Notes on Contributors

Ebenezer Akesseh is a Postdoctoral Teaching Fellow at the University of Notre Dame. He holds a PhD in Theology from Notre Dame with moral theology as his area of specialization. He also has an MPhil in Sociology and an MPhil in human resource management from the University of Ghana. His interests include fundamental moral theology, Catholic social teaching, African ethics, political theology, virtue ethics, theology and business ethics, and comparative ethics.

Maria Antonaccio is Professor of Religious Ethics and the Director of the Humanities Center at Bucknell University. Her books include *A Philosophy to Live By: Engaging Iris Murdoch* and *Picturing the Human: The Moral Thought of Iris Murdoch*. Her current research focuses on the dilemmas of human agency in the Anthropocene and the prospect of fashioning a critical humanism in conversation with posthumanist and new materialist alternatives.

Victor Anderson is the Oberlin Theological School Professor of Ethics and Society and African American and Diaspora Studies at Vanderbilt University. He received his PhD in Religion from Princeton University (1992). Anderson teaches and writes on theology and ethics, American philosophy and religious thought, religion and culture studies, and Black religion. He is the author of *Beyond Ontological Blackness: An Essay on African American Religious and Cultural Criticism* (1995), *Pragmatic Theology: Negotiating the Intersections of an American Philosophy of Religion and Public Theology* (1998), *Creative Exchange: A Constructive Theology of African American Religious Experience* (2008), and numerous articles and essays including “Theorizing Black Religion” in *African American Studies* (2010, edited by Jeanette R. Davidson, Edinburgh University Press).

Don S. Browning (1934–2010) was Alexander Campbell Professor Emeritus of Religious Ethics and the Social Sciences in the Divinity School, University of Chicago. He was the co-author of *From Culture Wars to Common Ground: Religion and the American Family Debate* (1997, 2000) and *Reweaving the Social Tapestry: Toward a Public Philosophy and Policy of Families* (2001). He is also the author of *Marriage and Modernization: How Globalization Threatens Marriage and What to Do about It* (2003).

Elizabeth Bucar is Professor of Religion and Dean’s Leadership Fellow at Northeastern University. She writes and teaches about gender, sexuality, and politics in everyday religious practice. Bucar’s books include *Creative Conformity: The Feminist Politics of US Catholic and Iranian Shi’i Women* (Georgetown University Press, 2011), *The Islamic Veil: A Beginner’s Guide* (Oneworld Publications, 2012), the award-winning *Pious Fashion: How Muslim Women Dress* (Harvard University Press, 2017), and *Stealing My Religion: Not Just Any Cultural Appropriation* (Harvard University Press, 2022).

Lisa Sowle Cahill is the J. Donald Monan Professor of Theology at Boston College. She is a past president of the Society of Christian Ethics and of the Catholic Theological Society of America. Her books include *Blessed Are the Peacemakers: Pacifism, Just War and Peacebuilding* (Fortress, 2019), *A Theology and Praxis of Gender Equality* (Dharmaram Publications, Bangalore, 2018), and *Global Justice, Christology, and Christian Ethics* (Cambridge University Press, 2013).

Francisca Cho is Professor of Buddhist Studies at Georgetown University. Her research focuses on East Asian Buddhism and its expression through fiction, poetry, and film. She also looks at the interface between Buddhism and the modern world via the dialogue between Buddhism and science, which entails methodological questions about how to account for changes in religious systems. Her latest book is *Seeing Like the Buddha: Enlightenment through Film* (2017) and her forthcoming book is a study of Buddhism in relation to the category of cinema.

David A. Clairmont is Associate Professor in the Department of Theology at the University of Notre Dame. His research and teaching focus on comparative religious ethics, religious accounts of professional ethics, and the relationship between ethics and spirituality. He is the author of *Moral Struggle and Religious Ethics: On the Person as Classic in Comparative Theological Contexts* (Wiley-Blackwell, 2011) and *Religious Ethics: Meaning and Method* (with William Schweiker, Wiley-Blackwell, 2020). His articles have appeared in the *Journal of the Society of Christian Ethics*, the *Journal of the American Academy of Religion*, the *Journal of Religious Ethics*, and the *Journal of Moral Theology*.

Niki Kasumi Clements is the Watt and Lilly Jackson Assistant Professor of Religion at Rice University. She is the author of *Sites of the Ascetic Self: John Cassian and Early Christian Ethical Formation* (2020), the volume editor of *Mental Religion* (2016), and is at work on her next monograph, *Foucault the Confessor*.

Francis X. Clooney, S.J., is the Parkman Professor of Divinity at Harvard Divinity School. From 2010 to 2017, he was the Director of Harvard's Center for the Study of World Religions. His primary areas of Indological scholarship are theological commentarial writings in the Sanskrit and Tamil traditions of Hindu India. He is a leading figure in the field of comparative theology, faith seeking understanding across religious borders. Recent books include *Reading the Hindu and Christian Classics: Why and How It Matters* (University of Virginia Press, 2019) and *Western Jesuit Scholars in India* (Brill, 2020). He is currently writing an intellectual autobiography, *Priest and Scholar, Catholic and Hindu: A Love Story*.

Brian Collins is an Associate Professor and the Drs. Ram and Sushila Gawande Chair in Indian Religion and Philosophy at Ohio University. He is the author of *The Head Beneath the Altar: Hindu Mythology and the Critique of Sacrifice* (Michigan State University Press, 2014), and various essays on Hinduism and the study of religion. His second book, *The Other Rāma: Matricide and Varicide in the Mythology of Paraśurāma* is forthcoming from SUNY Press.

Cheryl Cottine is an Assistant Professor of Religion at Oberlin College. She works in the area of comparative religious ethics with an emphasis on early Confucian ethics. Her current research involves thinking about the relevance of early Confucian conceptions of roles, relationships, and virtues for contemporary moral theory.

Jesse Couenhoven is Professor of Moral Theology in the Humanities and Theology Departments at Villanova University. He is author of *Stricken by Sin, Cured by Christ* (Oxford University Press, 2013), a *Discussion of Original Sin, Freedom, and Responsibility and Predestination: A Guide for the Perplexed* (T&T Clark, 2018), an overview of central questions relating divine and human agency.

Nicholas Denysenko serves as Emil and Elfriede Jochum Professor and Chair at Valparaiso University. He received his graduate degrees at St. Vladimir's Orthodox Theological Seminary (MDiv, 2000) and The Catholic University of America (PhD, 2008). He taught at Loyola Marymount University in Los Angeles from 2010–2017, where he also served as Director of the Huffington Ecumenical Institute. Denysenko specializes in liturgical theology and Orthodox Christianity. He is the author of *The People's Faith: The Liturgy of the Faithful in Orthodoxy* (Rowman and Littlefield), and *The Orthodox Church in Ukraine: A Century of Separation* (Northern Illinois University Press).

Mark Douglas is Professor of Christian Ethics at Columbia Theological Seminary in Decatur, GA, where he directs the Master of Divinity degree program. He is the founding editor of *@ this point: theological reflections on church and culture*, the seminary's online journal, and the author of *Confessing Christ in the 21st Century* (Rowman and Littlefield, 2005), *Believing Aloud: Reflections on Being Religious in the Public Sphere* (Cascade, 2010), and *Christian Pacifism for the Environmental Age* (Cambridge University Press, 2019). His current work explores connections between violence and climate change at the beginning of the Anthropocene.

Georges B. Dreyfus spent fifteen years in Buddhist monasteries before receiving in 1985 the title of Geshe, the highest degree conferred by Tibetan monastic universities. He then entered the University of Virginia where he received his MA and PhD in the History of Religions program. He is currently Professor of Religion in the Department of Religion at Williams College. He has published five books, including *Recognizing Reality: Dharmakirti and his Tibetan Interpreters* (SUNY Press, 1997), *The Svatantrika-Prasangika Distinction* (co-edited with Sara McClintock, Wisdom, 2003), and *The Sound of Two Hands Clapping: The Education of a Tibetan Buddhist Monk* (University of California Press, 2003), and many articles on various aspects of Buddhist philosophy and Tibetan culture. He has been Chair of the Religion Department at Williams College and Chair of the Tibetan and Himalayan Religions group of the American Academy of Religion. He is the recipient of various awards such as a National Endowment for the Humanities.

Rick Elgendy is Assistant Professor of Christian Ethics and Public Theology at Wesley Theological Seminary. He works with political theologies and ethics, systematic theologies, and critical theories. He is the co-editor of the volume, *Renegotiating Power, Theology, and Politics* (2015), as well as articles in *Political Theology*, *The International Journal of Systematic Theology*, and *Studia Patristica*.

C. Stephen Evans received his BA from Wheaton College in 1969 and his PhD in philosophy from Yale University in 1974. He is currently University Professor of Philosophy and Humanities at Baylor and Director of the Baylor Center for Christian Philosophy. He is also a Professorial Fellow at the University of St. Andrews and at the Australian Catholic University. He has published many books and articles, focusing on Kierkegaard, the philosophy of religion, ethics, and the philosophy of the human sciences. He has received two Fellowships from the National Endowment for the Humanities and major grants from the Pew Charitable Trusts and the Templeton Religion Trust. Prior to Baylor, Evans taught at Wheaton College, St. Olaf College, and Calvin College. He is a past president of the Society of Christian Philosophers and the Kierkegaard Society of North America.

Winnifred Fallers Sullivan is Provost Professor in the Department of Religious Studies and Co-Director of the Center for Religion and the Human at Indiana University Bloomington. She studies the intersection of religion and law in the modern period. Sullivan is the author of *The Impossibility of Religious Freedom* (Princeton, 2005, 2nd ed. 2018), *A Ministry of Presence: Chaplaincy, Spiritual Care and the Law* (Chicago, 2014),

and *Church State Corporation: Construing Religion in US Law* (Chicago, 2020), co-author of *Ekklesia: Three Studies in Church and State* (Chicago, 2018) and *The Abyss or Life Is Simple* (Chicago, 2022), and co-editor of *Politics of Religious Freedom* (Chicago, 2015) and *At Home and Abroad* (Columbia, 2020).

Darrell J. Fasching taught comparative religious ethics at the University of South Florida. His books focused primarily on issues of violence and non-violence and include *The Ethical Challenge of Auschwitz and Hiroshima* (1993), *The Coming of the Millennium* (1996), and (with Dell de Chant) *Comparative Religious Ethics: A Narrative Approach* (2001).

Michael Fishbane is the Nathan Cummings Distinguished Service Professor of Jewish Studies at the University of Chicago. He is a Fellow of the American Academy of Jewish Research and a Fellow of the American Academy of Arts and Sciences. Fishbane is the author of many books in Jewish thought and literature, from biblical antiquity to the present. Most recently, he published *Fragile Finitude. A Jewish Hermeneutical Theology* (University of Chicago Press, 2021).

Franklin I. Gamwell is Shailer Mathews Distinguished Service Professor Emeritus at the Divinity School of the University of Chicago. His current thinking is focused on political theory. His publications include: *Democracy on Purpose: Justice and the Reality of God* (2000), *Politics as a Christian Vocation: Faith and Democracy Today* (2005), *By the People, for the People: A Political Voice for Progressive Christians* (2010), and *Existence and the Good: Metaphysical Necessity in Morals and Politics* (2011); he has recently published two volumes of his essays: *Religion Among We the People* (2015), and *On Metaphysical Necessity: Essays on God, The World, Morality, and Democracy* (2020).

Bruce Grelle is Professor Emeritus in the Department of Comparative Religion and Humanities at California State University, Chico. He is the author of *Antonio Gramsci and the Question of Religion: Ideology, Ethics, and Hegemony* (2017), co-author of *The Practices of Global Ethics: Historical Backgrounds, Current Issues, and Future Prospects* (2016), co-editor of *Explorations in Global Ethics: Comparative Religious Ethics and Interreligious Dialogue* (2000), and author of multiple articles and book chapters on religion and public education.

John Hare is Professor of Philosophical Theology at Yale University and taught at Lehigh University, Calvin College, and Yale University. He published seven books, including *The Moral Gap* (Oxford University Press, 1996) and *God's Command* (Oxford University Press, 2015).

William D. Hart is the Margaret W. Harmon Professor of Religious Studies at Macalester College. He is the author of *Edward Said and the Religious Effects of Culture* (Cambridge, 2000), *Black Religion: Malcolm X, Julius Lester, and Jan Willis* (Palgrave, 2008), and *Afro-Eccentricity: Beyond the Standard Narrative of Black Religion* (Palgrave, 2011). Hart's current project is titled *The Blackness of Black: Key Concepts in Critical Discourse*. His research interests include black studies; relations among slavery, race, animality, and criminality within ethical rhetoric, and a comparative exploration of human sacrifice as a religious and political practice.

Markus Höfner is Senior Research Associate at the Institute for Hermeneutics and Philosophy of Religion, Zurich University, Switzerland. His publications include *Sinn, Symbol, Religion. Theorie des Zeichen und Phänomenologie der Religion bei Ernst Cassirer und Martin Heidegger* [Meaning, Symbol, Religion. Theory of Signs and Phenomenology of Religion in Ernst Cassirer and Martin Heidegger] (2009), *Ewiges Leben. Ende oder Umbau einer Erlösungsreligion* [Eternal Life. End or Modification of a Religion of

Redemption?]) (co-edited with Günter Thomas, 2018), *Gottes Gegenwart* [God's Presences] (co-edited with Benedikt Friedrich, 2020).

Slavica Jakelić is the Richard P. Baepler Distinguished Professor in the Humanities at Valparaiso University's honors college. Her scholarly interests and publications center on religion and nationalism, religious and secular humanisms, theories of religion and secularism, theories of modernity, and inter-religious conflict and dialogue. Jakelić is a co-editor of three volumes: *The Future of the Study of Religion*, *Crossing Boundaries: From Syria to Slovakia*, and *The Hedgehog Review's* issue "After Secularization." She is the author of *Collectivistic Religions* and is currently working on two books, *Chastening Religious and Secular Humanisms* and *Ethical Nationalisms*.

Albert R. Jonsen (1931–2020) was Professor Emeritus of Ethics in Medicine in the Department of Medical History and Ethics, University of Washington, Seattle. He received the McGovern Award of the American Osler Society, the Annual Award of the Society for Health and Human Values, and the Davies Award of the American College of Physicians. He is the author of *A Short History of Medical Ethics* (1999), co-author of *The Abuse of Casuistry* (1988), and co-editor of *Source Book in Bioethics: A Documentary History* (1998).

Morny Joy is a Faculty Professor in the Department of Classics and Religion at the University of Calgary. She has researched in the subjects of philosophy, religion, and history of religions, as well as multiple projects on women and religions in many countries of the world. In 2011, she received an honorary doctorate from the University of Helsinki for her work in the field of women and religion. Edited books include: *Continental Philosophy and Philosophy of Religion* (Springer), *Women, Religion and the Gift* (Springer), *After Appropriation: Explorations in Intercultural Philosophy and Religion* (University of Calgary Press), and *Women's Rights and Religions* (Equinox).

Kevin Jung is Associate Professor of Christian Ethics at Wake Forest University. He is the author of *Christian Ethics and Commonsense Morality* (Routledge, 2014) and *Ethical Theory and Responsibility Ethics* (Peter Lang, 2011). He is also the editor of *Religious Ethics and Constructivism* (Routledge, 2018) and co-editor of *Doing Justice to Mercy: Religion, Law, and Criminal Justice* (University of Virginia Press, 2007) and *Humanity Before God: Contemporary Faces of Jewish, Christian, and Islamic Ethics* (Fortress Press, 2006). Jung works at the intersection of moral philosophy and religious ethics, with research interests in metaethical issues.

Elisabeth Rain Kincaid is Assistant Professor of Ethics and Moral Theology at Nashotah House Theological Seminary. Her interests include natural law theory, virtue ethics, law and theology, business ethics, and Spanish Scholasticism.

Albertus Bagus Laksana, S.J., is currently Dean of the Sanata Dharma University School of Theology in Yogyakarta, Indonesia. He received his PhD in comparative theology from Boston College (2011) with a focus on Muslim–Christian encounters. He previously taught at Loyola Marymount University, Los Angeles. His area of research covers both Catholic systematic theology and the intersections between theology and culture, Asian theologies, comparative theology, and theology of religions. His publications include *Muslim and Catholic Pilgrimage Practices: Explorations through Java* (Routledge, 2014) and essays in different journals such as *The International Journal of Asian Christianity* and *Kritika Kultura*. He is also the editor of two Jesuit journals in Indonesia, *Basis* and *Rohani*, covering culture and spirituality.

J. Harrison Lee is a graduate student in the PhD program in the Department of Philosophy at Baylor University. Prior to starting his PhD, he received a BA from UNC-Chapel Hill (2013), an MA from University College London (2014), and an MA from Georgia State University (2017), in each case majoring in philosophy. His research interests lie at the intersections between moral philosophy, action theory, metaphysics, and theology. He is especially interested in Aristotelian and Thomistic approaches to these topics.

Robin W. Lovin is Cary Maguire University Professor of Ethics Emeritus at Southern Methodist University and a former president of the Society of Christian Ethics. He is the author of two studies of twentieth-century Christian social ethics: *Reinhold Niebuhr and Christian Realism* (1994) and *Christian Realism and the New Realities* (2008), and co-editor, with Joshua Mauldin, of the *Oxford Handbook of Reinhold Niebuhr* (2021). He is also author of *Christian Ethics: An Essential Guide* (2000) and *What Do We Do When Nobody Is Listening? Leading the Church in a Polarized Society* (2022).

Christine Luckritz Marquis is Assistant Professor of Church History at Union Presbyterian Seminary. Her teaching and research explore early Christian communities and their practices, especially those founded in Egypt and Syria. Interests include memory and spatial practices among early Christians, the role of violence in early Christian identity formation, early Christian material culture, understandings of the body, and Christian interactions with neighboring Christians in both the West and Persia, as well as non-Christians, especially early Muslims. She is currently working on her first book, which explores how memory and spatial practices were transformed by acts of violence among Egyptian ascetics.

Paul Mendes-Flohr is Professor Emeritus of the Hebrew University of Jerusalem, and Professor Emeritus of Modern Jewish Thought and Intellectual History, Divinity School, University of Chicago. He recently published *Martin Buber. A Life of Faith and Dissent* (Yale University Press, 2019).

Richard B. Miller is the Laura Spelman Rockefeller Professor of Religion, Politics, and Ethics in the Divinity School and the College at the University of Chicago. He has published numerous articles and chapters on religious ethics, moral philosophy, and political thought, and his books include *Interpretations of Conflict: Ethics, Pacifism, and the Just-War Tradition* (University of Chicago Press, 1991), *Casualty and Modern Ethics: A Poetics of Practical Reasoning* (University of Chicago Press, 1996), *Children, Ethics, and Modern Medicine* (Indiana University Press, 2003), *Terror, Religion, and Liberal Thought* (Columbia University Press, 2010), *Friends and Other Strangers: Studies in Religion, Ethics, and Culture* (Columbia University Press, 2016), and *Why Study Religion?* (Oxford University Press, 2021).

Anne Mocko is Associate Professor of Asian Religions at Concordia College in Moorhead, MN. She is a historian of religions trained in ritual theory and in the religions of South Asia. Her main research has focused on the changing practices of kingship and state religion in contemporary Nepal, and she is the author of *Demoting Vishnu: Ritual, Politics, and the Unraveling of Nepal's Hindu Monarchy* (Oxford University Press, 2016). She has more recently been working on a popular-audience book (tentatively entitled *Eco-Karma*), examining Jain daily practice as an alternative model for environmental responsibility.

