action that presumed the average adult as the primary subject, and usually the white adult male in the so-called "developed" world.

The absurdity of such an assumption – that people do not need to take human development and variation into account in ethical analysis – seems obvious. But adult-centrism has been a serious problem for religious ethics (Wall 2010). In modernity, the presumed subject of dominant moral theories has been the mature and unchanging adult. In reality, there is no generic static adult; people are living, breathing, and evolving beings at various stages of life and maturity (or frailty). Yet children's full inclusion in religious communities and ethical discourse is far from commonplace. Many religious communities direct worship at adults and leave children on the sideline. When ethicists consider children at all, they often subsume them under the auspices of other topics, believing that the study of procreation or families or marriage, for example, already includes them. Not surprisingly, some contemporary scholars name children one of the last frontiers of liberation, following others such as women, people of color, the elderly, and the less able whose voices and rights have been obscured and marginalized.

The silencing of children is not entirely a twentieth-century phenomenon, however. Oversight in the Western world goes back at least to early modern adages that children should be "seen but not heard" and even earlier centuries of Western history when social and political hierarchies placed children in the same tier as other subordinates, such as women, servants, and slaves (Miller-McLemore 2003). Even in non-Western cultures that have greater regard for children, children have had to accommodate adult whims as well as hope for adult benevolence.

Religions and religious ethics play a key role in this arbitration, sometimes rallying to children's support, serving as a source of strength and well-being, and sometimes enforcing children's compliance to unjust and abusive rules aimed at honoring adult priorities. On one hand, religions name children in authoritative texts, symbols, doctrines, and moral teachings. They are valued for perpetuating the tradition and parents themselves (especially fathers). Religions have upheld the sanctity of children and childhood, opposing harmful social practices, such as infanticide or child labor. Religions strengthen kinship ties, benefiting children by providing safe and encouraging environments for growth. Some traditions ritually or informally sanction the wider community as extended or adoptive kin and create religious schools to educate children. All religions see socialization of children as a primary adult responsibility, although traditions differ over the extent to which they also credit children themselves as capable of religious awareness or wisdom (Browning and Miller-McLemore 2009). The Abrahamic traditions, for example, see children as blessings and gifts from God. Islam and Judaism embrace children as a fulfillment of God's covenant, inheritors of and participants in the tradition, and Christianity lifts up gospel stories that portray Jesus welcoming children as models of faith and reflections of the divine image. Many First Nation religions and some streams of Hinduism position children as closer to the divine than adults (Browning and Miller-McLemore 2009). Even though some traditions, such as Buddhism and Christianity, rank celibate religious life over families, this priority does not necessarily

mean a negation or neglect of children. Monastic communities have sometimes sustained important reciprocal relationships with the surrounding community in caring for children in extended families or taking in abandoned children. Prominent celibate traditions, such as Catholicism, identify families as a “domestic church,” a small-scale institution that parallels the formal body in forming inhabitants in the faith tradition. Some religions, such as Judaism and Hinduism, locate important rituals within the domicile at the heart of regular family life.

On the other hand, almost all religions harbor moral and spiritual assumptions that are markedly one-directional (the adult-forms-child) and forward-looking (the child-becomes-adult). That is, religious literature focuses largely on how adults should form children but seldom, if ever, on how children powerfully form adults or on how children possess connections to the transcendent that adults lose as they age, assume responsibility, and become jaded (Miller-McLemore 2003, 2017). Religious traditions also enforce rituals and mores that have ambiguous and destructive consequences. The Abrahamic traditions, for example, have (mis)used the commandment of honoring parents to keep children on a tight leash, and Judaism and Christianity have upheld household codes that arrange power in families hierarchically under the *pater* with women, children, and slaves subservient to patriarchal rule. Christianity has described children as depraved and deserving of corporal punishment, predicated on scriptural passages that suggest that “sparing the rod” leads to unruly, ungrateful children. Islam has also sanctioned corporal punishment and promoted other practices that can jeopardize children, such as child labor and marriage. Religions, such as Confucianism, have strict imperatives about respect for superiors or “filial piety” that can greatly constrict children’s lives. Religions also control sexuality and enforce rigid gender norms through social pressure and even invasive physical means, such as genital circumcision and mutilation. Over history, religions have given boys of all ages considerable unjust advantage over girls in education, domestic labor, discipline, social privileges, religious authority, and even survival at birth.

In short, religious traditions have benefits, affirming children’s creation and bringing them up as participants in religious communities devoted to worship of the transcendent and to care of others. And they also sanctify beliefs and practices that harm children, justifying, for example, child battery or fostering an environment where clergy child sexual abuse goes unchallenged. In short, religions have the power to affirm and embellish children’s value and identity and the power to distort and malign them.

Contemporary Efforts to Reconstruct Childhood

Over history and across societies, cultures construct childhood according to particular contexts and expectations, and religion has served as an active participant in this process. Western understandings of children shifted dramatically in the transition from premodern to modern to postmodern times (Miller-McLemore 2003). With the Enlightenment and the rise of modern science, prominent spokespersons challenged religious assumptions about children as flawed miniature adults-in-the-making, at fault and in need of correction, and held up new images based on scientific reason and research. In contrast with doctrines about children’s inherent depravity, modern philosophers and scientists proclaimed their natural innocence and purity (Higonnet 1998). Drawing on principles of human freedom and individual autonomy, people also promoted greater gender and sexual equality, raising for the first time the idea that children have basic rights to shelter, food, protection, and education that adults must recognize and respect.

Modern secular approaches to children have had their own undersides, however, sometimes as virulent as religious approaches. Although Enlightenment ideals led to a greater recognition of children's value and needs, they also tended to discount and disempower children, picturing them as "blank slates" and hence without moral and spiritual experiences and lacking in moral responsibility and influence. Romanticized ideals of children as naïve and unformed protected them from horrendous work conditions in factories, for example, and led to the creation of new laws limiting children's employment and assuring their education. But these same ideals also eventuated in new forms of exploitation (Miller-McLemore 2003). Rendering children precious and "cute" deprived them of active contribution to household sustenance, increased their susceptibility to sexual abuse, and turned them into products to be consumed by expectant parents or used by the market to sell products. Moreover, ideals of innocence were not applied equally. They defended white middle- and upper-class children as pure while dismissing non-white and working-class children as unruly and even dangerous, thereby perpetuating white supremacy and classism. Premodern ideals at least retained a sense of children's moral role, despite patriarchal trappings and regardless of context, whereas modern ideas often externalized blame for children's problems, placing it on parents and the environment and robbing children of genuine moral agency. Modernity also ushered in an individualism that recognized individual worth but turned love and marriage into an adult-to-adult affair and pursuit of personal fulfillment, ignored children and their care as a communal endeavor, and artificially severed individual development from its inherent relational dynamics. These new family norms made it harder and harder to take children into account in important adult decisions and policy matters such as divorce, affordable childcare, parental leave, medical intervention, and social welfare programs.

A shift has occurred in the last half century that is as significant for constructions of children as the shift from premodernity to modernity. Hand-in-hand with postmodern ideas that questioned universal truths and located knowledge and authority in particular contexts, adults have begun to see children as complex and competent beings. Although not a collective development by any means, people recognize children in more fulsome and realistic terms; no longer seen as depraved or innocent, children are regarded as knowing creatures with complicated desires and significant talents and challenges, meriting greater recognition, understanding, and inclusion, even if this change means more work and more struggle for adults (Higonnet 1998).

This encyclopedia entry itself is a good example. The topic of children is included because of a growing consciousness over the last century about children as full human beings with valid desires, agency, and contributions regardless of their age. Heightened regard for children arose in the twentieth century as much a result of growth in the social sciences and related legal developments as a consequence of any action by religious organizers or scholarship in religion (James and Prout 1990). Of course, religious communities and activists have remained staunch advocates for children, and scholars in religion have added their own efforts to a research movement now commonly identified as childhood studies. Nonetheless, for a majority of the twentieth century, scholars in religion abdicated their role in understanding children to those in the social sciences. Likewise, people in religious communities were more likely to turn to childhood experts in the wider culture than to religious leaders and resources. Fortunately, progress in secular research on children has sparked fresh research in religion in the last two decades.

Childhood studies received an official label and place in the university in the 1990s as a result of efforts among sociologists and anthropologists specifically (James and Prout 1990). Its roots, however, run back to the father of psychoanalysis Sigmund Freud, even if contemporary scholars accuse developmental

psychology of harboring an essentialist approach to children. Although Freud studied childhood sexuality to figure out adult pathology and regarded children along with women as more “primitive” than adult men, he still gave the study of children scientific status and plowed the ground for a century of social science research on children. Second-generation Freudians, such as Freud’s own daughter Anna, one of her protégés Erik H. Erikson, and British pediatrician D. W. Winnicott, took special interest in children in clinical settings. Behaviorist psychology arose in the early twentieth century in direct opposition to psychoanalytic belief in the unconscious and early childhood memories. But both schools shared avid interest in studying children. New child “experts” ranged from psychologists and psychiatrists to pediatricians and educators. Although many social scientists distrusted religion, it remained a peripheral area of interest. Psychology documented, for example, how trust in infancy shapes adult faith, how children develop images of God after their parents, how early transitional objects like a blanket are transformed into adult ritual, and how moral and spiritual reasoning progresses from concrete images to abstract concepts.

Childhood studies benefits from this history but also stakes out new territory. Since the 1990s, it has become a recognized area similar to programs in gender or race, housed in several universities, bridging several disciplines, and offering minors and doctoral study aimed at understanding children and childhoods plural. As this label suggests, scholars redefine childhood as a socially constructed category without universal features (James and Prout 1990). There is no such entity as *the child*; instead, cultures construct childhood and children in diverse ways. Scholars criticize sequential developmental theories for mistakenly viewing children only in terms of progression into adulthood rather than as valid subjects in themselves and for focusing on what children are becoming rather than on what they already are. These early theories relied on modernist notions of rationality and universality, promoting a misleading schema in which children advance from simplicity and irrationality to complex rational behavior, thereby creating as natural and inherent a false dichotomy between the supposedly immature child and the mature, reasonable, competent adult.

By contrast, childhood studies scholars recognize children as full persons with voice, knowledge, and agency (James and Prout 1990). Children are active participants rather than passive recipients of adult action. They shape their own social lives and the lives and societies around them. As part of this claim, scholars strive to give voice to children. Some social scientists even go against the typical neutrality of modern science and make clear their advocacy. Research interests arise out of concern about children’s welfare amid war, famine, poverty, and abuse; and the aim is to contribute to fresh policy perspectives and public practices. Distinct from earlier efforts on behalf of children, however, researchers seek to address children’s silence and sometimes attempt to include children themselves as contributors. Consequently, scholars increasingly turn to ethnographic methodology in order to ground theory in children’s own words, actions, and thoughts (Ridgely 2011).

Ethical Issues: Current and Future Directions

Unfortunately, a great deal of scholarship in childhood studies in the social sciences and humanities makes little to no reference to religion. This omission is a serious oversight since religion has such a widespread impact on individuals and societies, especially when it comes to moral norms and values, even within the so-called secular age. Fortunately, a decade after childhood studies was launched, scholars in religion sought to address the undeveloped state of research on children (Bunge 2012). People have

published books, organized academic societies and conferences, devoted special journal issues to children, and generally made a wealth of fresh insight available to the wider public.

Religion researchers run into one ethical problem shared by all scholars in childhood studies: how to best represent children? Even as scholars made space for children, they encountered difficulties in studying them (Ridgely 2011). Whether in theoretical examination of historical sources or actual interviews, putting children at the center is not easy. In fact, such claims negate the inextricable connections between children and those who care for them, often women and mothers who also need to remain central in theorizing about children. Conflicts of interest between adults and children arise inevitably, even in the birth process itself where infants are born months before neonatal growth is complete because of female anatomy. Childhood studies must consider how to enhance children's lives without diminishing the lives of women.

More challenging yet, how can adults do research on children without foisting adult presumptions on them? Ageism and adultism differ from other discriminations such as racism and sexism because age evolves in ways that race and sex do not. All people have once occupied the position of children, and all children become adults, at least physically. So, time partly solves the inequity, loss of voice, and invisibility. By contrast, differences such as sexual and racial status are more difficult to amend, although people affected by these discriminations often take action. Children rarely organize on their own behalf or initiate research on themselves. Can they use the research of adults to advance their own cause? Or is the research often a means to enhance the researcher's position? Even in the most carefully structured project, adults still have power over children and risk taking advantage of them or crossing appropriate limits. Minimally, adults must recognize how we often project our own needs, desires, and preconceptions on children. Children themselves often wish to please adults, including the adult researcher. As with any vulnerable population, children also raise difficult legal issues of consent, protection, and boundaries that internal review boards are justified in scrutinizing closely.

Pragmatically, scholars use various means to ameliorate these hazards (Ridgely 2011). They rely on retrospective analysis of their own childhoods, and they interview adults about their childhood experiences, although in both of these cases adult memories of childhood both aid and obscure understanding. More successful, many scholars resort to social science methods of qualitative research, ethnography in particular, to get at children's experience through observation, interviews, and extended immersion in contexts in which children live. Scholars in the humanities adopt more conventional literary and interpretative methods, rereading classic texts from a children's angle, for example, and digging for fresh textual material previously obscured by an adult orientation. Primary sources in religious studies present particular limitations. In almost all traditions, classic texts over twenty centuries reflect the elite, male, and patriarchal perspective of leaders and authors, written for other members of their own class and not representative of children's experience. This elite position excludes men of other classes, women without education, and, of course, children themselves. Innovative research in religion draws on methods from both the humanities and social sciences, unearthing new interpretations of scriptural and historical texts through a children-centered approach and doing ethnographic studies that explore the meanings that children develop *in situ*.

Leading religion scholars in childhood studies have urged religious ethicists to play a more prominent role in social debates about children. Many scholars also argue that including children more fully has the capacity to transform ethics as a discipline itself (Wall 2010). Serious consideration of children has the

capacity to revolutionize basic categories of analysis and interpretation, concepts such as rights, responsibility, agency, vulnerability, relationship, and so forth.

What are some of the specific ethical issues that arise for children? Considerable debate clusters around children's rights, sparked by the 1989 United Nations Convention on the Rights of Children, which the United States alone has not ratified. Children's welfare is often at great risk as a result of human and natural crises (see, for example, statistics available through the Children's Defense Fund, www.childrensdefense.org, and the United Nations Children's Fund, www.unicef.org). Other scholars tackle questions of children and adult responsibilities within specific communities and institutions, such as families (should children have chores or access to paid employment? what do adults owe children?), religious congregations (should children participate in key rituals?), education (how should religion be taught? what should children know about sexuality, climate change, or evolution?), and hospitals (in what ways should children contribute to their own healthcare decisions? what are optimal ways to care for sick children?) (Bunge 2012). Long before childhood studies became fashionable, scholars across a number of disciplines uncovered the deep entanglement of religious institutions and families in child sexual and physical abuse. More tangential to religious ethics but still a serious matter are questions about children's religious ideation. How do their religious lives evolve if the linear models of twentieth-century psychology are inadequate and inaccurate? Do children, for example, have religious desires, experiences, or callings?

Today, children are an important subject matter for study in religious ethics, and children are themselves viable subjects and participants in their own right. Scholars question previous assumptions about children's inability to grapple with existential and highly theoretical questions. Closer study reveals how actively children construct their world and their own unique theories about the divine, religion, faith, ritual, morality, and much more. Children reveal the powerful and life-long influence of everyday bodily experiences, especially material practices and artifacts. Their religious faith is shaped as much by routine habits as by verbal confession of beliefs. Since religion has an extensive influence on daily life, shaping who has power in families, for example, or what girls are allowed to wear, efforts to uncover and recover the rich and ambiguous history of religious beliefs and practices related to children will strengthen the depth and effectiveness of ethical discourse and public policy. Appreciation for children also means appreciation for what all people have once been, allowing us to see our own past anew. Most crucial for all of us, however, adults need to learn to listen when children talk.

CHAPTER 111

Joy and Laughter

Terence J. Martin

The religions of the world promise people many positive things – freedom, salvation, enlightenment, even heavenly bliss – though they all too often wind up denigrating human life. Christianity, for its part, offers its adherents peace and joy, though it frequently does so by urging people to regard actual life as nothing but a transitory stage meant for weeping and groaning, while deferring joy and laughter to an unknown, future realm (Luke 6:21). In addition, some of the most creative minds in the formative period of this tradition belittle corporeal life and its manifold pleasures, and later tradition follows suit with an austere morality that threatens to strangle the vital aspirations of ordinary people. Laughter too is regularly shunned, or at least severely tamed, as laughter often is linked with the pride and insolence of those who doubt God. As Peter Berger puts it, a “long line of grim theologians” managed to constrict and darken the horizon of human life in much of mainstream Christianity, so much so that one has to wonder whether there truly is any room left in it for joy and laughter (Berger 1997, 202). Indeed, even if one grants the legitimate insights of this dark perspective – that life can be dreary and treacherous, that the mind often is distorted and the will corrupted to terrible ends, that pleasures can be seductive and then become destructive, and that laughter can be cruel – still, one must wonder, where is the joy in all this? Is there no space for a full and ample life? Is there no opening for pleasure? Is there any room left for laughter?

Some promising efforts appear in the history of mainstream Christian theology, though it proves very difficult to break the negative fetters of early tradition. Augustine, for example, states very broadly in *The City of God* that all creatures – even robbers and monsters – seek peace and joy, though most people mistakenly find fulfillment in mere “temporal things.” Christians who aspire for the city of God, Augustine famously says, may rightly use these things and the peace they yield, but only in passing, as a stepping-stone to a higher end, and thus never as a source of true joy, since only God offers final and eternal peace (Augustine, 1998, book 19, chapters 10–28). Such a statement means, significantly enough, that Christians need not shun involvement in the world, as some were tempted to do; and yet it also reveals a deep and abiding discomfort with physical and social existence. Human beings, as Augustine sees it, are like pilgrims making their way through an alien world, under assault from enemies both within and without, with few sources of joy and no good reasons for laughter (Augustine 1998, book 18). Echoing Augustine, Anselm of Canterbury pursues much the same line of thinking in some rarely noticed chapters toward the end of the “Proslogion.” In his words, “if there are many joys in enjoyable things,” and the suggestion is that in fact there are a great many such joys, then “how rich and how great must be the joy [to be found] in Him who made these enjoyable things” (Anselm 1974, 101–1). Natural goods, in short – beauty,

strength, melody, friendship, and so on – are legitimate sources of joy; and yet, in line with Augustine, their true value is to provide a stepping-off point for imagining that ultimate good than which no greater good can be imagined. Though Anselm sounds more comfortable with worldly joy, his entire project – as he tells us in the first chapter – is driven by his keen sense of the “heavy sorrow ... [and] unmitigated plight” that marks the “wretched fate of man” (Anselm 1974, 91–93). So the question arises once again: does the Christian tradition make space for joy and laughter in this world? Or is the whole point simply to escape the dark and dreary lives we live?

The purpose of this entry is to indicate a positive way from within one current of the Christian world for affirming somewhat brighter possibilities for human flourishing. I refer to the work of Erasmus of Rotterdam (1466–1536), the cosmopolitan scholar of ancient languages and literature, trenchant reformer of church and society, unwavering critic of war and champion of peace, and witty satirist and well-practiced controversialist. To start with, it must be acknowledged that Erasmus inherits and often works within the classical framework evident in Augustine and Anselm; and thus it is not uncommon, as we will see shortly, to find Erasmus expressing similarly otherworldly and mystical sentiments. At the same time, however, Erasmus moves beyond these boundaries to create what can best be called a joyous Christian humanism animated by levels and layers of laughter. This is an approach marked by a capacious sensibility, one that is dedicated to entertaining and savoring the myriad ways in which people are amazingly odd, if not quite simply “mad” – not in a clinical sense, to be sure – but nonetheless somehow besides themselves, slightly demented in judgment, perhaps vehement in passion, or possibly just happily mindless and full of folly. As Erasmus leads us across the landscape of human existence – certainly in *The Praise of Folly* (Erasmus 1979a), but in other works as well – we are invited to think about life with nuance and agility, marveling at the tenuous equipoise of opposites and grappling with the surprising inversion of appearance and reality. The world seems topsy-turvy, or perhaps inside-out, but in any case not the way we took it to be; and the perceived incongruity strikes home, to one degree or another, giving rise to a range of responses, at once ironic and comedic. In a manner both daring and refreshing, Erasmus confronts his readers with the zany madness of mystical ecstasy, the innocent but funny folly of ordinary life, and the laughably vile schemes of the powerful, and each elicits and deserves its own kind of laughter. Given the dreary asceticism of traditional theologies, however, Erasmus is especially provocative when – blending “moral vision with a spirit of merriment” – he outlines an ideal Christian life filled with joy and pleasure (Gordon 1990, 99–100).

In the closing pages of *The Praise of Folly*, Erasmus has the goddess Folly introduce a group of saintly fools and religious ecstasies. Quoting randomly from scripture, Folly praises these “fools for Christ’s sake” who live a blessed but odd life – abandoning property, ignoring injury, and renouncing pleasure. Indeed, these holy fools live so completely outside of themselves that they seem to have been absorbed into that “Highest Good which gathers all things to Himself.” Naturally, too, they flee from “whatever is related to the body,” as they are “carried away in the pursuit of the eternal and invisible things of the spirit” (Erasmus 1979a, 115–138). Many interpreters have taken Erasmus seriously in extolling this type of folly, and to their credit such a reading does find support in other works of Erasmus (see Erasmus 1998, 393–397). M. A. Screech above all has championed the idea that the heart of the theology of Erasmus is to be found in the “witty, erudite, sustained and moving praise of a form of religious ecstasy which is indistinguishable from a bout of temporary madness” (Screech 1980, xvii). Indeed, as Screech puts it elsewhere, “the joy of such an ecstasy ... surpasses the natural joys that all human beings put together have ever known in this wide world” (Screech 1999, 113–117). Though such ecstasies may be filled with

heavenly joy, there nonetheless are good reasons to think twice about their praise, as these are remarkably odd people who speak “incoherently” and whose facial expressions “vacillate repeatedly”; they are “bitterly hostile to literature,” something Erasmus could never embrace; and they show no interest in the moral life praised elsewhere by Erasmus. He also places signals within the text to warn us against taking Folly’s praise at face value – in particular, her brazen claim to cite authorities in the manner of “great masters of divinity,” though Erasmus pokes fun at the methods of theologians; and her sophistical use of proverbs to earn her listeners’ approval (Erasmus 1979a, 115–138). So the joy experienced by these mystical madmen may be something noble, yet there is no denying that they are truly odd and thus deserve a good laugh.

Far more delightful are the natural fools who populate the first section of *The Praise of Folly*: the newborn and the elderly man – both bald and babbling – who charm the world with their toothless and witless manner; and between those ages, love-stricken men and women playing their wonderfully silly games of romance. What a panorama of innocent and contented fools, and what variety of pleasure and joy! There are those “thick-skulled, lumbering louts” who happily march off to battle; the bleary-eyed scholars forsaking sleep for the sake of reputation; the avid hunters and the exuberant gamblers who think of nothing else; and plenty of religious nuts fascinated with relics and magic. All of these and so many more enjoy a “sort of continuous inebriation” thanks to the good graces of Folly. Social life also depends on the “spice of folly”: what party, what friendship, and indeed, what marriage could thrive, Folly asks, without the dear quirks, the slight illusions, the fortunate oversights which make life good and give it cheer? No one is “joyful and happy” without her services, Folly proudly beams, as she alone pours “forth joy into the hearts of gods and men alike” (Erasmus 1979a, 9–75). With this rollicking review of everyday life, Erasmus assumes a comical perspective that is at once capacious and generous. In principle no one is exempt from the charms of innocent folly; and yet, as Peter G. Bietenholz observes, the “true originality of Erasmus” rests in casting Folly’s “compassionate approach to the common – and pleasurable – follies of human existence.” Even “weakness” and “delusion” are taken as a “source of pleasure” – a fact that can only elicit a “sympathetic smile” from readers, if not a hardy and appreciative laugh (Bietenholz 2009, 133). And who can help but grin with delight when Folly suggests – surprisingly, but somehow truly, and reversing the world’s expectations – that “fools, simpletons, [and] nincompoops” are far happier and decidedly more fun than the self-serious experts who run the world for their own benefit (Erasmus 1979a, 54–57)?

The laughter of Erasmus takes a satirical turn when Folly comes to deal with the vain and vicious madmen who torment the world for personal gain. From the common lot appear the crazed husbands, hypocritical mourners, savvy financial schemers, and conniving legacy hunters; but it is the professional fools who prove the most destructive – the cut-throat merchants, domineering teachers, vain authors, pretentious authors, quarrelsome philosophers, ridiculous monks, arcane theologians, decadent princes, greedy bishops, and warlike popes. What an unsavory lot, this is! And how grotesque they appear, especially when viewed from afar, as Menippus once did in a dialogue by Lucian of Samosata, when he surveys the “innumerable broil of mortals” from his perch on the moon. As Folly puts it, you would think you were looking at “a great cloud of flies or gnats quarreling among themselves, warring, plotting, plundering, playing, frisking, being born, declining, dying” (Erasmus 1979b, 76–115; see Lucian of Samosata 1988, 267–323). What Erasmus elicits from this vantage is a laugh of disgust at the treachery of these many villains. It is the job of the satirist, after all, to cut through the facades, debunking the air of legitimacy, uncovering the hidden corruption, and thereby exposing the concealed vices for all to see. Having done so, the satirist opens the way for explicit criticism and invites overt laughter at the culprits. Laughing critically

at the powerful can be dangerous, of course; and some of his targets took offence, though the satire of Erasmus is comparatively moderate and often quite light, especially by the standards of sixteenth century religious controversies. In this regard, it is interesting to note that – even to this day – there are those (Screech, for instance) who complain that Erasmus works mainly by mockery and ridicule, only occasionally “softened” by charity (Screech 1999, 164 and 312). In his defense, Erasmus avoids targeting individuals by name, often feigning surprise that someone might think that he was speaking of them, and playfully musing whether his suggestions might have inadvertently hit a guilty target (see Erasmus 1979a, 146 and 148). More importantly, many of his best satires are a kind of literary diptych, where laughing criticism is offset by a counterpoised ideal, to which the laughter ultimately leads (see Erasmus 1997a).

The work of Erasmus aims to foster a life lived in peace, filled with joy, and guided by intelligence. Given his scholarly labors, it is understandable that Erasmus would affirm an active life of the mind, something he does explicitly in “The Godly Feast,” where he gathers a group of ordinary laymen for a feast of conversation that is “equally learned and devout” (Erasmus 1997d, 204). More startling, however, is the claim put forward in “The Epicurean” by a character named Hedonius that “there are no people more Epicurean than godly Christians.” This proposal stuns Spudaeus, for whom Christian life is to be “as far as possible from pleasure.” Not true, says the Erasmian Hedonius, as Christ – who was anything but “sad and gloomy” – did not call people to a “dismal mode of life,” but in fact led “the most enjoyable life of all and the one most full of true pleasure.” Hedonius is not speaking, to be sure, of “shameless love, unlawful passion, [and] excessive wining and dining,” as no pleasures are worth the pains that follow such things. Instead the pleasures of which he speaks are psychological and moral, as the greatest pleasure is said to be a “good conscience,” which for Erasmus entails an ethical life unburdened by remorse and a sense of reconciliation with God (Erasmus 1997c, 1073–1086). Relieved by Christ of the torment of a bad conscience, the pious come to enjoy what Erasmus calls a “complete innocence of life,” or what amounts to the same thing, a personal life of peace (Erasmus 1998, 94). With a good conscience, Erasmus suggests, the pious enjoy “no less delight” in life than do the worldly, though it is done “in a different fashion.” All the gladness of heaven resides, therefore, in the actual life of the godly and righteous person. This is evident, Hedonius continues, in a number of ways, but most stunningly in the great pleasure they find in banquets and in sexual love, certainly very down-to-earth pleasures, and ones usually shunned by the religiously austere. Indeed, we are told, godly people enjoy fine banquets far more than the “vulgar gourmand, as they feast on modest food and rich conversation seasoned with thanksgiving,” and they savor “sexual love with great intensity, as their pleasure [is] derived from [the] unbroken intimacy” between two people “who love each other equally and sincerely” (Erasmus 1997c, 1083–1085). With these surprising examples, Erasmus insists that the truest joys of a righteous and godly conscience are to found in the midst of the social worlds in which people live and breathe.

Erasmus shows us many characters who illustrate such a life in the *Colloquies*. In “The Old Men’s Chat, or the Carriage,” for instance, a kind of symposium in transit, we listen in on the stories of life shared by four old friends who have not seen each other for forty-two years. There is Polygamus, whose “hard drinking” and “unrestrained sexuality” have aged him quickly; the proper and somewhat lifeless Eusebius, who has lived “quietly” and very correctly on the “prebend” received from his “cathedral chapter”; and the likeable vagabond Pampirus, who has lived in a free but careless manner, bouncing from one religious order to another. Unlike these three, however, Glycion has lived with remarkable ethical richness – with family, in public, among friends – and for that very reason, with great pleasure.

Of the four he has aged the least, as he has lived the best, relishing the joy of “living honourably and agreeably” and savoring the “tranquility” that comes from being at peace with God and others (Erasmus 1997d). “Courtship,” for its part, introduces us to two young people, with the smitten Pamphilus playfully and paradoxically suggesting to the lovely Maria that they might grow into virginity over the course of their marriage. What Erasmus manages with this richly ironic dialogue – Maria is baffled by the suggestion – is to rethink the relationship of religion and sexuality. In defiance of ascetic tradition, Erasmus insists that the pleasures of sexual life arise from nature and thus are not inherently sinful; but that also means that abstinence “from sexual intercourse isn’t a virtue” (Erasmus 1997e). The banquet colloquies, finally, also are devoted to the pleasure of the participants, treating their bodies to savory dishes and their minds to “conversation as pleasant as it is profitable” (Erasmus 1997f, 928). In these and other colloquies, we are met with a host of characters – consistently presented with gentle irony, sincere delight, and a smiling embrace – who have accepted the Erasmian challenge to “run the risk of human life,” even with all of its uncertainties and troubles, hoping thereby to savor the natural joys of a godly and virtuous life (Erasmus 1997e, 266).

To say the least, Erasmus takes us a long way from the ascetic and austere sentiments of much traditional Christianity. For those who would turn against life, despise the body, denigrate the mind, scorn pleasure, or even shun laughter, he responds in a manner that echoes Epicurus, bluntly telling people of this sort to get on with it and leave life, if that’s what they wish, as the means are readily at hand (Epicurus 1994, 29; Erasmus 1997e, 266). This is Erasmus’s parting shot at ascetic religion, and it is a quip with a satirical bite, as there is something downright mad about a life intentionally stripped of joy and laughter. Then again, for Erasmus we human beings go mad in a variety of ways, and each demands its own form of laughter, and it is by irony and laughter that Erasmus uncovers and responds to each. The sweet charms of innocent folly are met with light irony and a gentle chuckle; the savage madness of the vicious are exposed with provocative satire; the heavenly vehemence of ecstatic mysticism is praised with hesitant amazement; and the wonderfully odd life of the virtuous is embraced with merry delight. In each case Erasmus laughs, and with each kind and degree of laughter he invites us into the truth of that particular form of life. “What is to prevent one from telling the truth as he laughs?” Horace asks in defense of his brand of satire; and Erasmus would answer that only in laughing appropriately does one come to know the truth of any form of life and the joys that animate it (Horace 1929, Satire I.1.28). Indeed, as Berger comments, laughter discloses things that are missed in the “serious attitude” (Berger 1997, 135; see 83). So to get at the truth of life, one must have a well-honed capacity for irony and a sharply-tuned sense of humor.