Elena Namli is Professor of Theological Ethics at Uppsala University, Sweden. Her research focuses on social and political ethics. She has published on philosophical as well as on theological ethics. Her publications include *Human Rights as Ethics, Politics, and Law* (2014), *Jewish Thought, Utopia and Revolution* (co-editor, 2014), *Etik* ([Ethics], with Carl-Henric Grenholm, 2019), and *Future(s) of the Revolution and the Reformation* (editor, 2019).

Thomas W. Ogletree was Professor of Theological Ethics at Yale University Divinity School and the Graduate Department of Religious Studies. He was a past President of the Society of Christian Ethics. He was the author of *Christian Faith and History: A Critical Comparison of Ernst Troeltsch and Karl Barth* (1965), *The Use of the Bible in Christian Ethics* (1983), and *Hospitality to the Stranger: Dimensions of Moral Understanding* (1985).

Lauren E. Osborne is Assistant Professor of Religion at Whitman College. Her research focuses on meaning and experience across the text, sounds, and feelings of the recited Qur'an. Her publications in this area thus far include "Textual and Paratextual Meaning in the Recited Qur'an: An Analysis of a Performance of Sūrat Al-Furqān by Sheikh Mishari Rashid Alafasy" in *Qur'anic Studies Today* (Routledge, 2016), as well as "The Experience of the Recited Qur'an" in the *International Journal of Middle East Studies* (2016). She is also currently writing a book on the topic of Qur'an recitation.

Bharat Ranganathan is the Beamer-Schneider SAGES Teaching Fellow in Ethics in the Department of Philosophy at Case Western Reserve University. He studies religious ethics and moral and political philosophy, focusing especially on issues in normative and practical ethics. He also has longstanding interests in the philosophy of religion and theory of religion, especially the relevance of philosophy, science, and theology for the study of religion. His recent publications include "On Helping One's Neighbor" (2012), "Mahmood, Liberalism, and Agency" (2016), and "Might Only Theology Save Medicine? Some Ideas from Ramsey" (2017).

Frank E. Reynolds (1930–2019) was Emeritus Professor of History of Religions and Buddhist Studies in the Divinity School and Department of South Asian Languages and Civilizations at the University of Chicago. He was the co-editor with Robin Lovin of *Cosmogony and Ethical Order* (1985) and the author of several essays on Buddhist ethics.

Lamin Sanneh (1942–2019) was D. Willis James Professor of World Christianity and Professor of History at Yale. He was an Honorary Research Professor at the School of Oriental and African Studies in the University of London, and was a life member of Clare Hall, Cambridge University. He was awarded an honorary doctorate by the University of Edinburgh. For his academic work he was made Commandeur de l'Ordre National du Lion, Senegal's highest national honor. His many works include *The Crown and the Turban: Muslims and West African Pluralism* (1997) and *Whose Religion is Christianity? The Gospel Beyond the West* (2003).

Kevin Schilbrack is Professor and Chair of the Department of Philosophy and Religion at Appalachian State University. A graduate of the University of Chicago Divinity School, he writes about philosophical questions raised by the academic study of religion. He is the author of *Philosophy and the Study of Religions: A Manifesto* (Blackwell, 2014) and is now working on a book on the value of embodied cognition and social ontology for understanding what religion is and how it works.

Jonathan W. Schofer is Assistant Professor of Classical Rabbinic Literature in the Department of Hebrew and Semitic Studies at the University of Wisconsin–Madison. His primary area of research is in classical rabbinic ethics, and he has a longstanding interest in comparative ethics, including a study of early Confucian thought. He is the author of *The Making of a Sage: A Study in Rabbinic Ethics* (2005).

William Schweiker is Edward L. Ryerson Professor of Theological Ethics at the University of Chicago. His scholarship and teaching engage theological and ethical questions attentive to global dynamics,

comparative religious ethics, the history of ethics, and hermeneutical philosophy. A frequent lecturer and visiting or guest professor at universities around the world, he has been deeply involved in collaborative international scholarly projects. His books include most recently *Religion and the Human Future: An Essay in Theological Humanism* (2008, with David E. Klemm), *Dust that Breathes: Christian Faith and the New Humanisms* (2010), and *Religious Ethics: Meaning and Method* (2019–2020, with David Clairmont). He is also Editor-in-Chief of the *Wiley-Blackwell Encyclopedia of Religious Ethics*.

Anton Sevilla-Liu is Associate Professor for Clinical Pedagogy at the Faculty of Arts and Science, and the Graduate School of Education at Kyushu University, Japan. He teaches and conducts research on Japanese philosophy and education, and is particularly interested in how religious ethics might help us rethink moral education and human formation in a global age. He is the author of *Watsuji Tetsurō's Global Ethics of Emptiness: A Contemporary Look at a Modern Japanese Philosopher* (2017), and has numerous publications in *Journal of Religious Ethics*, *Asian Philosophy*, and *Journal of Philosophy of Education*.

Michael R. Slater is Associate Professor of Theology in the Department of Theology and Religious Studies at Georgetown University. He is the author of *William James on Ethics and Faith* (Cambridge University Press, 2009) and *Pragmatism and the Philosophy of Religion* (Cambridge University Press, 2014).

Michael Sohn was born and raised in Toronto, Ontario, Canada. He earned his PhD from the University of Chicago and received a postdoctoral fellowship from the École des Hautes Études en Sciences Sociales (EHESS) in Paris, France. He taught philosophy and religion at state universities in Ohio and Wisconsin before taking on a government position as a senior advisor at Ontario's Ministry of Finance. He is the author of *The Good of Recognition: Phenomenology, Ethics and Religion in the Thought of Levinas and Ricoeur* as well as a number of articles in peer-reviewed journals, including *The Journal of Religious Ethics*.

Aaron Stalnaker is Associate Professor of Religious Studies at Indiana University. He has written two book-length studies in comparative religious ethics, namely *Mastery, Dependence, and the Ethics of Authority* (Oxford University Press, 2020) and *Overcoming Our Evil: Human Nature and Spiritual Exercises in Xunzi and Augustine* (Georgetown University Press, 2006). He has also published articles in a number of venues, including the *Journal of Religious Ethics*, *Soundings*, *Philosophy East and West*, *Dao*, and *International Philosophical Quarterly*. He founded the Comparative Religious Ethics group within the American Academy of Religion, and is currently Associate Editor of the *Journal of Religious Ethics*.

Per Sundman is Professor of Ethics, at the Faculty of Theology at Uppsala University, Sweden. He is a member of *Societas Ethica* and the Society of Christian Ethics, and is currently serving as Chairman of the Swedish Confederation of Professional Associations, at Uppsala University. He is the author of *Human Rights, Justification, and Christian* (1996) and *Egalitarian Liberalism on the Meaning and Justification of Social Justice* (2016).

Donald K. Swearer is the Charles and Harriet Cox McDowell Professor of Religion at Swarthmore College, where he teaches courses in Asian and comparative religions. His main field of research is Buddhism in Southeast Asia, with special attention to Thailand. His recent publications include *Becoming the Buddha: The Ritual of Image Consecration in Thailand* (2004), *The Sacred Mountains of Northern Thailand and Their Legends* (with Sommai Premchit and Phaitun Dokibuakaew) (2004), *The Legend of Queen Cama* (with Sommai Premchit) (1998), and *The Buddhist World of Southeast Asia* (1995).

Günter Thomas is Professor of Ethics and Interdisciplinary Studies in the Faculty of Protestant Theology at Ruhr-University Bochum. He is also a Research Associate in Systematic Theology at the Faculty for Public Theology of the University of Stellenbosch, South Africa. His research focuses on theology and sociology, medical anthropology, religion and media, constructive theology of the twentieth and twenty-first centuries. His publications include: *Media – Ritual – Religion* (1998), *Implicit Religion* (2001), *Neue Schöpfung* (2009), *Exploring Vulnerability* (editor, 2017), *Responsibility and the Enhancement of Life* (editor, 2017), *Risk and Trust* (editor, 2017), *Gottes Lebendigkeit* (2019), *Im Weltabenteuer Gottes Leben* (2020).

Sumner B. Twiss is Distinguished Professor of Human Rights, Ethics, and Religion at Florida State University, holding a joint appointment between the Religion Department and the Center for the Advancement of Human Rights, and also Professor Emeritus of Religious Studies at Brown University. He is the co-author or co-editor of (and contributor to) ten books and the author of over sixty published articles in the areas of comparative religious ethics, biomedical ethics, philosophy of religion, global ethics, intercultural human rights, and the comparative study of just war. His most recent books are: *Religion and Public Policy: Human Rights, Conflict, and Ethics* (co-editor, Cambridge University Press, 2015), *Chinese Just War Ethics: Origin, Development, and Dissent* (co-editor, Routledge, 2015), and *Practices of Global Ethics: Historical Developments, Current Issues, and Future Prospects* (co-author, Edinburgh, 2016). His forthcoming articles are on: Christian ethics and comparative ethics, human rights and global ethics, religious perspectives in the UDHR, and religion and human rights.

Brett T. Wilmot is the Associate Director for the Ethics Program and Teaching Professor in the College of Liberal Arts and Sciences at Villanova University in Pennsylvania. He completed his PhD at the University of Chicago Divinity School in Religious Ethics in 2002 and has been at Villanova since that time. He is broadly trained in religious and theological ethics, with specialization in religion in public life, particularly the role of religious convictions in democratic politics. Since 2008, he has also taught in Villanova's MSc in Church Management program through the Business School. He has testified before the City Council of Philadelphia on ethics reform for city workers and also consulted with Federal Reserve Bank in Philadelphia on ethics in the workplace. His publications include "Defending Democracy against Its 'Cultured Despisers': A Critical Consideration of Some Recent Approaches in *Journal of the Society of Christian Ethics* (2006) and "Scriptural Reasoning and the Problem of Metaphysics: Insights for Argument in Liberal Democracy in *Journal of the Society of Christian Ethics* (2009).

Werner Wolbert is Professor Emeritus of Moral Theology at the University of Salzburg, Austria. He is the author of *Der Mensch als Mittel und Zweck. Die Idee der Menschenwürde in normativer Ethik und Metaethik*, (1987), *Vom Nutzen der Gerechtigkeit. Zur Diskussion um Utilitarismus und teleologische Theorie*, (1992), *Was sollen wir tun? Biblische Weisung und ethische Reflexion* (2005), *Du sollst nicht töten. Systematische Überlegungen zum Tötungsverbot* (2008), *Gewissen und Verantwortung* (2009). Current research areas are Mercy and Justice, Ethical Theory, Biblical Ethics.

Lee Yearley is the Walter Y. Evans-Wentz Professor of Oriental Philosophy, Religions and Ethics in the Department of Religious Studies at Stanford University. He focuses on comparative religious ethics, concentrating on the theoretical and literary presentations of human excellences and deficiencies especially in Confucian, Daoist, and Christian contexts. His many works include *The Ideas of Newman: Christianity and Human Religiosity* (1978) and his renowned *Mencius and Aquinas: Theories of Virtue and Conceptions of Courage* (1990). He was the 2015 recipient of Stanford University's Dinkelspiel Award for Distinctive Contributions to Undergraduate Education.

Preface to Volume 1 – Moral Inquiry

Maria Antonaccio

The *Encyclopedia of Religious Ethics* introduces readers to basic issues in moral inquiry, a selection of moral traditions, and surveys a range of moral issues. Each of the three volumes covers one of these three elements of religious ethics, with Volume I focusing on moral inquiry.

What distinguishes “religious” ethics from other approaches to ethics is, first and foremost, its connection to the religions. While there is much debate in modern scholarship about the precise meaning of the term “religion” there is at least a widely shared conviction that there are such things as religions, by which is meant social groups and traditions of thought and practice that are in one way or another about the deepest human questions and the ultimate goal(s) of human life, including but not limited to reverence for a divine being or beings. Thought about or practice in relation to what is held to be ultimately real and important seems to be a longstanding feature of human life across historical periods, geography, and cultural traditions.

Volume I addresses general theoretical issues in the study of religious ethics in order to clarify the contours of religious ethics as a discipline and intellectual practice. The entries contained in this volume provide conceptual resources for understanding the moral beliefs and practices of diverse religious traditions, the social practices and institutions that transmit those beliefs and practices, and the methods and approaches used to compare religious ethical traditions. Accordingly, the volume is divided into three parts: (1) Reflection (2) Transmission (3) Comparison. Each of these parts is further divided into sections that provide additional specification of these general themes. For example, Part 1 on Reflection represents the major foci and theories of religious ethics as a field of study, with sections on moral knowledge, moral formation, and normative approaches. Part 2 on Transmission addresses the mechanisms and pathways by which traditions of religious ethics are reproduced, interpreted, and contested, with sections on texts, institutions, and practices. Part 3 on Comparison presents some of the most salient theories, approaches, and concepts that have been deployed in the task of comparing traditions of religious ethics.

Many of the entries in Part 1 of this volume reflect the fact that the field of religious ethics overlaps in significant ways with moral philosophy. For example, in the section on normative approaches, readers will find entries on deontology, consequentialism, and virtue, among others. Other entries in this volume highlight themes that are distinctive to the study of religious ethics, such as entries on performance and

liturgy, and on pilgrimage and meditation (in Part 2 on Transmission). Still other entries reflect recent developments and approaches to the study of religious ethics that have been informed by trends in other disciplines, such as the entry on embodied knowledge (in Part 1) and on secularism and post-secularism (in Part 3).

Taken together, the entries in this volume are intended not only to provide an accessible overview of a particular topic, but also to reflect the authors' distinctive contributions to the field of study. No attempt has been made to impose on the contributors any particular view of the topics on which they were invited to contribute. Rather, the diversity of topics and approaches contained in this volume reflects the vitality of religious ethics as a field of study. We encourage readers to make use of Volume I not only to seek information on the particular topics contained herein, but also to gain a broader understanding of the shape of religious moral inquiry as a complex and dynamic enterprise that takes place within and among individuals, communities, and institutions over time and space.

In his entry “On Religious Ethics” that introduces each volume of the *Encyclopedia*, William Schweiker speaks of religious ethics as a field of study that undertakes three interrelated *tasks* – critical, comparative, and constructive – from what he describes as a hermeneutical *standpoint* and with respect to interlocking *dimensions* of reflection: descriptive, normative, practical, fundamental, and metaethical. These dimensions of inquiry arise from the persistent questions that surround human existence – questions, Schweiker notes, that “demarcate a space of human existence determined by the problem of how one ought to live religiously.” The *Encyclopedia* as a whole enacts this multi-dimensional approach insofar as the three volumes present for scholarly reflection “the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide conduct.”

While the editors of the three volumes of the *Encyclopedia* support, to varying degrees, a hermeneutical approach to religious ethics, to view the field of religious ethics as presented in these volumes as proceeding from a hermeneutical standpoint is less a prescriptive than a descriptive statement – and even an invitation. Readers are invited to engage in the critical, constructive, and comparative tasks themselves as they consider the entries in each volume of the *Encyclopedia*. The entries in the present volume introduce readers to major concepts, categories, and theoretical approaches in the study of religious ethics, illuminating how moral thinking and moral formation occur in religious contexts and thereby providing resources for the comparison of moral traditions in Volume II as well as constructive reflection on practical moral problems in Volume III.

INTRODUCTION

On Religious Ethics

William Schweiker

The publication of the *Blackwell Companion of Religious Ethics* in 2005 represented a defining moment for religious ethics. Happily, this new *Encyclopedia of Religious Ethics*, incorporating and updating the entirety of the three volumes and published fifteen years later, continues the work of defining the meaning, task, and forms of religious ethics. Ethicists, historians of religion, theologians, philosophers, political theorists, and other experts have explored the moral outlooks and practices of the world's religions. Drawing on and revising religious resources, basic themes in Moral Theory as well as a host of contemporary moral and political problems are treated. The *Encyclopedia's* three volumes mirror the structure of the Companion but now greatly expanded: Volume I on issues in Moral Theory; Volume II on Moral Traditions; Volume III on Moral Problems. Throughout the volumes, topics will be explored in depth and in most cases comparatively even as the individual authors express their reasons and judgments on the topics.

Given the comprehensive nature of this work, the purpose of the present entry is not to provide a detailed "introduction" to the volumes. Such an introduction is not possible given the sheer size of these volumes and insofar as this is a collective work rather than a single line of argument. This entry is meant to provide orientation to the range of questions and kinds of thinking found in the various parts of *The Encyclopedia of Religious Ethics*.

Religious Ethics?

Anyone who works in religious ethics confronts an immediate and obvious problem. "Ethics" or "moral philosophy" is not indigenous to the world's religions. Inspired by Socrates and other sages, Greek and Roman thinkers engaged in the rational analysis and justification of norms, practices, forms of character, and ways of life believed to secure human happiness or well-being (*eudaimonia*). The inspiration of Socrates, and the memory of his conviction and execution on the charge of impiety, meant that ethics was also a challenge to the authority of religious and traditional moral beliefs. What is more, the conception of a good human life advocated by Hellenistic philosophers is foreign to the religions. Religious traditions obviously sustain reflection on human well-being, happiness. However, these accounts are set within an order defined by beings, realms, ideals, purposes, and practices not limited to human life and flourishing.

The scope of concern found in the world's religions is thereby wider than the discourse of ethics and Hellenistic ideas about human well-being. It is quite unremarkable, then, that the world's religions have generally not used the idea of ethics to specify the character of their outlooks on what defines a good life, right conduct, noble character, and proper social relations. For scholarly purposes, *ethics*, as used in this *Encyclopedia*, is the term for a discipline of thought that interprets, critically assesses, and, often, applies the *morality* of a religious community or tradition. *Morality*, accordingly, is the actual rules, duties, goods, rituals, practices, and values of a community used to orient life.

Similar problems surround the idea of “religion.” None of the historical legacies explored in this *Encyclopedia* initially defined themselves as a religion. The term seems to have arisen from the Latin *religare*, meaning to tie or to bind. Religion specified how one was bound to the origins of the city of Rome as itself a sacred reality. Other ideas of religion developed, especially during the seventeenth to twentieth centuries, in order to facilitate the study of the beliefs, practices, values, and histories of human communities. As explored in the following volumes, definitions range from religion as belief in gods or one God, claims about sacred power, ultimate concern, to the charge that religion is about concealed mechanisms of domination.

Most contemporary scholars agree that a religion includes several features: convictions about what is most important in life (experiences like birth and death, sex and sorrow) in relation to what is believed to be ultimate, sacred, holy, or divine, ritual actions, beliefs about the whence and whither of existence, codes of conduct, communal life and its structures, and also experiences of transcendence (e.g. enlightenment, redemption, mystical insight), religious leaders. However, these features of religion are disputed and bear different meanings in diverse cultures and traditions. Again, for scholarly purposes, this *Encyclopedia* holds that the distinctive feature of *religions* from other human sociocultural forms is that they are about what is ultimately important and real for some community of people. That is to say, the referent or object of religious devotion and/or practice is not just what is important or valuable to people, but it must also, in some way, be real, defined in many ways. Likewise, what is real (however defined) is not the referent or object of religion if it is not ultimately important to some human community. While variously conceived, some social and cultural form or practice is not *religious* if it does not bind together importance with something, someone, or some condition that is held to be real.

The idea of “religion,” just like “ethics,” is a scholarly invention. As rightly noted in the various parts of this *Encyclopedia*, these ideas are not native to traditions, much less necessary categories of the human mind. They are tools for inquiry and reflection. What is more, one must keep distinct, if sometimes related, the morality or ethics of a religion (the actual ways of life, beliefs, values, norms, and outlooks of a people) from the intellectual labor of scholars and thinkers called “ethics” and/or “religious ethics.” What is sought in these volumes and this entry is an account of the intellectual enterprise of religious ethics ever mindful of complex connections to ways of religious and moral living.

Given the conceptual problems surrounding religion and ethics, it is not surprising that one finds different options in the intellectual pursuit of religious ethics. Some distinct approaches have typified the field, although there are manifold subtypes and variations (see Schweiker 1998; Twiss and Grelle 1998, 11–33). First, some religious ethicists have sought to specify a unique concept, phenomenon, rational structure, or set of practices called religion more or less manifest in what are conventionally seen as the “religions.” Often called the *formalist* approach to religious ethics, the task is to show the place and import of religion for the moral life (see Green 1978; Gamwell 1990). Others adopt, second, a *sociolinguistic* approach. These thinkers explore specific action guides recommended by communities and/or

how communities specify through ritual, myth, discourse, and belief often incommensurable ways of life (see Little and Twiss 1978; Stout 1988). Third, there are scholars who develop versions of *ethical naturalism*. This approach is concerned with the particularity of moral outlooks, but also “treats a system of beliefs as a whole and refuses to isolate moral propositions for analysis from propositions about how things are in the world and how they come to be that way” (Lovin and Reynolds 1985, 3). More recently, a group of scholars, headed by Elizabeth Bucar and Aaron Stalnaker, have written about a third wave of work in Comparative Ethics focused especially on cultural and moral diversity (Bucar and Stalnaker, 2012). This has opened the field to cultural and ethnographic studies without loss of a normative purpose. Each of these approaches in religious ethics, as well as various permutations on them, can be found in this book. No attempt, thankfully, has been made to demand agreement among them.

Another way of conceiving religious ethics is now in view and it finds expression throughout this *Encyclopedia* and other works (see Schweiker and Clairmont 2020). The remainder of this entry gives an account of this *hermeneutical* and *multidimensional* option alongside other approaches to the field. Like formalists, a multidimensional approach specifies a structure for ethical thinking necessary to examine specific traditions, but is not reducible to their distinctive languages and practices. Yet, as shown below, it moves beyond most formalist proposals in terms of how knowledge and disciplines are conceived. With the sociolinguistic and naturalistic options, a hermeneutical approach to religious ethics examines the distinctive outlooks of traditions. However, precisely as hermeneutical in character, religious ethics labors between and among traditions rather than focuses on the incommensurability of language-games, distinct action guides, or even moral worldviews. And with more recent accounts of Comparative Ethics, a hermeneutical approach insists on understanding the cultural and social location of the religions even as it seeks to draw on them as resources for constructive ethical and religious ethics. “Religious ethics,” on this account, is defined in terms of critical, comparative, and constructive *tasks* of moral inquiry into religious resources undertaken from a hermeneutical *standpoint* and with respect to interlocking *dimensions* of reflection. My contention is that this account captures something of the scope and spirit of this *Encyclopedia of Religious Ethics*.

Of course, it must be stressed that what follows is a proposal for religious ethics, developed in view of this work. There is no assumption that every author or editor will agree or even ought to agree with this depiction or, for that matter, any other depiction of religious ethics. As a field of inquiry, part of the vitality of religious ethics is precisely that it must constantly engage in appraisals of its purposes, methods, and criteria of adequacy. In fact, this *Encyclopedia* must partly be seen as engaged in that kind of appraisal.

We turn next to the question of how to characterize the *tasks* and *dimensions* of religious ethics in order that the full import of these volumes can be grasped.

Tasks and Multidimensional Inquiry

There are many ways to define ethics and also many ways to carry out ethical reflection. Contemporary scholarship in *religious ethics* undertakes to a greater or lesser extent several related *tasks*.

Religious ethics entails the *critical* inquiry into complex ways of religious and moral life, but often also indicates the *constructive* use of religious sources in meeting current problems. Each of those tasks, the critical and constructive, is often bound to the work of *comparison*. As found in Volume II, a scholar

critically explores a tradition by comparing its expressions through time and/or seeing it in relation to other cultural and social dynamics, including other religions. Constructive work, like that undertaken in Volume III, compares accounts of how to live with other proposals in order to assess duties and values binding on people. The question – explored in Volume I of this *Encyclopedia* – becomes: how ought we to define religious ethics as a discipline, an intellectual practice?

With the rise of the modern Western world there were extensive debates about what constituted a discipline of thought. There emerged the conviction that any genuine discipline must have a distinct, or unique, subject matter, even as there was the need to define a “system of the sciences” around a fundamental principle or scientific method in order to ensure the coherence of knowledge. The core of the modern project was to understand the world and free human beings from ignorance and illusion. One did so by specifying the method, purpose, and criteria of various disciplines in such a way that each was *autonomous* and yet consistent with all others because they shared a *rational* structure. As Stephen Toulmin has noted: “In the underlying European worldview, then, the value of a single all-embracing system of theories, into which phenomena of all kinds could eventually be fitted, was taken for granted right up until the twentieth century” (Toulmin 2001, 87). Ethics, for instance, had to be about a distinctive domain of human conduct, say, about obligation or utility, which was different than other sciences, and yet founded rationally or empirically in the same way as other sciences. This led to the radical distinction between ethics as a *normative* discipline and other *descriptive* approaches to human behavior even if they shared similar cognitive commitments. One finds, interestingly enough, residues of this modern outlook in formalistic approaches to religious ethics. Even those who reject the modern enterprise, from the Romantics to some sociolinguistic thinkers and ethical naturalists and the cultural turn in ethics, assume that definition of a discipline only to deny it. They often contest the modern account through ad hoc or unsystematic approaches to inquiry.

This *Encyclopedia* aptly shows that the aspiration to isolate one formal structure of reason built on a single principle or to specify one scientific method as alone adequate for research is insufficient given genuine moral, religious, and cognitive diversity. Still, as formalists have long seen, there is also the need to define and characterize the discipline of religious ethics as an intellectual pursuit. Further, the modernist desire to establish the autonomy of ethics around some *sui generis* dimension at action (e.g. the moral “ought” or obligation or virtue) fails to indicate how moral reflection can and must interact with other intellectual practices in order to address exceedingly complex problems and phenomena. A crucial aspiration of much contemporary discourse is to move beyond the formal rationalism of the modern project as well as its denial by Romantics and others. It is to grasp a more humane, practical form of reasonableness. Yet in order to be apt for religious ethics, this construal of ethics must also, as naturalists, sociolinguistic, and cultural/ethnographic approaches show, explore the connections among “moral” beliefs and actions and other convictions and practices of actual living communities.

There is an important turn of late in providing an account of knowledge that bears promise for religious ethics. This is what can be called *multidimensional* thinking. What is rejected by a range of thinkers in various fields is a depiction of knowledge gained and justified through autonomous disciplines tenuously held together by *one* formal rational structure or method of inquiry. As the moral philosopher Mary Midgley has astutely noted:

We exist, in fact, as interdependent parts of a complex network, not as isolated items that must be supported in a void. As for our knowledge, it too is a network

involving all kinds of lateral links, a system in which the most varied kinds of connection may be relevant for helping us to meet various kinds of questions.

(Midgley 2003, 25)

In this light, the burden placed on any intellectual practice aimed at knowledge is to specify those points at which it is linked to other disciplines given shared interests, norms and even values. Knowledge is a complex, reflexive network; it is a space of warranted intelligibility or reasonability.

This depiction of knowledge is important not just for addressing shared interests. It is basic to the determination of the cogency, scope, and integrity of a discipline. Rather than focusing on the *autonomy* of a “discipline,” one will be interested in the *lateral links* wherein reflection and information move in and out of an intellectual practice (see Gustafson 2004). *Scope*, rather than *autonomy*, will be essential in deciding the validity, the truth, of claims. Accordingly, a discipline is best defined in terms of the basic questions it seeks to answer. When carefully examined these basic questions naturally pose other questions that, if answered, implicate a form of reflection in other modes of inquiry pursuing their own questions. A method must be devised not on one formal model of rationality but in order to match the problems and questions that need answering.

A multidimensional account of rational inquiry seems particularly apt for religious ethics. In very different ways, what scholars call the *religions* provide guidance for human living through rituals, myths, exemplars, doctrines, and teachings that answer a range of questions surrounding human existence. These questions demarcate a space of human existence determined by the problem of how one ought to live religiously – say, live as a Protestant Christian, a Shi’ite Muslim, or a Tibetan Buddhist. *Morality*, the religious ethicist can insist, is a term for the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide conduct. From the perspective of actual traditions, religious ethics must be conceived as examining various features of how the moral space of life, as we can call it, is conceived and enacted in life. Viewed as a whole, this *Encyclopedia* can be seen to enact just this kind of examination of religious moralities.

If one takes seriously recurring questions found in the legacies of religions and formulates them at an appropriate level of generality, it is possible to adduce the multidimensional shape of religious ethics (see Schweiker 1995; Schweiker and Clairmont 2020). At least five deeply interrelated questions ground the dimensions of inquiry used to engage in its comparative, critical, and constructive tasks. What is more, each of these dimensions of ethics probe various tensions, or *aporia*, in order to isolate analogues among religious outlooks. The questions that found the dimensions of ethics are not related in a sequential or deductive manner; they are not a check-list to be applied to thinkers, texts, or practices. They arise out of tensions in human life and constitute the interacting “dimensions” of ethics that aim to explicate a religion’s account of and directions for orienting existence and conduct in the moral space of life. And insofar as religions use stories, rituals, and exemplary characters in order to guide life, these dimensions explicate and analyze the moral meaning of these phenomena. Further, the dimensions are important for the reader of this work in order to understand what specific questions a scholar is answering, even as the religious ethicist is held accountable for questions not answered but which are in the background of a religious outlook.

This account of moral inquiry articulates an approach for religious ethics that labors alongside *formalists* and those working *sociolinguistically*, *naturalistically*, and *cultural/ethnographic* approaches to reli-

gious traditions and communities. The account admits with formalists that a construal of ethics is an intellectual construct, but it denies that one dimension alone defines ethics and it specifies, like the other approaches, questions and answers of ethics from within the resources of real traditions. In this way religious ethics escapes the modernist reduction of a discipline to one rational principle or method, while also avoiding relativistic forms of postmodernism. What, then, are the multiple and interacting dimensions of ethical inquiry that represent a distinctive option for religious ethics and can provide orientation for reading these volumes? Recall, these are not ordered in any hierarchical way; they are mutually interactive and informative.

Dimensions of Ethics

The Descriptive Dimension

Human beings live and act in specific places, times, and sets of relations. How a situation is described, defined, and interpreted has implications for the possibilities and limits on actions and relations. In its widest compass, some construal is given of the moral context of the entirety of human life, often enough through myths, ideologies, or a moral worldview. Specific moral situations will be described, defined, and interpreted with reference to the wider outlook.

So when, for example, a Buddhist practitioner must decide in a situation what to do, there is the need to answer a basic question, “what is going on?” This is a difficult question not only because of the complexity of any situation, its openness to multiple interpretations, and the limitations of human perception and attention. The question is rendered all the more difficult because someone (authority figure, practitioner) must sort out what reality or perspective on reality is at issue, one marked by conventional truth or one rooted in *Dharma*. A devout Muslim too must determine “what is going on” in a specific situation. This requires not only a description of that case, but also knowledge of how Allāh is acting, the import of *Shari’a* on a case, and also specific reasoning skills. Behind these religious teachings is a basic human perplexity: how is genuine insight into a situation related to and blocked by human “blindness” to what is the case? Importantly enough, the religious often explore the dialectic of blindness and insight.

While each tradition provides answers to the question “what is going on?” they do so in wildly complex and different ways. Ethics has a *descriptive* dimension that is linked to other interpretive or hermeneutical disciplines, aimed at genuine insight, ranging from studies of myth to specific analyses of events and situations that provide ways to construe and understand moral situations. Religious ethics draws on a range of resources, experiences, types of discernment, and even beliefs about reality. These resources provide the means to describe and analyze a situation in terms of its moral meaning.

The Normative Dimension

Deciding “what is going on” in any concrete situation is never a disinterested activity. The descriptive dimension of ethics is necessarily related to some norms and values that orient thinking and action. These norms and values allow some realities to appear within moral perception; they also can conceal realities, and hence the tension of blindness and insight. Christian ideas about neighbor love, for instance, might allow a perception of human worth and vulnerability even for those deemed enemies. This

depends, of course, on how neighbor and love are normatively understood. “What norms and values ought to guide human life?” That too seems to be a basic question asked repeatedly in the legacies of religious traditions. A religious ethics has a *normative* dimension.

A bewildering diversity is found among the religions on the normative question. In many traditions there are distinct and sometimes conflicting *sources* for defining what norms and values ought to guide life. One source is the native intelligence of human beings struggling to live together; it is reason and intelligence. Another source is the ultimate binding claims and teachings, the revelation, of the community. Consider aspects of Jewish thought. Rooted in the so-called Noahide covenant, Jewish thinkers have long insisted that every person can at some level grasp moral principles. Yet, for the Jewish community, this knowledge is rudimentary in light of the revelation of the divine will in Torah. Not surprisingly, there are debates within religious traditions about the relative authority of the various *sources* of norms and values and how these ought to relate in living religiously. The sources drawn upon in moral thinking also link to other intellectual practices, especially ones interested in human valuing, social norms and goods, and debates about moral intelligence.

Disputes about the sources of moral norms and values also turn on the *content* of and *relations* among norms and values. Generally speaking, religious traditions acknowledge and seek to sustain a range of goods, like bodily integrity, family, education, art, and, at the highest level, moral excellence and righteousness (see Finnis 1983; Nussbaum 2000). How these goods are understood differs between traditions and even within a tradition; they constitute another link to disciplines, from economics to anthropology, which explore basic goods. Classical Hindu accounts of caste show, for example, that the meaning of bodily integrity shifts between the warrior caste (Kṣatriyas) and the priestly caste (Brahmans). Nevertheless, some domain of goods or values is protected and promoted by living morally. There are also debates about the norms for deciding how to respect and enhance goods. African beliefs about what is owed ancestors as the norm for human choice are decidedly different than, say, the Ten Commandments in the Hebrew and Christian Bibles. In each case, norms protect and promote goods within religious living.

However, matters are more complex. Just as the descriptive dimension of religious ethics probed the tensions between blindness and insight in human moral thinking, normative reflection has to address the question of whether or not the divine, sacred, or ultimate is beyond our conventional distinctions of good and evil or not. In fact, most religious traditions, despite their profound differences, hold that the sacred, ultimate, or divine somehow transcends or exceeds the common sensical distinctions of good and evil. And if that is so, then, normative and descriptive dimensions of inquiry are reflexively related at the level of perception and decision-making. They link ethics to other ways of articulating, describing, and valuing human actions and relations. Adducing these dimensions from widespread questions in no way shields us from the stark differences between and within traditions. Attention to these dimensions facilitates critical, comparative, and constructive work.

The Practical Dimension

When people ask about what is going on and what are the norms and values that ought to orient their living, they do so for practical rather than merely theoretical reasons. Whatever else we want and must say about the religions, they are first and foremost ways of orienting human life. They are ways of addressing the tensions, the *aporia*, of perplexity and wisdom in human life, fighting perplexity in the

name of wisdom. While the ethicist or religious thinker will develop complex epistemological theories or debate the nature of value and the validity of some conception of a norm, this is not the concern of most people. For example, as the Bhagavad Gītā opens Arjuna, standing beside Kṛṣṇa, watches a bloody battle unfold between members of his family. Should he join the battle? In the struggle of decision, a host of forces might be active, the advice of a god (Kṛṣṇa), duties bound to class or social role, bonds of love. Here too is a basic question: “what ought I or we to do?” Where is wisdom to be found?

Religious ethics has a decidedly *practical* dimension, no matter how theoretical and speculative moral inquiry becomes. It is related to other disciplines that focus on decision-making and judgment. Little wonder that so many religions link their ethics to law as well as the demand to imitate moral saints or to participate in practices of divination or study and commentary. Traditions develop complex and subtle patterns of moral reasoning in order to answer the practical questions of life. Confucian teachings about how to live the scholarly life are decidedly different than Jewish patterns of *Halakhic* reasoning. Each is, nevertheless, a response to the practical question “what ought I or we to do?” Of course, it might be illuminating to explore how *Halakhah* throws light on Confucian practices of moral reasoning and vice versa. Comparison is always possible in religious ethics.

It is also clear that this “I” or “we” is never some kind of isolated and ghostly being, but someone in relation to others. What I ought to do is related to what we ought to do. Who we are is related to other communities, who speak of “we.” While certain traditions have emphasized a radical individualism in moral action, by and large there is profound awareness that moral quandaries find people amid others. Therewith develop patterns of communal reasoning and judgment; that is, the formation of a political ethics. The point is that some form of practical reasoning and judgment will be found. The work of scholars in other fields (law, social analysis, rhetoric) can aid the religious ethicist. Noting the practical dimension of ethics facilitates, rather than delimits, critical, comparative, and constructive thinking.

The Fundamental Dimension

Insofar as individuals and communities confront questions about how to orient life, something is asserted about the moral structure of reality and human beings as creatures with the power to act and choose in concert with others and thereby influence reality, themselves, and others. That is, ethics is about the proper conduct of agents, human and otherwise. Human beings can be and ought to be aware of themselves in relation to others, the context of life, and with respect to norms and values about how rightly to live. But, ironically, human beings confront here too a tension, the one between freedom and bondage. We are – to some extent – freely acting beings but in a world and universe that constrains our freedom even as we can be (and usually are) in bondage to powers beyond ourselves, say, addictions, or political forces, genetic makeup, family structures, or economic necessity. Any ethics aims, thereby, to answer a question seemingly presupposed in other moral questions: “what does it mean to be a moral agent within the wider compass of reality?” From philosophy to neuroscience, religious ethics is linked with other fields of inquiry into human being and doing and the nature of reality itself.

Religions present fantastically complex accounts of agency and the moral context of life. This is what is meant by the subject matter of the *fundamental* dimension of ethics. A good deal of modern Western ethics defined an “agent” as a being with reason and will, who can act intentionally, bring about changes in reality, others, and the agent’s self, and have accountability for actions imputed and/or ascribed to him or her (see Gewirth 1978). The scope of the moral world is determined by the interactions, cooperatively

or not, among these agents. Each of the defining attributes of agency has of course been hotly debated. What do we mean by reason or will or intentionality or accountability or moral ascription? How do we best understand the formation of moral character, say through the virtues? There has been reflection on the limitations of agency, the nature of corporate agency, and questions about moral self-understanding.

Work in religious ethics is challenging and amending modern Western conceptions of agency by attending to non-human agencies and also the wider realms of reality. Human beings can be – and often are – in bondage to powers beyond themselves even as they also retain a measure of freedom. In the Christian tradition, what it means to be an agent is defined not only in terms of the power to act and to be held accountable. It is also defined by patterns of relation in which the self exists in God and in others through faith and love before God's kingdom. Further, faith and love are understood with reference to the divine activity, and this means, paradoxically, that at least two agents, the human and the divine, act in any genuinely good action. Sin, or a broken relation to God and others, is marked not just by wrong acts, but, more profoundly, by an estrangement in which one must act alone and for one's own purposes and good. God's judgment on sin is really the withdrawal of the divine presence such that the agent is left to his or her own devices. In traditional African ethics what it means to be an agent is rendered complex by the fact that the ancestors are operative agencies in the world. This is also why, as noted above, practical and normative issues in Buddhism hinge in part on the distinction between conventional and Dharmic truth and so on a distinction between "self" and "person." Insofar as the root problem is craving that gives rise to suffering, one can only speak of an agent or person through conventional terms. In the light of the teachings of the Buddha, ultimately, there is no-self.