In the end, laughter in the Erasmian manner is “a vehicle for Christian joy,” as Screech nicely puts it, though the joy in question is rich in ethical value and concentrated fully on humanistic ends (Screech 1999, xxiii). In fact, Screech offers a good example of this, when he notes that “men like Erasmus were ill at ease in a world where Christian laughter was fighting a losing battle against Christian thumbscrews.” And yet Erasmus persisted with laughter, certainly about the silly superstitions that infest popular piety, but also at the errors of dissidents, the vainglory of monks, the absurdities of theologians, and even the lethal madness of a warrior pope. What Screech says of Rabelais works as well for Erasmus, as “such laughter in its Christian context is positive and life-enhancing.” In Screech’s words, “error is not hated; it is laughed away,” and the same thing could be said of vices of all sorts (Screech 1999, 72 and 269). Therein lies the great ethical value of mocking laughter. As we have seen, however, a different sort of laughter emerges when Erasmus entertains the ideal of a godly and virtuous life. Recall, for instance, those odd but balanced figures wherein transcendent and natural goods are ironically held in suggestive

equipoise – an old man who has not aged (Glycion); a marriage that will aspire to virginity (Pamphilus and Maria); and a “godly feast” of ordinary laymen. What joy these figures experience, and what virtues they embody, somehow managing to relish a taste of the ultimate, even as they remain well-grounded in their natural and social worlds. In the words of Walter Kaiser, such religious and ethical lives represent a “joyous humanism,” one that rejoices in the pleasures of life, even as it insists that “the only true pleasures are those of the mind, that the pleasures most people seek are more painful than pleasurable, [and] that God is the fountain of joy” (Kaiser 1963, 80–81). In their wonderfully odd lives we encounter with eye-opening amusement the comical prospects for a joyous Christian humanism, no matter how fleeting their example might prove.

CHAPTER 112

Play, Recreation, and Sport

Eric Bain-Selbo

Introduction

There are generally two broad approaches one can take to thinking about the relationship between recreation and sport and religion and, by extension, religious ethics.

One approach is to look at the ways in which recreation and sport intersect with institutional religion. In other words, one might try to understand how a particular religious tradition views recreation and sport. What are the resources within the tradition that lead to a particular judgment about recreation and sport? What kind of guidance do the authorities in that tradition give to their adherents about recreation and sport?

The work of someone like William Baker is an excellent example of this approach. In *Playing with God: Religion and Modern Sport* (2007), Baker focuses primarily on sport in the United States and particularly on how it has been viewed and handled by Christianity (though he touches on Judaism and Islam as well). Baker recognizes certain commonalities between religion and sport. As he notes, “religion and sport seem to have been made in the image of each other” (Baker 2007, 2). But the story he tells is one of institutional ambivalence toward sport.

Lincoln Harvey helpfully summarizes the ambivalence of Christianity to sport in terms of three “notes” drawn from the history of that relationship. He identifies these as instrumentalism, opposition, and popularity (Harvey 2014, 33). Christianity has used (instrumentalism) sporting metaphors and analogies rhetorically (e.g. the letters of Paul), and exploited sporting life as part of its evangelism and call to bodily discipline (think here of the “muscular Christianity” movement and the Young Men’s Christian Association). But it also has condemned sport (opposition) as a possible and dangerous distraction from the religious life. From this latter position, sport is seen as an immoral activity or at least an activity that distracts from a properly moral life. At the same time, the history of the relationship of Christianity and sport reveals the incredible persistence and attraction of sport across cultures and despite religious condemnation (popularity). As a consequence, Christianity (like other religions) has had to make some sort of accommodation with sport and sporting culture (Harvey 2014, 33, 56).

In regard to recreational activities like dance, games, and popular music (activities often associated with festivals), Barbara Ehrenreich, in her book *Dancing in the Streets: A History of Collective Joy* (2006), recounts how authorities in the Christian tradition sought to squelch such fun among the masses. These activities were thought to lead adherents to neglect the discipline needed for a proper Christian

moral life. Such an attitude may be exemplified in this old joke: “Why do Baptists avoid sex standing up? Because it might lead to dancing.” Today, of course, many religious traditions embrace various recreational activities to form and strengthen communal bonds as well as recruit new members.

In general then, institutional religions have vacillated between condemnation and acceptance of recreation and sport, between active resistance and instrumental co-opting of recreation and sport.

The second approach to thinking about the relationship between recreation and sport and religion is to examine how the former may function very much like the latter. In other words, how are recreation and sport like religion? Do recreation and sport play similar roles for human beings that religion plays? How can we use certain religious or theological concepts to better understand recreation and sport?

It is this second approach that will be taken in this entry. While there certainly is much of interest in the first approach, the second approach looks more deeply at the intrinsic connections between recreation and sport and religion. And, by taking this approach, we will gain significant insights into those areas of overlap that recreation and sport and religion have in regard to moral virtues and the life of moral excellence. This entry will focus primarily on sport (baseball, soccer, basketball, etc.), but the lessons learned largely are applicable to recreation (gardening, dancing, yoga, etc.).

Play as Unifying Concept

The relationship between morality and institutional religions is indisputable. All religious traditions have rules about moral behavior and virtues that adherents should cultivate. At the same time, recreation and sport also have rules about moral behavior and virtues that participants (and, sometimes, even spectators) should cultivate. The umbrella concept under which we can best understand these practices, moral behavior, and virtues is “play.” The most prominent theorist of play is Johan Huizinga, and his *Homo Ludens: A Study of the Play Element in Culture* (1955) is useful in a comprehensive account of recreation, sport, and religion.

Play is associated predominantly with recreation (e.g. hiking and dancing) and sport (e.g. competitive activities like baseball and soccer). Like religion, it is a concept that can be difficult to define. Huizinga concludes that play “is a voluntary activity or occupation executed within certain fixed limits of time and place, according to rules freely accepted but absolutely binding, having its aim in itself and accompanied by a feeling of tension, joy and the consciousness that it is ‘different’ from ‘ordinary life’” (Huizinga 1955, 28). In terms of the emotional experience of play, he adds that the “play-mood is one of rapture and enthusiasm, and is sacred or festive in accordance with the occasion. A feeling of exaltation and tension accompanies the action, mirth and relaxation follow” (Huizinga 1955, 132).

For Huizinga, play is “primordial” (Huizinga 1955, 3). As theologian Michael Novak writes: “The basic reality of all human life is play, games, sport; these are the realities from which the basic metaphors for all that is important in the rest of life are drawn. ... *Being, beauty, truth, excellence, transcendence* [italics in the original] – these words [are] grown in the soil of play ... Art, prayer, worship, love, civilization: these thrive in the field of play” (Novak 1994, xvii). He adds, “Play is the most human activity. It is the first act of freedom” (Novak 1994, 32).

Play precedes not only religion, but all civilization or culture. In fact, it is the very basis of civilization or culture. In this sense, play is the fundamental human practice or disposition from which civilization or culture (including religion, recreation, and sport) develop. Huizinga insists that “play is older and

more original than civilization” and that “culture arises in the form of play ... it is played from the very beginning” (Huizinga 1955, 75, 46). Novak reverses the typical argument that play represents some kind of human diversion when he writes, “Cease play, cease civilization. Work is the diversion necessary for play to survive” (Novak 1994, 43). Even more strongly, Huizinga argues that the “spirit of playful competition is, as a social impulse, older than culture itself and pervades all life like a veritable ferment. ... We have to conclude, therefore, that civilization is, in its earliest phases, played. It does not come *from* play like a babe detaching itself from the womb: it arises *in* and *as* play, and never leaves it [italics in the original]” (Huizinga 1955, 173). Roger Caillois makes a similar argument about the central role of play in the development of culture in his book *Man, Play and Games* (2001).

Huizinga’s argument may strike many people as counterintuitive. Play seems so frivolous and trivial (after all, it is *just* play) while culture and civilization (the arts, law, religion, etc.) seem so important and serious. Play seems meaningless, while culture and civilization seem to be the very basis of meaning. But play *does* have meaning. As Randolph Feezell notes, “play is a free activity, intrinsically valued and therefore meaningful, joyous, or happy, ending in a consummation or fulfillment [not just accomplishing a task or winning a game, but even simply playing well]” (Feezell 2004, 50). If there is an absurdity to play, it is not because it is meaningless. Its absurdity arises from the intensity of our play and the feeling that it is the most important activity we could be doing and, on reflection, that we are engaged in *merely* play or that “it’s only a game.” For Feezell, this gives rise to the dominant attitude of the player: irony (Feezell 2004, 55–57, 74–76). Robert Ellis notes that “a strangely paradoxical thing about sport *for the vast majority* of those who play and those who watch, is that *sport is terribly important but also utterly unimportant*. [italics in the original] ... Like play, sport is a kind of serious irrelevance. Worship is often described in similar ways” (Ellis 2014, 215).

Huizinga and others affirm that play (and thus recreation and sport) is meaningful – one of the qualities that make it sacred. Play is sacred in that it creates special time and space, creates an ordered whole, includes an experience of transcendence, and (of course) is meaningful. By seeing play in these ways, we not only see how recreation and sport are akin to religion, but how religion fundamentally is play.

Play, particularly in the form of specific games or sports, takes place at a particular time and in a particular place. For example, a Major League Baseball game will have a specific time to begin and is played in a specific space (Wrigley Field in Chicago, Fenway Park in Boston, etc.). That specific time is set apart from ordinary or profane time. It is special – of a greater quality and importance. Similarly, that specific space is set apart from ordinary or profane space. It too is special in regard to quality and importance. In other words, the time during which a Chicago Cubs baseball game takes place is radically different than either the time immediately before the game or the time after. And the physical space of Wrigley Field is a radically different space than the space around the stadium. What is characteristic of a baseball game at Wrigley Field, however, is true of play in general. Whenever and wherever it occurs, that time and space is set apart or transformed. People who enjoy the physical activity of hiking and appreciate the beauty of the natural world in which they engage in that practice know the difference between sacred and profane time and space just as well as Chicago Cubs fans do. As Huizinga concludes, in all cases we end up with “temporary worlds within the ordinary world, dedicated to the performance of an act [the play itself] apart” (Huizinga 1955, 10). He adds, “there is no distinction whatever between marking out a space for a sacred purpose and marking it out for purposes of sheer play” (Huizinga 1955, 20). This “marking out” of space (and we can add, of time) is the process of making something sacred.

A critical aspect of the sacred is that it brings order out of chaos. Or, we might say, creating order out of chaos is how the sacred is established. Huizinga insists that play “creates order, *is* order. Into an imperfect world and into the confusion of life it brings a temporary, a limited perfection” (Huizinga 1955, 10). In creating or being order in the midst of the ordinary or profane world, play provides us with a qualitatively better world (albeit temporary) in which we have heightened and meaningful experiences. To engage or be in this world is what transcendence is all about. Huizinga concludes, “In play there is something ‘at play’ which transcends the immediate needs of life and imparts meaning to the action. All play means something” (Huizinga 1955, 1). In his insightful treatment of play, philosopher Hans-Georg Gadamer writes:

Play has a special relation to what is serious. It is not only that the latter gives it its “purpose:” we play “for the sake of recreation,” as Aristotle says. More important, play itself contains its own, even sacred, seriousness. Yet, in playing, all those purposive relations that determine active and caring existence have not simply disappeared, but are curiously suspended. The player himself knows that play is only play and that it exists in a world determined by the seriousness of purposes. But he does not know this in such a way that, as a player, he actually *intends* this relation to seriousness. Play fulfills its purpose only if the player loses himself in play. Seriousness is not merely something that calls us away from play; rather, seriousness in playing is necessary to make the play wholly play. Someone who doesn’t take the game seriously is a spoilsport. The mode of being of play does not allow the player to behave toward play as if toward an object. The player knows very well what play is, and that what he is doing is ‘only a game’; but he does not know what exactly he “knows” in knowing that.

(Gadamer 1994, 102)

While Huizinga uses religious or theological language to describe the import of play, other authors are much more explicit about their theological commitments. For theologian Robert Ellis, play is the very mode of action of God. The creation itself is a product of God’s play, and our play is the means by which we can participate with God and in God (Ellis 2014, 147). Thus, it is through play (including recreation and sport) that we transcend this world and connect with God. Ellis concludes, “God the player has created us *homo ludens*, restless creatures seeking to grow and mature, and seeking after God. Insofar as the move to transcendence in sport might be a seeking after God and might be met by an answering movement by God then we might feel more confident in speaking of salvation in sport” (Ellis 2014, 274).

Another theologian, Lincoln Harvey, notes that creation is “*unnecessary yet meaningful* [italics in the original]” (Harvey 2014, 83). It is unnecessary because God, perfect and complete already, did not need to create. Yet, creation remains meaningful as that within which we live out our lives in purposeful and significant ways. Harvey’s point, of course, is that play is like God’s creation (Harvey 2014, 83). Play is unnecessary yet meaningful. He concludes:

The Christian doctrine of creation allows us to understand that our being – our *is*-ness, so to speak [italics in the original] – is best described as the unnecessary-yet-meaningful reality of being freely loved into existence in Jesus Christ. This would suggest that when we play – unnecessary but meaningfully – we are living out our deepest identity as unnecessary but meaningful creatures.

(Harvey 2014, 83–84)

In sum, then, we see parallels between play and certain religious and even theological ideas and concepts. For Huizinga, of course, these parallels are a consequence of the fact that play is the fundamental element

before and behind civilization and culture – including such practices as religion and recreation and sport. If we grant the merits of this argument, however, what does any of it have to do with ethics? Because religion, recreation, and sport are all play practices, we find that they also have similar moral frameworks.

Ethics in Recreation and Sport

Huizinga claims early in his book that play “has no moral function” (Huizinga 1955, 6). But in a number of places he makes arguments counter to that claim. For example, he writes:

Though play as such is outside the range of good and bad, the element of tension imparts to it a certain ethical value in so far as it means a testing of the player’s prowess: his courage, tenacity, resources and, last but not least, his spiritual powers – his “fairness;” because, despite his ardent desire to win, he must still stick to the rules of the game.

(Huizinga 1955, 11)

Later, he notes that play “proceeds within its own proper boundaries of time and space according to fixed rules and in an orderly manner [and] promotes the formation of social groupings” (Huizinga 1955, 13). Such “fixed rules” and “social groupings” are not necessarily moral in nature, but certainly can be. Even more telling, however, is the way in which he writes about “fair play.” Huizinga insists that “the essence of play is that the rules be kept – that it be fair play” (Huizinga 1955, 52). This emphasis on fair play extends beyond just a particular game, however. It has much greater cultural and civilizational implications:

Civilization will, in a sense, always be played according to certain rules, and true civilization will always demand fair play. Fair play is nothing less than good faith expressed in play terms. Hence the cheat or the spoil-sport shatters civilization itself. To be a sound culture-creating force this play-element must be pure.

(Huizinga, 1955, 211)

In short, the rules of play are no different than the rules of civilization. In both cases, rules function to maintain order and foster appropriate and fair relationships among individuals. In short, play is the root from which morality sprouts – whether in the form of religion, recreation, sport, or other similar cultural practices. The to-and-fro of human interaction is play, and that interaction gives rise to habits and norms, some of which are codified into moral rules.

Of course, there are many different ways of thinking about moral behavior – deontological, utilitarian, and more. For our purposes, we will use an Aristotelian framework (inspired by the work of Alasdair MacIntyre). In particular we will look at the human propensity to achieve excellence or even perfection in a variety of practices, the virtues that enable us to achieve our goals, and the community that sets standards and in which we engage in our practices.

In a religious context, all traditions have accounts of what an excellent or even perfect human being is. Most simply, particular founders of the religions serve as models of excellence or perfection. For example, Jesus is the model for Christians, Muhammad for Muslims, and the Buddha for Buddhists. These traditions and others also have a set of practices (generally ritualistic in nature) and behaviors in which adherents engage in order to become more like the exemplary models that they praise or even worship. The cultivation of particular virtues, such as humility, charity, and courage, allow the adherents to progress toward the

goal of being more like the model. And it is the particular communities that arise through these traditions that articulate and preserve the conceptions of excellence or perfection, define what the virtues mean in that particular community, and train people to achieve their goals.

In the context of recreation and sport, Huizinga points to all three elements (excellence/perfection, virtues, and community) when he writes:

From the life of childhood right up to the highest achievements of civilization one of the strongest incentives to perfection, both individual and social, is the desire to be praised and honoured for one's excellence. In praising another each praises himself. We want to be honoured for our virtues. We want the satisfaction of having done something well. Doing something well means doing it better than others. In order to excel one must prove one's excellence; in order to merit recognition, merit must be made manifest. Competition serves to give proof of superiority.

(Huizinga 1955, 63)

For Huizinga, one of the ways in which excellence (if not perfection) was demonstrated in ancient times was through warfare (a dangerous form of play), which required the exercise of many virtues (e.g. courage, loyalty). While modern and contemporary civilization have not been devoid of warfare, people have devised other means by which individuals can be honored by their communities – including recreation and sport (Huizinga 1955, 75, 101).

Pursuit of Excellence/Perfection

Whether someone is an Olympic athlete or a recreational runner or a home gardener, they likely hope to achieve some level of excellence even if not perfection. And all three likely have exemplary models of their practice – ranging from legendary Olympic champions to the local 10k race winner to a particular neighbor proficient in gardening – that help them understand what excellence looks like in their practice.

The Olympic athlete, of course, can hope to come close to perfection. While the recreational runner may not be after perfection, certainly she hopes to achieve some kind of excellence in that activity. So it also is the case with the home gardener, who, for example, might hope to grow the perfect zucchini or tomato. In short, regardless of the kinds of practices we engage in, human beings tend to want to do them well and even excel at them. Even the losers in competitive sports still are trying to achieve excellence in their performance. Indeed, they may even engage in the practice in an excellent way, though the winning opponent still exceeds them. Thus, Robert L. Simon advises that we not think of competitive sports as “zero-sum games,” but as “*a mutually acceptable quest for excellence through challenge* [italics in the original]” (Simon 2010, 27).

From a theological position, only God is perfect. But Ellis concludes that when “players really compete and try to be the best that they can be, determined to win if they can, they are engaged in a kind of quest for perfection” (Ellis 2014, 243). True and lasting perfection may be out of the grasp of mere mortals, but there is a chance for a moment of perfection. Novak writes:

Athletic achievement, like the achievements of the heroes and the gods of Greece, is the momentary attainment of perfect form ... as though there were, hidden away from mortal eyes, a perfect

way to execute a play, and suddenly a player or a team has found it and sneaked a demonstration down to earth. A great play is a revelation. The curtains of ordinary life part, and perfection flashes for an instant before the eye.

(Novak 1994, 5)

This perfection is a vision, however brief, of that which is divine. Novak describes it as “the reaching of a form, a perfection, which ordinarily the flesh masks, a form eternal in its beauty. It is as though muscle and nerves and spirit and comrades were working together as flawlessly as God once imagined human beings might” (Novak 1994, 16–17). Our drive to achieve such perfection is “a deep natural impulse that is radically religious” (Novak 1994, 19).

In sum, Feezell reminds us that, for Aristotle, the “good life ... requires both intellectual and moral excellence” (Feezell 2004, 136). While recreation and sport may contribute to intellectual excellence in varied ways (gardening may require more intellectual work, for example, than weightlifting), the argument here is that recreation and sport can and do contribute to achieving some kind of moral excellence – as we can see when examining the moral virtues that allow us to achieve excellence in these practices.

Virtues in Pursuit of Excellence and Perfection

Aristotle argues that virtues are means between two extremes. For example, courage is the mean between rashness and cowardice. In a military conflict, one should neither rush blindly into harm’s way nor cower before the enemy. Courage designates the more appropriate mean between these extremes. In other words, courage is the way one can achieve the goods internal to a particular practice (in the military arts, for example, those goods would include victory). But cultivating the virtue of courage as well as other virtues is about even more than excellence in specific practices. Cultivating virtues is critical for living the good life. As Feezell concludes, the “virtues sustain not only practices but our quest for the good. Courage, persistence, truthfulness, and justice are as much required in our quest for how best we ought to live as for our pursuit of goods internal to practices” (Feezell 2004, 136).

In regard to recreation and sport, Feezell identifies “sportsmanship” as a kind of virtue, one that “is a mean between excessive seriousness, which misunderstands the importance of the spirit of play, and an excessive sense of playfulness, which might be called frivolity and which misunderstands the importance of victory and achievement when play is competitive” (Feezell 2004, 95). Sportsmanship also may include how the winner of a contest relates to the loser. There are no hard and fast rules here, but a tradition of customs to guide the competitors. In line with Simon’s emphasis on sport as a “mutual quest,” we find that custom generally requires the victor to show humility (another important virtue) toward the loser and for the former to commend the efforts of the latter (exemplifying the virtue of charity). And, of course, there are corresponding customs related to how the loser should relate to the victor.

While “sportsmanship” may not be considered a standard moral virtue, more typical moral virtues also apply to the practices of recreation and sport. For example, “truthfulness” in following the rules, humility in being a “good sport,” and friendship and self-sacrifice in being part of a team are examples of how moral virtues function in a sporting context. Simon points us to other virtues when he writes, “Values such as commitment, discipline, respect for the standing of others, and appreciation of excellence are also presuppositions of moral and rational development” (Simon 2010, 200). This notion of “respect”

for others is central to what Simon describes as the “mutual quest for excellence through challenge.” Ellis adds, “between great opponents there is not only fear but also respect and camaraderie” (Ellis 2014, 205). He notes that the Latin roots of the word “competition” point us toward the idea of “striving together,” and that sport “is fundamentally relational, and is a cooperative enterprise even between opponents” (Ellis 2014, 206). In other words, competitive sports entail a moral relationship among participants.

Religions promote the good life, the life of virtue and the pursuit of excellence or perfection. But many other human practices do as well, including recreation and sport. What ties them all together, of course, is play. As Huizinga concludes, “virtue, honour, nobility and glory fall at the outset within the field of competition, which is that of play” (Huizinga 1955, 64).

Tradition and Community

Virtues are by nature difficult to define with great clarity. It can be difficult to know when one has struck the mean between two extremes. How do we know if a particular action is courageous rather than rash or cowardly? This uncertainty is why traditions and communities are so important.

Accounts of human excellence and descriptions of the virtues that help to achieve it are preserved and carried forward by traditions that are lived by people in specific communities. The Islamic tradition is the keeper of certain conceptions of the good life and human excellence (the prophet Muhammad being the exemplary model), and it promotes and teaches particular virtues that help people to achieve the good life and human excellence (e.g. *zakat* or charity is a central virtue in the Muslim life). Similarly, becoming an excellent swimmer or an excellent gardener may have some tangible measures (e.g. victory for the former and growing large vegetables for the latter), but they also very much depend on criteria that are provided by a tradition of those practices and by communities. And more intangible values like “sportsmanship” and “respect for the game or practice” clearly are a function of tradition and community standards. As noted above, there are no clearly articulated and accepted moral rules in this regard, but only a host of customs supported by traditions of practices and communities that support those practices (e.g. the many and varied rituals surrounding the interaction of athletes at the conclusion of a contest). Perhaps Novak sums up this view best:

For many Americans, as for the Greeks, athletics remain the field of experience closest attuned to human perfection, where *beauty* of formal action meets the form of the *good*, where the utmost *individual achievement* is linked to perfect *solidarity* [italics in the original] with others, where the word for “good” means at once beautiful, true, and brotherly.

(Novak 1994, 91)

Undoubtedly, there are important differences between religious traditions and recreation and sport. The former have a penchant for transcendental thinking that is not prevalent (at least not explicitly) in the latter. The former certainly conceive of themselves in ways radically different from the ways that the latter conceive of themselves. In addition, the former often have denigrated and condemned the latter.

But there also is much in common between religious traditions and recreation and sport. As we have seen, arguments have been made that they all arise or develop from the intrinsic nature of play in the human species. We also have seen how ethics in these cultural phenomena can be understood in the same Aristotelian framework.

In short, recreation and sport function for human beings in many of the same ways that religious traditions function for human beings – including, or perhaps especially so, in regard to ethics. It is this functional identity that has led some to argue that sport, for example, may take over those functions in the centuries to come. In other words, it may be that people drift away from religious traditions because they find other cultural phenomena that function in similar ways.

We believe there is a great transition in the recent religious history of the Western world ... from a rigid dichotomy in which religiosity is restricted to institutional traditions and stereotypical beliefs and practices to a steady decline of those traditions, beliefs, and practices and a recognition that religiosity is diffused through our lives to greater and lesser degrees.

(Bain-Selbo and Shoemaker 2016, 148)

While Bain-Selbo and Shoemaker approach the topic from a humanist and/or social scientific perspective, even theologians like Ellis are exploring this possibility. As he writes, “we must at least ask whether sport has become a meaning-making exercise in our culture just as another meaning-making practice [religion] declines” (Ellis 2014, 91). He concludes:

People may turn to sport as once they turned to institutional religion in order to express certain feelings; experience certain emotions or states of mind; construct identity; dramatize important human instincts; inhabit a rhythm of life; participate in life-shaping ritual; and so on. Taking all this together it seems that there are good reasons for saying that some people play sport for religious or quasi-religious reasons.

(Ellis 2015, 189)

Another reason why human beings are drawn to recreation and sport is to cultivate virtues that lead to human excellence and to be part of a tradition and community that affirms those virtues and the pursuit of human excellence. In this way, we might even say that recreation and sport share a family resemblance (through their common ancestor, play) with religious ethics.

CHAPTER 113

Personhood

Darlene Fozard Weaver

In ordinary usage person and human being are largely interchangeable terms. In religious ethics the terminology of “person” and meaning of personhood is more complex and varied. Religious ethics offer longstanding and rich accounts of human persons (moral anthropologies), and locate them in broader religious cosmologies. Moral anthropologies are both descriptive and carry normative weight that informs reasoning about practical moral problems.

In addition to these broader accounts of human beings, the language of personhood has more specific meaning and operates in more technical ways in religious ethics. Indeed, the person is a central concept in many forms of contemporary religious ethics. Human persons enjoy distinctive moral status as compared with nonhuman animals. Moreover, in many religious as well as secular ethics the person has a sacral quality (Joas 2013). However, concepts of persons vary across religious traditions and within them. Disagreements about the characteristics and capacities essential to personhood, who counts as persons, and whether personhood merits the ethical importance it carries have perennial import. They not only lie at the heart of polarized debates in ethics, they are fundamental to the most pressing moral challenges humanity confronts.

Human Beings as Persons

All religious ethics entail reflection on what it means to be human. The term person derives from the Latin *persona*, which refers to masks worn by actors and, by extension, to characters portrayed and to the actors themselves. Christian thought about the divine as a personal God and as a Trinity of divine persons, and christological reflection on the human and divine natures of Jesus Christ contributed to the meaning and use of “person.” Evolving concepts of personhood impacted religious, philosophical, and legal thought beyond Christianity. In modernity concepts of person variously emphasized responsibility, personal identity, rationality and moral value, to a largely evaluative or prescriptive meaning today (Rudman 1997, 144).

A contested question in ethics is whether person and human are coterminous, that is, whether all human beings are persons. Some religious traditions claim there are non-material spiritual creatures like angels which may share characteristics of persons. Increasingly, entities other than human beings are being recognized as persons. For example, corporations are treated legally as persons and some

non-human species are accorded the status of personhood in some legal contexts. Moreover, human beings are not always affirmed as persons. Some people deny that prenatal human lives, including embryos and fetuses, have the status of personhood. Others stipulate that to be a person a human being must display certain indicators of personhood, such as a capacity for memory or intentionality (Fletcher 1974).

Personhood as a Description of Human Beings

Debates about persons and human beings show that concepts of personhood operate descriptively and prescriptively. Descriptively, concepts of personhood are ways of interpreting what kind of creatures human beings are. While the concept “person” is largely Western, reflection on human experience, abilities, and purposes for human existence is discernible across religious ethics. In this most general sense, personhood describes the structure and conditions of human existence and provides a way to pick out particular characteristics of human beings that differentiate them from other creatures.

There are several cross-cultural, fairly generic observations we can make about persons, based on multiple dimensions of human existence. Human persons have bodies, with typical basic needs (food, water, protective shelter and clothing) and capacities. Our bodies situate us in biological kinship networks. The way human communities meet these needs, organize them in social relations, and culturally encode them, will vary. Religious convictions and practices belong to that work and provide resources to transcend it in moral critique and transformation. Human beings are therefore also social creatures. Persons typically live in communities and navigate these relationships in complex ways. Human persons are capable of developing and negotiating relationships of various kinds – sexual, familial, friendly, political, and economic. Human persons are self-conscious and cultural creatures as well. Persons inhabit social roles, which mediate a given person’s identity, prerogatives, and responsibilities within a community or institution. A person might be a mother, a daughter, a spouse, a friend, a doctor, a citizen, a Muslim, a consumer, a volunteer at a soup kitchen, and a basketball coach in a youth sports league. The expectations associated with these roles are deeply influenced by the communities she inhabits, as are the scales of value through which her stellar or lackluster performance of these roles are assessed. They interpret their own existence through religious practices and creeds, art, intellectual inquiry, and moral systems.

As a more theorized and particular concept, personhood has emphasized human subjectivity more than human embodiment or sociality. Concern for subjectivity predates the Enlightenment. Early Christian development of concepts of person developed in tandem with reflection on divine person. The question of divine personhood involved debates about temporality, relationality, and embodiment, to name a few (see Augustine 1963). Jewish and Christian scriptures posit that human persons as the image of God (the *imago dei*), which was variously based on human rationality, consciousness, or freedom. Modern concepts of personhood concern human nature not divine personhood, yet during the Enlightenment the notion of personhood retained these religious influences. For Locke (1690) a person “is a thinking intelligent being, that has reason and reflection, and can consider itself, the same thinking thing, in different times and places; which it does only by that consciousness which is inseparable from thinking and seems to me essential to it; it being impossible for anyone to perceive without perceiving that he does perceive.” Modern views of the person are often associated with the emergence of human rights discourse. Joas (2013), however argues against the idea that human rights represent the apex of

anti-religious Enlightenment thinking. Nor are human rights the clear progeny of religious claims. For Joas human rights is more properly the descendant of abolitionism, fights for religious freedom, and arguments against torture.

A morally significant concept that is allied with personhood includes the “self.” The notion of selfhood not only accents subjectivity but casts personhood as largely interior. Human beings differ from other creatures because they display a capacity for purposeful action. Taylor (1989) argues that persons are distinguished by their ability to choose according to reflectively held choices. Selfhood, for Taylor, is tied to moral agency.

Personhood as a Prescriptive Concept

Prescriptively, personhood assigns human beings (and, increasingly, other entities) a moral status relative to other creatures or collective agents. Concepts of persons necessarily pick out features of human existence as salient for this status, for example, that human beings are self-conscious creatures and that this capacity of consciousness is central to being a person. However objective these features are taken to be, they are unavoidably inflected by and deployed within larger historical and cultural perspectives.

An ongoing question is who or what counts as a person. Disputes over personhood matter because they concern the rights, responsibilities, and opportunities for recourse that are available to persons. The personhood of marginalized and vulnerable populations is often challenged or denied. The African slave trade, Jim Crow law in the United States, and apartheid were all predicated on a denial of the full personhood of black human beings. Eugenic movements and genocides are founded on judgments that physical and cultural differences from dominant populations indicate inferior status. The full personhood of other groups of human beings – for example, the unborn and some disabled persons – is publicly questioned.

The prescriptive import of personhood goes beyond legal status. Concepts of persons interpret the value and meaning of humanity, shape and evoke moral sensibilities like respect or reverence, and impact human social interactions and cultural expressions. Kant argued that persons have supreme moral worth on account of their rational autonomy. Persons alone enjoy a uniquely non-instrumental value, and reason attests to the respect that is due to them. Kant’s affirmation of the unique moral status of persons belongs to wider philosophical and religious valuation of persons and helped drive it, too. One example is the “personalism” developed by Emmanuel Mounier and advanced by Catholic thinkers including Karol Wojtyła, who later became Pope John Paul II (Rudman 1997). According to personalism the distinctiveness of persons lies in human subjectivity, which is itself recognized as inter-subjective. Hence, the person’s full realization lies in rightly ordered relationships with God and others. Moreover, in Catholic personalist thought the person comprises a moral criterion. Moral attitudes, behaviors, and relationships, as well as policies and institutions are assessed with regard to their import for persons.