In the religions, forces other than self, insofar as we can speak of a self, are at work in the world and in the individual. Each of the religious traditions, furthermore, examines complex psychological and sociological mechanisms that lead to moral failure, delusion, and conflict – mechanisms like inordinate craving (Buddhism), distorted loves (Christianity), ritual impurity (Hinduism), violation of ancestral bonds (African and Native-American ethics), and systemic, social distortion. An agent is set amid forces that must be considered in attaining valid understanding. Inquiry into what it means to be an agent within these rich accounts of moral reality is the fundamental dimension of religious ethics simply because these ideas are presupposed, and so *fundamental*, in all other moral questions.

The Metaethical Dimension

If one looks at the legacies of religion, there seems to be one further general question that helps to constitute the shape of religious ethics. It arises from the tensions between truth and illusion in human experience. The Buddha insisted that anyone could test the truth of his teaching in actual life. Jesus is reported to have said, "I am the way, the truth, and the life." Hindu ways of life claim to accord with the truth about the cosmos and also the specific tenor and form of individual life. Muslims believe that the Qur'an gives the final and ultimate revelation of the will of God. Every religion, despite what modern critics hold, purports to be truth seeking and truth teaching. Communities and traditions implicitly pose the question and provide some account of the truth of their morality and their picture of how to orient existence in the moral space of life. Of course, claims to truth differ and so too the means for showing their validity (experience, teaching, revelation, etc.). To enter into this kind of reflection is to engage in what is often called by scholars, somewhat unhappily, "metaethics." Reflection centers on clarifying moral concepts, strategies of validating claims, and forming judgments about the relative weight the

evidence and interpretations from other fields of inquiry can and ought to have in guiding life. This is meant to sort out truth from illusions the confusion of which too often befalls human life. The question of validity or truth is posed from within the religions. This too is a dimension of religious ethics, both about a religious morality and about the discipline of religious ethics itself.

The question of the truth of a moral outlook is without doubt one of the most vexing issues for religious ethics. While the ethicist might explore dimensions of a tradition's morality, how does one judge the truth of an entire religion? How does one show that a constructive religious ethics is true? On one level, the religious ethicist can address this question comparatively and critically. In Volume II of this *Encyclopedia*, readers will see scholars examine the ways in which one or several traditions go about showing the truth of their moral beliefs and practices. Further, if the religious ethicist is working within a specific tradition, say, Shi'ite Islam or Zen Buddhism, then, presumably, its strategies of validation will be in play, a matter also explored in parts of this *Encyclopedia*. Finally, when a thinker attempts to offer a constructive religious ethics, comparatively or not, then some account of how the position is validated must be given.

When the ethical task is to speak critically, comparatively, and constructively across traditions about shared human problems, matters become pressing. It poses a question implied in the very undertaking of religious ethics: from what *standpoint* is inquiry carried out and what criteria of adequacy or truth pertain to its work?

Hermeneutical Standpoint

The *dimensions* of inquiry gleaned from persistent questions and perplexities of human life aim to provide a coherent way to undertake, singularly or collectively, the comparative, critical, and constructive *tasks* of religious ethics. They also signal the kinds of questions engaged by scholars represented in every part of this work. Moral knowledge is thereby depicted as a network of intelligibility, a space of reasons, about how rightly to orient life that is held and enacted by some tradition or community and examined by scholars and religious leaders through multidimensional reflection. The religious ethicist might also make constructive claims about how rightly to live. This is, a proposal for the orientation of conduct and life that is responsive to the complexity of the "religions" and also shifts in the way knowledge and disciplines are conceived. The account of the scholarly labor of religious ethics in this *Encyclopedia* does not prejudice one set of moral beliefs over another, say African over Confucian; nor does it specify only one kind of ethics, say virtue ethics or deontology, as best for a normative understanding of the religions and meeting present-day challenges. It is an inductively developed *method* for, or *approach* to, religious ethics. Working alongside other options in the field, this proposal is, hopefully, subtle enough to facilitate the examination of the moral outlooks and practices of the world's religions. Through its dimensions, religious ethics interacts with many fields of inquiry.

However, we have been led to the thorny question of the standpoint and criteria of religious ethics. For those who take a *formalist* approach, the contention is that despite empirical differences among religions one can discern or articulate philosophically a basic structure shared by the religions that facilitates critical, comparative, and constructive work. One seeks to develop an ethics outside of substantive connections to any tradition or the surrounding life-world (see Benhabib 1992). The criterion of adequacy must be determined with respect to moral rationality itself and/or through a metaphysical vision. Those who

pursue a *sociolinguistic* approach in the discipline insist that the sheer diversity among religions and cultures means that material differences rather than formal similarities must be basic to method in religious ethics. Moral rationality, on this account, is tradition-constituted rationality (see MacIntyre 1990). The means to validate a position are internal to a tradition or they emerge at the intersection of competing traditions. *Ethical naturalists*, for their part, insist that norms and values must be grasped and evaluated in terms of their place in a whole outlook on life. And those who adopt a *cultural/ethnographic* approach grant the sheer differences in moral outlooks. The standpoint of the religious ethicist, thereby, is to engage in the examination of a community's moral worldview even while acknowledging the substantive outlook that backs her or his inquiry.

Shifts in how to describe moral knowledge enable one to conceptualize religious ethics in a new way. Similarly, there are developments afoot that demand a standpoint in religious ethics somewhat different than the other approaches in the field. While the method of religious ethics is aptly described as *multidimensional*, its standpoint can also be conceived as fully *hermeneutical* in character conjoined to specific criteria of adequacy. The importance of this standpoint is found in the moral significance of recent global developments that parallel shifts in the construal of human knowledge.

Recent Developments

Developments that characterize the present age warrant a hermeneutical standpoint in religious ethics. These recent developments, and others too, are charted throughout these volumes. A prominent one is the growing awareness around the world of the diversity of religious and moral beliefs, practices, and convictions. A good deal of modern Moral Theory seemed to efface the particularity of outlooks out of a concern to isolate general features of human existence deemed of universal ethical relevance. The need nowadays is to understand and to explain the moral vision of communities and cultures on their own terms without an initial judgment of truth or goodness. This requires interpretive engagement with the forms of thought, types of texts, practices, rituals, and organization of religions and societies.

The present awareness of global diversity has spawned the critical and comparative tasks of religious ethics, both in formulating more adequate categories of thought (Volume I), by exploring the legacies of traditions (Volume II), and in order to address shared moral problems (Volume III). However, understanding beliefs and practices, no matter how critical that might be, is not the same as justifying them, determining their truth. In a world in which the religions too often and too readily sanction violence and hatred of others, neglect or denigration of the environment, and also back excessive preoccupation with one's religious condition, judgments about what counts as a valid policy for living are required. Present worries about moral diversity provoke inquiry into how one is to establish norms that transcend particular systems of authority in order to address shared human concerns. This seems to require that the standpoint of religious ethics be neither so formal as to efface differences nor so historically particularistic that normative judgment across moralities becomes impossible.

The awareness of moral and religious diversity is just one development in the current situation that challenges how one conceives of the standpoint of religious ethics. The age of "globality," as it is called, is marked by multiple forms of reflexivity, ranging from economic processes to cultural and informational flows (see Schweiker 2004). Reflexivity is the ability of an acting entity to respond to information coming from elsewhere and to adjust its self-understanding and actions in this light. Human persons can

respond to recommendations and judgments on their actions, say, from others, a sage, moral saint, or a god, and then seek to live and act better. Reflexivity is then a kind of self-examination. Increasingly, one is aware of the ways in which social systems, cultures, and religious traditions are, analogically, reflexive or learning and self-testing beings. Global reflexivity works through economic, cultural, imaginary, and legal mechanisms shaping human and non-human life.

The reflexive dynamic of global flows has brought with it new and unexpected developments. During the twentieth century, many scholars of religion defined their work in terms of secularism. The modern world was supposedly a time in which ideas and experiences of religion or transcendence or the sacred were being effaced by the pressure of differentiated social structures and the march of science to demystify the world. Similarly, the legacies of colonialism demanded that peoples around the world adjust their lives and cultures to the secular order (see Appadurai 1996). Throughout this *Encyclopedia*, and especially Volume II, one can trace the ways religious traditions have responded to secularism, colonialism, and modernism.

The noonday of the secular world never really came, or it only appeared in faint glimmers. The present age is characterized by nothing so much as the force and movement of the religions on the global scene. Global reflexivity, the ways in which communities appear in the “gaze of the other,” is of great moral import. One can witness the transformation of traditions in and through interactions with and resistance to other global forces, including other religious traditions, rather than the pressure of secularization. This also seems to require a hermeneutical standpoint in religious ethics insofar as hermeneutics examines the dynamics of human understanding through encounters with divergent claims to meaning, encounters in which transformation of life as well as conflict are possible.

The awareness and worries about moral diversity and global reflexivity arising out of the contours of the emerging age are deeply intertwined with shifts in moral sensibilities. These shifts in sensibility are other developments that impinge on the standpoint of religious ethics. The modern world from the seventeenth to twentieth centuries saw the apotheosis of human power in technology, political organization, the media, and economic systems, and with these developments an exclusive concentration on human flourishing. Ironically, modern anthropocentrism turned against itself. Holocausts, genocides, terrorism, grinding poverty, and horrific wars scarred the twentieth century and now too the twenty-first century. Massive suffering and violence have sparked deeper sensitivity to the vulnerability and preciousness of persons (see Gaita 2000; Glover 2000). Conjointly, there is growing awareness of the interdependence of every form of life on this planet. People around the world are imaging the scope of moral value to include but also to exceed human well-being. This ecological sensibility has challenged long-standing beliefs about moral value and standing. In various ways, moral sensibilities for the worth of all realms of life are spreading around the world. This is sorely needed insofar as the religions continue to take violent expression and to foster ignorance and the neglect of finite, planetary resources. Emerging sensibilities can and must aid in the transformation of the traditions that spawn but also thwart moral aspirations.

The realities of moral diversity, global reflexivity, and emerging moral sensibilities are obviously inter-related developments. Taken together, these demarcate some of the contours of the current moral space of life. In order to understand and respond to them, religious ethics must carry out critical, comparative, and constructive work. Because of the deeply interrelated nature of current dynamics, religious ethics obviously needs to be defined beyond modern conceptions of what constitutes a discipline or an intellectual practice. Furthermore, something important is at stake in an account of an ethical standpoint once

the reflexive dynamics of cultural interactions amid human diversity in global times is seriously considered. The religious ethicist does not simply exist within or outside actual traditions. She or he is always thinking at the *lateral connections* among communities, traditions, and intellectual practices. What does this fact mean for the standpoint of religious ethics?

Standpoint and Criteria

In order to specify the standpoint of religious ethics in the light of current global developments, one can reclaim terminology from the Hellenistic world that arose within its religious and cultural imagination prior to the development of “ethics.” The standpoint of religious ethics is *hermeneutical*. Derived from the Greek god Hermes, hermeneutics is reflection on the possibilities and limits of understanding ambiguous meanings won through the act of interpretation and thereby how meanings are conveyed from one realm to another. In the Homeric texts, the virtual sacred literature of that culture, Hermes conveyed meanings from the gods to mortals. Other religions, as found in this volume, explore the conveyance of meanings across boundaries in revelations, divinizations, rituals, exegetical strategies, and mystical insights.

The point is certainly not to reclaim Greek ideas in order to define the standpoint of religious ethics! The insight is that religious ethics conceived as a hermeneutical enterprise moves between traditions or among expressions of one tradition, seeking understanding and the orientation of conduct and life. No doubt that movement will always be marked by the ethicist’s “home tradition,” religious or secular. One remains a Chinese or Japanese Buddhist religious ethicist or an African Christian or a postmodern European Aristotelian. No one (thankfully) must necessarily sacrifice their identity for the sake of undertaking religious ethics. Yet the standpoint, the posture of thinking, takes place at the reflexive connections of traditions and other forces working in the world. The religious ethicist on this picture enacts the lateral links among the dimensions of ethics and other forms of inquiry into the moral beliefs and practices of the religions. In the process some degree of knowledge and understanding is attained, a shared world of meaning is partly disclosed, even as identities can be confirmed or tentatively transformed. The religious ethicist participates in the enacting of a complex network of moral knowledge, never complete yet nonetheless attained. This hermeneutic action is achieved by undertaking the adventure of thought signified through the various dimensions of religious ethics.

How then are we to judge the validity or truth of the work of a religious ethicist? This is a question hotly debated in the pages of this *Encyclopedia*, particularly in Volume I. Generally stated, two *criteria* bear on a hermeneutical standpoint in ethics. First, any adequate ethical claim, whether about the beliefs and practices of a specific tradition or a proposal for meeting a current moral problem, must prove its great adequacy to relevant material in argumentative exchange with other accounts. A position is truer than some other insofar as it answers more comprehensively and coherently the range of questions specified in the dimensions of ethics. It must, accordingly, meet demands entailed in the act of multidimensional inquiry, as well as be error reducing with respect to rival positions or interpretations (see Taylor 1990). Again, scope rather than autonomy is basic to the adequacy of an ethics. This is a *procedural* criterion. It means that a religious ethics is never justified prior to lively engagement with other positions. Additionally, a position must afford some advance in thinking by provoking or providing deeper insight into a moral problem or way of life. This second *heuristic* criterion is more illusive than

the procedural one. What counts as insight, let alone “deeper” insight? Nevertheless, a moral position can claim greater adequacy, greater truth, if it enables one to apprehend, understand, and respond to factors really pressing on human lives but missed by other moral positions. *Heuristic* and *procedural* criteria are applicable to the scholarly labor of criticism and comparison as well as to constructive ethics. These criteria can, of course, be elaborated in much greater detail, a task not needed in this Introduction but one explored throughout the *Encyclopedia* as a whole (see Schweiker and Clairmont 2020)

There are good reasons within the religions as well as those found in global dynamics to adopt a hermeneutic standpoint in moral inquiry. The religious ethicist can isolate and articulate these various reasons as backing for her or his work. Abiding by the criteria of a hermeneutical standpoint within multidimensional inquiry, religious ethics can, but need not, aid in the reconstruction of religious identities around criteria of ethical truth, rather than subjecting the question of truth to communal identity. In this way, a thinker critically and comparatively releases the resources of traditions and communities for constructive thought about how rightly to orient human life.

Conclusion

This entry has sought to address terminological, methodological, and also criteriological issues within the ongoing work of religious ethics. It has sketched an approach to the discipline working alongside others in terms of *tasks*, *dimensions*, and *standpoint*. This proposal is meant to aid the reader in exploring the richness of the thought represented in this *Encyclopedia*, as well as to outline a new possibility for religious ethics itself. One should not expect all scholars represented here to use this proposal, nor is that needed. As noted before, part of the vitality of the field is to keep constantly in play the appraisal of its work and adequacy. Yet by enlisting a vast range of renowned scholars from various disciplines, traditions, and cultures, the labor of religious ethics now crosses disciplinary boundaries that have for too long inhibited its development. *The Wiley-Blackwell Encyclopedia of Religious Ethics* presents an exciting vision of moral inquiry engaged with the fantastic resources of the world’s religions, open to other fields of reflection on the human adventure, and dedicated to understanding and addressing moral challenges and possibilities emergent in our global times.

1 Moral Knowledge

CHAPTER 1

Moral Theories

Robin W. Lovin

Moral Life and Moral Theory

Every religious tradition offers guidance for living a moral life. At the most basic level, this guidance is simply woven into the fabric of observances, beliefs, and expectations that shape a way of life we identify as Hindu, or Christian, or Ibo, or Confucian. In most cases, traditions also give rise to teachers, prophets, and philosophers who provide a critical assessment of these everyday expectations. Aristotle (384–322 BCE) gave a systematic account of the virtues that were honored in Greek culture. The Hebrew prophets (eighth to fifth centuries BCE) identified principles of justice and mercy that explained the requirements of the Law (Torah) and sometimes criticized the ways the Law was generally observed. Confucius (551–479 BCE), Lao Tzu (sixth or fourth century BCE), and Chuang Tzu (399–295 BCE) showed the right way to observe Chinese traditional virtues by relating them to the demands of social harmony or to the patterns of an underlying natural order. Such reflections may be called “moral philosophy.” By identifying principles on which practices rest, these reflections systematize prevailing expectations, and they also provide a basis for criticizing and revising them. Most religions have had moral philosophy, in this general sense, for a very long time (Donagan 1977).

Modern moral theory, however, has a more comprehensive critical purpose. Moral theory is less about how to live a particular way and more about why we ought to be moral and what it means to say that a rule, an action, or an ideal is moral. Western philosophers, beginning in the seventeenth century with Descartes, Spinoza, Hobbes, and Locke, attempted to answer these critical questions by establishing the rational requirements for any sort of morality. A moral theory in this modern sense may also give rational arguments for specific moral commands and prohibitions. Some moral theorists begin with this normative task. Others concentrate first on the questions of moral authority and moral meaning. In either case, the theorist develops a comprehensive basis for explaining, comparing, and criticizing existing ways of life or systems of moral philosophy, including religious moralities. On the basis of the moral theory, the theorist can make judgments about whether the requirements a religion or a way of life imposes are morally justifiable. The theorist also appears to have in principle a powerful tool for comparative study by assessing diverse systems of belief and practice in light of the structure of morality that the theory provides. At the beginning of the modern period in Western thought, these theoretical tools were believed to hold great promise for adjudicating religious conflicts and settling disputes about morality.

Moral Theory and Religion

The earliest use of moral theory in religious ethics, then, was by Western philosophers who used their theories for a critical evaluation of traditional Christian ethics. This theoretical assessment of prevailing moral traditions has been repeated, with important variations, by other philosophers in relation to other traditions around the world (Cho 1998). Extensive use of moral theory as a tool in the comparative study of religious ethics is a more recent development (Little and Twiss 1978).

The way that a modern moral theory can relate to a religious tradition is well illustrated by the work of Immanuel Kant (1724–1804). Kant based his moral theory on a *categorical imperative*, an exceptionless moral rule that requires us to act only on those reasons that we can also make into universal laws, governing the choices of others as well as our own. Thus, lying is morally wrong because we cannot rationally formulate a rule that would require it as a universal practice. We choose to tell a lie only by allowing ourselves an exception to a rule that we acknowledge in the very act of breaking it (Kant 1964).

Kant's moral theory overturned several understandings of the moral life that have been common in Western Christianity. A Kantian could not argue that God has implanted certain ends and purposes in human beings by nature, so that all people share certain moral aims. Desire for a goal, even if it is universally shared, does not explain why we are morally required to pursue it. Kant's theory thus disposes of a pattern of argument, based on the universal human desire for peace, or happiness, or blessedness, that Catholic Christian writers had learned early from Greek philosophy and built over the centuries into an elaborate theory of natural law, given special prominence in the work of Thomas Aquinas (1125–1274). Likewise, Kant calls into question the claim, more common among Protestant theologians, that we are obliged to obey God's commandments simply and solely because it is God who commands us. Even when God is the lawgiver, the rational person cannot accept the command as a *moral* law unless it meets the test Kant sets out in the categorical imperative.

While there is little left of some religious ways of thinking about morality in Kant's moral theory, Kant preserved what many people regarded as central to the practice of Christian ethics. Other theories raised more radical questions about conventional moral expectations. Friedrich Nietzsche (1844–1900) devised a moral theory in which the basic principle is the development of a person's capacities for creativity and control over the circumstances of life, so that when we ask what we are required to do, the answer must be closely tied to the possibilities inherent in our individual personalities. When viewed from this theoretical perspective, many prevailing moral expectations and the religious beliefs that support them have no moral justification (Nietzsche 1998). In this case, the theory does not provide a rational basis for traditional moral requirements, but offers instead a moral justification for setting traditional morality aside. Nietzsche understood his task to be the destruction of traditional Christian morality, so that something new might arise in its place.

Varieties of Moral Theory

Kant and Nietzsche are two of the most important moral theorists in terms of their impact on religious thought, but they hardly exhaust the possibilities for moral theory. The study of moral theory in the West since the seventeenth century has produced a variety of competing accounts of the basic principle of morality, rather than a single, dominant theory. While all of the theories aim to provide a basis for ethics

that is independent of existing moral beliefs and particular religious traditions, they establish that starting point for morality in different ways, and their assessments of religious beliefs and practices vary accordingly. In this section, we will briefly survey the main types of moral theory and consider the general implications of each for our thinking about religious ethics.

There is no universally accepted taxonomy of ethical theories, nor even any strict conventions about how to name them. Nevertheless, the main types of moral theory are generally recognized, and we can follow an outline that allows us to consider the implications of each for thinking about religious ethics. The terminology used here appears, with some modifications, elsewhere in this volume and more widely in the contemporary literature of philosophy and religious ethics.

We have already noted that moral theory has two basic tasks. The first is to make sense of the multitude of rules, proverbs, parables, tales of moral heroes, lists of virtues, and descriptions of moral ideals that guide the moral life as we are supposed to be living it. “Normative ethics” develops theories that systematize moral expectations and explain how a living moral tradition can be understood as a consistent system of moral requirements. The second task of moral theory is to explain why a certain kind of discourse is, or appears to be, uniquely authoritative for conduct. Why is it that when we use moral language, we make a claim on someone’s behavior that is more demanding than when we recommend a restaurant or a movie? Why should we expect other people to concur in our moral judgments and act in ways that support the moral claim? Philosophers have given the study of these questions about the meaning and authority of moral language the name “metaethics.” (The term is coined by analogy to “meta-physics,” which inquires into the nature of reality, while physics systematizes the laws that govern how reality behaves.)

Metaethics and normative ethics, then, are two main divisions of ethical theory which answer rather different questions about the nature of moral claims in general and about the norms that guide specific moral choices. Each of these questions, in turn, has elicited a variety of answers that become the main types of ethical theory.

Normative Ethics

Religious traditions usually offer a variety of guides for specific moral choices. They teach moral rules. They use stories and parables to show how the moral life is lived in specific situations. They identify saints and heroes or produce lists of virtues to explain the goals of the moral life. Normative theories generally try to establish one type of guide as primary. The rule or the goal becomes the key to understanding the varieties of traditional moral advice. A theory may try to show, for example, that a large body of cautionary tales, commandments, and proverbs all express a small number of basic rules. Alternatively, a theory may argue that rules, laws, and virtues a tradition teaches all point to a single goal, or perhaps to a small number of primary goals.

Deontology presents normative ethics as a system of rules. (The term derives from the Greek *deon*, meaning that which is necessary or obligatory.) A deontological theory might, for example, give an account of Jewish ethics that emphasizes the centrality of obedience to the Law. A deontological theory of Confucian ethics would stress the rules governing relationships to parents, rulers, patrons, or teachers that are essential to the Confucian way of life. A comparison of two different religious traditions based on deontological theory would identify the key moral rules in each tradition and compare the patterns of

action expected from believers who follow these rules. Deontological theories give less attention to consequences and focus more on choices and actions when deciding the right thing to do.

Teleology, from the Greek *telos*, or goal, focuses the decision about whether an act is right or wrong on the results which it is intended to achieve. A teleological theory of religious ethics evaluates actions in terms of how they contribute to a goal, rather than how they conform to a rule or commandment. The goal might be a characteristic of a community of believers, such as being organized to welcome strangers and provide hospitality for their needs. It might be a state of affairs in society, such as having a system of justice that treats rich and poor equally. Or the goal might be a virtue of persons, valued habits they acquire by repeated patterns of choice and action. A teleological theory may include a number of important goals, or it may propose that the variety of our goals can be understood in terms of a single goal – “happiness,” “blessedness,” or “love,” for example – to which all the rest are subordinate. In any case, a teleological theory evaluates choices and actions in terms of whether they sincerely intend and effectively achieve the goal.

Because every religious tradition probably includes both rules and goals, devising a deontological or teleological theory that accounts for how a tradition guides moral choice inevitably involves a decision about which parts of that guidance are most basic and most important. This can be controversial. Christian ethics, for instance, regularly sees new versions of the argument between deontological thinkers, who insist on doing what the rules require, and teleological thinkers, who are prepared to ignore familiar moral rules to achieve the most loving results. Hindu ethics can be interpreted either as a set of rules governing an elaborate hierarchy of specific relationships, or as a set of virtues that characterize the person who knows how to order life well within those relationships.

Metaethics

Religious traditions do more than provide normative guidance. They also explain why we are required to do what the moral norms prescribe. Moral theories provide several types of frameworks for understanding these explanations. We will focus here on three of them: rationalism, naturalism, and non-cognitivism.

Rationalism

Kant’s ethical theory is an example of ethical rationalism. Failure to follow the requirements of morality always involves us in the contradiction of willing to do something that we are unwilling to make into a general rule that human beings ought to follow. What ethical rationalism shows us is that moral requirements are not imposed on us by outside authorities to test our obedience. We impose moral requirements on ourselves, if we think rationally about our conduct. We are required to act morally because acting against the basic principle of morality is self-contradictory (Gewirth 1978).

Rationalist moral theories can develop in close connection with traditional religious ethics. Rationalist moral theories often offer as the basic principle of morality some version of the requirement that we treat others consistently with the ways we would expect to be treated ourselves (Green 1988). The same principle appears in more traditional form in many religions, including the “Golden Rule” of Christianity (Matthew 7:12). On the other hand, the close resemblance between the basic principle of morality and a traditional religious precept that requires us to “do to others as you would have them do to you” does not imply that

the moral theorist will find every requirement of traditional morality logically consistent with this basic principle. Ample opportunity remains for philosophical critique of conventional moral expectations that are not obviously consistent with the basic moral principle. Also, even with respect to central moral principles, the moral theorist may conclude that treasured religious language about persons as children of God or as individuals with a sacred dignity is superfluous once the logical point is clearly understood.

Naturalism

Where rationalism grounds moral requirements in reason, naturalism seeks that ground in the regularities of nature and human experience. While these would seem to be more difficult to state precisely than the requirements of reason, there is no doubt that nature imposes some constraints on all of us. We all have basic physical needs. Physical security requires that we live in society, and although societies vary greatly in the ways they are organized, they must all restrain and support us in some of the same ways, or their promises of security will be in vain. Every moral system offers some account of what we have to do to live a good human life within these constraints of nature and society.

Ethical naturalism makes understanding of the human good the key to ethical theory. What we are required to do, morally speaking, is the thing that allows us to flourish as human beings under the particular constraints with which we live. The set of requirements we develop may vary considerably as individuals with different talents and needs seek to make their way in societies that differ a great deal in the resources and opportunities they offer. The classical philosophers who first gave us versions of ethical naturalism did not always experience or appreciate that variety, but the task of building a moral theory calls our attention to the common project that underlies many quite different ways of talking about the things that make a life worth living. A great variety of moral and religious traditions share the thought that claims about what we ought to do are based on the persons we want to be, and on what it takes to become that sort of person. The proof that we have it right, for this kind of moral theory, is not that our rules do not contradict themselves, but that they point us toward becoming recognizably good people.

Naturalism provides a moral theory that is well suited to religious traditions that speak about ethics in stories of saints, heroes, and other exemplary lives, or that recount the natural constraints on human life in myths about the creation of the cosmic order (Lovin and Reynolds 1985). In Western religion and philosophy, it provides a way to link contemporary philosophical ethics to the discussions of virtue and human excellence that run from Aristotle through Thomas Aquinas to modern Roman Catholic moral theology (Porter 1999).

However, a naturalistic moral theory may also suggest that the traditional language of religious morality is superfluous or misleading. If we learn by careful observation what human flourishing requires, what sense does it make for a religious tradition to tell us that the requirements of morality are God's commands? Moral theorists who adopt a thoroughgoing naturalism often regard religious language with suspicion, suggesting that the supposed commands of God are really expressions of the self-interest of the preachers, and proposing that we might all see that more clearly if we insisted that the case for a moral requirement be made only in naturalistic terms.

Non-cognitivism

For all the differences between them, rationalism and naturalism agree that sound moral judgments rest on knowing something that is universally true, whether that knowledge is about moral reason or about

human nature. Each type of theory struggles to make this claim to universality credible in spite of obvious human diversity, and to accommodate diversity in spite of the claim that moral truths are universal. Some moral theorists, however, have sought to resolve this tension by abandoning the claim to universality. Indeed, they deny that our claims about what morality requires rest on any knowledge at all.

For the non-cognitivist, moral language is a way to praise the sorts of action we call moral and a way to express our commitment to acting morally, even if we find it difficult to do so. We can avoid arguments about whether the world really is the way our moral language says it is by recognizing that moral language does not make claims about facts (Hare 1952). Moral language expresses the commitments of persons and groups to ways of acting. It does not make sense to ask whether such a commitment is “true.”

Non-cognitivist moral theories have proved most useful in thinking about ways of life that are radically separated by time and distance. It is not altogether plausible to say that two persons locked in a face-to-face moral dispute are not really making any claims about what is the case. By contrast, attempts to settle the differences between, say, the Aztec culture of warrior virtues and the European bourgeois values of individualism and moderation by assessing their views of human flourishing from some supposedly neutral standpoint often leave us with a sense of irrelevance (Williams 1985). The differences are just too great to think that they can be reduced to right or wrong ideas about some set of facts. We will understand them better, the non-cognitivist suggests, if we recognize that these alternative moral worlds are not built on views of the facts at all.

Non-cognitivism may seem an unpromising moral theory for religious ethics, useful primarily to those who reject religious claims to moral knowledge. Non-cognitivism does, however, offer a strong alternative to all forms of naturalism and rationalism for theologians who seek to build their moral systems directly on divine revelation. A religious thinker who finds no secure basis for morality in human experience and believes that obedience to God’s command is what makes an action right or wrong will find an interesting ally in the non-cognitivist, who will at least join in demonstrating that none of the languages of morality actually make the universal claims about the world and our knowledge of it that they appear to be making at the outset.

Criticism of Moral Theories

Recent developments in philosophy have called into question the construction of moral theories. Critics suggest that a principle of morality cannot be isolated from the way of life in which it is embedded. Normative theories at their best are accounts of the central convictions that shape a particular way of life. Metaethics, however, is largely useless. The effort to build a general theory of morality, critics charge, distorts the religious and cultural systems to which the theory is applied, and the accounts which emerge reflect more of the theorist’s own ideas than of real moral life.

In religious ethics, the criticism of moral theory has often been received as good news, freeing religious thinkers to explore a multitude of relationships between religious beliefs and moral practice, unconstrained by a rigid philosophical system that seeks a logic of morality independent of its practices (Stout 1981). Use of moral theory as a tool for comparative religious ethics has also been criticized for privileging a set of Western philosophical questions and then making these the basis for comparison (Cho 1998).

These criticisms are important, but they suggest caution in the use of moral theory, rather than an entire rejection of it. Several centuries of effort have failed to produce a general theory of morality that

could function in the way that theory functions in the natural sciences. It would be a mistake to use a moral theory as a standard against which religious ethics could be measured, or as a system by which all religious ethics might be organized. The questions of moral theory do reflect the modern, Western philosophical context in which they emerged, and there are no doubt other questions in traditional religious thinking which are important to those traditions, and which the moral theory may miss entirely.

Nevertheless, the questions of moral theory are important, if only to those who have been trained by Western philosophy to ask them. To give up on the creation of an authoritative standpoint from which to view all possible traditions does not invalidate the more modest project of asking how different traditions look when we try to examine them carefully from our own partial point of view. Precisely because the moral life as lived does not come with a theory attached to it, the possibility of systematic comparisons between lived traditions will often depend on having some theory to guide the study. The task, especially in comparative religious ethics, is to determine which theory least distorts the experience of persons in the tradition, while best enabling the investigator – from his or her own distinctive standpoint – to make meaningful connections between the traditions.

CHAPTER 2

Moral Truth

Maria Antonaccio

Moral Truth and Moral Realism

All religions make moral claims that are considered binding on their adherents: claims about what moral beliefs to hold, what moral values to pursue, and what forms of moral character and conduct to cultivate. Insofar as a religious community embeds its moral claims within a larger vision of reality and human life and expects its members to conform their lives to that vision, some notion of “moral truth” seems to be presupposed in every such community. Religions differ, of course, in the content of what they regard as morally true and in their methods of validating or sanctioning their moral claims. And the scholar or moral theorist may regard the validity of a community’s moral claims in quite different terms than its members do. But religious communities are implicitly “realistic” about their moral claims: those claims are considered true in the sense that they refer to and provide access to some notion of “the real.”

Philosophers have made a similar point about the practice of morality generally: some notion of moral truth seems to be presupposed in everyday moral practice (Smith 1991). The fact that persons routinely argue about moral claims, appraise actions as right or wrong, and seek resolutions to moral conflicts, suggests that persons engaged in moral argument are trying to avoid a mistaken judgment or course of action. Common moral practice thus seems to assume some version of moral realism – the view “that there are correct answers to moral questions to be had” and that “there exists a domain of moral facts about which we can form beliefs and about which we may be mistaken” (Smith 1991, 399; Brink 1989).

Nevertheless, the notion of moral truth is one of the most contested subjects in ethical theory. In an age of awesome scientific advances, acute recognition of moral and religious diversity, and persistent global conflict over moral claims, the idea of moral truth seems hard to sustain, perhaps even dangerous. How is the religious ethicist to make sense of a community’s moral truth claims in an age of moral skepticism?

The aim of this chapter is metaethical, namely, to provide the conceptual tools needed to understand how religious traditions validate moral claims. The chapter begins by addressing some background assumptions that have shaped contemporary discussions of the idea of moral truth. It then presents a typology of metaethical theories and critically assesses them in relation to the task of religious ethics.

Moral Truth: Background Assumptions

Ordinary notions of “truth” seem to assume that truth claims can be tested by their conformity to some knowable fact. Purported statements of fact (e.g. “The cat is on the mat”) can be tested by comparing what is asserted to the reality or state of affairs to which the statement refers (“Is the cat really on the mat?”). But when it comes to assertions purporting to state truths of a moral nature (e.g. “Murder is wrong”), difficulties arise. While one can test an assertion such as “The cat is on the mat” by looking to see whether this is in fact the case, there is no analogous procedure for testing whether the assertion “Murder is wrong” is true (i.e. nothing in the act of murder itself from which we can *directly* determine its “wrongness”). The problem seems even more acute in the case of moral imperatives, such as “Thou shalt not kill” or “Love your enemies.” What kind of “fact,” if any, can determine the truth status of such commands?

Many moral theorists of the twentieth century took the difficulty just noted as indicating a fundamental difference between moral discourse and factual or “value-free” science. Unlike scientific inquiry, there seem to be no empirical facts in relation to which the truth status of moral statements can be assessed, and hence no “truth” to be discovered about morality. The distinction between facts, which tell us how things objectively “are,” and values, which tell us how things “ought to be,” underlies one of the most influential arguments in modern moral philosophy – the so-called naturalistic fallacy. In its basic form, the argument logically prohibits the deriving of evaluative conclusions from factual premises. But in practice, it carries far-reaching implications for ethics. One of its effects was to sever the deep connection between moral claims and a wider vision of reality that had been traditionally affirmed by many metaphysical systems and religious traditions. Moral – as well as religious, political, and aesthetic – beliefs were no longer regarded as genuine insights into the character of reality, but as the subjective attitudes or recommendations of the thinker who proposed them (Murdoch 1960). Values were seen as the product of human choice, rather than as perceptions of the real.

Given these assumptions, much twentieth-century moral theory was inhospitable to moral realism, and thus to religion as well. The traditional realist claim that there are moral facts (or “correct answers to moral questions”) discoverable by human reason was thought to violate the fact–value distinction, which defines “facts” as morally neutral. The perceived failure of moral realism spurred the growth of antirealism in ethics. But the extremes of realism and antirealism do not exhaust all of the available options in metaethics. New forms of moral realism have emerged which reject both the empiricist assumptions of modern moral theory and traditional realist views about how to validate moral claims. The following section presents a spectrum of metaethical theories and considers their implications for the study of religious ethics.

Varieties of Moral Realism

Metaethical positions may be distinguished by their answers to three fundamental questions: (1) Do moral facts exist? (2) Do moral statements have truth value? (3) Can moral claims be rationally validated? These three questions may be called ontological, semantic, and epistemic, respectively. The ontological question is usually answered by referring to theories as “realist” or “antirealist”; the semantic question, by referring to theories as “naturalist” or “non-naturalist”; and the epistemic question, in terms of whether theories are “cognitivist” or “non-cognitivist.” Forms of moral realism generally give a positive

answer to both the ontological and the semantic questions. However, different forms of moral realism provide different accounts of what *makes* moral statements “true” (or meaningful) as well as how their truth can be known. In its strongest (traditional) form, moral realism holds that moral facts exist independently of our beliefs and theories about morality (Brink 1989, 7), that is, independently of our “mental machinery” or our cognitive frameworks. But what, exactly, are “moral facts”?

Ethical Non-naturalism

Some theorists, called “intuitionists,” held that moral facts have a unique mode of existence: they are “non-natural” properties perceived through a special kind of moral knowledge (i.e. intuition). The intuitionist G. E. Moore argued that moral terms such as “good” and “right” refer to some really existing property of persons, actions, or institutions. But that property cannot be identified with or reduced to any other property or state of affairs (e.g. happiness); it is *sui generis*. Moore was, in this respect, a non-naturalist. Non-naturalists deny that moral values can be derived from any determinate account of non-moral nature. Kant, for example, held that the ground of obligation must be sought not in the nature of the moral agent or the agent’s circumstances, but *a priori* in the concepts of pure reason. Although non-naturalists can be moral realists (like Moore), all non-naturalists leave the fact–value distinction intact: moral values are distinct from non-moral facts.

Some scholars argue that divine command theory is a form of non-naturalist moral realism. The Christian theologian Karl Barth, for example, held that the command of God defines a revealed morality that may differ radically from what reason can discover. The Jewish philosopher Emmanuel Levinas made a similar point about the function of valid ethical commands. In both cases, the domain of moral value, defined by a command or duty, is discontinuous with the realm of non-moral “nature.”

Ethical Naturalism

Other moral realists, called “naturalists,” reject the claim that moral facts are unique non-natural properties known by intuition or revealed by God’s command. There are no distinctive moral facts and properties “over and above the facts and properties that can be specified using non-moral terminology” (Pigden 1991, 421). Many moral and religious traditions are “naturalist” in this sense. Thinkers like Thomas Aquinas, in Christian ethics, and Moses Maimonides, in Jewish ethics, held that moral terms like “good” or “right” can be predicated of actions and beliefs that conform to the principles of natural law. Some scholars of Buddhism have argued that dharma functions similarly to natural law, representing both the principle of order and regularity in nature and the idea of universal moral law (Keown 1996). Other forms of naturalism hold that “good” and “right” can be predicated of those forms of excellent human character and conduct whose cultivation leads to human flourishing. In each case, goodness or rightness is not seen as a *sui generis* moral property. Rather, to call something “good” or “right” is to say that some particular set of facts or state of affairs warrants the attribution “moral.”