Religious ethics explicate the prescriptive weight of personhood in diverse ways, though doing so unavoidably involves appeal to descriptive beliefs about human beings. In natural law thinking human capacities and experiences inform moral prohibitions and responsibilities. Beliefs regarding human sexual differentiation and the significance of this for gender roles and relations impact sexual mores, and reproductive morality (Chaudhry 2013). African religions view human beings in communal terms rather than as individuals, yet they still regard morality in terms of social duties that are keyed to human welfare realized within community. While Buddhist ethics do not conceptualize human beings as persons,

human life does enjoy a distinctive value in Buddhist ethics, chiefly because of a human capacity for “awakening.” Differences among these religious traditions should not be minimized, but the examples provided here show that morally freighted reflection on the meaning of being human unfolds across world religions. Moreover, the moral status of human beings in relation to the rest of creation is a key issue in religious ethics and a profitable locus for comparative religious ethics. Finally, the dynamic relationship between the descriptive and prescriptive meanings of personhood point to an overarching question for religious ethics: how is the good related to the real? If moral obligations are somehow rooted in features or structures of human existence, moral claims are true or false, even if they are also deeply situated and shaped by historical and cultural forces. Put differently, personhood is fundamentally important for the question of moral realism.

Corporate Agents and Corporations as Persons

The notion of corporate personhood attempts to make sense of collective forms of agency. Institutions, associations, communities, and groups can act in concert, even though the intentionality, positional authority, freedom, and power of individual members will vary. In Western religious ethics it is difficult to attribute responsibility, particularly moral culpability, among individual members of corporate agents. This is because modern Western notions of responsibility privilege individual agents and tend to regard the “ability to have done otherwise” as a threshold for responsibility. Religious ethics informed by more communal views of human beings, for example African religions do not face these questions in the same way.

The language of corporate personhood also has a more narrow and specific meaning with regard to the legal status of incorporated institutions. In the United States corporations are recognized as persons for some purposes. Corporations, as a collection of individual persons acting in concert, can sue or be sued. The Supreme Court case *Citizens United v. Federal Elections Commission* (2010) ruled that financial donations to candidates by corporations count as an exercise of constitutionally protected free speech. But as early as 1819 *Dartmouth College v. Woodward* affirmed that corporations, like persons, enjoy the right to enforce contracts. Legal personhood for corporations underscores the importance of personhood as a socio-political locus for assigning, asserting, and adjudicating rights and obligations.

Religious ethical interest in corporate or collective forms of responsibility is growing. The topic represents an important task for future work in religious ethics.

Animals as Persons

Scholarly interest in animals and ethics is burgeoning in recent decades (Singer 1975). For religious ethics the central moral question concerns human moral obligations vis-à-vis non-human animals. Religious ethics frame human moral responsibilities toward animals in terms of larger creation narratives. Although the categories of “religion” and “ethics” are not organic to non-Western religious thought, attitudes toward the place of human beings within creation are a locus for comparative religious ethics and collaboration. It is important not to minimize differences across religious traditions. Indigenous American attitudes toward nature (and humans in relation to it) differ markedly from Jewish and Christian scriptures that depict human responsibilities to exercise dominion over or stewardship of creation. However, religious ethics must respond to developments beyond particular traditions. Arguments on behalf of the personhood of great apes, dolphins, and other non-human creatures are gaining traction. Legal cases also indicate a growing support for affirming and protecting the status of

personhood in animals. Courses in animal law are now offered in law schools. Attributing legal personhood to non-human animals allows for legal representation of their interests. Consider that non-human animals can suffer, and therefore their interest in not suffering must be taken into account (Singer 1975). The attribution of personhood to non-human animals relies upon and has import for approaches to human personhood that emphasize particular capacities. Recognition of sentience, intra-species communication, and complex social relations among certain non-human species all vex the notion that human beings enjoy a unique moral worth based on what were thought to be distinctive human characteristics and capacities. Importantly, growing recognition of animals as persons belongs to broader challenges to anthropocentrism or speciesism.

Environmental Entities as Persons

The legal status of personhood has been attributed to environmental entities in several instances. New Zealand accorded the status of personhood to Te Urewera, a national forest. In 2017 several rivers were recognized as legal persons. The Wahganui river in New Zealand is perhaps the first river to receive the status of person. Indian courts soon after declared the Ganges and Yamuna rivers as legal persons. Legally affirming an environmental entity as a person makes it possible for the river to be represented by counsel who will advocate for the interests of the entity. In Bolivia the Law of Mother Earth accords all of nature rights to life and to exist, rights to continue vital cycles and processes free from human alteration, the right not to be polluted, and the right not to have cellular structure modified or genetically altered, among other rights.

These cases again underscore the legal importance of personhood. They also complicate ethical debates regarding the grounds for human moral worth, the moral status of vulnerable human populations, and the best religious, philosophical, and pragmatic means for addressing environmentally unsustainable anthropocentrism. Claims about the characteristics that warrant the attribute of personhood matter because they help us to demarcate the scope of our moral concern and because they inform the ways we envision human wellbeing or flourishing. Critics argue that laws which attribute legal personhood to environmental entities diminish the value accorded to human beings, so many of whom are already denied the protections and rights associated with legal personhood. Whether or not this is persuasive, religious ethics face the daunting and urgent task of rethinking the meaning and place of human persons in the face of climate change. After all, human persons are part of a natural environment – indeed, a cosmos. Some religious cosmologies acknowledge the intrinsic value of all creation. This common ground may provide a principle for interreligious collaboration in response to climate change. Jenkins (2013), however, argues that our climate crisis is unlike any moral challenge humanity has faced before and therefore requires new approaches to moral inquiry and action. He advocates for “prophetic pragmatism,” an adaptive ethics that emerges from local engagement with concrete moral challenges (Jenkins 2013, 9).

Problems with Personhood

Some scholars think that moral anthropologies in general, and concepts like personhood more particularly can smuggle in unexamined and unsupported claims (Benhabib 1992). Concepts of persons reflect particular historical and cultural perspectives which smuggle problematic assumptions into moral analysis and normative judgments. Theological anthropologies, for example, reflect the experience and perspective of the religious thinkers who develop them. As Cone (2010) argues, theological discourse about both divine and human persons in dominant Christian theology are predicated on an unexamined

whiteness. A premise of the black liberation theology he developed is that truthful theological discourse must participate in God's self-disclosure as a God of liberation. For Cone this means not only that it is true to say that God is black but that human redemption means becoming black like God. Religious moral anthropologies have not only reflected and warranted racial discrimination, they also contribute to gender discrimination. For example, hierarchical yet complementarian views of sexual differentiation can be found across the religious ethics of Abrahamic traditions. Among the tasks and purposes of contemporary religious ethics is confrontation with this complicity and exploration of religious ethical resources for correcting it. Chaudhry (2013) provides one instance as she negotiates concepts of tradition and authority while charting incommensurable patriarchal and egalitarian "cosmologies," in which concepts of gendered persons are key features.

Contemporary scholarship in several fields, particularly social sciences, challenge aspects of Western views of personhood. Behavioral economics, for example, suggests that persons not only desire and choose within environments that limit, shape, and frame the options available to them, "choice architectures," but that trivial environmental factors can unconsciously influence choice. Cognitive psychology challenges a widely held view in religious ethics that moral judgment is – or ought to be – based on reason, by offering insights into confirmation bias and other biases, and through arguments that cognition and emotion are best characterized in terms of automatic processes or reflex-like responses to stimuli (McRorie 2016). Scholarship in these and other disciplines, particularly the social sciences, complicate received thinking about human persons, particularly as moral agents. When moral responsibility is understood chiefly as the ability to do otherwise, it becomes difficult to establish accountability and culpability when so many environmental and unconscious factors influence our choices, or amount to reflex rather than choice. Of course, as non-theologians sometimes fail to recognize, religious traditions offer complex moral psychologies that sometimes anticipate much later "findings" from social sciences, and these disciplines can themselves benefit from the work of religious ethics. Religious ethics should engage the social sciences in a shared endeavor to understand the human person. As McRorie (2016) observes, thinking alongside social sciences can assist religious ethics with the work of public moral argument. Moreover, engagement with social sciences can empower religious ethical thinking about persons and agency, helping religious ethicists discern "how to change the conditions we find ourselves in when we decide they do not adequately empower the kind of agency we would prefer. ... [T]he more we learn about the determinants of our economic behavior, the more power we have to influence our own lives, and promote our agency – at least, if agency is understood ... as helping agents to achieve their own reflectively held ends" (McRorie 2016, 219).

Transhumanism and post-humanism represent additional challenges to traditional concepts of personhood. Transhumanism is a loose intellectual movement which heralds the prospects that enhancement technologies represent for overcoming human limitations. Enhancement technologies encompass everything from corrective eyewear to psycho-pharmacology to gene editing to the prospect of "immortality" in the form of downloading one's consciousness to a computer server. Post-humanism also refers to wildly divergent positions like critical theories that advocate for the deconstruction of concepts like human nature and advocates for a future without human beings, for instance a state of affairs in which growth in artificial intelligence brings about the extinction of human beings. Debates among trans/post-humanists and between them and their critics concern the moral permissibility of specific enhancements, distributive justice and access to enhancement technologies, and the morality of forging a new or post-human species.

While some enhancement technologies improve the quality of human life, emerging technological and socio-political threats endanger a viable *human* future. Some religious ethicists discern anti-humanist impulses in transhumanism and posthumanism. Schweiker (2010) and others call for renewed forms of humanism that respond to the radical extension of human power through technology.

Illustrative Practical Questions

Practical moral questions regarding personhood encompass issues at the beginning and end of human life, like abortion, embryonic stem cell research, physician-assisted suicide, euthanasia, and the determination of human death. Practical questions also include human beings in certain medical conditions, such as a persistent vegetative state, and with certain disabilities, such as severe cognitive impairment. These are complex issues, and moral arguments about them vary, but the question whether particular human beings count as persons figures prominently in them, as do debates about the moral import of personhood.

Emerging technologies pose new practical questions regarding persons. CRISPR (Clustered Regularly Interspaced Short Palindromic Repeats) expands human capacities for gene editing. Scientists can create human-nonhuman chimeras, beings fashioned through combining cells from different embryos. Technological capacities to alter characteristics of personhood outpace public moral argument about the proper use of these technologies. Moreover, some ethicists argue that transhumanist and post-humanist technologies – and the anti-human impulses within them – undermine moral commitments that are crucial for securing human rights and protecting the welfare of vulnerable human populations.

Concepts of personhood are at stake across the domain of practical ethics. Access to healthcare, education, or clean air and water ultimately rely on prescriptive judgments about what human persons need and deserve. Political enfranchisement, privacy rights, and conscience objections entail judgments about respect for persons and the conditions necessary for persons' fulfillment. Because concepts of personhood are culturally situated and therefore subject to power dynamics, critical deconstruction of these and allied concepts is an ongoing task in ethics.

Conclusion

Although there are varied and conflicting concepts of personhood, and the value of “person” as a moral concept is contested, the idea that human beings are persons, and that personhood is key to the moral status of human beings is a crucial feature in many forms of religious ethics. Previous moral atrocities such as the unspeakable evil of Shoah and contemporary moral problems – the roiling waves of white ethno-nationalism, the ongoing threat of nuclear annihilation, the unfolding crisis of the Anthropocene – demonstrate that the attribution of moral status to human beings is the fundamental moral challenge we confront. Religious ethics have constructed, legitimated, and benefited from concepts of personhood that diminish or deny the equal moral status of some human populations. Religious ethics have also envisioned, inspired, and led efforts to expand and defend the recognition of human moral worth, and to translate that worth into conditions and practices that are consistent with that worth. A perennial task for religious ethics is to revise religious traditions by their own best insights in service of ever more adequate understanding of the person and ever more inclusive promotion of human worth in a diverse and interconnected creation.

CHAPTER 114

Pleasure and Pain

Susan A. Ross

Pleasure and pain are embodied experiences shared by sentient life, both human and nonhuman. Religious traditions see them both positively and negatively. While some experiences of pain have largely been condemned, such as torture, pleasure is an ambivalent reality: sometimes praised, sometimes cautioned against. Sexual pleasure in particular has received greater attention in the twentieth and twenty-first centuries as the range of acceptable sexual expressions has widened. Religious traditions have also concerned themselves with end-of-life pain, its treatment, and implications for human autonomy and dignity.

Jewish and Christian Sacred Scriptures

The second creation narrative in Genesis provides an initial focus on both pleasure and pain as experienced by the first humans. The trees in the garden are described as “delightful to look at and good for food” (Genesis 2:9). But the fruit of the tree of knowledge of good and evil was expressly forbidden to the first couple by God, and their punishment for disobeying this command was pain: for the woman, “in pain shall you bring forth children” (3:16) and for the man, work would involve “toil” and “the sweat of your brow” (3:17, 19). Thus human existence from the outset contains both pleasure and pain, with pain seeming to be a result of disobedience.

The theme of pain and suffering as a consequence of human actions is a recurring theme in the Jewish and Christian scriptures. The ancient story of Job is in part a response to the widely held assumption that human beings bring pain and suffering on themselves by their actions. Job is an upright man, undeserving of calamity, yet he loses everything and questions God. In the end, all is restored to him but God never answers Job, leaving him only with displays of power. The Psalms are filled with laments over the pain and suffering experienced both at the hands of one’s enemies and also at the pain of loss (Psalms 5, 6, 10, 13, 18, 22, 25, 31, 38, 42, 43, 55, 56, 63, 69, 77, 88, 102, 137, 142, 143).

In some of the most troubling scriptural passages, God orders the destruction of all humanity (Genesis 7), Abram to sacrifice his only son (Genesis 22), the destruction of Israel’s enemies (Exodus 12), and even the cruel deaths of children who dare to tease one of the prophets (2 Kings). Such passages raise profound questions about the goodness of God and God’s tolerance of pain and suffering for the Chosen People and their enemies.

But pleasure is also given biblical attention. Many of the psalms express joy and pleasure (Psalms 9, 14, 16–18, 21, 23, 30, 34, 40, 47, 48, 65, 84, 92, 97, 98, 100, 126, 149). The Song of Songs is the most famous biblical tribute to the pleasures of a couple's love, filled with sensual descriptions: "Let him kiss me with the kisses of his mouth! More delightful is your love than wine" (Song of Songs 1:1–3). The couple experience great pleasure in beholding the other's beauty and in their physical attributes. While later Christian commentators allegorized the lovers as symbols for the divine and human, the biblical couple's pleasure in each other suggests this model for human relationships as a delight.

The Jewish rabbinical tradition continues this emphasis on the goodness and pleasures of human life. The Jerusalem Talmud (Kiddushin 4:12) includes the story of a rabbi who set aside money so that he could eat from every kind of good food once a year, based on the idea that a person would ultimately be accountable for every permitted pleasure unenjoyed. Judaism also encourages the enjoyment of the Sabbath by partaking in pleasurable things, including sex, good food, and wine. Husbands are obliged to give sexual pleasure to their wives (as well as food and clothing). In Judaism, marriage and its sexual pleasures are goods of creation.

In the Christian scriptures, Jesus rejects the idea that pain and suffering are a result of one's own or one's parents' sinfulness (John 9:1–4). He is attentive to the pain of those who seek healing (Matthew 4:24–5, 8:1–4, 8:28–34, 9:1–8, 15:29–31, 17:14–20, 20:29–34; Mark 1:21–8; Luke 13:10–7, 14:1–6, 17:11–9; John 9:1–12), he enjoys good food and wine with his companions (Luke 7:33–4, 7:36, 14:1; John 2:1–12), and he suffers pain at the hands of his executioners (Matthew 27:26–50; Mark 14:43–5:41; Luke 22:47–53:49; John 18:1–19:30). Jesus's suffering on the cross will become a central theme in Christian treatments of pain and pleasure and also anticipates a shift in the Christian understanding of the place of pleasure from its positive Jewish roots. Jesus's willingness to suffer and die, interpreted as his atoning death for the sins of humankind, models how the Christian should respond to pain and suffering with humble acceptance.

In a number of passages in his letters, Paul writes of his willingness to suffer (2 Corinthians 6:3–10, 11:16–33, 12:1–10). He also writes about the temptations of the body (1 Corinthians 5:1–13, 6:12–20; Galatians 5:16–24; 1 Thessalonians 4:3–5) and suggests that it is better to forego the pleasures of marriage for the higher good of self-restraint, evidencing the Greek roots of his thought (1 Corinthians 7:1–40). Paul is often credited (or blamed) for introducing a dualistic understanding of body/soul to Christian anthropology.

Western Historical Perspectives

Christian attention to pain and suffering grew in the first three centuries, especially because of persecutions by Roman authorities. Christian martyrs were admired for their willingness to endure pain for the sake of their faith (e.g. Saints Lucy, Agnes, Cecilia, Bartholomew, Lawrence) and their stories provided inspiration for Christians up to the present. Tertullian, a third-century theologian, famously wrote that "the blood of the martyrs is the seed of the church" (*Apology* 50). But once Christianity became the official religion of the Roman Empire in the early fourth century, there was no more physical ("red") martyrdom. New forms of "white" martyrdom developed: "white" because pain and suffering were bloodless and voluntary, taken up by ascetics seeking a way to forego the pleasures of food and sex for the sake of their salvation. The stories of the desert fathers provided inspiration for Christians, as

these ascetics willingly endured temptation and physical pain. Monasticism, which developed in the fifth century, was an organized form of communal life in which the worldly pleasures of wealth, sex, and power were renounced through vows of poverty, chastity, and obedience. It should be noted, however, that Benedict (480–ca. 547), the founder of Western monasticism, preached moderation in all things, including asceticism.

Augustine (354–430) picked up on this ambivalent attitude toward pleasure, particularly with his idea of concupiscence, the inordinate desire of the self for its own gratification. Scholars credit (or blame) Augustine for the Christian tradition's subsequent suspicion of sexual pleasure. For Augustine, sexual pleasure could not be separated from its root in concupiscence, thus all sexual pleasure was tainted by sin. Although Augustine did not wholly condemn sex, defending it as a good creation of God, he nevertheless claimed that before the Fall of Adam and Eve, sex between husband and wife would have been purely rational and solely for the purpose of reproduction. It is also worth noting that for Augustine, sexual sins were always serious sins. This categorization of sex as “grave matter” put sexual (“venereal”) pleasure under a cloud of suspicion that remains up to the present.

The medieval period saw a blossoming of spirituality, much of it based in the courtly love traditions. The mystics of this time, both men and women, drew on the Song of Songs for inspiration and the metaphor of the “spousal” relationship between God and the soul was richly developed. Spiritual writers expressed their pleasure in their relationship with God, often in very sensual terms, but also wrote of their desire to participate in the pain and suffering experienced by Jesus on the cross. Such mystics as Hildegard of Bingen (1098–1179) and Julian of Norwich (ca. 1342–ca. 1416) asked God for illness and suffering; Catherine of Siena (1347–1380) kissed lepers' wounds. The famous Bernini sculpture of Teresa of Avila (1515–1582) in the church of Santa Maria della Vittoria in Rome shows the saint being pierced by an arrow held by an angel; Teresa herself writes: “The sweetness caused by this intense pain is so extreme that one cannot possibly wish it to cease, nor is one's soul then content with anything but God” (Lewis and Zimmerman 1916). This conflation of pleasure and pain in spiritual experience was common in the mystical tradition.

But the deliberate infliction of pain was also a tool used by both secular authorities and the Roman Catholic Church to punish criminals and to root out heretics, especially during the inquisition. Originating in France in the twelfth century, the inquisition sought to counter heresy within the church through various means of questioning and torture. While torture had been practiced by Rome and by some of the European societies where Christianity had spread, and while Augustine had only reluctantly justified physical punishment as a part of the civil jurisdictional system, the Catholic church did not explicitly condemn torture until the early nineteenth century. It was practiced in various horrific forms by the Spanish and Portuguese Inquisitions and in the persecution of suspected witches in Europe and the early American colonies by both Catholics and Protestants. The thumbscrew and rack, to name only two of the devices, were used to extract confessions, but even if a confession was made, the tortured person often either died or suffered permanent damage. In the case of the persecution of witches, if a suspected witch were thrown into a body of water and did not drown, this would, ironically, indicate her guilt. In addition, the burning of witches or heretics at the stake was practiced by both Catholics and Protestants. These punishments and tortures were morally justified by the argument that the sinner's/victim's eternal salvation was at stake and thus extreme measures were permitted. It should be noted as well that torture was also practiced widely around the world in different cultures and religious traditions.

By the eighteenth century, torture and public executions became less tolerated in European society, with prisons replacing them as forms of punishment. Jeremy Bentham (1748–1832), the English philosopher who developed the theory of utilitarianism, designed the prison as a panopticon, later theorized by Michel Foucault; the purpose of the panopticon prison was to maintain control over a prison population that would not know if it was being observed or not. As a replacement for torture, prison did not involve inflicting physical pain on the prisoner.

Bentham is also significant for the purposes of this entry for his theory of hedonism, which held that an action could be judged by the amount of pleasure or pain that it produced; he developed the “hedonic calculus,” which measured the potential pain or pleasure that actions would involve. For Bentham and utilitarians such as John Stuart Mill, pleasure was an intrinsic good; but for Christian ethics – and for Jewish and Muslim ethics as well – pleasure is not an end in itself. The purpose of human life is ultimately to share life with God. Pleasure may be a result of living a virtuous life, but, especially for Christian ethics, the willingness to endure pain and suffering for justice’s sake is equally if not more important.

A final significant figure in a historical consideration of pleasure and pain for religious ethics is Sigmund Freud (1856–1939). As a physician originally trained in neuroscience, Freud believed that human beings naturally sought pleasure and avoided pain. While infants are driven by this dynamic, the mature person is able to defer pleasure for other goods. But perhaps even more significantly, Freud’s psychosexual developmental understanding of the person was based in the ideas that sex is the driving dynamic in human life and that all pleasure has a sexual basis. Each stage of life is a process of working through various conflicts so that one might arrive at a mature (atheistic) stage where one’s neuroses and “hysterical misery” can be transformed into “common unhappiness.” Freud was indirectly influential on Christian ethics as the tradition became more accepting of sexual pleasure as a good in itself.

Hinduism, Buddhism, and Islam

Although this entry is focused largely on Christianity and, to a lesser extent, Judaism, Hinduism, Buddhism, and Islam have important contributions to make in considering pain and pleasure. Hindu ascetics practiced sometimes extreme forms of asceticism and yogic practices. For Buddhism, the awareness that suffering is caused by desire is one of the “Four Noble Truths.” In becoming more aware of one’s reality through practices of mindfulness, and following the Noble Eightfold Path, the person can come to see that reality is not under one’s control, and that seeking pleasure or pain is ultimately seeking an illusion. Ideally, one develops enlightenment in the detachment from desires. Pleasure and pain are thus two realities which have no intrinsic significance.

Islam is guided by the idea of the supreme power of Allah. Everything comes from God and one’s pain and suffering, whether they come from natural causes or are a consequence of human actions, can be interpreted in different ways: as punishment, as a test or trial, as an opportunity for purification or the expiation of sin, and as potentially transformative. The devout Muslim should respond to pain and suffering with patience and confidence in Allah’s mercy and power. While the pleasures of this world are permissible as long as they are seen in relation to the divine, the ultimate pleasures will be experienced in paradise. Other religious traditions, such as some Native American peoples, also practiced forms of self-mortification in preparation for certain rituals or battle.

Contemporary Issues

There are a number of ethical issues related to pleasure and pain in the present: how contemporary thinkers consider the pain and suffering inflicted by human beings on each other and on nonhuman life, how pain is or should be treated in situations of physical suffering and end-of-life care, and the role of pain and suffering in a virtuous life. In relation to pleasure, issues include how pleasurable created goods are valued religiously and the complex set of questions related to sexual pleasure.

Genocide and Torture

The question of pain and suffering has loomed large in the twentieth century, due in large part to the atrocities visited by human beings on their fellow creatures. The Holocaust has become a symbol for human inhumanity to other humans, as millions of people, primarily Jews, were tortured and murdered in the Nazi “final solution” by their neighbors and government, and as other genocidal events (Armenian, Cambodian, Bosnian, Rwandan) have erupted worldwide. Genocide, the intentional action to kill an entire people because of their religion, race, or ethnicity, is a “crime against humanity,” under international law yet it continues into the present as religious, political, economic, social, and geographic forces pit peoples against each other.

Torture is also prohibited under international law, yet it too persists, often justified as necessary in order to prevent a greater loss of life. As global terrorism has increased, the morality of the use of torture has come increasingly under debate, with proponents arguing that extracted confessions could provide valuable information that could save many lives, while others continue to maintain that torture is always intrinsically evil, never to be allowed, and that it ultimately corrupts those who torture and the groups (governments, military, citizenry) that allow it. Photographs from the Iraqi prison Abu Ghraib in 2004 showed American soldiers torturing and humiliating Iraqi prisoners, leaving not only physical but also psychic wounds, and leading to a chorus of protests and condemnations and later court-martials for the military personnel involved. But there remain a significant number of people, including political leaders, who maintain the usefulness, if not the morality, of the use of torture. While some argue that religious persons can, in limited circumstances, justify torture for the sake of a greater good, the vast majority of religious authorities condemn torture for its assault on human dignity, both for the torturer and especially the one tortured.

Animals

The question of whether it is moral to inflict pain on animals is a related issue to the deliberate infliction of pain on human beings. Animals are sentient creatures and experience pain. There are laws against animal abuse and organizations for the protection of animal welfare in much of the world; religious traditions see nonhuman life as part of God’s creation and worthy of human protection. Some religious traditions prohibit the consumption of some animals (e.g. Hinduism), while others (e.g. Jainism) prohibit the destruction of all life, even insects. Studies indicate that persons who torture animals are more likely subsequently to inflict cruelty on human beings. Medical research on animals, which can involve inflicting pain, has led to advances in human diseases, but is also controversial. The

morality of the widespread use of factory farms, which involve confinement in small spaces, use of antibiotics, and sometimes mutilation, is questioned on a number of grounds: the harm to people (e.g. through antibiotic use), the harm to the environment, and, most significantly, the harm to the animals themselves. Although animals are unable – at least in human terms – to express themselves, and thus lack what is understood as reflective intelligence, religious traditions see all of creation as worthy in the eyes of God.

Physical and End of Life Pain

The pain of childbirth was long understood by Christianity as a consequence of the first woman's disobedience, but when medical anesthesia became available in the mid-nineteenth century, few opposed its use, other than a few religious leaders. The relief of pain is considered to be a responsibility of ethical healthcare. But the deliberate and voluntary infliction of pain is also a religious practice. Some Shi'a Muslims ritually commemorate the martyrdom of Imam Hussein, the grandson of the Prophet, who died in 680 at the Battle of Karbala, by voluntarily flagellating themselves in solidarity with this tragic event. Some Christian ascetics also practice self-flagellation as a discipline and as pious imitation of the scourging of Christ before his crucifixion. For some religious traditions, willingly enduring pain is a sign of virtue and spiritual advancement. There is also some research that indicates that religious faith may help in enduring pain. The crisis of opioid abuse in the early twenty-first century is in part a result of better pain management through prescribed medications, but it has also resulted in addiction to the pleasurable "high" that results from these same medications.

Given modern advances in medical care, people are living longer with serious illnesses than in the past. The "death with dignity" and "right to die" movements have largely been based in the idea that no one should be forced to suffer intractable pain, particularly at the end of life. Some countries and US states have passed legislation allowing for assisted death. Even despite advances in pain management, adherents of this position argue that people suffering from incurable and painful illnesses should be allowed to end their lives voluntarily, in full control of their minds, and without unbearable pain. Religious traditions are, with a few notable exceptions, opposed to physician-assisted death, although many also make the point that extraordinary measures need not be taken to prolong life unnecessarily.

Pain and suffering are inevitable parts of life. While no one should be forced to suffer and while suffering should be alleviated if at all possible, it is not possible to eliminate pain entirely. Religious traditions approach the significance of pain and suffering with a variety of responses. Hinduism teaches that our sufferings are the result of actions in our previous lives. Buddhism teaches that suffering is caused by desire; human beings should seek to eliminate their attachments to worldly things through contemplation and compassion for others. Judaism and Islam maintain a confidence in God's providential love and care for humanity. Judaism also has a long tradition of lament and complaint against God without loss of faith. Christianity's belief in original sin sees pain and suffering as the result of the "Fall," and that the salvific death of Jesus Christ, God's Son, frees humanity from eternal punishment.

Pain and suffering can, in some situations, result in a greater awareness and deepened appreciation of the human condition. But religious traditions insist that this point should never be used to justify them.

Liberation theologians condemn ideas that suggest that suffering is to be endured for a greater reward in the next life and work for the alleviation of pain and suffering, especially that resulting from injustice. Christian feminist theologians in particular have been critical of atonement theologies which interpret suffering as positive and necessary, and which encourage women and other oppressed people to endure suffering without complaint or resistance. Black womanist theologians have especially challenged ideas of surrogacy that see bearing burdens for another as virtuous. In sum, pain and suffering are largely understood religiously as a consequence of finitude, sin, or human frailty, to be responded to with compassion and efforts to ease them. While they can be a potential source of growth, pain and suffering are never to be seen as good in and of themselves.

Pleasure

Although life is inevitably painful at times, it is also filled with many pleasures: the beauty of natural surroundings, of other people and relationships, food, the arts, sex. Religious traditions, for the most part, see the beauty and pleasures of the world as goods to be enjoyed, but in moderation and never at the expense of others. The Roman Catholic “sacramental principle” sees the potential of divine revelation in all of creation; the “heavenly banquet” is often used as a symbol of eternal life.

Some ascetical practices are intended not so much to produce pain, but rather with the idea that depriving the self of given pleasures for a time increases one’s awareness of dependence on God and of the worth and fragility of human pleasures. The Jewish marital practice of abstaining from sexual intercourse during and after the woman’s menstruation is also intended to enhance sexual pleasure when relations are resumed. Similarly, the practice of “giving up” a particular pleasure in (Christian) Lent is meant to imitate Christ’s time in the desert before his public mission, to train the person in greater self-control and to increase one’s hunger for God. During the month of Ramadan, Muslims fast during daylight hours but feast after sunset; they are also obliged to donate to charitable causes. Jews fast on Yom Kippur and remember their sins.

Sexual pleasure has been a topic of much religious discussion and debate, especially in Christianity. As noted above, Augustine viewed sex for pleasure as intrinsically sinful; masturbation, sex outside of marriage, and same-sex relationships – all of which involve sex for pleasure – were and continue to be condemned as sinful in conservative Protestant traditions and in official Catholic teachings. In Roman Catholicism, even marital sex without the potential for procreation is seen as sinful, despite the fact that many Catholics use some form of “artificial” birth control. While Judaism and most mainline Protestant traditions permit the use of contraceptives, it was not until Vatican II (1962–1965) that Roman Catholicism acknowledged that the “unitive” purpose of marital intercourse, distinct from its procreative purpose, was one of the God-given “ends” of marriage.

Feminist theologians have observed that little if any attention has been given to women’s sexual pleasure, which is not connected to procreation; nearly all of the religious literature condemning masturbation refers to its practice by men, probably reflecting older beliefs that held that the male seed held the whole person, to be nurtured in the woman’s womb. The erotic, seen as a quality of the divine, is celebrated as delight in the pleasures of creation, including sexuality. Religious traditions, however, overwhelmingly see pornography as sinful. Pornography, its critics claim, objectifies sexual partners and thus violates human dignity, challenges the virtue of self-control, and disconnects sexual expression

from relationships. Related practices, such as bondage or sadomasochism, in which sexual pleasure is derived from inflicting or receiving pain, are also condemned as violations of human dignity.

Pleasure and pain play significant physical and spiritual roles in religious traditions, and there is much debate about how they are and are not appropriate means of growth in the person's moral and spiritual development. While Judaism has largely had a benign view of human pleasures enjoyed in moderation, Christianity has a more complex understanding of the role of pain and pleasure, given the central significance of the Cross.