From the perspective of a non-naturalist like Moore, naturalist moral theories (by definition) commit the naturalistic fallacy: they identify moral value with a description of certain features of reality, thus confusing “is” and “ought.” But this judgment is misleading. Naturalists reject the distinctions on which the so-called naturalistic fallacy rests: the distinction between moral (i.e. non-natural) and non-moral (i.e. natural) reality. While strict naturalists hold that moral claims are coterminous with claims about reality and human existence, other naturalists (sometimes called “non-reductive” naturalists) are more

sensitive to Moore's charge. They contend that the domain of morality must include but is not reducible to natural goods; the latter are ordered by a principle of assessment that is relatively independent of natural goods (Schweiker 1995).

Naturalism is well suited to describe religious views that stress the connection between beliefs about reality and claims about moral goodness. An influential paradigm in the study of comparative religious ethics adopts the perspective of ethical naturalism to analyze the relation between cosmogony and ethical order (Lovin and Reynolds 1985), and the correlation between "worldview" and "ethos" (Geertz 1973) in diverse traditions.

The remaining two versions of moral realism seek to revise the metaphysical claim of traditional moral realism that moral facts exist independently of our beliefs and theories. They also qualify the assumption that moral facts are known and validated through intuition, commands, or natural moral knowledge.

Reflexive Realism

"Reflexive realism" argues that moral claims are validated with respect to some feature of human experience understood as morally basic (Schweiker 1995; Antonaccio 2000). Although reflexive realists contend that the *source* of moral truth lies in some reality that exists prior to or independently of our knowledge of it (e.g. nature, God, the Good), our *grasp* of moral truth is mediated and rendered meaningful through some feature of human existence. Versions of reflexive realism identify different aspects of human experience as the medium through which moral claims resonate in human life. Some religious thinkers argue that moral claims impinge on human life through various "senses" (e.g. of gratitude, dependence, obligation, etc.) (Gustafson 1984). Others are more rationalistic, claiming that there is a "deep structure" of religious reason keyed to specific features of human moral experience and expectation (Green 1988). Still others identify the call of conscience as morally basic (Schweiker 1995). In each case, the locus of the validity of moral claims shifts from direct knowledge of "moral facts" to some feature of human experience. Moral knowledge is not simply a matter of "discovering" moral truth, as traditional moral realism holds. Rather, the moral life requires human beings to engage in the creative work of interpreting what moral claims mean as they impinge on human experience in particular circumstances.

Reflexive realism illuminates a feature of religious traditions that traditional moral realism often obscures: the *difficulty* of acquiring truthful moral knowledge. Even when a tradition posits a paradigmatic moment when moral truth is apprehended (e.g. when the moral law is revealed to the community, or the sacred manifests itself in the natural order), this is only the beginning of moral knowledge, not the end. Religious traditions contain complex forms of textual interpretation, patterns of moral and legal reasoning, rules for ritual practice, techniques of prayer and meditation, discourses of great moral teachers, etc., in order to further the process of moral education. In thus depicting moral insight as a struggle requiring moral effort, religious traditions may present a subtler version of moral realism than the idea of "discovering moral facts" suggests. Moral truth is not passively apprehended, but creatively refracted through human experience and understanding.

Internal Realism

"Internal realism" also revises certain features of traditional moral realism. It argues that moral claims are validated not by reference to an empirically knowable set of independently existing "moral facts," but with respect to some cognitive framework, such as a community's moral beliefs. The truth or falsity of

moral claims can only be established in relation to the total system of cultural meanings of which they are a part, rather than in relation to some metaphysical account of “moral facts” *tout court*. This has led some theorists to classify this position as a form of “ethical constructivism” or “idealism” rather than realism (Brink 1989, 19). For example, Christian narrative ethicists argue that the Christian community’s vision of life is constituted by beliefs and narratives that cannot be translated into the general language of “natural” or “public” morality (Hauerwas 1981). Attempting to warrant Christian truth claims in terms of some general notion of intelligibility is unfaithful to the biblical witness. Fidelity means taking the moral claims of the community as true; no extra-communal warrant is needed.

Other accounts of internal realism, however, stress that it is still a form of *realism* (Putnam 1987; Stout 1988). They acknowledge that a certain “conceptual relativity” is unavoidable in moral theory. Yet these positions leave open the possibility of a convergence of moral truth claims between communities. A comparative analysis of moral communities informed by internal realism would proceed “holistically.” Rather than asking whether a particular community affirms the belief that “Murder is wrong,” the theorist asks what the concept of “murder” (or its closest analogue) means in that cultural context: how it is defined, under what conditions it applies, and to what other beliefs and practices of the community it is related. The identification of cross-cultural moral truths is possible as long as the theorist recognizes that the meaning of moral claims is dependent on a wider framework of cultural beliefs.

The Challenge of Antirealism

Despite these revisions of traditional moral realism, many theorists remain unconvinced. Recalling the three questions noted above, antirealists give a negative answer to the ontological question about moral facts; they deny that moral statements have truth value; and they usually embrace some form of non-cognitivism in ethics. But forms of antirealism differ over what a moral statement means once its truth status is undercut, and whether reason has any role to play in ethics under these conditions.

If one assumes that all religions start from “realist” premises, then antirealism seems to threaten the very idea of religious ethics. Antirealists advance a different notion of the “validity” of moral claims than the idea of conformity to a set of moral facts (as in moral realism) by highlighting the practical dimension of morality. Moral values are human constructions meant to serve practical purposes. Although moral statements are not fact stating, they are not meaningless. Their aim is practical or action guiding rather than cognitive.

Moral Nihilism

The most radical form of antirealism, moral nihilism, claims that there are no moral facts, and hence no “truth” about morality. While other antirealists hold that ethics can continue without the notion of moral truth, nihilists believe that the whole project of morality and its rational justification is a “sham” (Smith 1991, 35). The paradigmatic case of moral nihilism is Nietzsche’s critique of Western (and especially Christian) ethics, whose moral claims he saw as a disguised form of the human will to power. Morality had nothing to do with finding the right answers to moral questions, but with “the struggle for mastery, and envy and resentment of those who achieved it” (Schneewind 1991, 154). Nietzsche’s method of unmasking moral claims to lay bare the psychological and political interests that drive them, seems to be

aimed at the traditional realist claim that moral values are rooted in reality. But a revised form of moral realism, such as reflexive realism, recognizes that distortions and abuses of morality are inevitable given the fallible, mediated character of human understanding.

Emotivism

Although emotivism, like other forms of antirealism, denies that moral statements can be judged in terms of truth and falsity, it does not regard ethics as a sham, as nihilists do. As developed by the American philosopher C. L. Stevenson, emotivism articulated a novel theory of moral language. Moral statements do not make truth claims or provide any factual information whatsoever; they express the subjective attitudes of the speaker who utters them. The statement “Murder is wrong” does not purport to state a moral truth, or even a fact about the speaker’s disapproval of murder (Rachels 1991). Rather, moral statements are “emotive”; they *express* the speaker’s moral disapproval (“I’m against murder!”). The purpose of such statements is to persuade others to share the speaker’s attitude, and thereby to influence their conduct.

Many theorists today reject emotivism as irrational (i.e. as denying the place of reason in ethics). Yet emotivism may still be a useful theoretical tool for religious ethics insofar as it shifts attention away from the emphasis on “moral reasoning” and the rational validation of moral claims characteristic of much (Western) modern moral theory, and suggests that there may be other (emotive or expressive) functions of moral language besides the statement of purported truths. Instead of testing the validity of moral claims in relation to a set of moral “facts” (as in traditional moral realism), a constitutive feature of experience (reflexive realism), or a community’s beliefs (internal realism), emotivism insists that the function of moral discourse is expressive and persuasive. This insight expands the range of available options in analyzing the function of moral discourse both within and across traditions.

Prescriptivism

Prescriptivism, associated with the British moral philosopher R. M. Hare, builds on some of the insights of emotivism and was developed in part to answer its deficiencies. Like emotivism, prescriptivism shifts the debate in metaethics away from the ontological question of “whether moral facts exist” toward the semantic question about the meaning of moral statements. Against the view of many moral realists that moral statements are *wholly* descriptive (i.e. fact stating), prescriptivists contend that moral statements may also contain a “prescriptive” element (formerly called “emotive”) (Hare 1991, 452). In fact, there are many kinds of sentences whose meaning is not determined by “truth conditions” at all. Imperatives are a case in point. The meaning of the sentence “Shut the door” is not dependent on establishing its truth conditions (it has none), yet we still understand its meaning (Hare 1991, 452). Where prescriptivism departs from emotivism is its insistence that the presence of the action-guiding element in moral discourse does not necessarily mean that one cannot reason about ethics. “Universal” prescriptivism holds that “there are rules of reasoning which govern non-descriptive as well as descriptive speech acts” (Hare 1991, 455). Imperatives associated with “ought” statements are governed by the rule of universalizability (Hare 1991, 456).

Prescriptivism influenced one of the earliest methodological approaches to comparative religious ethics. David Little and Sumner Twiss (1978) adopted the conceptual terminology of “action guides” in

order to stress the practical and prescriptive force of moral and religious discourse in influencing human behaviors and attitudes.

Conclusions: Moral Theory and Religious Ethics

The metaethical theories presented here, while often technical, address a set of questions that are crucially important to religious communities. Does the validity of moral claims rest on their connection with some notion of “the real,” as moral realism holds? Does their validity derive from their practical force in motivating human conduct toward particular ends, as antirealism argues?

Much current academic discourse is “antirealist” in sensibility. It holds that moral beliefs (as well as other human ideas and social practices) are “social constructions”; they have no validity beyond what human beings attribute to them to further their interests. Scholars of religious ethics often share this view. Yet for many members of religious communities, morality is not a contingent matter of human preference or social convention. It is a force that is as deep and often recalcitrant to human preference as the notion of “reality” itself. Faced with this apparent disparity between current critical discourse and the lived experience of moral communities, how should the scholar of religious ethics proceed?

Theories of moral realism challenge both the view that reality is value neutral, as well as the constructivist claim that reality is infinitely malleable to human purpose, by insisting on the connection between moral beliefs and claims about reality. Even if the scholar rejects this connection, realist theories remain indispensable to the study of religious ethics because they clarify why and how moral claims exert the force they do *on those who actually believe them to be true*. The danger of assuming an exclusively antirealist methodology is that the substantive claims of a tradition may be subordinated to the methodological commitments of the scholar rather than illuminated in their own terms.

At the same time, religious ethicists should be wary of relying exclusively on moral realism as the metaethical theory best suited to the study of religious communities. Academic study presupposes the need for critical distance between the scholar’s perspective and his or her subject matter. An exclusively realist perspective threatens this distinction by allowing the scholar to accept the claims of the tradition as the last word on the validity of its beliefs and practices. Moreover, the claim of some realists that moral truth is immediately apprehended (e.g. revealed by divine command, or discovered in the regularities of nature) understates the ambiguity of moral and religious experience as well as the strenuousness and fallibility of human understanding. Theories of antirealism, almost by definition, presuppose some reflective distance from a tradition’s own (realistic) account of its moral claims. They require the scholar to ask how moral discourse functions and how truth claims are actually validated in the life of communities.

Revised forms of moral realism may strike an appropriate balance between theoretical rigor and appreciative understanding of religious traditions. Reflexive and internal realism recognize that moral knowledge is mediated by the particular institutions, beliefs, and vocabularies of historic religious communities, and that members of those communities may grasp its moral truths only in a partial or distorted fashion. Yet both positions retain the realist insistence that the validity of moral claims must be assessed in terms of some general notion of intelligibility – some notion of “the real” – rather than being confined to the preferences of individuals, the claims of communities, or the scholar’s own theoretical commitments.

CHAPTER 3

Norms, Values, and Metaphysics

Franklin I. Gamwell

What is the relation between norms and values in religious ethics? Critical reflection addressed to this question should include a clarification of the key terms involved: “norms,” “values,” and “religious.” In discussions of morality and religion, each of these terms may be used in differing ways, the merits of which are part of the discussion. This chapter seeks philosophically to explicate the distinctive nature of religious ethics and, in that respect, the basis for comparing the ethics of differing religions. Meanings of the three key terms will be stipulated in the course of that pursuit and thus will be commended only insofar as they permit a coherent and useful statement of the character common to all religious ethics. The term “ethics” is also used in differing ways, sometimes to mean a critical theory of the moral life. In contrast, “ethics” will here designate sets or systems of moral beliefs or prescriptions in terms of which humans explicitly seek to lead their lives, and I will use “moral theory” to mean critical reflection on the validity of such moral systems.

Given this use of “ethics,” the three key terms will be so defined that they are connected in the following way: Distinctively religious ethics are those that ground all valid norms in a comprehensive value or set of values. On this account, as I will seek to show, religious ethics presuppose a certain conception of human decision and imply that moral theory, including the study of comparative religious ethics, is incomplete without metaphysics, that is, critical reflection on the character of reality and human purpose as such. The discussion here proceeds in the context of theoretical thought in the West. This restraint does not, I think, prevent valid conclusions about religious ethics generally, but it does mean that full confirmation of those conclusions waits on attention to comparative inquiries not pursued here.

Defining the Terms

In the present discussion, “values” designates the ends or states of affairs that human activities seek to realize or promote. Given the limits its situation sets, a human activity becomes what it is through pursuit of some end or ends. This follows from the evident fact that distinctively human life occurs with self-understanding. The object of a self-understanding must be the self inclusively and thus can only be the purpose in or by which all aspects of the self or all relations to its situation are integrated or unified. In understanding itself, then, an activity understands the difference it makes to the realization of some

state of affairs. This initial description, we might note, does not explicitly say whether human life involves a substantial self that persists throughout some extended time, a conception some religions or religious thinkers deny. The self that is understood in a self-understanding is the present activity, and the relation of this activity to what appears as a human individual is another question.

A self-understanding, moreover, must be chosen. Although every activity is caused in greater or lesser measure by its situation, self-awareness means an understanding of those determinations and, therefore, cannot be simply another product of external causes. The ends or states of affairs we pursue are properly called values because each activity chooses from among alternatives for purposes the situation allows, and taking this choice with understanding means an affirmation of the chosen alternative. Because human activities understand themselves, we live by way of decision for some or other end we take to be good. So interpreted, Aristotle's dictum cannot be surpassed: "The good has rightly been declared to be that at which all [human] things aim" (Aristotle 1941, *Nicomachean Ethics* 1094a, 2–3).

Religious ethics, I propose, are distinguished from other moral systems by the affirmation of some comprehensive value or values or by taking something to be comprehensively good. Such a value or set of values defines an all-inclusive end, to which all specific purposes ought to contribute or of which all other values ought to be specifications. Each religious understanding of the moral life, then, asserts something as the comprehensive purpose that every decision for a self-understanding ought to exemplify or the comprehensive telos by which strictly all human activity ought to be directed, although differing religions may disagree about the character of the comprehensive good. On many conceptions of morality, the notion of a comprehensive good is finally not sensible, so that religious ethics as here understood are impossible. For this reason, a coherent theory of values and norms in religious ethics must show that such an ethic can be valid, and I will argue below that there is a comprehensive purpose or, what comes to the same thing, that the conception of human decision presupposed by all religious ethics is valid. It will be useful further to explicate that conception here.

Religious ethics presuppose that every decision for a self-understanding includes an awareness of the comprehensive good, which we either pursue authentically or violate by also taking something else to be the comprehensive telos. This follows because "ought implies can." No human can be morally bound to decide in accord with a principle of which she or he is ignorant, and a religious ethic asserts that all human activities ought to exemplify the comprehensive purpose. Since the decision for an authentic or duplicitous understanding of this purpose is taken in a particular situation, this choice is simultaneously a choice among the specific possible purposes available; that is, the former determines how the specific alternatives are evaluated. Thus, we can say that activity by way of self-understanding is a decision for some answer to the question of our ultimate worth, and this question is "we ourselves" (Tillich 1951, 62).

I do not mean that all human activity is religious. "Religion" designates the primary form of culture in terms of which we humans *explicitly* ask and answer the question of life's ultimate worth (cf. Ogden 1992, ch. 1), a definition more or less clearly illustrated by the so-called world religions or the principal differentiations within them. In contrast, the decision for a self-understanding is implicit in consciousness, in the background rather than the center of attention, because this decision integrates the activity as a whole, and clear consciousness can focus only on a fragment of what is understood. The function of a religion, then, is to represent explicitly in concepts and symbols, including ritual practices, an answer to the question of ultimate worth and, thereby, to mediate or cultivate implicit decisions for that answer in the lives of those who participate in the given religious community.

This is the point in saying that religion is the *primary* form of culture in terms of which the question of ultimate worth is explicitly asked and answered. We may also speak of a secondary form or forms of culture in terms of which the same question is addressed, namely, concepts and symbols that allow theology and philosophy critically or theoretically to interpret and assess answers to this question. In distinction from both our implicit decisions and our moral theory, then, a religious ethic is an account of the comprehensive good, and of moral principles and prescriptions grounded by it, in terms of which adherents of the religion in question seek explicitly to lead their lives. So understanding religious ethics is, naturally, controversial, and this underscores that the definition stipulated here is not sensible unless the presupposed understanding of human decision is valid.

The remaining term to be clarified is “norms.” It is often used broadly to mean all more-or-less general moral prescriptions, and this meaning accords with our frequent designation of moral systems as normative systems. But our present discussion will be served by using the term in a more narrow sense, namely, to designate rules or principles of human interaction that prescribe constraints on the values of given actors or the ways in which values may be pursued. Norms, in other words, constitute social practices or prescribe reciprocal rights and responsibilities in some pattern of interaction. Although such prescriptions may be legal in character, all institutions or enduring associations are constituted by norms. Still, rules and principles in this sense presuppose that actors have other values they pursue even while they participate in a given social practice, and thus no norm or set of norms defines an all-inclusive good.

Religious ethics have sometimes been criticized as inconsistent with fundamental norms of this kind. Stated in terms of a traditional distinction, the indictment asserts that a comprehensive telos excludes all perfect duties, duties “not to do, or not to omit, an action of a certain [specific] kind,” whatever the consequences, because all specific duties can be canceled by the imperfect duty “to promote a certain general end” (Donagan 1997, 154). For this reason, it is said, the affirmation of such a telos implies the absence of any inviolable human rights, including basic rights to life and bodily integrity. Rights are at best provisional because subject to rebuttal by the overriding obligation to create the best consequences.

The objection further concludes that religious ethics finally prevent any social practices at all, because all rules of social interaction can be overridden by the imperfect duty to pursue a comprehensive end. Since no individual can have settled expectations about the circumstances in which others will make their choices, it follows that she or he cannot have settled expectations about what others will do. For instance, one cannot count on another keeping a promise because circumstances when the promise falls due may require or permit some other action in service to the best consequences. Further, this unpredictability is, as it were, cumulative. If the promiser finds, at the time when keeping it arrives, that the future she or he faces is less settled, then it becomes less likely that keeping the promise is required in order to maximize the good. Hence, no one would have reason to participate in social practices or institutions in which reciprocal duties are to be observed whatever the consequences. One can even say that a religious ethic self-destructs. On any plausible account of the comprehensive telos, maximizing the good requires the social coordination and cooperation that an ethic of this kind prevents.