CHAPTER 115

Reproduction

Cristina L. H. Traina

Historically, religious ethics of reproduction correlated with religious visions of heterosexual marriage, which were in turn bound up with civil and religious law, women's social and religious standing, and theological and philosophical evaluations of nature and the "natural." Typically religious ethics of reproduction were religious ethics of sexuality, because fertility was poorly understood and nearly impossible to control outside of sexual abstinence. With the exception of some Tantric practices, most religious traditions have limited genital sex to heterosexual unions in religiously-sanctioned marriages in which children would be recognized both religiously and civilly. Although contraception, abortion, same-sex relations, and infertility (the latter, grounds for divorce in some traditions) were certainly concerns, it is fair to say that before the twentieth century religious reproductive ethics spent most of its energy on monitoring genital sex between men and women.

Advances in reproductive medicine, the associated increasing prevalence of assisted reproductive technologies (ARTs) and contraception, and the expanded availability of medical abortion have inspired changes in scholarly and clerical religious ethics of reproduction and also in religious reproductive practices. Increasing acceptance of same-sex and intentionally single parenting are also transforming religious ethics of reproduction. In general, religious ethics naturalize reproductive science, technology, and new household models by using traditional methods to reinterpret existing religious understandings of "natural" reproduction, altering moral traditions in the process.

This entry outlines some of the main tendencies and patterns in recent religious ethics of reproduction. Its main examples are drawn from Hinduism, Buddhism, Islam, Judaism, and Christianity, but its basic questions are relevant to all traditions.

Starting Points

Marriage, Sex, and Family

Although religious groups with monastic and hermitic traditions (like Buddhism, Eastern Orthodox Christianity, and Roman Catholicism) can be ambivalent about reproduction because of the spiritually distracting attachments that sex and children pose, major religious groups nonetheless envision a divine or cosmic purpose that values human reproduction. This purpose might be a matter of the Jewish and

Christian divine command, “Be fruitful and multiply!” (Genesis 1:28), the Buddhist concern to provide opportunities for souls to achieve enlightenment, or Hindu and Confucian hopes for offspring to carry out ritual responsibilities. Local economic, political, and even geopolitical circumstances can amplify or damp this affirmation: for instance, economic recessions, Israeli pronatalist policies, China’s former one-child law, or the structures of health-care coverage.

Religious groups have also traditionally placed reproduction within heterosexual marriage. The “natural” family into which this marriage is placed is not always a nuclear household (father, mother, children) but may be an extended family, with decisions about reproduction spread among many stakeholders. In addition, if fertility or marriage itself is a challenge, the religious ritual or legal traditions set priorities by defining family “cores” that may trump other religious guidelines for reproduction (see table below). For instance, a Confucian father may be willing to overcome an aversion to “wasting” sperm to use pre-implantation genetic diagnosis (PGD) or sperm microsorting with in vitro fertilization (IVF), increasing the chances of the birth of a son who can perform filial rites after his death. Contemporary Hindus may be uncomfortable with *niyoga* – the abandoned practice of a dead or infertile man’s relative impregnating his wife to conceive offspring for him – but it has been suggested as a precedent for artificial insemination by donor (AID). Orthodox Jews may be more concerned about a mother’s lineage than her heterosexual marital status, because Jewishness is passed through the matriline. Or, contemporary infertile Shi’ite Muslim couples reluctant to practice polygamy may nonetheless contract a licit temporary marriage between the husband and a second woman for the purpose of egg donation.

Religious tradition (Traina et al. 2008)	Reductive core of the “natural family”
Hinduism, Confucianism	Father and son
Judaism	Mother and child
Roman Catholicism, Eastern Orthodoxy	Husband and wife, bonded by God (children anticipated and desired; childlessness does not invalidate marriage)
Islam	Husband and wife, bonded by God through children
Buddhism, Protestantism	Depending on local traditions, husband and wife (children optional but anticipated and desired)

In these cases, presented with an apparently indivisible package of interdependent, inherited elements – “natural” family structure, sexuality, sex, procreation, inheritance, gender, and marriage – religious ethics may distinguish or even separate them, prioritizing one or a few over others. For example, in Shi’a Islam patrilineage can take priority over reverence for reproduction through marital intercourse, permitting intercytoplasmic sperm injection (ICSI) followed by IVF. Or, religious ethics adapt to changed social and scientific circumstances by developing new justifications for existing guidelines. For example, Roman Catholicism’s embrace of reproductive medicine and romantic marriage left its ban on contraception in place but allowed it to recommend family planning through timing techniques, arguing for these on the basis of spousal union, self-discipline, and self-gift, not just as a matter of respecting a “natural” process of conception (Kohlhaas 2018, Salzman and Lawler 2016). Either strategy alters the preexisting ethic.

Sources and Authorities

Sources, authorities, and their proportional weights in religious ethics of reproduction vary by tradition. More will be said about this below. Religious law, with accompanying institutions for interpretation and formal rulings, is the highest authority in Muslim and Jewish ethics of reproduction. In many Muslim countries, *Shari'a* (Islamic law) carries civil authority as well, connecting reproductive ethics to laws of inheritance and many other dimensions of daily life. Hinduism, Eastern Orthodox Christianity, Roman Catholicism, and some branches of Protestantism (Anglicans and Episcopalians, Methodists, Presbyterians) also follow religious law to varying degrees, although their law is not as comprehensive and usually is not linked to civil law. Most Protestants first consult scripture (the Hebrew Bible and New Testament). In addition, all traditions maintain some role for human reason, usually authorized by divine or cosmic intent and often exercised on the “laws of nature” it is thought to establish. In practice all groups rely heavily on cultural tradition, returning to their central sources when questions arise. Methods of discernment are addressed below.

Status of Embryos and Fetuses

Religious groups tend to believe that cosmic or divine intent is involved in some way in conception and birth. The rise of reproductive medicine and increasingly sophisticated methods of contraception and abortion have, overall, led to efforts to specify this involvement and its implications for what may and may not be done. A tradition's theory of the time of ensoulment, or the moment of personhood worthy of protection, can vary from the moment of union of sperm with ovum (Roman Catholics and many conservative Protestants) to birth (Jews). Consequences in the former case include Catholic absolute prohibition of abortion and conservative Protestant “adoption” of excess IVF embryos, and in the latter case liberal Israeli abortion law. Still, ensoulment does not dictate all. Roman Catholicism forbids even contraception, which prevents heterosexual intercourse from achieving conception; liberal Protestants who may not agree on the moment of “personhood” nonetheless agree that killing a fetus is sometimes appropriate. No major contemporary tradition embraces infanticide, or the killing of infants after birth.

Gender

Religious law aside, religious moral preference for reproduction within heterosexual marriage has many other roots: a desire to channel sexual desire and give it a purpose beyond pleasure; ritual and sacramental considerations; a concern for stability for offspring; and male-female reproductive complementarity, to name a few. In addition, gender plays a strong role in many religious ethics of reproduction, but not always with the same results. In a *de jure* example, official Catholic teaching and conservative Protestantism embrace the doctrine that men and women possess different, complementary gifts and personalities, so that a household missing a male or female parent is actually an unhealthy environment for children; for them motherhood is all women's true calling, and historically many believed a married woman should not limit childbearing. In a *de facto* example, Athenian Eastern Orthodox women agree that women are meant to be mothers, but by contrast they justify limiting or delaying maternity – even

through abortion – because of their determination to be excellent mothers, realizing their true maternal nature to the greatest degree possible. Thus even when traditions see motherhood as an accompaniment of “natural” femininity, motherhood does not take the same shape or lead to the same reproductive practices in all settings.

Religious Practices of Moral Discernment

Religious ethics of moral discernment typically take one of three forms that overlap in practice. In the Christian and post-Christian West, religious ethics is a scholarly discipline related to philosophical ethics. In addition, Christian denominations have often issued carefully argued position papers on the ethics of reproduction; in other traditions general rulings – like *fatwas* issued by state-appointed Egyptian imams – often function analogously. Globally, however, formal academic and denominational moral arguments are not typical. Rather, religious reproductive ethics is often decentralized and contextual, even individual, and may be most accessible through ethnography. Interpreting religious ethics of reproduction requires careful attention to all three genres of religious ethics.

In addition, representative religious positions on reproductive ethics range from fine-grained, definitive judgments to general guidelines. At one extreme, official Roman Catholic teaching on reproductive ethics is developed by the church’s bishops, cardinals, and pope at the Vatican, the church’s seat in Rome. This binding teaching is based primarily on the natural law – a kind of sharing in God’s creative intentions for the world – whose principles are universally apparent and which Catholics believe God instills in all people. Thus, from the official Catholic perspective, Catholic ethics of reproduction is both centralized – because developed by the church’s highest leaders – and universally applicable – because based in universal reasoning about universal human phenomena.

At the other extreme, for many reasons Buddhist moral reflection is largely local and even individual. First, traditionally Buddhists reject a Western model of exclusive religious identity; one can maintain Buddhist practice alongside Shintoism, or Confucianism, or even Judaism, and these traditions have some weight in one’s moral decisions. Second, Buddhists see people as being at different stages on the path toward enlightenment and therefore toward moral perfection (and the enlightened are sometimes thought to have greater moral freedom than those still on the journey). Finally, although monastic life is highly structured, often by strict rules of behavior, lay life is less so; religious authority in lay Buddhism is decentralized, with a strong focus on local teachers as spiritual guides and on the individual spiritual journey (alongside regionally-inflected devotional practices).

In the middle, Christian Protestant denominations work out statements on reproduction. These are often democratically developed and frequently non-binding. Likewise, Hindu ritual law binds, but flexibly. For instance, even in the past *niyoga* was not the only way for a Hindu man to acquire a ritual son. He could have adopted a son or recognized a son conceived before marriage (or even a son his wife had conceived with another man).

Finally, even traditions with religious law or universal moral rules have mechanisms that account for particularity. Shi’a Islam endorses *ijtihad*, an individualized form of private, reasoned moral discernment, often exercised in reproductive decisions. Greek Orthodox Christians are comfortable with *economia*, granting an exception to religious law – including prohibition of abortion – when an imperfect situation renders it necessary for the greater good. And Catholic priests in many parts of the world have

been known for granting pastoral exceptions to the ban on birth control in recognition of individual conscience and the obligation to promote flourishing.

The two traditions in which adherence to religious law is most central to observance are Judaism and Islam. Both are concerned to prevent adultery in order to preserve family and religious lineage, but with instructively flexible results for assisted reproduction. Jewish *halakhah* traces Jewishness through the matriline and defines adultery as a sexual relationship between a married Jewish woman and a Jewish man who is not her husband. Fascinating possibilities open up: for instance, a married straight or lesbian woman who conceives using sperm from a non-Jewish man bears a Jewish child and does not commit adultery. By contrast, Islamic law traces lineage through the patriline and has a stricter definition of adultery but allows polygamy – hence the Shi‘ite work-around mentioned above, in which a single woman marries a man temporarily in order to donate ova to him and his first wife. Male lineage is maintained. (Sunnī Muslims, more concerned to maintain the genetic link to both parents, forbid all donor gametes.) In addition, Iranian Shi’a Islam manages the prohibition on sperm donation by permitting married couples to donate their embryos to other couples; in this case the value of confirming the marriage through childbearing takes precedence over preserving lineage.

Surprisingly, however, both traditions are also highly decentralized. In both cases, rulings on religious law are local, not universal, and believers are obligated to follow the rulings of local rabbis or imams. In the case of Ultra-Orthodox Judaism, one must follow the ruling of one’s own rabbi, even if it differs from another local rabbi’s opinion.

Challenges for Religious Ethics of Reproduction

The recent disengagement of reproduction from sex has raised new questions with which religious groups are still grappling. In large part they stem from addressing infertility, which is a social and sometimes religious problem, through medicine, rather than through social and religious channels. Below is a sampling of these questions.

Surrogacy

As noted, masturbation to produce sperm for ARTs, adulterous use of third-party gametes and wombs, extra embryos, and extra-uterine fertilization pose challenges to most religious ideals of heterosexual marriage. Religious laws of inheritance and lineage or membership also raise objections.

Surrogacy is particularly challenging because it involves all of these elements of assisted reproduction, not to mention a commitment on the part of an unrelated person that goes far beyond providing gametes. In traditions in which surrogacy is not absolutely prohibited, surrogacy raises issues of justice: access, for intended parents, and exploitation, for surrogates. For instance, only infertile Israeli women are eligible for surrogates. To fulfill their religious obligation to procreate, single and gay partnered men must seek surrogates abroad, with accompanying worries about exploitation; and unless the surrogates are Jewish, their offspring may not be considered Jews. Majority-Hindu India accepts surrogacy but worries that intended parents will exploit poor Indian women (Sallam and Sallam 2016). Among Protestant Christians, Grace Kao is developing theologically-informed norms for surrogates and intended parents that delicately balance self-gift and self-protection, surrogate medical autonomy and parental

involvement, covenant and justice (Kao 2019). Kao's work highlights the moral complexity and singularity of the intimate relationships among surrogates and intended parents, in addition to all the issues discussed at greater length above. The ethics of surrogacy is an important frontier for all traditions of religious ethics because it will clarify so many moral arguments, methods, and priorities in the ethics of reproduction.

Two fertility procedures that do not disrupt the links among heterosexual coitus, conception, and birth – uterine and ovarian tissue transplants – may meet less religious ethical resistance than surrogacy, and ethical arguments about them will also be revelatory. First, homologous and heterologous ovarian transplants are beginning to be discussed for women whose ovaries are diseased or compromised by chemotherapy. Religious ethical rulings on heterologous ovarian tissue transplants will reveal whether traditions that value unimpeded process of conception, spousal gametes, and restrictive ethics of transplant value one more highly than the others (Lauritzen and Vicini 2011). Second, reflection on uterine transplants will reveal other hierarchies of value. For instance, many Sunnī jurists forbid all transplants and others, transplants that are not essential to the health of the recipient. These judgments would rule out uterine transplants for Sunnī Muslims, even though such transplants would permit women to conceive with their own eggs through marital intercourse, with no disruption of conception or confusion of lineage (Padela and Clayville 2018). The same reasoning might make them acceptable to Greek Orthodox, for example.

An additional challenge for religious ethics of reproduction is that, just as the burden of “natural” pregnancy falls on women, so does most of the medical burden of ARTs (male infertility is usually not socially burdensome to men, but medical treatment of it is). Religious women whose communities might previously have accepted their infertility and provided them alternative vocational pathways can face religious and cultural pressures to do everything possible to conceive and bear children, at great personal and financial cost. Granted, the fear that the advent of ICSI would lead to abandonment or second marriages among Shi'ite Muslim women whose infertile husbands need help conceiving has not been realized (Inhorn 2012). Still, traditions that accept ARTs have not yet developed rigorous religious ethical arguments that protect women in couples with fertility challenges from the double burden of vulnerability to social, emotional, and economic harm and of painful, burdensome, and expensive medical procedures. Option can easily become obligation, reinforcing rather than loosening pronatalist doctrines of marriage.

Intentional Single Parenthood and Same-Sex Parenthood

One of the strongest religious cases for ARTs is that they permit heterosexual married couples to conceive and raise the families that would be theirs absent their infertility. In essence, they provide fulfillment of a divine or cosmic intention that would otherwise be impossible to them. The ends justify the means: “Natural” ends canonize “unnatural” procedures. In most religious communions, intentional single and same-sex-couple parenthood do not carry the same procreative mandate (with the exception of orthodox Judaism, in which the procreative mandate applies to all, with the assumption that it will be accomplished in heterosexual marriage), and same-sex marriage is recognized in only a few liberal communions. Religious arguments for same-sex use of ARTs and surrogacy can proceed in several mutually non-exclusive ways: by analogy with heterosexual marriage, accepting the marriage as valid and infertile; as fulfilling the partners' deepest natures of maternity or paternity; and as enabling genetically

connected offspring. All three arguments, as well as Judaism's procreative mandate, reinforce the "nuclear" two-parent, genetically related family as the reproductive norm, albeit without parental sex and gender complementarity.

Single parenthood is harder to justify on this model, but easier to defend on gender essentialist grounds: a person's divinely-given masculinity or femininity yields the calling to become a father or a mother, whether or one is partnered or not. For women, single parenthood through AID and related means carries an additional cachet of virtue: self-sacrificial motherhood without sex (Kahn 2000); and serving as a surrogate mother can be read as self-sacrificial gift (Kao 2019). ARTs and surrogacy remain challenging for single and same-sex partnered Orthodox Jewish men, given halakhic debates over whether a Jewish woman's egg or a Jewish birth mother is the criterion of Jewish offspring.

Eugenics and Gene Editing

Although some religious ethics that embrace ARTs have endorsed preconception testing for genetically transmitted diseases (most famously, Jewish endorsement of testing for Tay-Sachs disease), ARTs press at the boundaries between avoiding and curing illness, and between curing and enhancing persons. ARTs also provide opportunities for exercising sex preference without resorting to infanticide or even abortion. PGD permits embryo selection both for sex and against known disease. Religious ethical judgment depends on a number of factors: whether there is a religious obligation to produce both male and female offspring (e.g. Judaism); whether there is a religious obligation to prevent suffering (e.g. Buddhism can be ambivalent, as suffering can overcome bad karma); and whether there is a religious case to be made that social and social justice effects trump individual freedom (private decisions to select for gender have skewed China and India male and Japan, female (Fuse 2013), with consequences for society). Germ line gene editing in theory provides opportunities for deleting and replacing harmful genes, or introducing genes thought to be advantageous. Although decisions not to risk passing on a known genetic disease – and even decisions about with whom to procreate, whether sexually or (recently) through AID – have long been acceptable, religious ethicists from most traditions agree that the new level of intervention and new degree of permanence that germ line gene editing represents urges caution or even prohibition.

Cultures of Reproduction

In the Global North and West, contemporary ethics of reproduction tend to focus on the process of reproduction: sexual or medical acts, the origin of gametes, the sites of fertilization and gestation, and the status of the fetus or embryo. Questions that are peripheral or nonexistent in the religious ethics of these countries can take center stage elsewhere.

One concern that spans geography and tradition is the commercialization of conception and child-bearing, which in all traditions ideally begins with the sexual union of spouses but which is monetized when medical assistance is required. Most traditions that accept ARTs oppose payment for gametes and embryos; even payments in Shī'ite temporary marriages contracted for egg donation are for the marriage, not for the eggs. Similarly, many traditions are leery of high surrogacy fees and concerned about exploitation of poor and foreign women as surrogates. In part in response to concerns about monetization, Israeli surrogacy law limits the payment that Israeli surrogates may receive.

In addition, belief in reincarnation can involve the question, how do the parents' intent and state of mind at the time of conception affect the "worthiness" or "quality" of the soul to be born ("Medical Ethics" 2002)? In this case ethics of reproduction is as much about proper religious mentoring, prayer, spiritual discipline, and self-sacrifice as it is about the procedures of conception, pregnancy, and birth.

Finally, religious traditions have different cultures of adherence to declared religious norms. For instance, in the United States Roman Catholic women use contraception and have abortions at about the same rate as other women, despite the Vatican's prohibition of both (Jones and Dreweke 2011). Ultra-Orthodox Israeli women obey their rabbis and rabbinically-approved doctors in matters of reproduction but often try to see both as infrequently as possible (Raucher 2020). For women seeking to conceive, definitions of *hishtadlus* (adequate effort) can be elastic (Kahn 2006).

Conclusion

The strategies by which religious ethics naturalize reproduction are most visible in their responses to cases that challenge the norm of reproduction within heterosexual marriage: infertility, reproduction outside heterosexual marriage, and the like. Their treatments of these very common "exceptions" reveal their priorities and methods, as well as working subtle transformations in both.

CHAPTER 116

Subject Formation and Subjectivity

Jonathan Schofer

The first task to address with regard to “subject formation” and “subjectivity” is the range of scholarship and formulations to take as salient. In *Oneself as Another*, Paul Ricoeur addresses in detail the significance of “philosophies of the subject,” and their relation to the first-person standpoint of “I” encountering others and the world. He also expounds the role of the “speaking subject,” or the person “who designates himself or herself as an I” and carries out speech acts with and in relation to others (Ricoeur 1995, 4, 41, and more generally 1–26, 40–55). Exemplary as these studies are, Paul Ricoeur’s influence in contemporary ethics on these points is found not so much in an expansion of conceptualization and analysis of “subject formation” and “subjectivity,” but rather in a precise clarification of the role of “the first person” standpoint, and of the social role of a speech-act, when considering both the person engaging in moral action, and those who are objects of moral concern (Schweiker, Wall, and Hall 2002). The proliferation of interest in “subject formation” needs to acknowledge that it is really the controversial and at times problematic, yet also insightful, scholarship of Michel Foucault and its influence, whose formulations and observations have been at the root of the use of this concept. The writings of Foucault, and their mediation to researchers in religious ethics by way of Judith Butler and Talal Asad, have generated a large body of work in and relevant to religious ethics, and to some extent the trajectory of scholarship has corrected the excesses and imprecisions in Foucault’s own terminology, and to some extent the weaknesses in Foucault’s work carry through to recent studies. The attraction of Foucault’s examination of “subject formation” as a starting point for inquiry in religious ethics is that the term defines an approach to persons in social relations that attends closely to the pervasive and also complex roles that hierarchy, coercion, force, resistance, and subversion play in those social relations. From this starting point, other lines of inquiry in religious ethics appear naïve or simplistic in their presumed or actual treatment of these features of social life, which Foucault and those following him often gather as part of the broad term, “power.”

In a highly influential interview, Foucault summarizes the roles of his own studies as:

Three domains of genealogy are possible. First, a historical ontology of ourselves in relation to truth through which we constitute ourselves as subjects of knowledge; second, a historical ontology of ourselves in relation to a field of power through which we constitute ourselves as subjects acting on others; third, a historical ontology in relation to ethics through which we constitute ourselves as moral agents.

(Rabinow 1984, 351–352)

Understanding subjectivity and subject formation, on this account, demands historical analysis of the documented ways that truth, power, and ethics have operated in the world. This historical analysis, Foucault asserts, is deeply connected with “ontology” denoting the nature of the existence of truth, power, and ethics not only in the past but also very importantly in the present.

Foucault’s *The Order of Things*, as exemplary or inspirational for the study of “subjects of knowledge,” opens by saying that he aims to carry out a “history of science and thought” that does not give “pride of place” to the “noble sciences” of “mathematics, cosmology, and physics,” but rather to “the combination of corresponding transformations that characterized the appearance of biology, political economy, philology,” and new approaches to philosophy “at the threshold of the nineteenth century” (Foucault 1970, ix–xii). Foucault attends to changes, particularly “the suddenness and thoroughness with which certain sciences were sometimes reorganized; and the fact that at the same time similar changes occurred in apparently very different disciplines,” but he admits that he has difficulty explaining causation. On one hand, Foucault asserts, “the traditional explanations – spirit of the time, technological or social changes, influences of various kinds – struck me for the most part as being more magical than effective,” yet he does not offer a new response and writes instead, “I left the problem of causes to one side” (Foucault 1970, xii–xiii). *The Order of Things*, then, provides a model for scholars of subject formation to address the procedures through which authorized knowledge develops, changes, and conditions understandings of persons themselves, as at least one “axis” of understanding humans in social relations as part of religious ethics.

The study of power and subject formation, for Foucault, begins quite directly with the examination of public executions and punishment. He identifies the importance in the eighteenth century of “the ‘great reformers’ – Beccaria, Servan, Dupaty, Lacretelle, Duport, Pastoret, Target, Bergasse, the compilers of the *Cahiers*, or petitions, and the Constituent Assembly” (Foucault 1977, 75), and also responses at individual and social levels that led to:

a whole complex mechanism, embracing the development of production, the increase of wealth, a higher juridical and moral value placed on property relations, stricter methods of surveillance, a tighter partitioning of the population, more efficient techniques of locating and obtaining information: the shift in illegal practices is correlative with an extension and a refinement of punitive practices.

(Foucault 1977, 77)

By the “turn of the eighteenth and nineteenth centuries,” detention was made “the penalty *par excellence*” (Foucault 1977, 231). Disciplines had “long been in existence – in monasteries, armies, workshops. But in the course of the seventeenth and eighteenth centuries the disciplines became general formulas of domination.” A distinctive “art of the human body was born, which was directed ... at the formation of a relation that in the mechanism itself makes it more obedient as it becomes more useful.” In sum, “disciplinary coercion establishes in the body the constricting link between an increased aptitude and an increased domination” (Foucault 1977, 136–138). The prison “carries to their greatest intensity all the procedures found in the other disciplinary mechanisms” (Foucault 1977, 236). The discipline of the prison as the site for detention as punishment for crime, then, intensified the broader spread of discipline and docility in eighteenth-century France and beyond. This emergence of discipline as a focus and goal (most pronounced in the prison but visible and active in the domains of religion, military, and production) is for Foucault the most pervasive way that power relations have conditioned subjectivity since the nineteenth century in Europe.

Ethics is addressed directly by Foucault in volumes two and three of *The History of Sexuality*. In these works, Foucault departs from his expertise in the history of modernity in Europe and the United States, and he studies sources from ancient Greece and Rome. His inquiry into sexuality led him to consider sexuality in the broader frame of ethics. Ethics, in turn, is studied as part of the threefold axes of the subject, and Foucault's "historical ontology" of moral agency attends to dimensions of ethical life that researchers trained in ethics often find both relevant and neglected: diet, marriage, and sexuality. Foucault's research in ethics has components that today's scholars in religious ethics might find unexpected, but for Foucault they need to be addressed as part of the overall formation of moral subjects. For example, in Hippocratic collections, diet and regimen provide the context for sex:

If in fact sexual acts were a proper concern of regimen, and if they required "moderation," this was because they produced – through the motions of the body and the ejaculation of semen – warming, cooling, drying, and moistening effects. They raised or lowered the level of each of the elements that were responsible for the body's equilibrium. Hence they also altered the relationship between this equilibrium and the interaction of these elements in the outside world: heating or drying, which might be good for a cold, moist body, would be less so if the season and the climate were themselves hot and dry. It was not the function of regimen to prescribe quantities and determine rhythms: given relations that could only be defined in terms of general characteristics, the role of regimen was to negotiate qualitative changes and make such readjustments as were necessitated by circumstances.

(Foucault 1985, 115)

A key point here, then, is that moderation in sexual acts can be part of any number of aims and purposes, and the place of pleasure in a life-course has to be understood in relation to the multiple standards that condition practices. The writings of Hippocrates and perhaps also Plato present a world where regimen "characterized the way in which one managed one's existence, and it enabled a set of rules to be affixed to conduct" (Foucault 1985, 101). Marriage is another practice, that, at least in some sources, "calls for at least some sort of sexual moderation," whether understood through "a political regulation that is imposed" or by "deliberate self-limitation" of the husband's power (Foucault 1985, 166–167). The study of ethics as a part of subject formation, then, draws attention to the social practices of diet and marriage, and their regulation or guidance by authoritative experts, as points of inquiry.

Foucault's study of ethics in ancient Greece develops conceptual tools that can be transferred to other areas of research. First, Foucault specifies the relations between ethics and gender for this particular set of materials:

It was an ethics for men: an ethics thought, written, and taught by men, and addressed to men – to free men, obviously. A male ethics, consequently, in which women figured only as objects or, at most, as partners that one had best train, educate, and watch over when one had them under one's power, but stay away from when they were under the power of someone else (father, husband, tutor).

(Foucault 1985, 22)

Second, Foucault defines his primary interest as "the manner in which one ought to 'conduct one-self' – that is, the manner in which one ought to form oneself as an ethical subject acting in reference to the

prescriptive elements that make up the code. Given a code of actions ...there are different ways to 'conduct oneself' morally ..." (Foucault 1985, 26). Third, Foucault sets out four categories to consider in the formation of the ethical subject: (1) the "*determination of the ethical substance*; that is, the way in which the individual has to constitute this or that part of himself as the prime material of his moral conduct," such as the "mastery of desires" or the resisting of "temptations," (2) the "*mode of subjection (mode d'assujettissement)*" that is, ... the way in which the individual establishes his relation to the rule and recognizes himself as obliged to put it into practice," (3) the "forms of *elaboration*, of *ethical work (travail éthique)* that one performs on oneself, not only in order to bring one's conduct into compliance with a given rule, but to attempt to transform oneself into the ethical subject of one's behavior," and (4) the "*telos of the ethical subject*" which includes that a "moral action tends toward its own accomplishment" and also "commits an individual, not only to other actions always in conformity with values and rules, but to a certain mode of being, a mode of being characteristic of the ethical subject" (Foucault 1985, 26–28). For scholars of religious ethics, this set of concepts may be considered with affinity to those of virtue ethics, but perhaps with added subtlety to capture the complexity of ethics as lived in multiple facets of social life and interaction. Perhaps most important, Foucault's categories fully consider rules and codes, religious and otherwise, to be appropriate starting points for inquiry, yet his interest in the variety of ways that people may "conduct" themselves in relation to rules, and the variety of codes and rules that he addresses, expand productively the range of sources and domains of life that scholars of religious ethics might address.

One corrective to elements in Foucault's studies is carried out by Michel de Certeau in his, *The Practice of Everyday Life*. De Certeau sets out the metaphor of pedestrian walking to illustrate the range of possibilities that exist for people in the course of action: "The act of walking is to the urban system what the speech act is to language or to the statements uttered" (De Certeau 1984, 97). De Certeau elaborates:

First, if it is true that a spatial order organizes an ensemble of possibilities (e.g. by a place in which one can move) and interdictions (e.g. by a wall that prevents one from going further), then the walker actualizes some of these possibilities. In that way, he makes them exist as well as emerge. But he also moves them about and invents others, since the crossing, drifting away, or improvisation of walking privilege, transform or abandon spatial elements.

(De Certeau 1984, 98)

For De Certeau, the research of Foucault gives readers an account of the "spatial order" and relevant "possibilities" and "interdictions," but not the processes by which one "actualizes" some and not others. De Certeau is also particularly interested in forms of "improvisation" and innovation that he considers lost in the works of Foucault.

The analytic development of the term "subject" and the related "subjection" beyond Foucault is perhaps most indebted to Judith Butler. In her work, *The Psychic Life of Power*, Butler builds a theoretical account of subjection that draws explicitly from Hegel, Nietzsche, Freud, Foucault, Althusser, and Lacan. For her, the breadth of Hegel, the attention to confrontation in Althusser, and the psychoanalytic depth and richness of Freud and Lacan, all generate fullness in the conceptualization of subject formation that must be added to Foucault's outlook in order to address power in life. She opens by writing:

As a form of power, subjection is paradoxical. To be dominated by a power external to oneself is a familiar and agonizing form power takes. To find, however, that what "one" is, one's very formation

as a subject, is in some sense dependent on that very power is quite another. We are used to thinking of power as what presses on the subject from the outside, as what subordinates, sets underneath, and relegates to a lower order. ... But if, following Foucault, we understand power as forming the subject as well as providing the very condition of its existence and trajectory of its desire, then power is not simply what we oppose but also, in a strong sense, what we depend on for our existence and what we harbor and preserve in the beings that we are.

(Butler 1997, 1–2)

She continues, “Subjection consists precisely in this fundamental dependency on a discourse we never chose but that, paradoxically, initiates and sustains our agency.” For Butler, “‘Subjection’ signifies the process of becoming subordinated by power as well as the process of becoming a subject” (Butler 1997, 2). Butler’s strength and weakness in the study of subject formation is her commitment to connecting theories of power with psychoanalytic theories of the psyche. These two approaches oppose each other significantly, and Foucault himself aims to locate Freud in his studies rather than use a psychoanalytic starting point (Foucault 1965, 276–278; Foucault 1970, 373–386; Foucault 1978, 130, 150, 158–159). At the same time, for capturing complex states such as ambivalence, or the extremes of rage, as they condition or are conditioned by desire, Butler’s theoretical components offer subtleties in the consideration of subjectivity that others do not.

Butler’s later work, which explicitly addresses ethics – *Giving an Account of Oneself* – engages the phenomenology of Levinas to bring a strong attention to the “primacy” of the vulnerable other person into the theory of the subject. Butler is aware that there are conceptual conflicts in the positions she draws upon: “The Levinasian position is not, finally, compatible with a psychoanalytic one” (Butler 2005, 97). One might think that parallels can be found between the emergence of Levinas’s “me,” and Laplanche’s psychoanalytic account of an “overwhelmed” infant. Butler emphasizes, however, “Although Laplanche and Levinas both subscribe to primary passivity and identify the Other at the inception of the ‘me,’ the differences between them are significant,” and, “Levinas cannot accommodate the notion of a primary set of needs or drives” that psychoanalysis addresses (Butler 2005, 98). Along with recognizing these conflicts, Butler highlights forms of integration:

What perhaps emerges most emphatically from this conjunction of these very disparate positions (Adorno, Foucault, Laplanche, Levinas, Nietzsche, Hegel) is that the response to the demand to give an account of oneself is a matter of fathoming at once the formation of the subject (self, ego, *moi*, first-person perspective) and its relation to responsibility.

(Butler 2005, 135)

At this point in the theorization of subject formation, Butler asserts that the study of rhetoric, social critique, and the ethical topic of responsibility all gain primacy.

The study of subject formation as historical, with attention to the implications of historical examples for understanding religious traditions, appears most influentially in the work of Talal Asad. In *Genealogies of Religion*, Asad provides two extensive studies of Medieval Christian practices, integrating the awareness of “discipline” highlighted by Foucault with attention to tradition as formulated by Alasdair MacIntyre, which is familiar to religious ethicists. Asad emphasizes that he examines “disciplinary practices,” meaning “the

multiple ways in which religious discourses regulate, inform, and construct religious selves.” He aims to examine “two kinds of power process: formations of the self and manipulations of (or resistances to) others.” He emphasizes his interest in the point that “monastic discipline” notably “aims to create, through a program of communal living, the will to obey.” He wants to study how “force is a crucial element in the particular transformation of dispositions, not merely in the keeping of order among inmates” (Asad 1993, 125–126 and generally 83–170). The researcher interested in the category of “subject formation,” though, should be aware that Asad himself has an explicit and narrow account of the “subject,” which rejects many uses of the term: “*agent* and *subject* (where the former is the principle of effectivity and the latter of consciousness) do not belong to the same theoretical universe and should not, therefore, be coupled.” While he connects the subject with consciousness, he also wants to identify many sources of agency: “Instinctive reaction, the docile body, and the unconscious work, in their different ways, more pervasively and continuously than consciousness does” (Asad 1993, 15–16, emphasis in the original). For Foucault and Butler, though, the “subject” is not specifically “the principle” of “consciousness,” and the overlap between their approaches to “subject formation” and Asad’s study of “disciplinary practices” and force is quite close.

One form of integration between the work of Asad and that of Butler can be seen in Saba Mahmood’s *Politics of Piety*, an ethnography of Egyptian movements of Islamic revitalization in the 1990s. Mahmood attends to women in these movements, and her research is based on interviews at three mosques in the Cairo area. Her research emphasizes the forms of agency that appear when women cultivate virtues and expertise in religious practices, which are forms of agency that are obscured when subversion or resistance are taken to be the primary markers of response to hierarchy. For Mahmood, ethical training that transforms both emotion and desire has to be understood as a form of agency in the context of social relations and gender inequity. The process of acquiring new internal ideals, in response to external commands, may itself appear to be submission but actually is understood by a woman as learning and transformation. Mahmood gives great attention to perhaps controversial dimensions of embodied action in religious contexts, such as wearing a veil and achieving a virtue of shyness. She also discusses the significance of these observations for contemporary feminism and related attempts to “destabilize the normative social structure” (Mahmood 2005, 167).

A recent synthetic treatment of ethnographic, historical, and conceptual studies in subject formation and subjectivity can be found in Jonathan Schofer, “Ethical Formation and Subjection” (Schofer 2012). A core observation of that essay is that the analytical terms “subject formation” and “subjectivity” have been used actively by scholars since the formulations of Asad and Butler to address cases from antiquity to the present, in both “Eastern” and “Western” religions as well as philosophies, and also to some degree in constructive accounts. The categories enable scholars to integrate the study of power and social relations with the study of ethical ideals and norms, and to address emotions and desires along with rules and regulations. The scholarship on subject formation and subjectivity has moments of analytical clumsiness, along with contrasting moments of perhaps overly polemic assertions of rigor, which may rightfully frustrate those trained in analytic philosophy and theological correlates. With that caveat, the turn to address the subject and its formation is taken by those who want tools to understand the full significance of the relations between force and hierarchy, bodies and habituation, interpersonal relations, and ethical standards. This cluster of concepts and related scholarship offers a sophistication in the treatment of these relations, and of the human place in history and culture, that all students and scholars of religious ethics benefit from learning.

2 Challenges

CHAPTER 117

Ability and Disability

Jana M. Bennett

Disability and personhood are intertwined in contemporary ethics conversations. It is the case that many ethicists do not explicitly treat disability in their work, yet here I argue that if ethics is to be truthful about the world in which we live, ethicists *must* find ways to incorporate questions about disability into their work.

In making this claim about disability, I should add that I find the terms “personhood” and “disability” themselves to be deeply contextual, and particular to Western concepts. Thus, the focus of this entry’s descriptions and concerns with personhood are primarily drawn from Western philosophical and religious traditions, especially Judaism and Christianity. I will reference other perspectives as appropriate.

Before articulating my main argument – that good ethics begins with considering disability – I will describe four major ways that people in Greek, Roman, and Judeo-Christian traditions have discussed disability in the past, especially in relation to personhood. While past people have not necessarily dealt with disability in the ways we might do today, the question of disability was central to major philosophical and theological discussions. For example, is a person’s lack of virtue connected to a person’s disability? The Judeo-Christian tradition more particularly asks whether sin and disability are connected, which in turn raises the question of how a person might be saved from their sin if their bodily deformities themselves suggest sinfulness. These kinds of questions in previous centuries influenced and shaped how people responded to those with disabilities – what we might call ethical consideration and moral response, and continue to shape ethical response today.

Following that historical examination, I move to more contemporary questions in theology, ethics, and disability, with a particular focus on how contemporary philosophical and theological questions dovetail with serious concerns in disability studies. Modern philosophy brings new questions to the table regarding disability, in addition to the questions that are more long-standing in religious thought. I show that questions of disability and ability are embedded in contemporary questions in theology, but also how those questions of disability get ignored, at theology’s peril. I conclude by suggesting how theology and disability may fruitfully seek a path forward in today’s theo-ethical conversations.

Before turning to the historical narrative, I do want to emphasize that my use of the term “disability” in this entry is broad – encompassing mental and physical disabilities, and including both long- and short-term disabilities. The question of what counts as able-bodiedness and disable-bodiedness is contested, but is connected to the question of who controls what counts as health and ability. A difficulty with contemporary ethical theories is that they presume physical and mental health and, further, the idea of what health means is connected to the physical and mental health of white men of means. Usually the people

who control the social definition of health are the ones who comprise the dominant social group. For example, Meghan Henning, who writes on disability in antiquity, notes that literate educated elites, doctors, and priests at Temples and healing shrines were the ones who controlled that definition.

Part of the work of disability studies is to argue that ability and disability need to be defined far more broadly than everyday speech and current power structures allow. Disabilities include both temporary and lifelong bodily limitations. Most people will be disabled at some point in their lives, even if only briefly. Disability therefore should raise questions about the ways we understand people.

Disability in Western Religious Traditions

Ancient literature, scripture, and their early commenters all write about disability and what it means to be connected to God. The meaning of disability takes on both positive and negative connotations in the tradition.

One strong strand is to see disability linked to a person's sinful actions. Greek and Roman cultures linked disabilities to divine retribution. One text says, "But the gods who live at their ease were angered with Lykourgos, and the son of Kronos [Zeus] struck him to blindness, nor did he live long afterwards, since he was hated by all the immortals" (Kelly 2007, 43). Jewish tradition debated the precise kinds of physical ailments that prevent people from being priests. Leviticus 21:17–23 names laws against people with a range of disabilities (from permanent blindness to the more temporary broken hand). The laws in Leviticus prevent those with disabilities from doing priestly rituals. More than that, disabilities are seen as impediments to priestly service because there is a link between sin and disability. The New Testament develops this question of disability's connection to sin. At several points when Jesus is healing disabled people, he combines that healing with some phrase like, "Go and sin no more." In John's Gospel, Jesus himself makes a link between sin and disability to a paralyzed man that he heals. Jesus says, "See, you have been made well! Do not sin any more, so that nothing worse happens to you" (John 5:14).

Yet depravity or sinfulness is not the only focus in relation to disability. Sometimes disability is also linked to a person's superability to see God, or to show God to others. In Greek and Roman literature, prophets are often blind: one example is Teiresias, named in Homer's *Odyssey* (Kelley 2007, 44). Another example appears in John's Gospel, Jesus heals a blind man (chapter 9). Jesus's disciples clearly see a sin-disability connection, for they ask him, "Rabbi, who sinned, this man or his parents, that he was born blind?" But in this case, Jesus answers them, saying that neither had sinned. Rather, this man was born blind so that God's work might be revealed in Jesus.

While seeing disability as a superability connected to divinity, they also have the potential to make disabled people seem not quite like human persons. Nancy Eiesland's landmark contemporary book *The Disabled God: Toward a Liberatory Theology of Disability* narrates the Christian tradition's discussions of disability in this way:

The Christian interpretation of disability has run the gamut from symbolizing sin to representing an occasion for supererogation. The persistent thread within the Christian tradition has been that disability denotes an unusual relationship with God and that the person with disabilities is either divinely blessed or damned: the defiled evildoer or the spiritual superhero.

(70, 1994)

The disabled person is other than human: either more sinful than able-bodied people, or more heroic than able-bodied people. Either way, what it means to be a person gets related more closely to ability than to disability. Disabled people today may encounter either or both motifs of “disability as sin” or “disability as heroic” in their congregations’ healing services, special prayers, or other liturgical acts.

A third way people have long treated disability is to spiritualize or allegorize physical and mental ailments. For example, an often-debated text in disability studies is from the New Testament letter 2 Corinthians 12. In this chapter, Paul describes being caught up into heaven, and seeing God himself. Yet Paul tempers his elation at seeing God with the following words:

Therefore, to keep me from being too elated, a thorn was given me in the flesh, a messenger of Satan to torment me, to keep me from being too elated. Three times I appealed to the Lord about this, that it would leave me, but he said to me, “My grace is sufficient for you, for power is made perfect in weakness.” So, I will boast all more gladly of my weaknesses, so that the power of Christ may dwell in me.

How should that “thorn in the flesh” be interpreted? Some see the thorn as a physically-experienced thorn, some kind of disease or ailment that enables Paul to experience Christ’s own suffering. Others see that thorn in the flesh as a symbol of people who oppose Paul – so that disability caused by a thorn might in fact be symbolic of political or theological opposition. Basil of Caesarea is one church father who suggests that a heretical group opposed to him is a thorn in his flesh (Collins 2011, 168). Thomas Aquinas suggests Paul experienced physical pain, but this was so that he would not be tempted by greater spiritual evils, such as the sin of pride (Collins 2011, 171).

Another example of spiritualizing disability is the ancient use of the word *phrenitis*, a word describing mental illness in ancient Roman society, and which theologians borrowed. *Phrenitis* was used in similar ways to today’s “crazy,” as in “that person is driving me crazy,” but took on the additional meaning of opposition or heresy. As Wright (2017) notes:

In Augustine’s work, as in the writings of contemporary preachers such as John Chrysostom, Theodoret of Cyrrhus, and Peter Chrysologus – *phrenitis* served as a metaphor or a model for illness of the soul. That is, in early Christian terms, the failure to be saved. *Phrenitis* stood in for the delusion, the loss of self-control, and the threat of death that Christian authors associated with alternative religious paradigms.

Using mental illness in this way is troubling for a number of reasons related to personhood. One is that it enables simple dismissing of both people and arguments, on the basis that they are crazy or insane. Dismissing people for perceived mental illnesses dismisses their personhood and leads to ableism – a sense that only people with apparently perfect mental health (so often determined by people with power and money) deserve a hearing. Spiritualizing physical or mental health is a major way that contemporary people continue to respond to disability; for example, Catholics might still “offer up” their suffering to heaven, in which they link their suffering to the suffering of Christ.

A fourth major way to depict disability is to link disability with caring “for the least of these” as Jesus commands in Matthew 25:40. The third-century theologian Gregory of Nyssa’s homilies on poverty include discussion of people who are disabled in some way. He comments on leprosy, which “robs

humans of ‘their human form,’ turns them into ‘monsters,’ ‘beasts’ (Caspary 2012, 31). Yet Nyssa continues by suggesting that sickness and ill health are part of human nature and belong to all of us. We all therefore have a responsibility to recognize each other as human and care for each other as people made in the image of God. In Nyssa’s view, illness and disability do not take away that central theological claim, that what it means to be a person is to be made in God’s image.

Several difficulties emerge with these four characterizations of disability. First, an emphasis on sin connected to disability risks placing those who are disabled permanently outside their human communities. Second, emphasizing disability as a means of finding God may make disability seem overly desired, or overly triumphalist about disability, which may lead to people ignoring the real pain and suffering of the disabled. Third, spiritualizing disability or using disability as metaphors for other questions can have the effect of dismissing disability and its concerns. It also makes philosophical or theological disagreements into an illness to be cured. Fourth, while emphasizing care for the least of these is a way for emphasizing the need to establish real relationships with disabled people, it also can establish that relationship as a one-way street, suggesting that disabled people do all the receiving of help.

Of course, the four trajectories I describe in this section do not describe all the possible ways that people have engaged with disability. Still, these are major emphases that are present to this day. All of these emphases run the risk of objectifying disabling conditions – in positive or negative ways – without proper attention to the *person* who has the disability, and without fully including or engaging that person.

Some scholars, like Amos Yong, have argued for re-reading scripture with disability in mind. In his book *The Bible, Disability and the Church: A New Vision of the People of God* (2011), Yong uses scriptures to tell a story in which God in fact includes people with disabilities into God’s own life, and into the church. He focuses, for example, on the “one body, many members” vision in Ephesians to suggest that there is a unique, desired, and important place in Christian life for disabled people (see especially chapter 4 in Yong, 2011).

Contemporary Philosophical and Theological Strands

The modern period (1750 to the present) presents its own particular questions related to disability, questions that at times link to earlier historical concerns but that also develop in new or different ways. These questions arise especially out of modern philosophical thought (for example, the Enlightenment), and have significant proponents in contemporary ethics.

For example, Enlightenment thought (and its antecedent ways of thinking) has focused on rationality and autonomy as important characteristics of what it means to be human and what it means to be part of human society. To be autonomous is to be truly free, and to be able to make choices about one’s own life. To be rational is to be able to participate in free society, and recognize the importance of freedom and individuality. People with profound disabilities complicate the notions of choice and rationality, since most disability is not had by choice. In addition, disabled people are often perceived as people without the physical or mental capacity to participate fully in a rational, Enlightened society.

Utilitarian thought has some of its roots in Enlightenment thinking. Jeremy Bentham (1747–1832) is credited with originating this ethical framework, which emphasizes “the greatest good for the greatest number” as a means of determining what is right or wrong to do. On this view, it is possible to determine and calculate human happiness in a rational and universally-recognized way. A utilitarian view often

does not leave much room for those with disabilities, since the default thinking is “a person with a disability must necessarily be unhappy.” A corollary thought is that parents or other caregivers of people with disabilities are unhappy or miserable by association, or that people with disabilities add burdens to the human community because of their medical costs or inability to hold a job. One of the more notorious arguments in this vein comes from utilitarian thinker Peter Singer, who has aroused much anger and concern from Christian scholars because of his view that disabled infants do not satisfy the requirements for what it is to be human (Singer 1993, 175–217).

Disability studies suggests that focusing on pleasures and pains not only wrongly emphasizes able-bodied people as the ones deserving of life and happiness but that it is also unwise to make judgments about disabilities from the perspective of misery, especially since our perception of misery is culturally situated. A white person with economic advantages probably perceives misery and unhappiness by different markers.

Another strong influence in contemporary understanding of disability is the influence of scientific studies of health and genetics in the nineteenth century. Using some of the newfound scientific discoveries of the day, nineteenth-century thinkers developed a conception of what a “normal” body looks like. Examples included measuring head size, height, weight, and color of skin, and comparing them to determine a normative view of bodies. Late twentieth-century philosopher Michel Foucault described this new view of what counts as normal as the “medical gaze.” Foucault further argued that this medical view led to “docile bodies” of people that could be controlled by those in power. The way that we take on these docile bodies is by pretending that we have choices about how we use our bodies and that we could and should therefore change and fix those bodies as necessary. Thus, the “normal” body could be used to compare to other bodies and determine not only who was disabled, but to determine a standard by which the abnormal body could be fixed. A person with a missing leg could have that leg restored (via prosthetics) and thus disability would be fixed. The same could occur for those with vision, hearing, and other such impairments.

Later scholars of disability have named this the “medical model of disability.” The medical model has persisted through the twentieth century to the present day. Medical models have a particular focus on using technologies to enable disabled people to be part of society. Much medical literature emphasizes this kind of view, as we might expect.

In addition, the idea of a “normal” body easily mapped onto newfound nineteenth and early twentieth-century concerns for hygiene, health, and preserving a robust human race. Authors and activists of the day argued that “feeble minded” people should be sterilized so that they wouldn’t pass feeble genes on to others. This was most noted in the *Buck vs. Bell* case that tested whether the state of Virginia had rights to sterilize people deemed unfit. The plaintiff in the case was Carrie Buck, who probably suffered from effects of poverty and a worrisome foster care program rather than anything that could be called “feeble mindedness.” (Lombardo 2010). This early version of a eugenics movement has not disappeared from sight. In the early twenty-first century, versions of eugenics and eugenic reasoning appear in relation to abortion and Down’s syndrome. In fact, aborting supposed Down’s syndrome babies has, in disability circles, become named as one of the most significant issues of justice. Babies diagnosed with Down’s syndrome via prenatal testing are aborted at rates between 60 and 90 percent depending on the country (Gee 2016; Wolfberg 2012). Such hints of eugenics appear in relation to other disabilities, too. In a medical model of disability, for example, dwarfism is something to be fixed via growth hormones. For some dwarves, this may mean complete eradication of a group of people, depending on point of view

(see Little People of America, an advocacy group for dwarves and others of short stature, www.lpaonline.org). Cochlear implants are also sometimes seen as an eradication of deafness, and with it, deaf culture, with its sign language (Tucker 1998).

Numerous thinkers have been concerned with the effects of a medical model. Pope John Paul II's famous phrase "culture of death" applies to much work in disability studies. A culture of death promotes death of those who are imperfect, the ones who don't meet the standards of normalcy. A culture of death sees people as expediences. Those who are unable to match and support the efficiency required by a capitalist economy can and should safely be ignored or removed. This not only connects disability to the already fraught debate about abortion, but also to euthanasia, genetic testing, prenatal care, and other bioethics concerns (Pope John Paul II 1995, on the connection between disability, abortion, and culture of death, see especially paragraph 63).

John Paul II's concerns about global capitalism mirrors concerns raised by people in non-Western religious traditions, who have very different views of disability, and who also see capitalism as unjust colonization of native peoples. Non-Western views of disability may well be more accepting of disabled people, and at the same time similarly call capitalist regimes into question. There is additionally a link between a medical model of disability, colonization, and missionary work, as Benedicte Ingstad argues: "Linked to education, also from the start a missionary concern, biomedical knowledge provided new options for treatment of conditions that previously seemed unchangeable" (Ingstad 2001, 777).

Christian theologian Stanley Hauerwas writes about the tyranny of normality (in a chapter by the same name) in which he argues against some of the moral language ethicists and others use about disability. "We usually associate movements toward justice in our society with the language of equality. We assume to be treated equally is to be treated justly, but on reflection we may discover that is not the case. Often the language of equality only works by reducing us to a common denominator that can be repressive or disrespectful" (Hauerwas 1986, 213). Normalcy suggests a kind of equivalency – a desire to be a community of equals. This might seem nice on the face of it, except that what normalcy doesn't allow for is difference. The fact of disability might make us focus less on an ideal of equality, and more on difference. As Hauerwas goes on to argue "good communities learn to use the experience that comes from different functions" (Hauerwas 1986, 216).

Hans Reinders further articulates some of the concerns with liberal philosophies in his book *The Future of the Disabled in Liberal Society*. The kind of freedom and choice articulated by some also means the destruction and death of others. For example, Reinders argues that the possibilities present in genetic research – the eradication of certain kinds of genetic traits and diseases that seem to prevent people from participating fully in society – also seems to mean eradication of a whole group of people. If we work to eradicate diseases and traits, that also tends to mean we neglect to work for the inclusion of all people in our society, since we are actively working for the exclusion of certain groups of people. This exclusion, in turn, links to another aspect of liberal philosophies, which is the concept of equality. Equality has been an important idea for many thinkers. Reinders argues, however, that when it comes to genetic "fixing" of individuals, we are not really interested in an equality that includes all, but an equality of all those who might be considered "normal." A hope in genetic science suggests a hope in progress, especially scientific progress, and yet that limits our ability for care and compassion with others who do not meet the demands for normalcy (Reinders 2000).

One response to liberal philosophical thinking is to provide an alternative philosophy of what it means to be a person. Thomas Reynolds, basing his work in part on Alasdair MacIntyre's (1999) book *Dependent*

Rational Animals, suggests that what it means to be human is to be dependent, rather than independent and autonomous. The dependency of disability simply becomes one among many kinds of dependencies, a shared trait among all human beings. Thus disability is not an oddity in a society that privileges normalcy, but disability is itself simply part of what it means to be human (Reynolds 2008). Similarly, Deborah Creamer's important book on disability claims to be neither too triumphalist, nor too negative about disability. She speaks about bodies as having limits, which means both abled and disabled bodies (Creamer 2008). Embodied limits simply name a truth about what it means to be human, and thus places ability and disability squarely in the definition of what it means, quite simply, to be human.

In the late twentieth century, some scholars devised a new model of disability that moved away from a focus on normalcy and fixing the disabled individual. This new model is named the social model, and it sees society as the chief problem in disability. In the social model view, society creates disability by not enabling people – all people – to interact with each other. For example, a building without a wheelchair ramp has dis-enabled people in wheelchairs.

Social models of disability take the emphasis off of the seeming abnormality of the disabled person, and instead hints that it is society that is abnormal and unjust for not being inclusive. Social models of disability have allowed space for disabled people to seek justice. Social models are also the predominant model in disability studies currently. For example, the authors of the book *Deaf Gain* articulate several ways in which the very fact of being deaf is a benefit for contemporary society, rather than a hindrance (Bauman and Murray 2014). Examples include that deafness was the impetus for SMS technology, which we now encounter as the ubiquitous texting that provides much modern communication. Sign language and silence are other aspects of deaf gain explored in this book.

The social model of disability is now the major way of thinking about disability across disciplines. One important example is John Swinton, a foremost thinker in disability and theology, who has written the book *Becoming Friends of Time: Disability, Timefullness, and Gentle Discipleship*, which argues for a new conception of the theological doctrine of creation and the theological understanding of time. By rethinking these, we create space in our communities for the profoundly disabled and those with dementia or other serious brain injuries (Swinton 2016). For Christian tradition, rethinking community in order to be more inclusive of those with disabilities is a significant and important theological attempt to recognize disabled people as full persons made in the image of God.

Social models of disability have significant limits, however. One of those limits is that by over-emphasizing society as the chief problem, we may overlook the fact that people with disabilities do rely on medicine for help. Medical fixes can be important for people with disabilities and their participation in society. Social models of disability might also be dismissive of a person's pain and suffering insofar as they focus on social ills and suggest disability is a construct.

Going Forward

What I have tried to show so far is a broad array of ways people have thought about disability and personhood, both historically in the West, and in terms of contemporary ethical theories and questions. I suggest that disability is implicated in so many ideas, texts, and philosophical questions, that I would argue that disability needs to be assumed from the beginning of any work as having importance for any particular ethical conversation. In this entry alone, we have seen links to creation, sin, depravity, the

image of God, hermeneutics of ancient literature and scripture, poverty, colonialization, politics and power, choice and free will, worship (including healing services), and common ethical issues like abortion and euthanasia related to personhood and disability.

In my estimation, ethicists therefore need to be aware of disability and its implications in all our work, regardless of whether we write on something we would name explicitly as “disability studies.” We have a very broad Western tradition with which to dialogue about disability, both positively and negatively, and we need to make use of that tradition.

More than that, ethicists need to think seriously about what it means to be a community that truly recognizes the personhood of all, regardless of body type and ability. In this respect, we have a practical example in Jean Vanier. Vanier has long been an icon for disability theory and theology, but he writes extensively about the nature of what it means to be community together (Vanier 1992). Vanier is a founder of the L’Arche communities, in which abled and disabled people live together in community, and in which people do the hard work of ensuring that each person’s life and work is valued and seen as integral to the functioning of that community. Vanier’s L’Arche stands in stark contrast to the predominant ways that disabled bodies are treated in mainstream society. Vanier does not shy away from the fact that being community together is a quite difficult task. Yet, describing what it means to consider all as persons – and to consider the implications of saying so, even and especially in communities like Vanier’s – this is the call of religious ethics.

CHAPTER 118

Class

Devin Singh

Introduction

In this entry, I review attempts to describe and analyze class in relation to common metrics such as income, wealth, earning potential, and economic mobility. Rather than simply by quantitative indices, I claim that class should be defined primarily by the forms of economic power and privilege accessible to a given subset of society. Such power and privilege can be further understood by the relationship to labor and the means of production, and by the capacity or lack thereof to realize the economic interests of a given social subset. Such positionality is deeply imbricated in culturally specific markers of status, intellectual and cultural capital, and other forms of symbolic power. It also intersects crucially with categories of race, gender, and sexuality and requires intersectional analysis. I consider matters of class consciousness and relate this to discussions of the epistemic privilege of the poor and marginalized. I then explore what class means for religious ethics, asking how religious and ethical concerns (informed primarily by Christian traditions) interact with the question of class. I offer outlines for a normative framework for approaching the question of class within religious ethics, informed by liberationist perspectives, womanist traditions of social ethics, and an ethics of care.

What is Class?

While any given society is multiform, and social groupings are crisscrossed with a variety of differentiating factors and markers, for heuristic and socio-analytic purposes, not to mention the needs of demography and policy, class distinctions are typically based on economic factors (Wright 2005; Rieger 2013). Class is a term used, often vaguely, to capture the level and form of economic power and privilege accessible to particular segments of society. While this is not all that one might mean, this dimension of economic power is significant and even central to understanding the category of class. Such economic power is signaled by indicators like wealth and income level, as well as earning potential and economic mobility. Yet attempts to delineate class neatly with quantitative metrics such as income or education levels are usually inadequate for providing a meaningful descriptor of class identity. Class also signals one's positionality with regard to labor power, and the ability one has to command and enjoy the fruits of labor. Class location and mobility are often a function of education or forms of cultural and intellectual

capital, such as skill, training, and experience, and often run together with other social factors such as one's relational network and the opportunities that arise because of one's affiliations. This is why multidimensional and intersectional analyses are typically necessary when class is under consideration, since many social and cultural factors are at work in determining class identity and the mobility one might have within and out of a class.

Demarcating class based on simple quantitative metrics may be useful from a technocratic perspective of social policy and planning, but it is rarely socially explanatory. It may also lead to interesting tensions depending upon the metrics used. Consider the option of basing class distinctions on either education level or income level, both common metrics used in the United States. In an oft-cited comparison between university professors and tradespeople such as construction workers and electricians, professors may be in a "higher" class relative to tradespeople when education level is considered, but in a "lower" class relative to tradespeople when income level is considered. Beyond the potentially contradictory policy proposals that might originate from such a case, depending upon what measure is used, such metrics consider class identity in a vacuum, evaluating a single variable that on its own yields little insight.

One influential way to delineate class draws upon classical Marxian categories (Marx 1976). Class figured centrally in Marx's analysis of capitalist society and indeed was extended to various other periods and economic formations. Arguably, "[c]lass is the focus of Marx's work not because he assigns it a greater explanatory role in human history than other aspects of society, but rather because it has been repressed from consciousness generally and from the consciousness of capitalism's critics in particular" (Wolff 2013, 30). Class thus emerges as a pivotal explanatory lens in part as a corrective to regnant forms of social analysis blind to its importance. His approach defines class in terms of the mode of production and one's location within the particular relations of production within that mode. One can delineate and assess segments within a society based upon how they operate within the specific mechanisms of power that sequester labor and use it to generate value through the engines of production.

Within capitalism, the major class distinction is between the bourgeoisie and the proletariat. The former class owns the means of production and hence retains control over technology, machinery, land, and all elements used by labor to create value and produce goods. Members of the latter class own only their labor power and must sell this labor to the bourgeoisie in exchange for a wage. The wage is therefore used as a demarcator of labor and signature of value. Class belonging here thus defines where one stands in this broad economic schema. The bourgeoisie or capitalist class retains control over the means of production and various artifacts of congealed labor power such as machinery and other technology. The proletariat or working class retains control over its labor power, and is constrained to work for the capitalist class to generate the means of subsistence and social reproduction. Its labor also generates a surplus, however, and yet the mechanisms of capitalism allocate this surplus to the ownership of the bourgeoisie or capitalist class despite it stemming from the labor of the proletariat. This approach using classic Marxian categories is thus useful for understanding the allocation of power and access in a society, prompting questions of justice and resource distribution, such as whether the needs for survival and flourishing are being broadly met.

The Marxian lens draws attention to two factors that remain central to class analysis: economic power and privilege and the fact that class is a relational category. As suggested at the outset, class remains meaningful when attending to economic dimensions primarily, even while intersectional realities must be kept in view. Beyond economic metrics, however, many of which take class as a static category, the significance of class analysis emerges when power and privilege are brought into view. Power is the capacity to realize one's class interests and those interests are often conflictual and agonistic with respect

to other classes. Therefore, power includes the capacity to influence and direct the will and actions of other classes. Class thus pertains to the types of economic power that a certain subset of society is able to exert on other segments of society, with privilege indexing the particular advantages a class has in exercising said power.

Most complex societies involve divisions of labor, with subsets defined by the types of labor they perform, the differential values placed on that labor, and potentially but not necessarily different allocations of the fruits of such labor. Group levels of economic power and privilege are modified and conditioned by the group's location in a social network. Such levels are dynamic and processual, and best captured not in isolated or fixed indices but in analysis of the entire network and of the operation of the parts in relation to the whole (Thompson 1964). Class is thus a relational term, addressing classes in distinction from one another and in terms of their respective forms of agency and effects on each other (Aronowitz 2003; Zweig 2004). This is why class is less helpfully demarcated in purely quantitative terms – such as income level, net worth, or years of education. It requires additional evaluation in qualitative terms – the forms of economic power a particular social subset is able to exercise as well as the types of economic power to which it is subjected (Rehmann 2013).

Class in Society

Because class is a relational category and involves group location in a social network relative to other groups, the category of social capital offers important resources for class assessment. Here I draw on the work of Pierre Bourdieu, who extended Marxian categories to account for cultural and relational aspects that remain critical for grasping the dynamics of economic power in societies. His analysis of the forms of capital and the nature of distinction and symbolic power are particularly relevant in this regard (Bourdieu 1986; Bourdieu 1998). Bourdieu's approach draws attention to the relational aspect of capital, which in turn connects with class as a relational category. His theory is also useful in helping to conceptualize the signals and symbols that mark class, the ways symbolic power and cultural methods of distinction figure into class agency and privilege. This also sheds light on how other social categories may be indexed or cross-referenced with class and modulated based on class position.

Bourdieu explains that capital can take on various modes in society, outlining three main forms: financial, social, and cultural capital. Financial capital deals with material wealth and typically economic dimensions. Such a lens pertains most directly to dominant conceptions of class, calibrated as class tends to be to “properly” economic factors. Social capital indicates the benefits that come from membership within a group, however we define such benefits and however we demarcate group belonging. Such benefits stem from formal and informal relational networks within a social grouping, and provide a member access to other benefits enjoyed by group members, many of which are economic. These benefits may also be symbolic, wherein being marked as a group member alone affords advantages and privileges in a society that ascribes honor, status, and power to such group identity. Cultural capital speaks to resources of intellect, education, and artistic and cultural formation afforded certain group members that provide unseen advantages in negotiating a society's particular challenges and opportunities. Bourdieu notes that capital exhibits fluidity and a capacity for conversion: one form of capital may transmute – or transubstantiate, to use his intentionally theological terminology – into another. This is why it is common that access to one form of capital often affects one's capital levels in its other forms.