Although the issues raised by this criticism are complex, it cannot succeed against all religious ethics without the following assumption: An ethic based on some comprehensive value or values prescribes “looking at each calculation in isolation, and not taking adequate account of the effects on a society’s capacity to function of its being known that all actions are taken on the basis of such calculations” (Barry 1995, 219). But whether a religious ethic so prescribes depends on what comprehensive value or values it affirms. If taking each act separately means that the ethic self-destructs, then the comprehensive telos

in question insofar implies that cases should *not* be so taken, precisely for the reasons on which the criticism depends. It is one thing to apply a comprehensive purpose directly to every human activity and something else to apply it indirectly through social practices required to maximize the good. Moreover, such a purpose may prescribe its indirect application through certain inviolable human rights presupposed by all permissible social practices, and whether a religious ethic does so consistently cannot be determined without attention to its understanding of the comprehensive good.

In sum, a religious ethic asserts that a comprehensive value or set of values grounds all valid norms. Recent moral theorists have often distinguished between teleological and deontological ethics. On a typical account, the former grounds morality in some good to be maximized, and the latter asserts moral principles that are independent of any such telos. I believe that religious ethics require a more nuanced set of terms, in which two conceptions of norms are differentiated. Principles said to be independent of any inclusive good to be maximized should be called non-teleological. Accordingly, a non-teleological ethic asserts that the supreme moral principle is a norm or set of norms. In distinction, deontological principles prescribe duties to be honored whatever the consequences. In a given ethic, these norms may or may not be non-teleological, depending on whether they are said to apply indirectly a comprehensive purpose.

Defending Religious Ethics

Contemporary Western moral theory widely denies that any religious ethic, as here conceived, can be valid. Behind this denial is the recognition that a comprehensive purpose depends on or implies a value defined by the fundamental nature of reality. If there is an inclusive good by which all human activities ought to be directed, it follows that every possible object of human attention must implicate this good – and because humans can at least think about all things, at least in general, this good cannot be defined independently of the common character of all things. For this reason, the religions in our world typically relate comprehensive value to ultimate reality; in presenting an explicit answer to the question of ultimate worth, a particular religion typically includes an account of human purpose in relation to reality as such. Thus, a theoretical explication of any given religious ethic is inseparable from metaphysics, and the similarities and differences among the ethics of differing religions cannot be fully explicated without a metaphysical comparison.

But contemporary Western moral theory widely holds, at least by implication, that no metaphysics can be validated and, therefore, a valid ethic cannot depend on a conception of ultimate reality. In this respect, moral theory since Kant has been convinced by his arguments against the possibility of metaphysical knowledge. He, too, recognized that a comprehensive purpose could only be defined by reality as such and argued that the moral law must, therefore, be radically non-teleological. It cannot be determined by any possible values and thus can be defined only by the formal universality of practical reason. Few contemporary moral theorists endorse non-teleology in this radical sense. Most are convinced that Kant's categorical imperative is empty; that is, no distinction between moral and immoral actions or maxims can be derived from it. Nonetheless, there is a dominant consensus that moral theory is properly independent of metaphysics.

Within this consensus, some who also reject Kant's moral theory conclude that there are no moral values or norms. Only understandings of value-free facts can be valid, and critical reason can only be scientific in the empirical sense. Fundamental values are determined by an individual's subrational

decision, and norms are merely prior agreements that themselves depend finally on subrational value affirmations. More persuasive among philosophers earlier in the twentieth century, this theory continues to influence practical thought, notably in the social sciences (especially economics) and in wider political debates. But this view contradicts the conception of self-understanding given above. If the self is a choice with understanding among alternatives for purpose, then the alternatives must be compared evaluatively. A merely descriptive or factual comparison would not understand them *with respect to choosing* or would not understand the self as the decision. It then follows that a human activity necessarily is or involves a claim to validity for its evaluation, because, were the choice subrational, the comparative understanding of possible ends could only be descriptive or factual. In sum, no human could consistently believe that there are moral values or norms.

If we set that view aside, theories of morality without a comprehensive good are largely framed by two principal projects. Following widespread usage, we may call these neo-Aristotelian and neo-Kantian types of moral theory. If Kant held that an ethic of values implies an understanding of reality as such and concluded that the moral law must be radically non-teleological, these theorists typically seek to escape the apparent dilemma by denying the first or the second of these two assertions. One project has affinities with Aristotelian teleology. Rejecting whatever influence Aristotle's metaphysics may have had on his own moral theory, these neo-Aristotelians conceive of practical reason independently of strictly universal values and define the moral life by some ethos that is in all respects contingent on some specific tradition or culture. Thereby, moral teleology is affirmed without a comprehensive value and thus independently of metaphysics. Some hold that such an ethic is required by Wittgenstein's account of language as presupposing a specific form of life or by Gadamer's analysis of the "pre-understanding" involved in all hermeneutics, and some so-called communitarians and neo-pragmatic theorists illustrate the type.

I am persuaded that a theory of ethics as thoroughly tradition-specific cannot avoid a kind of moral relativism and, against itself, thereby implies that values and norms are determined finally by subrational decision. Every assertion that morality is historically specific in all respects implicitly claims validity for a comparison of moral traditions, namely, that their differences are historically specific in all respects. Since it cannot consistently depend on one of the moral traditions in question, this comparison can only purport to be a value-free fact. But saying that all differences between or among moral traditions are merely factual implies that no given such tradition can be valid. The same conclusion is reached by noting that a person who understands two or more historically or culturally specific moralities is thereby given a decision between differing sets of values or norms with which to evaluate her or his alternatives for purpose. If this decision cannot involve an evaluative comparison and thus a claim to moral validity, it cannot be taken with understanding.

For reasons similar to these, others who share the dominant consensus hold, with Kant, that a teleological ethic requires a telos defined by reality as such. Their project, then, denies the second assertion creating the dilemma Kant's legacy seems to offer, namely, that a non-teleological moral law can only be the formal universality of freedom as he conceived it. These theorists may be called neo-Kantians because, with him, they claim universal validity for some or other non-teleological principle or norm, even while they seek so to revise Kant that this principle or norm does indeed ground distinctions between moral and immoral action. More often than not, perhaps, the result is a theory of human rights, respect for which constrains or overrides any conflicting values that might direct an individual's decision (e.g. Apel 1979; Gewirth 1996).

I believe that a non-teleological ethic is also finally indefensible. As prescribing constraint on the pursuit of values, a norm evaluates alternatives for purpose in one respect. If it is independent of a comprehensive purpose, a universal norm or set of norms implies that differences among the alternatives in other respects are morally indifferent or make no difference with respect to choosing. But this implication is a moral evaluation of the alternatives in those other respects. The conclusion that something about possible choices is morally indifferent is not itself morally indifferent, since any of those choices is insofar said to be morally permissible. Hence, the norm in question implies, against itself, another moral principle in terms of which possible purposes in all respects are evaluated.

One can also make the point this way: to understand one's alternatives with respect to choosing is not simply to compare them as similar or different in one respect but, rather, to compare them inclusively, because the choice is among them as complete things. Hence, a norm can obligate the choice only by presupposing an inclusive evaluation with which that norm is consistent. Were there no such inclusive principle, there could be no norms at all, and the chooser would be obligated only hypothetically by whatever purpose she or he has chosen. But this, too, asserts the view that values and norms are determined finally by subrational decision, and that assertion contradicts the fact that humans live with self-understanding.

Naturally, these summary comments on the two principal projects in contemporary Western moral theory can do no more than suggest how the dominant consensus might be challenged. But if a more thorough treatment can sustain such criticisms, they provide a negative argument for an ethic based on a comprehensive value. If, against neo-Aristotelians, an ethic requires some or other universally valid principle, and if, against neo-Kantians, this principle cannot be a non-teleological norm, then there can be no morality at all without a comprehensive purpose. Success in this negative argument will insofar vindicate Kant's lucidity in this respect: a valid ethic either depends on a comprehensive good or is independent of all possible values. But the sound option is the one that both he and most Western moral theory since him have rejected.

Religious Ethics and Metaphysics

The above review of contemporary moral theory also includes the elements of a positive, although summary, argument for the validity of some or other possible religious ethic. On this argument, a comprehensive purpose is implied by the distinctive character of human life. Activity with self-understanding is a decision with understanding among alternatives for purpose. It is, therefore, a comparison of the alternatives with respect to choosing, and, since there could be no such understanding except as a claim to moral validity, there must be a valid principle of morality. The supreme principle of morality must be universally valid because it could not be understood as historically specific without thereby becoming one among many alternatives for choice that must themselves be evaluated. Finally, this universally valid principle of morality must be teleological, because the alternatives must be inclusively compared, and they can be theoretically explicated only in metaphysical terms because human purposes may include attention to strictly all things.

Assuming that this argument can be upheld in a more extensive examination, we can say that every human in every moment of her or his life is aware of the comprehensive good, at least implicitly, because "ought implies can." Life with self-understanding is constituted by asking and answering the question

we ourselves are. Sustaining this conclusion requires a more or less complete moral theory in which the character of our comprehensive telos is formulated and defended. Among other things, that theory must explicate how this purpose consistently requires its indirect application in or through deontological norms or social practices, including a principle of human rights.

These demands cannot be met without the critical pursuit of a more or less complete metaphysics. Still, we can offer here a reason for thinking that a valid metaphysics and, therefore, religious ethic, will be theistic. The specific values that humans in diverse particular situations ought to pursue will be realized, insofar as they are, in diverse actual states of affairs. It makes no sense to speak of maximizing a comprehensive good unless these diverse actualizations, as they occur, constitute a totality of realizations. But this implies an actual totality and, thereby, a universal individual whose activities include completely all realizations of value. Charles Hartshorne (1948) makes the point in saying that human life implies “the divine relativity,” an individual whose activities are completely relative to every other reality. Since this divine totality is itself the realization of value that increases everlastingly as value is realized in the world, the moral life is properly defined as the pursuit of values that maximize the divine good.

Saying that a comprehensive purpose and thus a valid religious ethic implies or presupposes a universal individual more or less obviously takes exception to some among the world religions. By this fact alone, some may think, that assertion is discredited. But ultimate reality cannot have more than one character. However impossible it may be in the final analysis fully to formulate and defend a metaphysics, it remains that metaphysical theism and its denial cannot both be true. To be sure, two or more differing religions may all affirm valid moral principles, even while they disagree about reality as such. But if a comprehensive purpose is inseparable from the nature of ultimate reality, then the common ground found in differing religious ethics either does or does not presuppose a divine individual, and the beliefs of a given religion cannot be false in this respect without introducing incoherence into its understanding of ultimate worth. This simply repeats that, however difficult the task and thus however tentatively conclusions should be held, the study of comparative religious ethics is incomplete without a metaphysical comparison. It also underscores that metaphysical comparisons, as those in moral theory, are finally inseparable from pursuit of the truth about reality and human purpose as such.

CHAPTER 4

God and Morality

John Hare

The topic of this entry is the relation between the single God of monotheism and the practices and theories of morality that have prevailed in the places in the world where these monotheisms have been strongly present. The topic is not whether such a God exists (or is the same God in the different monotheistic faiths), but whether, given that such a God exists, morality is dependent in some way on divine activity, or by contrast whether divine activity conforms to some independent moral standard. One statement of the question here is Plato's question in the *Euthyphro* (10aff): Do the gods love the holy because it is holy, or is it holy because they love it? The chapter will discuss Christianity, Judaism and Islam. This is by no means a complete list even of the Abrahamic faiths (ignoring, for example, the Baha'is and the Druze), let alone monotheisms in general. But there is not space for a wider scope, even if the author were competent. There will be no attempt to cover the religions of the East.

Moral theory has two main fields, namely the theory of the good and the theory of the right. And the study in both fields can be either of the meaning of the central *terms* (meta-ethics), or of what is properly said to *be* morally good or morally right (normative ethics), or of what *practices*, especially professional practices, fit the criteria established in normative ethics (applied ethics). The present chapter will deal with meta-ethics and normative ethics, and will not try to cover applied ethics except insofar as it is concerned with religious practices. We will start with the theory of the right or the obligatory, and then go on more briefly to the theory of the good.

This chapter will be using a notion of morality as a set of norms for social practice. There is a difficulty here, that we should not beg the relevant questions by assuming at the beginning an account that already presupposes a certain relation with God, or that is already weighted in favor of one of the competing accounts of ethics *within* monotheism. One way to proceed is by non-controversial examples. Examples of moral norms are that we should keep our promises, we should not commit murder, we should be grateful to people who are kind to us, and we should not nurse grudges. Some of these norms tell us what to do, and some of them tell us what not to do. Some are norms for action, and some are for character or attitude. Some of them are also legal norms, but some of them are not. They are all, however, norms for social practice in the sense that they are taught within a society, and they prescribe how we should treat each other.

Within all three of the Abrahamic faiths mentioned, there is a tension between two different ways of looking at the relation between God and morality, where morality is understood in the way just described. We can use the labels "divine command theory" and "natural law theory" for these two tendencies. Divine command theory holds that an act is wrong because it is forbidden by God, or obligatory because

it is commanded by God. A natural law theory holds that the wrongness of an act or the obligation to do it can be deduced from the laws of human nature and human flourishing. These labels are misleading, however, because they suggest that there is a canonical version of each tendency, to which any description is properly held accountable. But this is not the case. Within Christianity, for example, there are theologians and philosophers we can identify as divine command theorists and those we can identify as natural law theorists. Any description of their theories is accountable to their texts; but there is no authoritative version of either theory unless some group of Christians chooses to make some particular author authoritative. We can take the philosophers Thomas Aquinas (d. 1274) and John Duns Scotus (d. 1308) as characteristic of each tendency (though some of the secondary literature denies that Scotus is a divine command theorist).

For Aquinas, following Aristotle, “every man naturally wills happiness; and from this natural willing are caused all other willings, since whatever a man wills, he wills on account of the end” (Aquinas 1926–1936, q. 60, a.2). The Natural Law is the rational creature’s participation in the Eternal Law which is in God’s mind. Every created thing participates in some manner in the Eternal Law just in virtue of being created. But the rational creature “participates in the Divine Providence by providing for itself and others. Hence, it participates in the eternal plan through which it has a natural inclination to its due act and end. And this sort of participation in the Eternal Law by the rational creature is called the Natural Law” (Aquinas 1926–1936, I–IIae 91, art.2). This means that we can deduce the Natural Law from human nature and from these natural inclinations to the human natural end. Aquinas holds that the Natural Law is necessary and is known from its terms, and he lists the order of its precepts that is derived from the order of the natural inclinations: First there is the inclination to conservation of one’s own existence (common to all substances); second, “certain special things according to the nature he shares with other animals, ... such as intercourse between male and female, the education of children and the like”; third, “an inclination to good according to the nature of reason which is proper to him, as man has a natural inclination to know the truth about God, to live in society and ... [therefore] that a man avoid ignorance and that he should not offend others with whom he ought to live and similar things which relate to this inclination” (Aquinas 1926–1936, I–IIae 94, art.2).

For Scotus, by contrast, there are two fundamental drives for a human being, and not just one. Following Anselm, Scotus describes “the affection for advantage” for one’s own happiness and perfection and “the affection for justice,” which is a drive towards what is good in itself independently of its relation to oneself. Since we have both affections, the key question for us is how we rank them. The affection for justice is the “first check-rein” on the affection for advantage, and it is only because we have this check-rein that we have freedom (Reportatio II, d.6.q. 2, n. 10). Scotus has a more robust notion of the human will than Aquinas, since the will contains, in each person, a chosen ranking of the two affections. We can love God either for Godself, with the affection for justice, or for the sake of God’s relation to us, in which our happiness consists, with the affection for advantage. There is nothing wrong with this second kind of love, and we will have it even in heaven, but the proper ranking of the two affections is illustrated by the thought experiment that we would will the glory of God even if this did not include our own salvation. The second “table” of the law (of the two “tables” brought down by Moses from Mt. Sinai) is held by Scotus not to be natural law strictly speaking, since it is not necessary or known from its terms (Ordinatio IV, dist. 17, see Ibid. III, suppl. dist. 38, art. 2). It is possible, and indeed Scripture records it, that God “dispenses” from the second table, as in the command to Abraham to kill his son, and other stories involving the Hebrew midwives, the command to Hosea to marry Gomer, and so forth. The *first*

table, on the other hand, which involves our duties to God rather than to our neighbor, is strictly speaking natural law and is necessary. Scotus holds that God can “dispense” from the commands of the second table, but not the first.

There are many issues between these two thinkers, but we can focus on two of these. The first is whether it is true that all our willings are properly directed finally at our own happiness. The second is whether our moral duty can be deduced from our natural inclinations. We can call the first “the question of *eudaimonism*” (from Aristotle’s term *eudaimonia* meaning happiness) and the second “the question of deductivism.” The second question will hang on what is meant by “natural.” For the natural law theorist, the nature in question is *created* nature, not fallen nature. But for the divine command theorist, the question is whether our access to created nature is through our conception of the morally right, and whether it is God’s commands that give us an appropriate conception of this.

Within Christianity, the tension between these two basic pictures of the relation between God and moral obligation has had a long history. Luther followed Scotus to a large extent. Kant followed Luther, in particular in his account of self-love. He held that we should recognize our duties as God’s commands, even though he did not think it was God’s command that *makes* something our duty. Kierkegaard returned to a divine command theory of moral obligation. The early British consequentialists, like Hutcheson and then Paley, thought of God as giving us by special revelation the ideals that would take us to the greatest happiness of the greatest number. On the other hand, there has been a rebirth of new natural law theories over the last fifty years, some of which are not theist at all, like the theory of Philippa Foot, and some of which treat God as destination rather than commander (rather as Aristotle says that the god moves by being loved, not by giving commands, Eudemian Ethics VIII.3. 1249b14–15). Thus, John Finnis defends a version of natural law knowable by reason, but there is in addition a figure (he calls it “D”) and we are headed towards union with it.

Within Islam we can find a similar tension. We can start with the Mu’tazilites, who hold a version of natural law theory. The most worked-out version is given by ‘Abd al-Jabbar (d. 1025), but there is a tradition behind him of at least a hundred years. One difficulty here is that ‘Abd al-Jabbar does not make the distinction we have been using between a theory of the good and a theory of the obligatory. He does, however, have an account of wrongness according to which a wrong act is one that deserves blame, and an account of the obligatory, where the person who omits the act (if he is able to do the act) deserves blame; the obligatory is to be distinguished from the “merely right” and the “recommended.” ‘Abd al-Jabbar holds that right and wrong acts are evident to human reason in their right and wrong character. They are known immediately, independently of revelation. Revelation does indeed inform us of the obligations we already have and of means to fulfilling them, but these truths are recognized by reason when they are revealed, and this knowledge by reason is primary in justification (see ‘Abd al-Jabbar. 1962, VI. 1. 64). These standards that we learn from reason apply also to God. “The Eternal Glorious One is able to do what would be wrong if he did it” (‘Abd al-Jabbar 1962, VI. i. 127). Because God in fact only commands and does what is right (though He *could* do what is wrong), we can use these standards to judge what God is and is not commanding us to do. Describing ‘Abd al-Jabbar as a natural law theorist is in one respect misleading, however. The Mu’tazilites, and ‘Abd al-Jabbar in particular, hold that the right attracts us in itself, intrinsically, not because it leads to a benefit for us as agents of the action. Another way in which he resembles Scotus is that he insists that we have freedom of a particular kind, that we have “a power to perform an action or its opposite” (‘Abd al-Jabbar 1962, XI. 168). God knows that we will disobey, but he does not will the wrong; *we* will it.