Social capital signals that there is a kind of capital that inheres in *belonging* to particular social groups. By necessity, social capital thus understood requires differentiation and exclusion. Without boundary markers, such group membership is meaningless. In other words, if belonging to a certain group means social status and advancement, such capital would evaporate if the barriers to entry were eliminated and anyone could become part of the group. By its very nature, then, social capital requires forms of distinction, exclusion, and boundary maintenance, however arbitrary. Observers concerned with matters of justice and equality, as well as deleterious effects of segregation and marginalization in society, have thus highlighted the exclusionary dynamics of social capital's operations.

Because of the need for distinction and group boundary maintenance, groups develop symbolic markers and signals of group belonging. Thorstein Veblen's (1899) classic study of the leisure class offers a glimpse into the ways classes differentiate themselves from one another. In this case, ruling class belonging is marked by the forms of conspicuous consumption and leisure exhibited by group members. He also demonstrates how such practices are at times emulated by those outside the class, in an attempt to signal belonging or enjoy aspects of the privilege afforded such a class. Yet because groups are highly effective at policing their boundaries and forms of social distinction, such emulation is typically discernible, meaning it does not lead to seamless inclusion within the dominant group. Indeed, the emulated group may then modulate its practices, as in the case of the wealthy adopting forms of modesty and occlusion of affluence, while the less wealthy exhibit types of ostentation in an effort to mimic a now obsolete set of aristocratic practices. The insight from studies such as Veblen's is that class belonging, while centrally a factor of the type of economic power and privilege enjoyed by that group, is also bound up with sets of practices and symbolic markers that indicate access and can transfer the privileges of group belonging.

Whether or not symbolic differentiation is intentional, such distinction is often nevertheless at work in societies, as groups based on class factors of economic power and forms of labor often accrue other cross-references such as race, gender, sexuality, and ability. It has long been observed that class is racialized and gendered, with growing recognition that sexuality, too, factors in. Since labor power figures centrality in class identity, matters of ability are also clearly indexed, as barriers to and constraints around work influence one's ability to sell labor power. This means that categorization within particular identity groups in society has a consistent, observable bearing on one's class designation. This can be documented in the statistically significant paucity of women and racial/ethnic minorities among the class of owners of the means of production. The long history of legal barriers to property ownership for such groups is one of several clear causal factors for such disparity.

Therefore, both because of the group tendency to differentiate and police boundaries, and the historical legacy of eliding class with other markers such as race, gender, sexuality, and ability, intersectional analyses are called for (Crenshaw 1995; Collins 2000). At the most fundamental level, this means that when assessing class, that is, when evaluating the factors that forge differences among social subsets based on economic power and privilege, looking for "purely economic" factors is insufficient. Examining the existence of class also requires attending to the reproduction of classes, and thus matters of social reproduction and affective labor must also be considered (Bhattacharya 2017). Answers to the why, how, whence, and whither of class differences will therefore come from analyzing these other important identity markers and social categories that transcend the economic, narrowly construed.

Class Consciousness and Epistemic Privilege

In assessing the presence and persistence of class differences in society, one is led to ask whether a society and its various classes are aware of and recognize such differentiations, and what such knowledge means for these allocations of economic power. Marx observed that members of the proletarian class had differing levels of awareness of their social location or of the existence of their class at all, their class significance, and their capacity to change their class status. This awareness has been termed “class consciousness.” Such capacity for recognition is historically and economically conditioned (Marx 1963; Jameson 1981). One of the paradoxical benefits of capitalism is that the forces of abstraction and reification that form commodities can also contribute to a critical distance that enables a class to recognize itself, in ways that may be distorted but can be clarified (Lukács 1971). The Marxist tradition generally seeks to transform the consciousness of the proletarian class from mere self-recognition (“class in itself”) to united solidarity and action against capitalism (“class for itself”). A broader tradition of the sociology of knowledge stops short of advocating a specific political program while recognizing more generally that class location will affect one’s perspective and view of reality (Mannheim 1959).

Class consciousness can be related to what has been called the hermeneutical or epistemic privilege of the poor and marginalized, a principle taken up in liberation theology (Boff 1993; Singh 2017). This notion builds upon the biblical sense of God’s favor upon and presence among the poor (e.g. Matthew 25:31–46), as well as the Catholic magisterial principle of the “preferential option for the poor.” The position extends the idea of such prioritization of the poor to a claim about where truth, clarity, and, in some cases, revelation, are to be found. The claim is that the realities of the world and society are seen most clearly from the vantage point of the poor. Those who would have eyes to see must adopt a position alongside the poor and marginalized in order to grasp the truth of the situation. Not only can the world be glimpsed more clearly, but divine truths apprehended more accurately from this perspective.

For instance, the establishment of base ecclesial communities in Latin America – centered upon reading scripture closely with members of impoverished and exploited classes – was fueled by the quest for a clarity of mind and heart that was enabled by this lens of poverty and exclusion. Reading the Bible and society “through the eyes of the poor,” then, proclaimed the belief that one’s particular social position in relation to economic power and privilege served or inhibited one’s access to the truth (Sobrino 1984). Those of wealthy and privileged backgrounds had skewed views of reality. Aligning themselves with the poor was a way not only to serve and show solidarity, but to seek their own epistemic salvation and interpret the world, themselves, and God correctly.

We can see how this coincides with the idea of proletarian class consciousness. The latter asserts that a class for itself understands its position in society, the reasons for this location, and the mechanisms that need to be changed in order to establish more just and equitable socio-economic relations. Such a class has achieved a kind of enlightenment, a heightened awareness of social realities, and a sense of the course that must be plotted for liberation. Such awareness is not idealistic, however, remaining in the realm of thought alone. Rather, it is manifested in praxis, in concrete action and effort to change class distinctions. The class sees and acts clearly, and presumably any who join in solidarity with its struggle and position come to see clearly as well.

Class and Religious Ethics

These matters of solidarity and alignment with marginalized classes raise ethical issues around class. While class analysis may be done for the ostensibly neutral concerns of demography and social investigation, typically, when class is invoked, conversations about the appropriate individual and communal responses to class tensions and inequities quickly follow. Already implicit in many of the approaches cited above, ethical concerns abound concerning the nature of power differentials, inequities of privilege and access, and the relative agency of certain classes with regard to others. Marx set his sights on a classless society, free from the injustices engendered by class distinctions and differences. Working within a Marxist trajectory, Bourdieu's analysis of social capital also explores ways to overcome class power differences, in part through the reallocation and redistribution of capital, often in its non-economic forms, such as changes to education systems that prevent the ossification and exacerbation of cultural capital inequities.

What might it mean to think about class from the perspective of religious ethical theory? A number of ethical theories and frameworks may be relevant to assessing class and responding to moral challenges raised by the realities of class difference and disparity. At the outset it is important to recognize that class location itself shapes religious ethical theory, both in the decisions about which approaches to adopt and in the forms it takes, including which norms and goals to establish. Stemming from the aforementioned insights about class consciousness, social location, and perspectivalism, we must continually keep in sight the reality that class location influences how we might view the moral quandaries raised and what shape responses take.

In an effort to establish a minimal basis for a normative framework, my intervention is informed by womanist social ethics and feminist ethics of care. Womanist ethical approaches lend themselves to and interface directly with questions of intersectionality implicated in class analysis. Womanist scholars were some of the first to point out that the class interests advanced by white feminists, even when inflected with religious concerns, may be at odds with the needs and concerns of black women (Grant 1989). This reveals that class analysis is neither neutral nor purely objective, but involves the subject positions of the analysts and activists involved, including embodied matters of race, gender, and sexuality. The fact that white and black women concerned with class inequity could devise projects that were not in alignment revealed that race remained a critical modulator. Similarly, black women challenged the gender blindness of black male theologians, whose projects left patriarchy unaddressed, revealing that challenges to class inequity could not ignore gender. Poor, black and brown women thus provide a unique paradigmatic position for considering the multiple levels and directions of oppression and domination within contemporary society. A class analysis that employs a womanist lens and framework will thus ideally remain held accountable by these dimensions and avoid some of the typical and recurrent blinders that emerge even when liberationist and progressive class interests are advanced.

Womanist ethics attends to the whole person in conscious resistance not only to the forces of abstraction in capitalist society but to the dehumanization of marginalized peoples. Such a wholistic approach seeks to overcome the fragmentation of existence that is the result in part of the instrumentalization of certain segments of society for the purposes of labor. Implicit, then, is a resistance to considering people solely on the basis of class allegiances, even while economic injustice remains a central object of concern. Yet this challenge opens up into a broader and more thoroughgoing critique of at least two dominant ethical theories: utilitarianism and deontology. While theoretical purists may resist the implication,

utilitarian frameworks can result in the use of others for one's pleasure or utility maximization. The abstraction of class further enables this, where an entire social segment of laborers excluded from ownership from the means of production comes to serve the needs and desires of another governing class.

Deontological ethics within a Kantian tradition, which propose a categorical imperative that remains binding on all agents when certain conditions are met, also run into tensions with womanist priorities. Such an approach evinces a universalism that imagines abstract human needs and ethical concerns regardless of history and context, let alone embodiment and materiality. The situated, perspectival approach of womanist ethics raises concerns about the hidden assumptions of white, male perspectives masquerading as neutral standards for all times, places, and peoples. Therefore, the womanist challenge to abstraction and to disembodied and instrumentalist views of humanity that figure into class inequity also ends up challenging dominant strands of ethical theory, revealing the mutual implication of ethics and class.

Womanist ethicists and theologians question the centrality of suffering in Christian narratives of salvation, specifically challenging the role of surrogate suffering (Townes 1993). Surrogacy in this case denotes suffering on behalf of another, and has been elevated based on a particular interpretation of atonement theology that presents Christ's suffering as redemptive for humanity. In light of the role that black women have played in America, often serving as nannies and wet nurses, laboring and toiling on behalf of their white masters or employers, womanist thinkers critique the supportive role that Christian thought has played in this problematic arrangement (Williams 1993). From the perspective of a religious ethics of class, then, womanist thought issues the caution that Christian narratives of redemptive suffering, which have influenced the development of policy, politics, and economy in the West (Singh 2018), may be at work supporting a system that makes one class toil, labor, and suffer to support another.

The ethics of care is an ethical approach that centers relational existence and assesses morality in terms of one's fulfillment of various relational obligations. It focuses on the needs and concerns of those with whom one is relationally connected, emphasizing the particularity of the needs of others in their specific social and historical contexts. Virginia Held (2006) offers the care of a child as a paradigmatic instance to think through such concerns. Acting morally and ethically in such a scenario stems from vulnerability, affective bonds, relations of mutual dependence, and other senses of obligation that may precede and exceed universalized and abstract maxims of moral virtue. Despite utilizing the child as an exemplary case, an ethics of care is not to be relegated simply to the familial, personal, or private sphere, but has bearing on broader publics including the national and international level. It also bears on matters of justice, and while care and justice cannot be collapsed together, they refine and shape one another in significant ways. Care and concern for the specificity of actors and contexts will emphasize restorative and redistributive forms of justice more than retributive. Beyond models of simple fairness or balance, care will emphasize corrective and ameliorative measures that may look imbalanced when contextual differences are ignored. In this way, a care ethic also coincides with the preferential option for the poor introduced above, prioritizing the vulnerable and marginalized as those in need of special attention and protection.

The ethics of care emphasizes relational existence and eschews atomism and individualism. Not only does ethical formation not happen in isolation, but the ethical as such is relational. Such ethical relationality puts this view into tension with virtue ethics, which at times imply internalized and individually construed paths of moral formation. The ethical individual – and, originally, the virtuous man [*sic*] – were the paradigm to attain, as opposed to ethical postures of relatedness and ethical social networks as such. In attending to the specificity and particularity of ethical others, the ethics of care also pushes back against the universalism of typical deontological approaches. Maxims such as the categorical imperative commend

a universalizable course of action that intentionally denudes the ethical actor of history, society, and culture – not to mention biographical particularities including race, class, gender, and sexuality. Rather, an ethics of care emphasizes that moral action necessarily varies across time and space, that context and the specific needs of the other dictate what the ethical looks like in each situation. Furthermore, religiously inflected ethics of care derive injunctions to care for the poor and vulnerable from religious traditions in ways that resonate powerfully with the normative vision of this ethical system.

Given its attunement to relational dynamics and the variability emerging from specific relational encounters, an ethics of care is particularly suited to class ethics. Because class can be defined by the forms of economic power exerted and experienced by particular social groupings, agonistic relations between and within classes can benefit from an ethical vision that keeps such relationality central. In this regard, an ethics of care can provide systemic critique of the relations among classes, and call for care and concern for the classes rendered vulnerable or precarious. Moves toward restoration and redistribution will also challenge the differences and disparities in economic power and privilege. At the same time, an ethics of care recognizes particularity and the unique differences of those within relations. In terms of class, this means the vision need not entail the erasure of qualitative differences such as the division of labor, but seek to rectify quantitative differences where some are barred from access to the goods of life.

These approaches offer a variety of moral attunements that remain crucial for constructing a religious ethic of class. An overall posture informed by liberationist ideals that give priority to the poor and marginalized means that the exploitation and abuse of classes with less economic power and privilege must be kept in view. Furthermore, a liberationist lens converges with Marxian analyses of class that prioritize the economic mode of production as a central framework for understanding class structure in a society. Womanist ethics refines the general liberationist impulse by situating its analysis more self-reflexively within the intersecting matrices of domination that impose upon poor black women. Assessing and challenging class disparity by examining economic power and privilege alone gives way to a richer lens attuned to the ways racial, gendered, and sexualized differences play into class distinctions and inequities. Womanist thought also casts a critical eye upon the notion of suffering as labor, as productive, particularly on behalf of a more powerful and privileged other. It refutes the ways religious thought has valorized such productive suffering, recognizing how such associations have contributed to the view that enforced labor or labor as drudgery are somehow purifying and redemptive for the exploited worker. Finally, the ethics of care provides an ethical vision situated within relational networks, enabling assessments of class that recognize how various social positions and relations inflect what the moral thing to do is in any given situation. Surpassing individualistically and universally construed moral frameworks that may be blind to the communal and social realities that bear upon the moral problems raised by class, it offers a way to speak about ethical challenges of class with more faithfulness to the actual realities of the situation.

CHAPTER 119

Disease

Neil Messer

Introduction

This entry is concerned with the ways in which certain religious traditions think about disease, and the ethical response called for by their perspectives. It focuses on Christian and other Abrahamic traditions, and on human rather than non-human disease. Three questions must be addressed: first, what should we understand by disease?, second, how should we evaluate disease, so understood?, third, in the light of these understandings and evaluations, what responses to disease are called for?

Understanding Disease

Disease is usually defined in opposition to health, and there is a debate within the philosophy of medicine about which of these concepts has priority (Messer 2013, ch. 1). In a Christian perspective, health is associated with the capacity to live the kind of life for which we have been created (more of this later). It therefore makes sense to give conceptual priority to health, so understood, and think of diseases as deficits of that capacity or threats to it. For this reason, it is necessary first to sketch briefly the understanding of health which will shape the following account of disease.

Reflections on health in Abrahamic traditions often conceptualize it in terms of wholeness and integrity, connotations suggested by both the Hebrew *šālôm* and Arabic *ṣiḥḥa* and *salāma* (e.g. Gaiser 2010, 243; Sachedina 2009, 78). Such views articulate important insights, for example that a flourishing creaturely life is characterized by bodily and mental integration (cf. Barth 1961, 356). They also fit well with the widespread use of “health,” “sickness,” and their cognates as spiritual and theological metaphors. However, such holistic views of health also have their dangers, particularly when coupled (as they often are) to the World Health Organization (WHO) definition of health as “a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity” (WHO 2014, 1). The kind of holistic vision suggested by the WHO definition has well-known philosophical difficulties (Messer 2013, 2–6), but is also theologically problematic. By tending to subsume the totality of human good under the heading of health, the definition makes it more difficult to articulate the theological insight that health, though a real and important human good, is not the only one. It can also encourage the attribution of what a theological tradition may regard as disproportionate value to health.

For a Christian tradition, health can appropriately be understood as the capacity to live the kind of creaturely life that humans have been given by God: “strength for human life” (Barth 1961, 356). This line of thought may find echoes in other Abrahamic traditions (cf. Dorff 2012, 313), though it will take distinctive forms in each. Christian theology is likely to develop it christologically, seeing in Jesus Christ the fulfillment of what it means to live a human life.

If health is the capacity to live a human kind of creaturely life, then disease has to do with the loss of that capacity, or threats to it; but of course, not all threats to the fulfillment of the penultimate ends of human life are sensibly described as diseases. In this view, “disease” names a certain kind of threat: an internal state or condition that disrupts our physical or mental functioning and so hinders or threatens the fulfillment of our embodied creaturely lives (Messer 2013, 184–186). It is worth emphasizing “physical or mental functioning”: in this perspective, a human creature is an integrated psychophysical whole, so it makes sense to speak of mental as well as physical health and disease.

The concept of disease is related to various others, such as illness and sickness. In some accounts, “illness” is sharply distinguished from “disease.” The latter is taken to mean an objectively defined physiological (or perhaps psychological) condition, while “illness” refers to the subjective experience of having a disease. Some religious accounts make a similar distinction between subjective and objective perspectives (e.g. Sachedina 2009, 80). The disease/illness distinction may be a helpful reminder of different perspectives from which disease may be understood and experienced: for example, the inescapably different ways in which doctor and patient experience the patient’s body and its suffering (cf. Toombs 1992). However, it should not be drawn too sharply, nor should too much weight be placed on it. In the philosophical literature it has sometimes been used in an attempt to define disease (and therefore also health) in objective, value-free scientific ways (Boorse 1975). But in the religious perspectives discussed in this entry, to speak of human creatures’ health or to name conditions as diseases is always already to make a claim about the *good* of human creatures: description and evaluation cannot be sharply separated when we speak of disease.

Evaluating Disease

Disease and Evil

Typically, disease involves suffering (physical, psychological, or both) and is therefore experienced *subjectively* as an evil by the sufferer. In the religious perspectives surveyed in this entry, it will often also be regarded as *objectively* evil; yet various kinds of ambivalence about this can be discerned in the traditions.

The New Testament Gospels bear witness to Jesus’s resistance to the power of disease and death, for example in narratives of healing, exorcism, and raising from the dead, and ultimately in Jesus’s own resurrection from the dead. In the light of this New Testament witness, the Protestant Karl Barth infers that disease must be recognized unequivocally as an aspect of the evil opposed to the goodness of God’s creation. Yet he holds this insight in tension with another, to be considered later: that diseases may serve as salutary reminders of our finitude and mortality (Barth 1961, 366–374).

From an Islamic perspective, Sachedina (2009, 77–79) argues that disease may include elements of both moral evil – as when people fail to take proper care of their health – and natural evil, for example

genetic diseases that are not brought on by unhealthy lifestyles. For Abrahamic traditions, the presence of diseases in the world therefore raises questions of theodicy. For example: must an all-powerful Creator be recognized as the originator of diseases, and if so (since God is perfectly good), does that mean they should not, after all be considered evil? Should we rather say that they exist by God's will, to serve God's good purposes? Within Islam, Sachedina traces a range of answers to these questions, reflecting divergent views of divine action in the world and human freedom. At the more "determinist" end of the scale, diseases are seen as occurring by the will of God, and "whatever God does, he does for the best" (Sachedina 2009, 97), while at the other end of the scale there is more emphasis on human agency and responsibility.

Some recent Christian reflection places questions of theodicy in the context of modern evolutionary biology, which intensifies the challenge of accounting theologically for the presence of disease and suffering in the world. The biological processes of disease are products of the same evolutionary processes that gave rise to the human (and other) species celebrated as God's good creatures. Therefore, some authors (notably Southgate 2017) argue that a Christian theodicy must recognize evolutionary suffering (including disease) as part of God's good purpose: God wills the existence of a cosmos that includes all the goods associated with complex life, and an evolutionary process is the only way in which even an all-powerful God could bring such a world into being. This argument is often accompanied by others: that God suffers along with God's creatures, that God will bring suffering to an end and compensate the victims in the life of the world to come, and that humans are called to work with God for the relief of suffering and the healing of the world here and now.

Other Christians, however, still maintain that phenomena like disease should be understood as features of a "fallen" world, opposed to God's good purposes in creation (e.g. Messer 2009). "Falleness" here is not taken as a historical claim about the origins of evil, but a statement about the present condition of the world. Features of the present-day world such as disease are to be understood as evils, contrary to the will of God. The biblical and theological themes already mentioned are taken to indicate divine opposition to such evils, and to point to the eschatological hope that they will, in God's promised good future, be fully and finally overcome.

Disease and Sin

Abrahamic traditions have often seen diseases as connected in some way with sin. For example, a well-known New Testament text exhorts the sick to have the elders of the church pray for them and anoint them: "The prayer of faith will save the sick, and the Lord will raise them up; and anyone who has committed sins will be forgiven. Therefore confess your sins to one another, and pray for one another, so that you may be healed" (James 5:15–6a).

One way of understanding this is to think of diseases as punishments sent by God for specific sins; this understanding is found, but also vigorously questioned, in the Abrahamic traditions. In the Hebrew Bible, the book of Job thoroughly problematizes such a view, as does a New Testament story in which Jesus heals a man born blind: "His disciples asked him, 'Rabbi, who sinned, this man or his parents, that he was born blind?' Jesus answered, 'Neither this man nor his parents sinned; he was born blind so that God's works might be revealed in him'" (John 9: 2–3). Similarly, there are elements of Islamic tradition which see diseases as expiation or purification from sin, but others in which this view is challenged quite pointedly (Sachedina 2009, 91–93).

Apart from a simple view of diseases as divine punishments for specific sins, there are various ways in which Christian thinkers make sense of biblical texts, theological traditions, and practices that make connections between sin and disease. In general, as we have seen, both sin and disease may be understood as aspects of evil. For a Protestant like Karl Barth, we humans – sinful and alienated from God – have subjected ourselves to evil, and our subjection must therefore also be understood as God’s judgment on us. Paradoxically, this is fundamentally good news, because it points toward God’s mercy and the promise that both sin and disease, like other aspects of evil, will be overcome through God’s reconciling work in Jesus Christ (Barth 1961, 366–369). A more specific connection often made in the Abrahamic traditions is that ill health is one kind of harm suffered by those who are sinned *against*, either by individuals or as a result of unjust social systems and structures.

Disease and Spiritual Growth

St Paul’s story of a “thorn in the flesh” that afflicted him (2 Corinthians 12:7–10) is one Christian source of the insight that disease – though evil in itself – may nonetheless be an occasion for spiritual growth and the exercise of greater faith and trust in God. This thought is developed in various ways in different Christian traditions. In Protestantism, Barth (for example) insists in the strongest terms that sickness is a real and terrible evil, opposed to God’s good purposes. Yet without wanting to compromise that insight in any way, he also argues that the experience of sickness can remind us of our frailty and mortality. It can thereby redirect our attention to the true source of our ultimate hope, the eternal life promised by God in and through Jesus Christ (Barth 1961, 371–374).

Other Christian traditions may emphasize even more strongly the connections between disease and spiritual growth. In the Catholic tradition, Pope John Paul II reflected on the salvific meaning of suffering, in the light of the New Testament themes of sharing in Christ’s suffering and (in St Paul’s words) “completing what is lacking in Christ’s afflictions for the sake of ... the Church” (Colossians 1:24; John Paul II 1984; but for a critique see Biggar 2004, 50–55). And in Orthodox Christianity, diseases and afflictions may be seen, not only as potential prompts to reorient one’s life toward God, but as chastisements graciously given by God to undo the effects of sin in believers’ lives and help them on their ascetic journey toward deification (Delkeskamp-Hayes 2006).

The spiritual value of suffering is also a significant theme in Islamic tradition, for example in Qur’anic texts and Prophetic traditions in which “suffering caused by illness and death is [seen as] a divinely ordained tool for testing and perfecting human beings” (Sachedina 2009, 91). For example, illnesses may serve to expiate sins, to admonish and warn, or to test and refine a person’s faith.

Responding to Disease

A Mandate for the Work of Healing

To name disease as an evil, opposed to God’s good purposes for human creatures, is to state a strong theological mandate for the work of healing in its various forms. In the Christian tradition, this is illustrated by the Gospel narratives of healings performed by Jesus, which can be seen as signs that in his life, death, and resurrection God “has overcome and bound [the forces of death] and therefore those of

sickness” (Barth 1961, 368). This also implies a theological mandate for human beings to oppose the destructive work of disease in the world. In this respect Barth is one among many voices echoing a core Christian conviction about disease and the proper response to it, a conviction reflected in diverse ways in Christian practices of healing and healthcare from New Testament times to the present day. On the one hand this takes the form of Christian involvement in the practice of medicine, and on the other a ministry of healing involving practices traceable back to the New Testament, such as prayer, the laying on of hands, and anointing with oil (Archbishops’ Council 2000). There is potential for tension between these two expressions of the Christian mandate to heal, for example if seeking medical treatment is perceived as a lack of faith in the healing power of God. In practice, though, even theologians with a very confident view of God’s supernatural healing work tend to play down this tension, arguing for complementarity rather than conflict between medicine and Christian healing ministry (e.g. Warrington 2003).

Qualifications of the Mandate to Heal

Counterparts of the theological mandate to heal can be found in the other Abrahamic traditions; yet within all three Abrahamic faiths, elements of ambivalence about the work of medicine can also be discerned. In Judaism, some Talmudic and later texts say that healing is authorized or even commanded by God, so that from one perspective the value placed on healing in Jewish tradition amounts to “a virtual love affair between Jews and medicine over the last 2,000 years” (Dorff 2012, 314). Yet other texts suggest a more ambivalent attitude, seen for example in Talmudic debates about whether consulting a physician betrays a lack of faith in God the true healer (Sinclair 2003, 145–154). In Islam, Sachedina observes that those traditions which took a more determinist view of divine activity have at times been a source of quietism and reluctance to seek medical care, yet Islamic tradition also includes much more positive estimates of the work of medicine (e.g. Sachedina 2009, 82, 84, 91–94).

Within the Christian tradition, the theological mandate to heal will generate a strong ethical presumption in favor of medical practices and therapeutic interventions. However, both the mandate and the ethical presumption require some qualification and nuance. One way of expressing this is by means of Dietrich Bonhoeffer’s distinction between the “ultimate” and the “penultimate” (Bonhoeffer 2005, 146–170). In this theological perspective, health is a *penultimate* human good, of genuine but not *ultimate* importance. Diseases which threaten or destroy health will be seen as real and sometimes terrible evils, but not ultimate disasters, nor the worst things that can happen to us.

Those who adopt this qualified and nuanced affirmation of the work of healing will be critical of any tendency to attach *overriding* importance to the curing of disease, or to imagine that it must be done at all costs by any means necessary. This will have many practical ethical implications; a few examples must suffice. It may influence the ways in which Christians think about the allocation of scarce healthcare resources, motivating them to face honestly and faithfully the tragic choices which cannot be evaded (Verhey 2003, ch. 10). It will also influence a Christian ethical analysis of biomedical research, particularly in morally controversial areas. In public ethical and policy debates in some Western countries, to conduct such research is sometimes rhetorically presented as an overriding imperative; moral concerns may be dismissed as the private and irrational scruples of a religious minority, which should not be allowed to obstruct the relief of human suffering. The Christian perspective outlined here will be critical of such rhetorical appeals. It will certainly affirm the great value of biomedical research; but it will resist the tendency to brush aside moral concerns about particular research programs, or to exclude those

moral concerns from the arena of public rationality and confine them to the realm of private religious opinion (Messer 2011, chapters 1, 2).

This account of health and disease also informs an ethical perspective on human enhancement. The distinction between *therapies* (technological or other interventions intended to cure or prevent diseases, and restore or maintain health) and *enhancements* (interventions intended to expand human capacities aside from curing or preventing disease) is often said by non-religious bioethicists to be conceptually incoherent, ethically insignificant, or both (e.g. Harris 2007, 44–46). Some theological ethicists also question its significance (e.g. Koios 2012). Yet if “health” and “disease” refer to a specific and limited sphere of penultimate human good and its deficits, then it makes sense conceptually to distinguish between interventions intended to treat disease and those which aim at overcoming human limitations not caused by disease. This distinction also bears some ethical weight: the theological affirmation of the work of healing will generate a strong (though, as we have seen, not absolute) ethical presumption in favor of therapeutic interventions, but not of enhancements. This need not imply a blanket rejection of the latter, but will suggest a theologically motivated suspicion of such projects insofar as they represent a dissatisfaction with the limitations of embodied creaturely human being as such (Messer 2017, 167–175). In this religious perspective there is nothing wrong with being a finite, mortal, embodied creature.

The Spiritual Value of Disease and Suffering

What of the view that diseases, even if evil, may be occasions for spiritual growth or even serve a salvific purpose? To treat one’s disease and suffering as an opportunity to share in the sufferings of Christ, or to refuse treatment in order to make progress in one’s ascetic journey, are best regarded as vocations of some rather than all people (even those who emphasize this view of disease may acknowledge that few believers are able to respond in this way: see Delkeskamp-Hayes 2006, 227). There may be good reasons to organize healthcare practices and institutions in ways that keep open the space to follow such vocations (e.g. by respecting decisions to refuse treatment for such motives, and continuing to care for patients who make such decisions), but not to impose them as general obligations.

In a more general sense, though, the argument of Barth noted above – that diseases can serve as reminders of our finitude and mortality, and so redirect our ultimate hopes to God – can in Christian perspective be seen as applicable to all. One implication of this might be a reminder that for all of us, fragility, vulnerability, and dependence are simply part of what it is to be a human creature in this world. In modern times we are sometimes reluctant to acknowledge these aspects of our human condition in the ways we imagine and practice healthcare. Patient autonomy, for example, is sometimes conceived in ways that assume the human good consists in being independent, self-determining individuals. The religious perspectives on disease outlined in this entry will be critical of constructions of human flourishing which tend to deny the inescapably frail and (inter-)dependent character of human life.

Again, this may have various practical ethical implications. To give just one example: it is increasingly argued that not only unbearable pain, but also the indignity of losing one’s autonomy and becoming dependent on others, can justify voluntary euthanasia or assisted suicide. A religious perspective that regards frailty and dependence as part of the human condition may be critical of this line of argument, since it will contest the view that the value of anyone’s life is diminished by dependence or loss of autonomy.

CHAPTER 120

Home and Homelessness

Laura Stivers

Homelessness is becoming a widespread problem in our world, from refugees fleeing war-torn countries to shantytowns in large urban areas to displaced homeowners from gentrification in the United States. Homelessness is not inevitable. In some cultures, families ensure their members are housed and in some countries, governments prioritize housing people through particular public policies. In the United States we are increasingly accustomed to seeing homeless encampments and people begging on street corners and often think there is little that can be done to address the problem. We also tend to equate homelessness with these visible homeless, but there are many invisible homeless, people who are sleeping in campgrounds, in cars, or at the homes of friends or family. Even for many who have housing, overcrowding or dilapidated dwellings can be a problem. Homelessness and substandard housing are the result of extreme poverty and inequality. Globally this is even more the case, with people displaced by war and violence, natural disasters and extreme weather (often linked to climate change), and global economic policies that favor the rich and hurt the poor. Without a critical analysis of homelessness and global displacement, religious communities can often unwittingly reinforce some of the stigmas and structures that keep poverty and inequality in place. They can also confine hospitality to charity and not envision avenues of advocacy for structural changes that might prevent homelessness, poverty, and inequality.

State of Homelessness in the United States

Since 1984 researchers have classified people who are homeless into three groups (although the groupings are not always distinct): first-time/crisis/transitional, episodic, and chronic. Transitional homelessness refers to individuals or families who are homeless only once or twice and for a short period of time, usually related to an unexpected crisis such as unemployment, divorce, or eviction. Episodic homelessness entails people who cycle in and out of homelessness for differing lengths of time, often related to inpatient treatment centers, detoxification programs, or jail. Chronic homelessness includes people who have lived on the streets or in shelters for prolonged periods of time, and who usually face many obstacles to holding secure employment or housing.

The Department of Housing and Urban Development (HUD) collects data on visible homelessness (in homeless shelters or on the street), but misses many forms of hidden homelessness, such as people doubling up with family/friends or people staying in motels, campgrounds, or shelters for domestic violence.

Estimates on homelessness differ with the HUD's 2019 point-in-count 567,715 (HUD 2019); whereas the National Law Center on Homelessness and Poverty estimates that more than 3.5 million Americans are homeless each year and an additional 7.4 million are doubled-up with others due to economic necessity (NLCHP 2015). While people who are chronically homeless are the most visible, the US Conference of Mayors estimates that only 14 percent of homeless individuals fit into this category (US Conference Mayors 2016).

The only consistent variable for people who are homeless is extreme poverty, but there are some frequently found characteristics among people who are homeless. Families whose cash income is less than half of the poverty line (\$26,500 for a family of four in 2021) are in extreme poverty (Health and Human Services 2021). According to the United Nations (UN), almost 18.5 million Americans lived in extreme poverty in 2018 (UN 2018). Based on HUD 2019 data, individuals constitute 70 percent of the homeless population and families make up the remaining 30 percent (HUD 2018). While men make up 60 percent of the homeless population, homeless families are more likely to be headed by women. Race is also a factor in who is homeless. For example, African Americans, while only 13 percent of US population, make up almost 40 percent of the homeless population. In contrast, White people constitute 77 percent of the population, but only 48 percent of the homeless population (HUD 2019). Veterans make up 6.5 percent of the homeless population, but this group has seen a 50 percent decrease in homelessness between 2009 and 2019 (NAEH 2020). Chronic homelessness has also decreased due to an emphasis in many urban areas on Housing First, an approach to get people who are chronically homeless into supportive housing. The rationale for focusing on those most in need is in part an economic one as people with chronic illnesses use many public systems in an inefficient and costly way (e.g. emergency rooms, corrections, mental health). In contrast, there was an increase in homelessness over the past ten years for families and unaccompanied youth and children.

The 2016 Hunger and Homelessness Survey administered by the US Conference of Mayors says that for families with children, lack of affordable housing is the leading cause of homelessness, followed by poverty, unemployment, and low-paying jobs (US Conference of Mayors 2016). For unaccompanied individuals, lack of affordable housing and poverty are primary causes of homelessness and for some mental health and/or substance abuse are contributing factors. For women, domestic violence is a leading cause of homelessness. A fourth of homeless adults are employed but do not make enough to afford housing (Parade 2018). Some experts on homelessness have used the analogy of musical chairs to illustrate the causes of homelessness. The players are poor households and the chairs are affordable housing units. When the music stops, some people will not get chairs since there are fewer affordable housing units than poor households due to structural factors of housing supply, prices, incomes, and welfare spending. According to the National Low Income Housing Coalition (NLIHC), there is a shortage of 7 million affordable rental units available for extremely low-income households in 2019 (NLIHC 2020). Those who lose out in this situation of scarcity will be the most vulnerable, due to individual factors (e.g. disability, substance abuse, domestic violence, foster care, prison) and/or discrimination (e.g. racism, sexism, homophobia). The structural factors explain why we have homelessness, while the individual factors identify who is homeless.

The Economic Policy Institute (EPI) notes that in the last forty years, wages (adjusted for inflation) have gone down for a vast majority of workers in the United States (EPI 2018). In addition, job security has been steadily dismantled. At the same time, public assistance also decreased. When US postwar hegemony diminished, corporations found they could not make the same profits from production and so good paying manufacturing jobs decreased. Many manufacturing jobs went overseas as corporations could find a cheaper labor supply and lower labor and environmental regulations in developing countries. A number of corporations got involved in mergers and acquisitions to make higher profits, contributing to more job loss.

A shift from investment in production to investment in finance, which was increasingly unregulated, led to dubious investments and financial speculation. Technology and increased automation is also putting a lot of people out of work.

There has been decreased funding for low-income rental assistance despite the increasing income/housing affordability gap. According to the Center on Budget and Policy Priorities (CBPP), federal spending on housing assistance took a sharp turn in 1996, decreasing by 30 percent (CBPP 2016). Chronic underfunding to HUD has also meant that public housing developments are not well maintained and next to no new public housing is being built. Section 8, the Housing Choice Voucher program, is currently HUD's largest rental assistance program. It serves over 2 million households, including families with children, elderly households, and people with disabilities. Participants pay 30 percent of their income toward housing costs and the program covers the remainder up to a set amount (varies by region). The rent cap, as well as landlords in more well-off neighborhoods reticent to take Section 8 vouchers, can make finding housing difficult and often consigns voucher holders to impoverished neighborhoods. Furthermore, lengthy voucher waiting lists mean many families are not getting assistance.

Homelessness is clearly linked to structural factors, namely a lack of affordable housing, poverty, and oppression. We have a political economy without enough jobs for everyone, and too many jobs with inadequate pay and benefits. Furthermore, since the 1980s we have a smaller safety net to catch those who fall through the cracks. While the US government offers some rental assistance for low-income families, it is paltry next to the tax breaks it gives to promote homeownership (e.g. mortgage deduction on up to two homes). According to the Center on Budget and Policy Priorities, 60 percent of federal housing spending goes to households with incomes over \$100,000 (CBPP 2017). While viable solutions to homelessness would need to address the different needs of particular groups of people who are homeless (e.g. veterans, children, domestic abuse survivors, people with disabilities, people with addictions), all would most likely benefit if we were serious about addressing poverty and decreasing inequality.

Global Displacement

Internationally, the forced displacement of people has hit a record high. Displaced persons have to abandon their homes. Often facing discrimination due to ethnicity or place of origin, they are more likely to become homeless. A United Nations Refugee Agency report finds that almost 79.5 million people were displaced by conflict and persecution in 2019 (UNHCR 2019). Long lasting conflicts, like those in Somalia and Afghanistan; new conflicts and situations of insecurity, such as those in Syria, South Sudan, Yemen, and Venezuela; and a lack of solutions for refugees and internally displaced people, have caused a precipitous rise in the number of people without a home. Heartbreaking is the fact that 40 percent of the world's refugees in 2019 were children, many without their families (UNHCR 2019). A majority of refugees find asylum in neighboring countries but the overwhelming influx of refugees has led some countries to talk of closing their borders. There are also a large number of internally displaced people who have been forced to flee their home but who remain within their country's borders. At the end of 2019, a record 45.7 million people have been displaced internally due to conflict and violence (UNHCR 2019).

Natural disasters and extreme weather (e.g. floods, storms, earthquakes, volcanic eruptions, wildfires, landslides, and extreme temperatures) have caused twice as many displacements as conflict and violence. The Norwegian Refugee Council estimates that fourteen million people every year will be displaced from

weather-related events (NRC 2017). In recent years, south and east Asian regions have had the most weather-related displacements. For example, a 2015 earthquake in Nepal forced 26 million people from their homes, small island coastal people have increasingly been displaced by climate change-induced storms and flooding, and extreme typhoons, cyclones, and monsoon floods have led to displacement in the Philippines, China, and India.

Root causes of global displacement are multidimensional and interconnected. Conflict and violence are often not separate from environmental-related causes such as resource depletion and climate change. Existing racial, ethnic, religious, and cultural divisions are exacerbated by poverty and underdevelopment, weak governments and corruption, and environmental destruction. Colonial legacies and neocolonization in the form of globalization (e.g. unfavorable terms of trade, external debt, and economic reform programs in the Global South) also contribute to poverty, inequality, insecurity, and conflict.

When people flee their homes, they lose most everything – their homes, their jobs/livelihoods, and their material possessions. They can also lose their connection to particular communities that provide support networks and cultural identity. In addition, the education of children is disrupted. The more people are displaced and the longer they are without a home, the more they are traumatized, affecting their ability to recover both physically and psychologically. Displacement and forced migration cause an escalation in poverty and have public health impacts, such as higher rates of communicable diseases, acute malnutrition, and even mortality.

Hospitality and Justice

Hospitality is a foundational value of many different religious traditions. Hospitality is not simply about giving a homeless person charity. It also entails offering places of welcome and care, shaping healing neighborhoods, and advocating for policies and systems that are just and humane. In other words, hospitality must be connected to justice. In Judaism and Christianity, for example, hospitality as justice was a foundation of all morality. Having been freed by God from slavery, the people of Israel understood that a covenant with God included caring for all within their midst by sharing their bread with the hungry and bringing the homeless poor into their houses (Isaiah 58:7). For Christians, Jesus also modeled hospitality as justice. At the last supper, and throughout his ministry, Jesus opened the banquet for all to be seated at the table in relationship with God and one another. Jesus envisioned abundant life for all, where humans are not only physically housed, but are truly at home within caring, inclusive, and sustainable communities. Paul sought to make such a vision of *koinonia* community a reality in the early church. Translations for *koinonia* include fellowship, contribution, sharing, and participation. The early church aimed to embody these values by caring for all its members, distributing goods according to need, and worshipping and praying together (Acts 2: 42–47). Each member of the community participated fully in the fellowship and worship of the community because hospitality as justice was practiced with God's gifts shared sustainably by all.

The problems of homelessness and displacement are not only about people who find themselves without a place to sleep, but reflect a problem in our collective identity as a people and a society. Our high value in the United States on individualism and each person being responsible for him or herself can hinder our ability to envision alternatives to what seems inevitable. Many Americans have been socialized to accept a dominant cultural worldview that promotes individual initiative, enterprise, and achieving the American dream, but a society founded on such a competitive worldview privileges the winners and

marginalizes the losers. The neoliberal agenda that promoters of globalization espouse is also based on an individualistic competitive worldview. The elites in all countries benefit from the global capitalist economy at the expense of the rest. Religious worldviews, in contrast, ought to be based on inclusion and cooperation, encouraging religious followers to challenge the idea that homelessness and displacement are inevitable.

Jesus challenged those who tried to limit the seats at the banquet table and share crumbs rather than abundant loaves. Hospitality as charity does not afford the recipients full human dignity in ways that enable them to participate fully in community and fellowship. The bountiful goods at the banquet table are not earned, but are gifts from God, meant to be sustainably shared by all (including non-human creatures), not hoarded (Leviticus 25: 18–19, 23–24). All of God's creation is interdependent, with each person an intricate part contributing to the whole. Love of neighbor entails both being a neighbor to others and allowing others to be neighbor to us. As the story of the starving widow who serves Elijah (I Kings 17–18) attests, those who are poor and outcast can be just as hospitable as those who are rich and powerful.

While many religious communities preach the values of hospitality and justice, these are empty generalities apart from actual practices that consistently embody these norms. Out of fear, most communities stop short of fulfilling these values. Our real problem is our inability to see everyone as a neighbor. Out of fear we try to protect ourselves and justify such protection by constructing stereotypes that turn our neighbors into "others" who are dangerous. Thus, the homeless are often depicted as dirty, lazy, and drunken despite the fact that many people who are homeless work and many of those affected by homelessness are children. Immigrants, some of whom are refugees fleeing violence and/or environmental destruction, are simply trying to find a home place where they can restart and create stable and flourishing lives. Yet, undocumented immigrants are regularly labeled as "aliens" and increasingly immigrants and refugees are being labeled as dangerous terrorists.

Theologians have argued for the importance of rootedness and home to human well-being. The places we occupy have a lot to do with what and who we are. In short, our individual and communal identities are tied to home places, through both human and ecological relationships. Many have argued that humans need a sense of home if their identities are not to be dispersed and fragmented – we need a place we can pass through the stages of life, where we can belong to a community, where we can have a relationship with the natural elements, and where we have access to the sacred, however understood. Truly belonging to a place means being intimate with the people, land, and institutions of one's community and region. Home is where a person feels rooted, yet for many, rootedness and a home place are elusive. Religious communities can support rootedness and home through their inclusive and welcoming hospitality and by their support of and advocacy for structural justice in our institutions and global economy.

While there is no single blueprint, we could establish some basic levels of human and environmental flourishing. For one, all people in a society ought to have decent housing, access to adequate healthcare and a good education, and if they are able, work that allows them to live healthy lives and contribute to a healthy society. For people who are not able to contribute through work, we ought to find other ways that they can contribute to society and have services and safety nets so they can live well. Basic goods are not all that is necessary for people to flourish, however. Meaningful avenues for participation for all individuals in communities and the broader society are also important. If we are all to participate in society and relate to one another as neighbors, then there also needs to be a rearrangement of wealth and power, on both a national and international level. The substantial inequality in our society and world blocks

solidarity between people and thwarts just and compassionate communities. Charitable paternalism that sustains the status quo supplants solidarity and justice.

Hospitality as justice also requires sustainability. The issue is not simply about how all are going to be seated at the table but also about how we are even going to have a table. Hospitality as justice entails that people with wealth and privilege live more simply so that the earth can continue to sustain itself and its inhabitants. Domestically we must ask what type of houses and communities we are building. Sustainable hospitality requires structural changes that would move the American housing industry's emphasis away from investment in high-end, single-family homes toward earth-friendly, higher density housing and smart growth. Internationally, people from developed countries and elites from developing countries must start consuming less to ensure a home for both human and non-human animals on this earth. Poverty is intricately linked to environmental destruction and addressing climate change by lowering our dependence on fossil fuels is key to preventing global displacement.

Homelessness and global displacement are human-created problems. Religious communities can promote hospitality as justice by treating everyone as a neighbor and by changing structures to protect and/or create a sense of place and home for all. Structural change will require radical change of practice for all but the very poor. True hospitality that promotes solidarity with and justice for the homeless and displaced requires inclusive communities and implementation of domestic and international policies that address poverty, inequality, and climate change.

CHAPTER 121

Moral Struggle

Elizabeth Sweeny Block

Struggle in the moral life is a given. Moral struggle conveys the reality that human beings are “moral works-in-progress,” that is, we are “broken, incomplete, morally blind persons trying to understand and live with other broken, incomplete, morally blind persons” (Clairmont 2011, 12). The moral life is not characterized by comfort and certainty; rather, it is a challenge and a journey. Humans are finite, flawed beings, limited by our bodies, by our historical, social, and cultural locations, and by the challenge both to know the right thing to do and to act on that knowledge. Moral struggle is the condition of being a moral agent, and yet the reality of moral struggle does not mean the moral life is characterized only by confusion and despair. In fact, certain kinds of moral struggle can be constructive, formative, and productive. Moral struggle is a reality of human life; it is the labor that characterizes moral agency. Basic moral struggle is the difficulty in discerning the right and good and in aligning one’s intellect, desires, and will. A person may know the good and still not do it. Other forms of moral struggle, experienced and carried out by those who endure and resist oppression, are unique in that an agent is unable to do what is commonly considered good given the circumstances and context. This moral struggle, connected with moral injury or conditions of oppression, is distinct from the basic moral struggle – the conflict between knowledge and action – that characterizes the moral life. Additionally, large scale, global moral problems “such as violence and climate change” give rise to a new kind of struggle to deal with moral challenges that overwhelm individual agents.

The phrase “moral struggle” calls to mind a quandary, a particular moral problem for which there is no easy answer. However, moral struggle refers more broadly to the continuous, laborious journey of moral agents toward a life well lived and not just to the difficulty experienced in the discrete choices that moral agents must make, such as deciding on a particular course of treatment for one’s illness or no treatment at all, telling a friend something hard to hear or keeping it to oneself, or stealing money or doing what you know is right. Therefore, moral struggle is present not only in particular quandaries but throughout one’s life. The struggle of the moral life is inevitable given the realities of sin, structural injustice, human freedom, and competing goods. The reality of moral struggle is recognized most explicitly in virtue ethics, which understands human beings to be works-in-progress in need of ongoing habituation. Some other ethical models, by contrast, view the moral life as a matter of clear absolutes. The struggle of the moral life is especially represented in the work of conscience.

Moral Struggle Characterizes the Moral Life

Moral struggle is evident throughout the history of religious ethics and is especially prevalent in Christianity with its heavy emphasis on sin. Christianity is a religion of and for sinners, and so it focuses on what humans lack and cannot achieve on their own, without God's grace. The concept of moral struggle – the difficulty in knowing the good and the challenge of doing the good that we know – fits quite well into Christian anthropology. Although other religious traditions view humans as flawed, none does so quite to the extent of Christianity. Judaism “emphasizes the naturally weak and fallible character of human beings,” while Islam “underscores the ability of humans to overcome their weakness,” but Christianity stresses human failure (Mathewes 2010, 55). Islam assumes that people have the capacity to know the good and can act to realize it, while Judaism reflects a pattern of human weakness or helplessness in contrast to God's redemptive power. However, persons in any religious tradition can experience moral struggle: it can be difficult to obey religious laws, to put into practice what is taught, to discern when certain obligations outweigh others. Human beings struggle to know and do the good, no matter how much emphasis a religious tradition places on obedience and regardless of the close relationship between morality and human flourishing.

Acknowledgement of moral struggle begins at least with Aristotle, who countered Socrates's claims that knowledge is virtue and that it is not possible to act against what one knows to be right unless one is compelled by an external force. For Socrates, only an ignorant person would fail morally. In response, Aristotle addresses the problem of moral struggle, which he terms *akrasia*, often translated as “moral weakness” or “weakness of the will.” Moral weakness for Aristotle means either knowing the good but not pursuing it because one is derailed by one's passions or failing to understand the good to be pursued in the first place. Moral struggle is a failure of the will to move one to act rightly.

Aristotle's ethic captures several additional features of moral struggle: the difficulty but importance of aligning one's actions and one's intentions; the need to account for the context in which one is acting and one's own unique characteristics; and the goal of consistency in character and action over the course of one's life. Aristotle recognized the human good to be a life that accords with reason, aided by virtue, but he famously noted in his *Nicomachean Ethics* (Aristotle 1999) that “one swallow does not make a spring,” meaning that living a virtuous life does not happen in just one moment, and a life cannot be judged to have been well lived until it is complete (Aristotle 1098a 15). A life of virtue requires ongoing, repeated virtuous actions and habituation: we become virtuous by acting virtuously. However, Aristotle observes that the right way of acting in every situation cannot be determined abstractly because questions about how to act have no fixed answers. The best one can do is give an outline of right action; exact answers remain elusive without accounting for particularities. Ultimately, for Aristotle, virtue is found in the mean between excess and deficiency of virtue. Therefore, Aristotle concludes that it is hard work to be excellent because of the difficulty in finding the mean between extremes. Spending money or getting angry are easy to do, “but doing it to the right person, in the right amount, at the right time, for the right end, and in the right way is no longer easy, nor can everyone do it. Hence doing these things well is rare, praiseworthy, and fine” (Aristotle 1109a 25). One struggles not only to act well, but to do so for the right reasons and in the right context.

Moral struggle is present in scripture as well. The profound struggle of the moral life and the potential for conflict between God's commands and what appears to be the right thing to do are felt in the story of Abraham, who, following God's command, almost kills his son, a story found both in the book of Genesis

(22:1–19) and in the Qur'an (37:83–109). This story suggests, among other things, that what humans want and desire and what God wants may stand in tension. Moreover, the story implies that God does not provide a “seamless set of axioms and rules, a moral algorithm that will smoothly produce the right answer for devotees every time” (Mathewes 2010, 28). Rather, there is tragedy, complexity, and mystery in the moral life. There are no easy, obvious answers to moral dilemmas.

Moral struggle is also famously captured by Paul's words in his letter to the Romans: “I can will what is right, but I cannot do it. For I do not do the good I want but the evil I do not want is what I do” (Romans 7:19). Paul conveys the struggle of knowing the good but not doing it. St. Augustine grappled with this very problem: how one could act against what one knows to be good. Both before his conversion to Christianity and after, Augustine wrestled with the problem of evil. We are created good, but we are mutable, and our falling away from the good is caused by our own will. The struggle of the moral life is to order our loves so that we love God above all and love ourselves and things of this world in so far as they enable our love of God, but only God can turn our will away from evil and toward the good. The power to live a moral life is grace from God. For Augustine, Christian life is characterized by unremitting moral struggle, reflected in his own life, his conversions, and his self-described wayward youth.

Moral struggle is implied in Thomas Aquinas's approach to law and virtue as well (Aquinas 1948). Moral struggle for Aquinas is not an intellectual fault but results from a misdirected will. Reason apprehends the good, and the will moves us to that end. The problem lies in the motivation (or lack thereof) to act in regard to our own well-being and the well-being of others. Knowing the good is not necessarily sufficient to move one to act. This constitutes moral struggle. Furthermore, one can also fail when one desires the wrong thing or the will moves one toward something bad. Additionally, the right way to act is not always readily apparent. Knowledge of the good in particular situations is not obvious or consistent across all times and places. Aquinas asserts that the first principle of the natural law is to seek good and avoid evil, but what that entails in concrete circumstances will differ. We can ascertain that there are certain basic goods that ought to be pursued based on the natural inclinations of living things and humans in particular – goods such as life, reproduction, education of offspring – but these goods do not give us concrete directives for every situation in which we find ourselves. In fact, Aquinas states that the more we descend into particulars, the more likely it is that we will fail. The work required of moral agents to discern what the natural law dictates in particular situations constitutes moral struggle.

Some well-known religious figures wrote about moral struggle as they lived it. Martin Luther, for example, was no stranger to moral struggle. He wrestled with how to overcome his sinfulness and ultimately concluded that only God could save him. He wrote about the difficulties of living a moral life, noting that in an ideal world we would not need laws or punishment because we would all do what is right automatically. However, he observed that there are very few “true Christians” in the world, and so we need laws and the threat of punishment to restrain the wicked. In an imperfect world, the Gospel alone is not sufficient. Moral struggle was very real for Luther, although he came to realize that he could not save himself through any amount of human struggle.

There are times in the history of religious ethics when moral struggle is not readily acknowledged. The manualist tradition, dating back to the seventeenth century, gives the impression that morality is cut and dry and that there are clear answers to every moral dilemma. In contrast to this legalistic approach to morality, late twentieth-century scholars have emphasized the ambiguity of the moral life and moral knowledge. Rules and values are often experienced as conflicting, and at times it is impossible to realize two distinct, competing values given the limits of human existence. Justice and peace may conflict, for

example, and one may need to find a third way that preserves as much as possible of both. In such cases, the task of moral discernment includes prioritizing values and goods in difficult cases. Moral struggle reflects the reality that moral discernment is often a difficult choice between competing claims. The Roman Catholic Magisterium in particular has often been accused of failing to acknowledge moral ambiguity and instead insisting on a binary framework in which actions are either entirely good or entirely evil. A failure sufficiently to acknowledge moral ambiguity is a failure to recognize the inevitability of moral struggle. Competing values and claims and the lack of easy, ready-made answers to moral challenges render moral struggle a necessary part of the moral life.

Moral Damage and Structural Injustice

Moral goodness and human flourishing are limited not only by our own individual shortcomings – our struggle to align what we desire with what we know to be good and the difficulty in knowing what is right to do in the first place – but by the situations and conditions in which we are located and the systems of which we are a part. There is a type of moral struggle that arises in situations in which one cannot do what is typically identified as the good or right thing to do. Moral luck is that which is outside an agent's control but affects that agent in a morally relevant way (Tessman 2005). Bad moral luck interferes with human flourishing. Moral damage is bad moral luck that accounts for the difficulties in being virtuous that result from what is outside of our control. Moral damage names a particular type of interference in the ability to live a good life that is outside an agent's control. Oppression interferes with flourishing by creating circumstances external to the oppressed agent that limit her options. Oppression also interferes with flourishing by causing moral damage in the oppressed agent such that the agent is inclined to do what she would not do otherwise. In the context of a tragic dilemma, an agent may (need to) engage in an act that she would not choose otherwise, and this act brings with it sorrow and suffering. Moral damage results from bad moral luck that has shaped an agent in such a way that her character traits and choices are not completely in her control. Lisa Tessman (2005) provides the example of rape, which is often accompanied by victim-blaming. If a woman strategically submits to an attempted rape rather than risk her life resisting it, the woman might be blamed for the rape. The typical response would be to recognize that blame lies with the rapist, but Tessman also suggests that the gender system may have contributed to a woman's vulnerability such that she is afraid or unable to fight back because she has been socialized to have character traits such as passivity, fear of self-defense, or a lack of clarity about her own sexual desires (Tessman 2005, 38). The constitution of her character is not entirely in her control, although this does not remove her moral responsibility for her character and her choices. It does not diminish her agency.

All of this constitutes a certain type of moral struggle, wherein agents do not or cannot do what is expected or recommended.

Moral damage may interfere with the ability of an oppressed person to carry out the actions suggested by her/his own liberatory principles or at least to do so without internal conflict. Moral damage may also be directly destructive of the damaged self; feelings of hopelessness and an internalized belief in one's own inferiority are examples of forms of damage that may not only retard resistance but also cause great pain or an immediate lack of well-being for their bearer.

(Tessman 2005, 48–9)

Moreover, there are other virtues, such as sensitivity to the pain and suffering of others, which may be necessary but also detrimental to a person's well-being because possessing them causes great discomfort. There is acknowledgment, particularly on the part of feminist philosophers and theologians, that morality is not neat and tidy. Oppression and structural injustice result in a kind of moral conflict where one's own flourishing or, one's own ideas of what constitutes flourishing, are challenged by the context and reality with which one is confronted. This kind of moral struggle is not simply a matter of struggling to do what one knows to be right; this moral struggle is embedded in unjust structures and can be exacerbated by moral damage.

Competing Goods, Conflicting Moral Judgments, and Moral Incompetence

The struggle of the moral life is due in no small part to the reality that various values and goods compete with one another. Hard decisions must be made, and lesser evils must be chosen. The moral dilemmas before us do not always have obvious right and wrong answers, and often the right choice is accompanied by difficult consequences. This is explained by concepts such as the principle of double effect, which recognizes that a good action may have an unintended but foreseen negative consequence. Just war theory uses the principle of double effect to explain the destruction and loss of life that accompanies justified warfare. The principle applies to the treatment of ectopic pregnancies as well to explain the unintended loss of the fetus in remedying the inviable, harmful pregnancy. For an act to be licit, the principle of double effect requires that the act in itself be good or morally neutral, the agent's intention must be good, morally evil means may not be used, and there must be a proportionate reason to permit the premoral evil effect. These categories imply that the moral life involves hard choices.

Feminist scholars in particular have highlighted potential conflicts between values and judgments. For example, they have attended to the way emotion factors into moral decisions and whether and how reason and emotion work together or conflict. Some argue that reason and emotion cooperate: reason can be influenced and tutored by our emotions, just as our emotions can be tempered or excited by reason. However, the relationship between reason and emotion is not always harmonious. It is also possible that the conclusions reached through reasoning and through intuition conflict. Rather than contending that one method of moral judgment yield to another, some recent scholars have emphasized that life is fraught with unavoidable moral failures. Whereas Aristotle argued that in virtue right reason and desire ought to converge, the reality is that intuitive moral judgments may conflict with other intuitive moral judgments or with reasoned moral judgments. The "crying baby" dilemma is a helpful example:

You and several others are hiding from enemy soldiers when your baby starts to cry; if the baby is allowed to cry the noise will alert the enemies, who will kill all of you including your baby. Should you smother your baby if this is the only way to silence him or her and avoid alerting the enemies?
(Tessman 2014, 138)

The answer here is not simple. "The emotional response – a powerful negative affective response to the thought of smothering one's baby – competes with the reasoned judgment that there is no benefit to

refraining from smothering (the baby will still die).” Grappling with the conflicting judgments of reason and emotion constitutes moral struggle.

Recognition of the reality of moral struggle is part of accepting moral uncertainty. Not only do we struggle to do what we think or know to be right, but we are also faced with global moral challenges that do not present obvious, easy answers. We are, in many cases, overwhelmed by the scope of a moral problem such that we are unable to act or unsure where to begin. Willis Jenkins calls this “moral incompetence,” the notion that a moral problem is so grand in scale that it overwhelms us almost to the point of paralysis (2013). Moral incompetence names the inadequacy of our concepts and practices in confronting large-scale or even global moral problems. Facing overwhelming problems, such as climate change, constitutes a type of moral struggle that surpasses the conflict between what we know to be right and what we want to do. This is a type of moral struggle that challenges us to act in spite of our struggles and our ineptitude. Although the right answer may not be obvious, inaction is not an option.

Moral Struggle and Conscience

The term “conscience” captures the struggle of the moral life, often depicted as the angel on one shoulder, the devil on the other, attempting to persuade the agent of the right course of action. The definition and work of conscience can be understood more broadly as the labor of the moral life, the work that moral agents must do to discern the good and to live it. The term first appears in Paul’s writings in the New Testament, but references to the heart in the Hebrew Scriptures and to prudence and practical wisdom in Hellenistic writings are its precursors. Conscience has many definitions and associations: the voice of God within, the act of making a judgment, the internal dialogue that precedes judgment, and the guilt one feels after making a decision, to name a few. Conscience is both an internal sense and also transcendent, the place where subjective and objective morality converge, where individual discernment meets the objective reality of God. In Paul’s writings, and for St. Augustine conscience is the law written on human hearts. Jerome wrote of the spark of conscience that remains, even when we give in to pleasure or are deceived by reason, in that we know we are sinning. In and through conscience we experience moral struggle: we labor to know the good, or we know the good but fail to do it. But conscience is not only relevant in particular struggles and conflicts. Conscience is also the work of the moral life: discerning what it means to seek good and avoid evil in the course of our daily lives and interactions, and putting into action what we discern to be good.

Twentieth and twenty-first-century scholarship on conscience is situated in debates about whether morality and moral norms are static and fixed, independent of context, given by an authority, or whether morality is instead fluid, changing, and entails effort on the part of moral agents to do the work of formation and discernment. Conscience does not invent morality independent of an objective reality given by God, but neither is conscience merely obedience to law or authority because morality is not that simple or straightforward. Conscience is a delicate balance between subjectivity and objectivity, personal discernment and God’s law. As a medium between the person and God’s law, conscience is necessarily embedded in the struggle to know the good and to do it. In conscience, we live the struggle of the moral life.

CHAPTER 122

Posthumanism and Transhumanism

Ron Cole-Turner

Posthumanism and transhumanism are distinct but related features of the cultural landscape of the early twenty-first century. They are responses to the humanism of the modern West, especially that of the Enlightenment. Posthumanism is best seen as a philosophical and literary critique of humanism and its central claims, while transhumanism favors the enhancement of the human through technology.

These movements gained prominence in the late 1980s and early 1990s. For all their differences, they agree in rejecting the idea that humanity is a fixed reality with an immutable essence. Posthumanism sees humanity not as a biological species but as a flawed social construct characterized by anthropocentrism, rigid human/non-human ontological boundaries, sexism, and racism. Transhumanism sees humanity not as a flawed concept but as an incomplete product of evolution, limited by the constraints of its biology. They agree that science and recent technology both undermine the idea of a fixed humanity.

Despite their similarities, however, posthumanism and transhumanism differ in their histories, core claims, and significance for religious ethics. For example, their views on the enduring value of Enlightenment humanism could not be more opposed. As its name suggests, posthumanism is defined by its rejection of humanism and by its call for a cultural era that moves beyond humanism's core claims. Transhumanism, on the other hand, is a movement that seeks technological enhancement of the human as defined by humanism. Posthumanism proclaims for the end of humanism, while transhumanism calls for its enhancement.

This is not to say that the terms do not overlap or are never conflated. One widely-read critic of both movements, Francis Fukuyama, is often accused of running them together. Nick Bostrom, a key advocate of transhumanism, argues that humans should seek to become posthuman. Radical enhancement of intelligence or physical traits beyond the range of our species will produce a *transhuman* and ultimately a *posthuman*, engineered to the level of a superior species. Transhumanists hope this is so, but posthumanists see it as their worst nightmare.

Some suggest that posthumanism is pessimistic while transhumanism is optimistic. Others claim that posthumanism is rooted primarily in continental philosophy and transhumanism arises mainly in the English-speaking world. These generalizations are overly simplified, but they gesture toward important differences between the two movements. Posthumanism insists that humanism, which has largely defined the modern West, is a flawed construct that views normative humanity as the autonomous European male. Transhumanism, on the other hand, views humanity through evolution. Humans are intelligent but limited biologically. Our challenge is not to deconstruct humanism's flawed view of normative humanity but to recognize that there is nothing enduring about the human, except perhaps a longing for self-improvement.

Posthumanism: History, Forms, and Claims

Posthumanism appeared in academic circles in the 1990s as an interdisciplinary conversation among scholars in philosophy, literary theory, and cultural studies. Perhaps more than any other single publication, Katherine Hayles's *How We Became Posthuman* (1990) marks the debut of posthumanism as a widely-recognized focal point for academic exploration. Hayles's work, however, looks back to the emergence of posthumanism in various sources that were posthumanist in theme if not in name. Far beyond the usual academic disciplines, posthumanist ideas have found creative expression in fiction, visual and performing arts, film, and video games. Wherever the boundaries of humanity are stretched or challenged, a posthumanist perspective is being expressed even if posthumanism is unnamed. What unifies these disparate forms of posthumanism is their challenge to the concept of the human as advanced by Enlightenment humanism.

Criticisms of humanism are almost as old as humanism itself, mostly in isolated expressions that did little to undermine near-universal Western confidence in its concept of humanity as a secure, almost axiomatic foundation for Western culture and social order. Mary Shelley's *Frankenstein; or, The Modern Prometheus* (1818) raised profound questions about the meaning of the human person or subject, and her novel has been followed by countless other similar literary works over the past two centuries. From almost every imaginable vantage point, science fiction has probed the meaning of humanity as it confronts science today or in the future, or as it encounters intelligent but non-human beings on distant planets. Coming somewhat later and addressing different audiences, critics of technology such as Jacques Ellul, Martin Heidegger (in particular, his "Question Concerning Technology"), and Michel Foucault sparked intense discussion of the origins and the coherence of humanism and the role of technology in redefining natural boundaries.

In the late twentieth century, however, the growing chorus of challenges to humanism became more urgent and convincing, fueled in part by the broad cultural response to the horrors of war, mass death, colonial domination, and the environmental crisis. When these challenges converged, posthumanism came together as a movement with a name and a place on the agenda of the early twenty-first century intellectual scene, becoming a kind of lens through which selective central tenants of the humanism of the Western Renaissance and Enlightenment are identified and deconstructed.

Not everything about humanism is rejected by posthumanism, but several core humanist claims advanced by thinkers such as René Descartes and Immanuel Kant are seen as especially problematic. Chief among these are anthropocentrism and a distinctive view of the human subject as a rational and autonomous individual. Against a material universe that is viewed as a lifeless machine, human subjects stand alone in possessing and creating moral value. The natural world, including all forms of life other than humans, is a mechanism that blindly follows the laws of nature. Only humans are free, rational, and intrinsically valuable.

Human exceptionalism, as it is often called, is sometimes buttressed by anthropological dualism. Humans are free and rational because they possess an immaterial essence, which may be described as a rational soul, the mind, the self, or the person. The immaterial essence is housed in a physical body, which is subject to nature's laws, leaving only the human mind as free, moral, and rational. This non-material mind is what distinguishes humans ontologically from other creatures. While exempt from the deterministic laws of nature, the mind is able nonetheless to decipher these laws through mathematics and empirical science, thereby gaining a measure of control over nature and over the body. Aside from

God and angels, whose existence is doubted more as the Enlightenment matures, only humans possess this nonmaterial rationality and freedom. This is the ground of their absolute moral superiority over all other beings, including animals. Only humans are able to define, generate, and create value in nature. They are free and accountable for their own behavior, their personal religious beliefs, their own account of human happiness or flourishing, and their success or failure in life.

While these notions gave rise to claims of universal human dignity and human rights, in practice they coexisted with mass enslavement, rigid patriarchy, Eurocentric perspectives, and racism. For the posthumanist critique, such contradictions are not mere lapses or pragmatic concessions but are baked into humanism's very core. Human superiority over nature appears to be tied intrinsically, in practice if not in philosophy, to the superiority of some humans over others.

The thorough-going critique of humanism begins to take shape in the final decades of the twentieth century. The literary critic Ihab Hassan deserves special mention for introducing the word posthumanism in his 1977 essay, "Prometheus as Performer: Toward a Posthumanist Culture." Hassan's article was followed a few years later by the much-cited and reprinted essay by Donna J. Haraway, commonly called the "Cyborg Manifesto," which first appeared in 1985. In this article, Haraway gives posthumanism its most popular defining metaphor, that of the cyborg. She introduces the concept of the cyborg with these words: "By the late twentieth century, our time, a mythic time, we are all chimeras, theorized and fabricated hybrids of machine and organism; in short, we are cyborgs. The cyborg is our ontology ... a condensed image of both imagination and material reality" (Haraway [1985]2013, 191).

The cyborg is a compelling metaphor for posthumanism because it expresses many of the core affirmations that define the movement. As cyborgs, humans are not strictly human, at least not as humanism defines the human. The cyborg is neither human nor machine, but both at once. It very existence undercuts binary categories. It blurs ontological distinctions that mark the boundaries of what is human or animal, living or nonliving, natural or contrived, valued or used. The cyborg is all these and yet none of them. It cannot be made to fit into any one category of gender, race, or species. It deconstructs the anthropocentric foundation of the modern world.

By the time of the 1990 publication of Hayles's *How We Became Posthuman*, the movement was on its way toward recognition as a point of engagement within the academy. Posthumanism did not emerge in an intellectual vacuum. Its advocates are engaged in other intellectual movements, from feminism to gender studies to ecology, arguing that the Enlightenment's concept of the human underlies problems that are being addressed in each of these conversations. For example, posthumanists embrace a strong ecological awareness. However, unlike some environmentalists who may see nature as worth preserving for human benefit, posthumanists see all nature as a mutually interdependent web of creativity and value. The problem is that anthropocentrism has led to the idea that the natural world is nothing more than a resource for human exploitation. As a consequence of this way of thinking, the human impact on the planet and its climate has been so profound that some have suggested that we have entered a new geological age, with the Holocene of the past 12,000 years now giving way to the Anthropocene. The damage of anthropocentrism is planetary in its extent and geological in its enduring impact, and its underlying cause is a dangerously flawed concept of what it means to be human. For the posthumanist, there is an obvious link between anthropocentrism and the Anthropocene.

The impact of humanism on the environment is a phenomenon of history, but posthumanists are careful to point out that humanism has always been wrong, well before its consequences exposed its flaws. In that regard, the metaphor of the cyborg may be misleading to some. We might think that because

we are able now to create cyborgs and chimeras, we have just now entered a new era in our human relationship with nature, one in which we are erasing the categories of the past. According to posthumanism, however, it would be wrong to think that these categories were real until engineers messed with them. Haraway's cyborg does not mix categories to make them outdated. It shows that they never existed.

Even more important is the claim that the posthuman is not something that comes into existence in history. It is not something new (like the cyborg) that replaces something old (the evolved human). Here the practical difference between posthumanism and transhumanism becomes most sharply defined. According to posthumanism, transhumanists and their critics share the mistaken assumption that now we are "human," but someday we may become "posthuman." They disagree on whether the transition is our salvation or our suicide. Posthumanism, on the other hand, rejects the underlying assumption. We have never been "human" as defined by Enlightenment humanism. We are "posthuman" and always have been.

Transhumanism

The central claim of transhumanism is that human beings should be free to develop and use technology to enhance their capacities and to free themselves from the limits of their biology. Like posthumanism, transhumanism has a complex history and exists today in several forms. Some transhumanists point to the writings of Friedrich Nietzsche, especially his theme of the *Übermensch* ([1883]2008) as a super-human goal for humanity, as the most significant source for the movement. The most prominent transhumanists in Great Britain and the United States, however, question the centrality of Nietzsche's role in the rise of the movement. They point instead to the impact of Francis Bacon and eventually to Julian Huxley as the source of the movement.

Bacon was widely read in his own time (1561–1626) and ever since. His outlook was shaped by traditional Western Christianity, especially the idea that human beings were created to live in harmony with nature, ageless and healthy, but that this original state was lost through sin. In the Garden of Eden, the event called the "Fall" disrupted the harmonious relationship Adam and Eve had with God and with nature. Theology addresses the relationship with God, but Bacon sees the empirical method (what we today call "technology") as a way to restore our harmony with nature. Technology can provide an antidote to sickness and other forms of human misery, including aging and death, if only human beings will work hard to unlock nature's secrets.

More than three hundred years later, Julian Huxley drew on evolution rather than theology to advocate the use of technology to improve the human condition, not of course to repair human fallenness but to advance human evolution to a higher stage, from one evolved species in the genus *Homo* to the next. Huxley does not coin the term, but he uses the word "transhumanism" in a published lecture in 1951, which was expanded and reprinted in 1957 and which contains these oft-quoted words:

The human species can, if it wishes, transcend itself – not just sporadically, an individual here in one way, an individual there in another way – but in its entirety, as humanity. We need a name for this new belief. Perhaps transhumanism will serve: man remaining man, but transcending himself, by realizing new possibilities of and for his human nature.

(Huxley 1957, 17)

Huxley found inspiration in the writings of Pierre Teilhard de Chardin, a French Jesuit priest and paleoanthropologist who speculated about technology and the human future. The two contemporaries agreed that technology opens the door to profound human transformation, completing and in some ways going far beyond what evolution has begun.

The technological advances of the twentieth century inspired many writers and artists to explore how technology might change humanity. The first steps toward an organized transhumanism movement, however, date to the early 1980s. Max More's 1990 essay, "Transhumanism: Toward a Futurist Philosophy," helped define the discussion in the academy and beyond. In 1998, the World Transhumanist Association was launched. More than anything else, this event helped give rise to today's transhumanism as a cohesive and visible feature of the intellectual landscape. That organization, now known as "Humanity Plus" or "Humanity+," is the institutional focal point for transhumanism, and the core documents that define the movement are located on the Humanity+ website (humanityplus.org).

Among these documents is the "Transhumanist Declaration," first drafted in 1998 and modified over the years. The short statement provides a summary of the movement's vision: "We envision the possibility of broadening human potential by overcoming aging, cognitive shortcomings, involuntary suffering, and our confinement to planet Earth." As products of evolution, we human beings have room to grow because "humanity's potential is still mostly unrealized" (World Transhumanist Association 2002).

Another defining document is the "Transhumanist FAQ" (or frequently asked questions), which also dates to the late 1990s. A key sentence says that transhumanists affirm "the possibility and desirability of fundamentally improving the human condition through applied reason, especially by developing and making widely available technologies to eliminate aging and to greatly enhance human intellectual, physical, and psychological capacities" (World Transhumanist Association 2008). Some transhumanists think that these enhancements might produce "posthumans," individuals that began as humans but who are so profoundly changed that they no longer fit within the range of normal humans. Unlike posthumanism, transhumanists see the posthuman as something that we might create, not as a criticism of humanism.

In fact, transhumanists are clear that they do not accept the core claims of posthumanism. Transhumanism defines itself as part of the tradition of Western humanism. According to the transhumanist FAQ, "transhumanism can be viewed as an extension of humanism, from which it is partially derived. Humanists believe that humans matter, that individuals matter." Because humans are evolved, they are also radically changeable because of the growing power of technology. In fact, "we are not limited to traditional humanistic methods, such as education and cultural development. We can also use technological means that will eventually enable us to move beyond what some would think of as 'human'."

Thinkers such as Hans Moravec (*Mind Children*, 1988) and Ray Kurzweil (*The Singularity is Near*, 2005) stand somewhat on the edge of transhumanism. While transhumanists agree with them about what appears to be an unstoppable evolutionary emergence of intelligence, other ideas associated with Moravec or Kurzweil are questioned by some transhumanists. For example, they argue that the full contents of the human mind can be extracted from the brain and "uploaded" to some form of computer substrate, where it might continue with conscious awareness of its present life and past identity. Mainstream transhumanists find the idea somewhat far-fetched, doubting "whether uploading will be possible," according to the transhumanist FAQ. Others "have a pragmatic attitude: whether they would like to upload or not depends on the precise conditions in which they would live as uploads and what the alternatives are."

Another idea advanced by Ray Kurzweil, among others, is the notion of the singularity. The idea is that the pace of technological advance is accelerating, leading perhaps to the invention of superhuman intelligent machines that are themselves inventive. If technological advance can be viewed as a curve that slowly turns upward, there will come a time when the slope of the curve becomes nearly vertical, resulting in a near-instantaneous technological transformation of the world and perhaps the galaxy or even the cosmos. The moment the curve becomes vertical is the moment of the singularity, so-called because (like the original singularity, the “Big Bang”), it is impossible for the laws of physics or of technological prediction to comprehend what is on the other side. According to the transhumanist FAQ, transhumanists “differ widely” on the likelihood of a coming singularity. But “almost all of those who do think that there will be a singularity believe it will happen in this century, and many think it is likely to happen within several decades.”

While differing on questions of mind uploading and the singularity, transhumanists strongly agree that with its inevitable advance, technology will modify human bodies and brains so much that evolutionary limits will be transcended, freeing human beings to achieve what has previously been impossible. Since the first Lomekwian stone tools some 3.3 million years ago, our hominin predecessors have made tools and thereby set in motion an evolutionary feedback system by which our humanity has been shaped by the tools we make. Today the pace of technological advance is more rapid than ever. But more than that, technology today directly targets human modification. Until recently, even the most powerful technologies changed the environment around us, which then, through the relatively slow action of Darwinian mechanisms, changed human beings over generations. Now technology targets the human organism directly, changing individuals in a single lifetime far more than lineages were changed by technology over many lifetimes. It is the era of direct technological modification and enhancement of the human that inspires transhumanism.

The emerging technologies that show the potential for direct human enhancement are sometimes grouped together under the acronym “GRIN.” These are genetics, robotics, information technology, and nanotechnology. In reality, however, the most significant technological contribution to human enhancement available today is pharmacology, most often through the use of drugs developed to treat disease but thought to have enhancement potential for those in normal health. The general public is very much aware of the use of drugs to enhance athletic performance, and sports authorities have struggled to stay ahead of the technologies that are widely used to increase strength or stamina.

The publicity that surrounds debate over the use of performance-enhancing drugs in athletics provides a window on public reactions to other forms and dimensions of human enhancement. For example, the competitive pressure to use drugs that many athletes report may provide insight into the academic and job performance pressures that others identify as their reason for considering such things as cognitive enhancement drugs, which appear to be widely used in some circles. Transhumanists generally support the development and use of such drugs, but they also support careful study of side effects, both individual and societal, including the possible contribution of such drugs exacerbating economic and social gaps between rich and poor. They are also vocal in their opposition to systems of competition that put coercive pressure on individuals to use enhancement technologies against their will.

Some critics claim that the use of technology in place of hard work deprives us of personal integrity, authenticity of identity, and the sense of personal achievement. Another key issue in the debate is whether a meaningful distinction can be drawn between therapy and enhancement. While nearly everyone endorses the use of various medical technologies for therapy, many have doubts about using some of the same techniques for enhancement, which is often defined as the treatment of healthy individuals aimed

not at making them well but “better than well.” Transhumanists recognize the seriousness of these concerns, but they defend nonetheless the right of individuals to make choices about whether or not to use enhancement technologies.

Increased longevity presents a special attraction for some transhumanists, who hope to live long enough to experience firsthand some of the benefits of other technological enhancements that are not yet available. Simply extending life as we know it is not especially appealing, but transhumanists show strong interest in life extension in order to “live long enough to witness currently foreseeable technologies come to fruition,” hoping to “get the chance to become posthuman.” Even incremental enhancement is highly appealing for transhumanists, especially in areas such as cognitive enhancement. Beyond caffeine, various other drugs are seen as offering a boost to cognitive performance, perhaps by extending the productive work-day or sharpening the ability to focus. Future developments might stimulate the brain or create direct links between normal brains and computers, connecting the mind and the Internet and thereby opening the world of information to internal “search.” Most transhumanists are convinced that, one way or another, humans in the future will be more intelligent than we are today.

Like most people, transhumanists value having a positive mood, and so they embrace the use of psychopharmacology not just to treat such things as depression but to elevate the mood for heightened experience and performance. Some transhumanists see a connection between elevated mood, enhanced intelligence, and moral development. Given the pace of technological advance, and with the likelihood of enhanced intelligence, future humans with unenhanced moral capacity will be a danger to everyone. Human moral capacity, of course, is complex, and so there is widespread doubt about whether true “moral enhancement” will ever be possible. If not, then classical and religious means of moral education become increasingly important as science and technology advance.

Recent advances in genetics, especially in the power and sophistication of gene editing techniques such as CRISPR/Cas, have triggered a new phase in the debate over so-called “designer children.” While transhumanists are generally open to the idea of genetically modified offspring, enhanced perhaps for overall resistance to disease or to boost intelligence, they recognize the technical and societal hurdles that would have to be overcome first.

The relationship between transhumanism and religion is complex, considered both in the past and the present. While Huxley does much to promote the discussion of transhumanism in the mid-twentieth century, Teilhard’s (1965, 2004) theologically-inspired ideas draw more attention today than Huxley’s. In 2006, the Mormon Transhumanist Association was organized, and the Christian Transhumanist Association was organized in 2014. Academic conferences on religion and transhumanism have been held intermittently since at least 2004, and the American Academy of Religion has included a study unit on transhumanism as part of its annual meeting since 2009. In these settings, attention is given to the relationship between technologies of human enhancement, as advocated by transhumanism, and religious ethics.

Taken together, transhumanism and posthumanism pose various challenges to traditional religious ethics, especially to assumptions about definitions and norms for humanity. The bioethical principle of autonomy, for example, is widely assumed by transhumanists but widely challenged by posthumanism. Across the varied terrain of religious ethics, unchecked assumptions about humanity are called into question by the deconstruction of posthumanism and the techno-progressive reconstruction of transhumanism. Each movement asks in its own way about the meaning of human flourishing, offering a challenge to religious ethics to enter the public sphere with ideas that take seriously the current context.

CHAPTER 123

Violence

John D. Carlson

Context

For all its ubiquity, violence is ignored and underappreciated as a theme of sustained reflection. So mused the eminent political thinker Hannah Arendt in her 1970 essay on the topic. Politics, since its inception, has located war at the center of its study, much as military history has done with the strategies, tactics, and tools of warfare. There is extensive literature on the philosophy of punishment. Yet, “violence as such” receives no comparable consideration. When Arendt consulted the *Encyclopedia of the Social Sciences* while writing *On Violence* – in the wake of violent crackdowns against civil rights marches, a spate of riots in American cities, college protests and workers’ revolts in Europe and the United States, and political uprisings and revolutions throughout the world – she discovered there was no entry for the term (1970, 9). She found this lacuna disquieting in light of two other features of her day: first, a swelling enchantment with violence not simply as an instrument for expressing genuine grievances and pursuing justice or liberation (as there had always been) but as a positive step toward human self-actualization worthy of celebrating; and, second, the haunting and apocalyptic specter of a thermonuclear war that hovered over the world. It was not lost upon Arendt that these trends coincided: that liberationists and others on the Left influenced by Georges Sorel, Frantz Fanon, and Jean-Paul Sartre were glorifying violence at the very moment when humankind’s complete annihilation at the hands of nuclear doomsday devices was a reigning fear. “The more dubious and uncertain an instrument violence has become in international relations” as a result of the nuclear arms race, she averred, “the more it has gained in reputation and appeal in domestic affairs” (1970, 11).

Arendt penned these thoughts at the end of a turbulent decade, the apex of which was 1968, the year of Martin Luther King’s assassination and ensuing nationwide riots; the Prague Spring in Czechoslovakia and Students’ March in Poland; and the height of the Vietnam War and anti-war protests. Fifty years after Arendt’s work, the ubiquity of violence in 2020 (amid a global pandemic responsible for millions of deaths) remains uncontested: in protests against police violence in dozens of cities throughout the United States (some accompanied by looting and arson); in Hong Kong demonstrations against China’s authoritarian encroachment; and in ongoing civil wars and insurgencies in Ukraine, Syria, and Afghanistan. This year of violence bled into 2021 when, on January 6, President Trump incited an insurrection among his supporters after falsely claiming that the presidential election was stolen from him. In a dramatic siege that played out before the world, the protesters-turned-rioters stormed the Capitol while

Congress was certifying the election results. The siege killed five people, injured hundreds, caused physical damage to the most famous symbol of democracy, and disrupted the peaceful transfer of power between presidents for the first time in American history.

A scan of several recent encyclopedias shows that the omission Arendt identified now has been filled with new entries on “violence.” Yet, many of the critiques she lodged – about the way violence is poorly conceived in the academy and the public – still pertain. Her judgment that “violence as such” is understudied remains particularly apt for scholarly discussions in religion and ethics, prompting ethicist Jean Bethke Elshtain (notably influenced by Arendt) to comment in one of her final essays, “Ironically by ‘seeing’ violence everywhere – transferring the substantial moral force of the word *violence* into contexts where it fits poorly – scholars have hampered themselves and others in locating it anywhere” (2012, 273). Like Arendt, Elshtain trains her aim at the Left of her day. Though, in Elshtain’s case, those who “see violence everywhere” are rarely glorifying it. Rather, she believed, they are overly prone to condemn any form of coercion, force, or war: from military organizations waging war against terrorists abroad; to police and law enforcement agencies charged with keeping the domestic peace; to economic and political forces preserving “structural violence” throughout many sectors of society. If anything, those drawn to violence now are found predominantly among the Right, whether terrorists pursuing the religious calling of martyrdom or paramilitary groups, white nationalists, and Islamophobic vigilantes. In the name of “freedom,” protesters on the Right wielding semi-automatic weapons and spewing hate-filled slogans have descended upon public monuments in Charlottesville to celebrate white supremacy and occupied the statehouse in Michigan to protest public health measures in response to the COVID-19 pandemic. Citizens can reasonably debate how to balance individual freedoms – to guns, free speech, and free assembly – with concerns about public safety and health. But the omnipresence of weapons, Confederate flags, and skull icons found on one side of this debate – spurred on by a tough-talking president who spurns limits on force and extols “private, extralegal violence” and “vigilante justice” – has emboldened fringe elements of the Right and mainstreamed the glorification of violence in public life (Sarat and Obert 2020). The presence of plentiful religious symbols at the Capitol insurrection announces how some on the Right justify their violence (Manseau 2021).

Finally, while the threats of nuclear war of which Arendt spoke have receded in recent times (though hardly disappeared given the collapse of multiple US-Russia arms control treaties), new forms of global violence have emerged, associated with natural disasters and other effects of global climate change. Arendt herself had lamented, “If you ask a member of this generation... ‘How do you want the world to be in fifty years?’... the answers are quite often preceded by ‘Provided there is still a world,’ and ‘Provided I am still alive.’” Alas, fifty years later, some members of today’s youth answer similarly – not so much out of fear of nuclear war, but out of serious concern that global warming and natural disasters could destroy the planet or render it uninhabitable in their lifetime. About 7 in 10 young people say climate change will cause a great deal or moderate amount of harm to people in their lifetime. Climate change, in the words of one anxious 16-year-old climate activist, is “the greatest threat to life as we know it and [to] humanity as we know it. When your mom’s yelling at you, and you have classes, and, on top of that, everybody’s going to die ...it’s easy to let fear overtake you” (Kaplan and Guskin 2019). In this context, it is unsurprising to find the new face of political activist youth is not the Marxist revolutionary of Arendt’s day, but a gritty teenager, who memorably implores “How dare you!” as she chides world leaders at the United Nations for stealing her dreams and childhood.

Still other forms of violence have been pressed into the psyches of youth and parents alike. Those growing up in the era of major terrorist attacks in New York, Washington DC, Oklahoma City, London, Paris, Oslo, Baghdad, Istanbul, Madrid, Mumbai, and Moscow know well how much one event can

shatter lives, rock societies, and indelibly shape an entire generation. In response, declared wars and undeclared military actions around the globe – from Iraq, Afghanistan, Syria, and Yemen; to Libya, Mali, Niger, and Somalia; to the Philippines, India, Pakistan, and Iran – have sought to defeat terrorism and other threats portrayed as such. Despite Western governments' preoccupation with terrorism and counterterrorism, most innocent victims of both live in predominantly Muslim nations.

A focus on violence originating from or projected upon places outside the West easily obscures the reality of distinctively Western forms of violence carried out by disgruntled, disaffected, and often mentally disordered males who unleash their internal chaos on others. Far more mundane and recurrent than terrorism carried out by the religious militant are prospects of being mowed down in a mass shooting while at a movie theater, night club, concert, workplace, house of worship, or – of all places – at school. It took a pandemic rivaling the Spanish Flu of 1918, including lockdowns and school closures, to achieve a significant decline in mass shootings in America – a pause that broke once people emerged from their homes to re-enter public spaces.

Scholar Mark Juergensmeyer reminds us that terrorism, whether domestic or international in scope, extends its impact well beyond the moment when the players perform their gruesome acts and influence audiences long after they exit the “theater of terror” (Juergensmeyer [2000] 2003, 127). Terrorism seeks to instill persistent fear of violence. It connects a past act of violence with a hypothetical one in the future. Indeed, the very fear of violence elicits its own form of trauma. Some American parents and educators even have begun to worry that “active shooter” drills in schools take their own psychological toll on their children. In an odd reversal of post-traumatic stress, preparations to prevent violence create trauma based on an imagined future.

Still others encounter violent crimes or fear of crime in their own neighborhoods: assault, theft, murder, and rape. Cities in Mexico overrun by gangs or hampered by weak law enforcement face extraordinary forms of violence such as extortion, torture, and forced disappearances. We recoil with a special form of indignation when violence is carried out at the hands of corrupt officials charged with preserving peace and ensuring justice. A surge of highly publicized beatings and killings of unarmed Black Americans by US police officers – many caught on video and replayed around the world – sparked massive protests under the Black Lives Matter movement and vociferous calls for police reform. The outrage over police violence also has found voice through lootings, burnings, riots, assaults, and other destructive acts that reflect the shattered trust between citizens and those entrusted to serve and protect them. During these moments, it is the very police whose brutality is being protested who also are called in to quell violence. The protester wielding the sign that reads “Policing is violent” is herself dependent on the same police she condemns to protect her home and business. Alternately, the Trumpist insurgents who overran police and injured 140 officers while storming the Capitol forsook the Right's call to “back the blue” and Trump's own polemical idolization of law enforcement. Such cases and contradictions call for a deep reckoning with the meaning and nature of *violence* – a phenomenon featuring complex religious, political, and ethical dimensions.

Religion and Violence

Amidst so much violence – in so many forms – where does one begin to proffer the sustained reflection Arendt enjoined to make sense of phenomena so often deemed senseless? Scholars of religion, politics, and ethics are particularly attuned to the readiness with which violence has been linked to religion in

recent years. Religion's role in violence is worth reviewing though should not displace a broader ethical and political analysis needed to cogitate on violence in its more essential forms. As well, religious resources can illuminate and amplify the moral valence of violence, even if religion is not *per se* the cause or determinant of it.

Around the turn of the twenty-first century, a cottage industry of scholarship emerged exploring religious violence or, at least, the relationship between religion and violence. Those who were already tracing emerging cracks in the secularization thesis before September 11, 2001 were joined after by countless others eager to remind the world of the deadly violence that can explode when religion and politics mix (Appleby 2000; Kimball 2002; Lincoln 2006; Selengut 2003; Stern 2003). For a brief period, “new atheists” became the most strident critics of religion, reinscribing a new kind of Manichean worldview, whether claiming that “religion poisons everything,” calling for “the end of faith,” or otherwise arguing that secularism is peaceful and tolerant while religion is violent and bigoted (Harris 2005; Hitchens 2007). This heyday of interest in religion and violence has enjoyed a surprisingly enduring run with new work coming out throughout the second decade of the century (Murphy 2011; Carlson and Ebel 2012; Armstrong 2015; Sacks 2015; Powers 2020, and Jerryson 2020).

In response to scholarly and public preoccupations with religion's violent propensities, however, scholars such as William Cavanaugh have adopted a strong rebuttal: first, that “religion” is less responsible for the world's violence than secular institutions are; and second, Western actors and government institutions define and enforce categories of religion and secular in order to preserve the “myth of religious violence.” This myth relies on religion's putative extremism, irrationality, and “peculiarly virulent and reprehensible” violence to deflect critical attention from how war and force are used by secular and nationalist governments – which “hardly counts as violence at all” (Cavanaugh 2009, 13). As Cavanaugh goes on to show, “Without a clear distinction between what is religious and what is not religious, any argument that religion *per se* does or does not cause violence becomes hopelessly arbitrary” (Cavanaugh 2009, 21). Some make the point more starkly: that “the secular,” not religion, is the *real* locus of violence (Jakobsen 2004).

Those on either side in this debate can find ample evidence to reinforce their view. The power of religion in war is seen in the avowal of a Taliban fighter who proclaims of the decades-long struggle against the United States and US-backed Afghan government, “We see this fight as worship. So if a brother is killed, the second brother won't disappoint God's wish – he'll step into the brother's shoes” (Mashal 2020, A1). Yet a student of Cavanaugh (or a mentor such as Stanley Hauerwas) might conclude that the motivations of American soldiers in war are no less religious, redemptive, and worshipful than one finds in the Taliban. Hauerwas, pondering Lincoln's memorable words from the Gettysburg Address – “that these dead shall not have died in vain” and that “this nation, under God, shall have a new birth of freedom” – shows how the Civil War influenced “Americans to think they must go to war to insure that those who died in our past wars did not die in vain” (Hauerwas 2012, 227). Inasmuch as “fighting terrorism” and “defending freedom” have become sacred causes for which thousands of Americans have sacrificed their lives in Afghanistan, the withdrawal of US forces after twenty years of war would be an admission that their deaths were in vain. Where Arendt condemned revolutionary liberationists who celebrated violence as creative, teleological, or regenerative, the study of religious violence cautions against redemptive violence – whether undertaken by Crusaders, Islamist martyrs, or those who die for nationalist causes.

Scholars such as Cavanaugh and Hauerwas oblige us to ask what is so special about religious violence. Indeed, they rightly show the disservice of conceiving religion narrowly in ways that shield secular

causes or civil religion from scrutiny. Yet, neither tells us much about what he means by *violence*. Does Hauerwas, a pacifist, conceive violence the same way as Cavanaugh who is not? Indeed, in most of the religion and violence scholarship, violence rarely gets defined. It is as if, as has been said of pornography, we know it when we see it. But such an approach is insufficient, for it fails to make distinctions, for example, among power, force, punishment, coercion, and authority. Nor does most religion and violence literature attend to the moral dimensions of violence. We can do better. Arendt's political thought helps us begin to frame violence in implicit ethical terms, as informed by examples of her day.

Violence, Politics, and Power

If violence bears no essential relationship to religion, neither is it, for Arendt, a political concept. Indeed, violence is antipolitical. She conceives politics as a normative project involving the collective pursuit and exercise of power. Arendt upends the conventional view that violence is the supreme exercise of power. If anything, violence is negatively defined: "Power and violence are opposites; where the one rules absolutely, the other is absent. Violence appears where power is in jeopardy, but left to its own course it ends in power's disappearance ... Violence can destroy power; it is utterly incapable of creating it" (1970, 56). For Arendt, power – human beings' ability to act in concert – is legitimate in a way that violence is not. Several insights flow from this formulation of the inverse relation between power and violence.

To begin with, a government in power – that is, one empowered by the support of its people (*potestas in populo*) – has no need to resort to violence against its citizens. It can respond to peoples' objections through established and nonviolent political channels. Such is the lesson of the Civil Rights movement, which arduously but successfully employed nonviolence to demand an end to segregation through massive legislative and cultural reform. When individual US states turned their police dogs, firehoses, and armed posses against peaceful protesters, this resort to violence represented the loss of power, which they substituted with an effort to maintain its simulacrum: control. Authoritarian crackdowns on peaceful demonstrators – whether in Prague, Selma, Cairo, Aleppo, or Hong Kong – illustrate how governments resort to violence against their own citizens when governments lack power (*potestas*), hence, legitimacy.