A contrast to the Mu'tazilites on all these points is provided by al-Ash'ari (d. 935), who was himself originally a Mu'tazilite, but came to reject the view. He holds that a thing is wrong on our part only because we transgress the limit and bound set for us by God, and since God is subject to no one and bound by no command, nothing can be wrong on His part (al-Ash'ari 1953, 169–171). Lying, for example, is wrong only because God has declared it to be wrong, and if God declared it to be right, it would be right. God also controls who hears the divine commands and who does not, and God seals the hearts of infidels and locks them against the truth (al-Ash'ari 1940, 114). On the question of human freedom, al-Ash'ari emphasizes God's sovereignty over everything that happens, including what we ourselves do. We acquire by the gift of God at the time of the act the power that is confined to the ability to do just that act. Al-Ash'ari considers the question of whether this means that God creates evil (or wrong). The answer is not straightforward. According to al-Ash'ari, God creates the injustice of his creatures as their injustice, not his. On the question of the relation between reason and revelation, he affirms the use of reason (indeed his work is mostly a string of arguments, one after the other, rather in the manner of the Christian scholastics of the thirteenth and fourteenth centuries). But he does not hold, like the Mu'tazilites, that the guidance of revelation gives human beings what they then recognize as means to what their reason already prescribed for them.

There are many later Ash'arites who make various qualifications to al-Ash'ari's positions. One important figure is al-Maturidi (d. 944), who holds that reason has some authority independent of revelation, though it is the junior partner, but because we have a natural tendency towards what has bad results along with a reason that is attracted by what is good, our inclinations are not a reliable guide. Rightness and wrongness derive from our relation to God, which is what determines whether some initial harm is in the end a benefit, and, since God knows this relation much more perfectly than we do, God's commands are more helpful even than our knowledge of ourselves (al-Maturidi 1970, 346). Another central figure is al-Ghazali (d. 1111), who was strongly influenced by the Sufis, and his works are still read very widely in the Muslim world. He opposes the project of constructing a vision of the good life for human beings on the basis of reason. He holds that the ultimate human good is unknown to reason or experience, since it involves the next life and thus is known only by God's revelation to us. One final note in the comparison between Islam and Christianity in relation to the questions we have been considering is that whereas the Christian natural law theorists embraced *eudaimonism*, in Islam the situation is reversed: the Mu'tazilites rejected *eudaimonism* and al-Ash'ari accepted it.

Within Judaism, the most important advocate of a divine command theory is Maimonides (d. 1204). He discusses the Mu'tazilites and the Ash'arites (Maimonides 1963, i.71), and says that some of "our" authors followed the theory and the method of the first-named sect, though this was because they encountered them first, adopted them, and "treated them as demonstrated truth." But Maimonides himself thinks that the 613 commandments of the Torah are obligatory whether we understand the reasons for them or not. Sometimes we do see, after being given the obligation, how it is beneficial to us to obey (in a way particular to that obligation, and not derivative from the general benefit of obedience to God). But these reasons, though they may explain in some cases why God's beneficence gives the commandments to us, do not in any case render them obligatory. A key case here is the so-called Noahide laws, of which Maimonides gives us seven in the following order: the prohibitions of idolatry, of blasphemy, of wanton destruction of human life, of adultery, incest, homosexuality, and bestiality, of robbery, the requirement to establish a judicial system in society, and the prohibition of eating a limb torn from a living animal. Of these seven, one tradition says that the first six were already given to Adam, and the

seventh was given to Noah (being derived from Genesis 9:4). Maimonides's position on these laws is that those who are under them are gentiles under Jewish jurisdiction, and the justification for requiring their obedience is that this law is given in the Torah (Maimonides 1989, 8, 11). The judgments of the nations about, for example, adultery or robbery, are only *secured* (in Maimonides's term tied to the "necessary") by God's revelation to Israel. Adam and his descendants knew these commandments, but only on the basis of convention. Maimonides says "The Law, although it is not natural, enters into what is natural" (Maimonides 1963, ii. 40, 382). This is to say that the law fits our human nature and our human situation, but it is not *derived* from our nature or our situation; it is made obligatory by being given to us by God.

For a contrast to Maimonides, we can most easily take not a medieval figure, but a figure within contemporary Judaism. The current situation of Jews has changed in three significant ways from the situation in which they lived during the time of Maimonides: the acquisition of citizenship by Jews as individuals in modern secular nation states, the destruction of one third of Jewry in the Holocaust, and the establishment of the State of Israel. David Novak has argued in a number of works that because of these changes the relations between Jews and non-Jews now need something not essentially internal to Judaism to which both Jews and non-Jews can appeal. His candidate is the Noahide laws, and he identifies these laws as natural law. "In the case of Judaism, the tradition of natural law is, of course, expressed in and through the Noahide laws, which express the minimal standards necessary for Judaism's moral justifiability" (Novak 2014, 7). Novak does not deny that the recognition of natural *law* as law depends on the recognition of the Sovereign of the universe who created us and gave us the law. But he makes the Noahide law do work in justification that divine command theorists cannot accept because they do not think the institutions presupposed by this law (property, marriage, a court system) are deducible from human nature. For example, we will be human in heaven without property, we were human in the Garden without it, and some groups (for example, Franciscans) are human without it now.

This entry has so far dealt only with the theory of the morally right or obligatory. To close, we will discuss the theory of the morally good. The chapter started with a conception of morality as a set of norms for social practice. Some of these norms concern obligation, for example, the norm that tells us to keep our promises. Some of them concern character, for example the norm that tells us to be grateful to people who are kind to us. The central case of moral goodness is goodness of character, or, in another term, "virtue." In what does moral virtue consist? One influential account is Robert M. Adams's view in *Finite and Infinite Goods* (1990) that moral excellence (along with all other excellence) is resemblance to God, a proposal that links moral goodness directly with monotheism in the way that Plato links virtue with the Form of the Good. Adams then ties this account of the good to his divine command theory by saying that moral obligation is constituted by the commands of a *loving* God, and a loving God is a God who is resembled by the things we by and large agree to be excellent. Adams here replies to the most serious objection to divine command theory, namely that it makes morality arbitrary. His view about resemblance is right about some moral excellence. Our faithfulness resembles God's faithfulness. But some moral excellences do not fit this model well. Consider bravery or self-control. God is not brave or self-controlled. There are large questions here about divine impassibility, but the traditional (Aristotelian) account of the moral virtues is that they involve having the right amount of the passions and if God does not have passions, God does not have these virtues. It is better for a theist to think of God's relation to the moral good as involving more than just resemblance. Some additional relations are that the moral good takes us to God (this would fit bravery and self-control), or manifests God's presence (in the way that beauty manifests God's presence).

The account of the moral virtues in the different monotheisms varies as the authoritative texts and paradigms vary. For Christians, the central authoritative text is the Bible, including both Testaments, and the central authoritative paradigm is the life of Christ. One central virtue that derives from this paradigm is the virtue of humility, and this is a virtue that does not appear in Aristotle's lists at all. Another example of this kind of divergence is that the New Testament commends loving our enemies. Within Judaism, Maimonides understands the Torah's precepts as a school of virtue. So we are commanded to help our enemy reload his fallen ass and to return the animal if it strays (Exodus 23:4–5). The point of saying it is the *enemy's* ass is to displace our tendency to help only our friends and harm our enemies. The point of saying we should return lost property is to displace our tendency towards greed and avarice. In these cases and many other similar cases, what is being aimed at is a character of a certain specified sort, and the character is fundamentally one that loves the neighbor as a way of loving God. Within Islam, there is a continuous tradition of teaching about virtue. Al-Ghazali in *al-Mundiqh* (2002) gives us a list that starts, chronologically, with repentance, abstinence, poverty, and patience, proceeds with courage and steadfastness, then gratitude, single-mindedness, truthfulness, and (the highest virtue) reliance, which is based on the knowledge of God's oneness or unification. The highest contemplation is an absorption of all human attributes in the vision of God and then annihilation in the everlastingness of God. The lover who claims to love the Most Lovable (which is God) must show some signs of this. The first sign is that the lover has no fear of death, for it means meeting the Beloved face to face. The second sign is that the remembrance of God remains fresh in the heart. The third is a sacrifice of one's will for that of the Beloved. The fourth is a love of all of God's activities, and therefore of all our fellow human beings. All three of the Abrahamic faiths discussed here, despite their differences, can be appropriately said to identify the central good for human beings as a right relation to God and the neighbor, though the detailed account of this relation will vary. The main point of this chapter has been that there is a similar tension to be found internal to all three faiths about how to conceive of the relation of God to morality.

CHAPTER 5

Non-Theistic Ethics

Anton Sevilla-Liu

What is “non-theistic ethics?” This entry focuses on the ethics of non-theistic *religions*. How do their ethics differ from non-religious ethics and theistic ethics? And what approaches are employed to make such ethics possible? This entry provides a basic definition of non-theistic ethics and explores three basic “strategies” to realize this: emptying subjectivity, absolute mediation, and communitarian religiosity. It ends with a discussion of some key limitations of the very idea of non-theistic religious ethics.

Defining Non-Theistic Ethics

In order to obtain a clearer idea of “non-theistic religious ethics,” we begin with the distinction between religious and non-religious ethics. Franklin Gamwell provides a helpful definition, suggesting that religious ethics are centered around comprehensive values. “Comprehensive” here means values that have to do with the ultimate meaning of one’s life. In other words, the norms, values, and virtues that guide action in religious ethics are part of the larger task of answering the question, “What is life all about?” In contrast, non-religious ethics would then be forms of ethics that do not stipulate the ultimate meaning of life. This allows for a range of metaphysical orientations. Many modern moral theories are included within this sphere – deontology, utilitarianism, and modern virtue ethics do not require a particular metaphysical world view, allowing them to be applied to a range of worldviews.

This approach allows us to clear up a confusing point. Is non-theistic ethics not the domain of humanism (or “secular humanism”)? Edward L. Ericson (1988) suggests that humanism has both religious forms (as in Ericson’s own work) and secular forms (as in the work of Corliss Lamont 1997). While both forms of humanism agree on the focus on the human as a source of moral value, and a focus on this life (versus the afterlife), secularists oppose the label of religion altogether, whereas religious humanists do not. However, despite secular humanism’s rejection of the category of religion, both forms of humanism stipulate the ultimate ends of man and make metaphysical claims. They do this when they make human happiness the *chief end* of human life, or take a scientific, materialist stance. Thus, they are both forms of “non-theistic religious ethics,” if we follow Gamwell’s definition. (Arguably, any ethics that is *lived* is difficult to separate from metaphysical beliefs.) However, there are many religious traditions from the ancient and medieval periods that are also non-theistic, and focus most of this introduction will be focused on ideas derived from these traditions.

Having differentiated religious from non-religious ethics, we now differentiate non-theistic from *theistic* ethics. What we have here is not just a need to define, but a clear conceptual challenge: Gamwell suggests that a religious ethic is *necessarily* theistic. Our moral choices are part of our self-understanding. Each choice we make says, “this is what matters” and we direct our will toward these values as an end. But if our self-understanding is to have any coherence, these ends have to cohere as an *actual totality* that includes all realizations of value – god.

Preliminarily, we can extrapolate from Gamwell’s definitions and define non-theistic religious ethics as follows: (1) Ethics that orders moral life in response to ultimate concerns, (2) but does not unify values on a single point (“god”), and (3) does not draw ultimate meaning from one center. The conceptual challenge, however, is how can we fulfill condition 1 but at the same time fulfill conditions 2 and/or 3? We will examine three strategies for this, and then end with a brief reconsideration of the very definition of “god” and the relationship between ethics and religion.

Three Strategies for Non-Theistic Religious Ethics

In *modern* non-theistic non-religious ethics, there are various strategies for grounding ethics. The first is to focus on reason in the universal sense. This results in deontology and procedural interpretations of Kant – such as John Rawls’ idea of justice. Another approach is to focus on rationality in the sense of a rational agent that seeks its own happiness – a utilitarian approach. Pragmatists like John Dewey offer a different spin on this “rational agency” approach, focusing on the individual experimentally finding ways to better live within social and natural environments – a “scientific” approach. These various approaches appear to be the main strategies for contemporary humanists and non-religious ethics as well, and they all share the focus on *rationality*. However, traditional religions offer a wide array of approaches to ordering life without directly appealing to modern rationality nor resorting to theism.

Among the vast array of traditional non-theistic religions, we have Jainism, Buddhism, Confucianism, and Daoism. One could examine overviews of the ethics of these religions, asking how they construct ethics. However, one challenge to this approach is the internal plurality of each religion. For example, some strains of Buddhism (such as Amidism) are arguably theistic in structure, while others are clearly atheistic. Confucius is deified in some forms of Confucianism, whereas other interpretations of Confucius clearly strive to be secular and this-worldly. Daoism can be interpreted as polytheistic or as atheistic.

In order to avoid this conundrum, this entry will take a different angle and explore three different *approaches/strategies* that draw from certain religions but might be applied to a range of religious views (even theistic ones). These three approaches are: emptying subjectivity, absolute mediation, and communitarian religiosity. The details of these approaches will be drawn out from three modern Japanese philosophers, all affiliated with the Kyoto School of Philosophy and its “philosophy of nothingness.” These thinkers operated from within a largely non-theistic culture, drew from that tradition, and brought it into creative dialogue with Western philosophy and moral theory.

Emptying Subjectivity

Gamwell’s suggestion that religious ethics must be theist derives from his view of the human being. Because the human being is self-understanding and wills certain values, then these values must cohere

in a final telos. In contrast, the first strategy of non-theistic ethics is to transform the very idea of moral agency itself, in a way that makes a unified “point” of values unnecessary. This approach is demonstrated by the philosophy of Nishitani Keiji (1900–1990) in *Religion and Nothingness*. He drew primarily from Zen Buddhism (both Rinzai and Sōtō schools), but his frequent reference to Meister Eckhart suggests that even Christianity can take a “non-theistic” approach.

The first “phase” of Nishitani’s ethics is intra-personal, focused on acts of self-cultivation. Like Gamwell, Nishitani defines religion as an attempt to find meaning in life, to “fill” the deep void of meaninglessness that causes the self to suffer. But for Nishitani, the cause of this suffering is not a lack of “goods” but the very self – the ego – that tries to control reality using the will and the intellect. It is because of this desire to control that we suffer from the impermanence and ungraspability of reality. He thus urges us to face this “nihility” of impermanence and absurdity, in order to teach ourselves to let go and awaken to the “standpoint of emptiness.” Therefore, ethics in this phase is not about obeying interpersonal rules or overt actions, but about meditative practices and a discipline of being mindful of reality – to not flinch in the face of its absurdity – and to allow oneself to fall into a “Great Doubt,” where one realizes the utter futility of the will and the intellect.

Watsuji Tetsurō, who we will take up in succeeding sections, had a similar approach to early Buddhist ethics as a discipline of “emptying the self.” In *The Practical Philosophy of Primitive Buddhism* (1920), he suggested that external morality (right speech, right action, right livelihood) and meditation (right mindfulness and right concentration) are attempts to *bodily realize* the wisdom that phenomena are merely phenomenal, and the self and all things are thus fundamentally empty. This sort of approach is gaining popularity in secular discourses in the form of “mindfulness” practices.

In both Zen meditation and in the moral practices of Theravāda Buddhism, the aim is a shift in what John Ross Carter calls the “zero level” of ethics. (The first and second levels have to do with everyday moral analysis and reflective moral analysis.) In this shift, one learns to *see* reality differently. In the case of Nishitani, he suggests the need for phenomena to be seen in their paradoxical nature: both true and ephemeral, where being and nothing are one, and the self is one with all things. Because of this shift, Gamwell’s self-understanding and willing self are negated. Rather than aiming at a point, the will is burst open to become a locus of the “action of non-action,” allowing it to have a sense of ultimate meaning without there being a “point” to things, or an ultimate telos that actions aim toward.

This intra-personal ethics is then expressed inter-personally. According to Nishitani, as one goes deeper into realizing the root of one’s suffering, one realizes that the attachments that bind oneself to futile acts of control are actually part of a karma that one shares with all other people in history. Therefore, the struggle to awaken oneself becomes inseparable from the need to awaken all others from their attachment and their egotistic slumber. Here, great wisdom (Skt. *mahā prajñā*) is one with great compassion (*mahā karuṇā*).

This structure of awakening being expressed socially and historically as ethics is also found in the philosophy of Hisamatsu Shin’ichi (1889–1980), who saw awakening to formless self as tied to the unity of all humankind, and creating history suprahistorically. This would become the vision of a lay Zen group he formed called the “FAS Society.” Additionally, this relationship between wisdom and compassion is also shared by the contemporary movement of socially engaged Buddhism.

Ethics of Absolute Mediation

A second strategy for non-theistic ethics is to decenter the self via the “other,” and then realize ethics as a mediation of this other. Tanabe Hajime (1889–1962) uses this approach in his postwar masterpiece,

Philosophy as Metanoetics. He draws heavily from the teachings of True Pure Land Buddhism – a form of Amidism founded by Shinran (1173–1263) that is the largest religion in Japan.

As the title of Tanabe's book implies, the key practice of this ethics is *zange* (metanoia). For Tanabe, *zange* is the continuous practice of becoming aware of one's own failings as a person, of the hubris of thinking that we can perfect ourselves through self-power (*jiriki*), and then surrendering to the fact of our personal imperfection. This is a painful experience – one that Tanabe himself went through as he lamented his support of the Pacific War and the subsequent defeat of Japan. But as one goes deep into this remorse, one breaks through its bottom and is filled with a sense of peace in surrendering to absolute other power (*zettai tariki*). As such, one undergoes a conversion – metanoia – in two senses: one has a change of heart, and one goes beyond the contemplative thought (“noesis”) of the path of self-power. Tanabe calls this path “*zangedô*” (metanoetics).

Tanabe's approach has similarities with Nishitani (who was his student and colleague) – it involves the transformation of the self in realizing its own limits. But there are clear differences that Tanabe himself emphasizes. First, he claims that the standpoint of Nishitani and his teacher, Nishida Kitarô (1870–1945) was a “gate of sages” – one that relies on the ability of the self to, by its own power, intuit the absolute. In Pure Land Buddhism, this is called *ôshô* (leaving the secular world), in contrast to *gensô* (returning to the secular). Tanabe emphasizes the latter. Second, this gate of sages implies an *overcoming* of egoism and radical evil. Tanabe does not think these can be overcome. Rather, in becoming remorsefully aware of these, they become an opportunity for opening up to the absolute other. Moreover, practice does not culminate in enlightenment – the practice of *zange* is endless.

This is similar to theistic ethics. Tanabe claims that Augustine, Kierkegaard, and Karl Barth drew close to the idea of metanoetics. However, Tanabe stresses that absolute other power does not exist independently as a “being” or as absolute Being. Instead, it is a nothingness that expresses itself purely as the self-negation of finite beings. To put it somewhat simplistically, the infinite only exists insofar as the finite realizes itself as finite. He thus describes this absolute as “absolute mediation” and “absolute nothingness.”

The second difference from theism is that *zange* does not *aim* at the absolute as a telos. Tanabe explains this using several ideas in Shinran's *Kyôgyôshinshô* (which literally means “Teaching of Practice, Faith, and Witnessing”). Ethics has two senses here: practice (*gyô*) and witness (*shô*).

The former, ethics as practice, involves realizing one's own worthlessness and surrendering to other power through *zange*. In this ethics, one does not perfect oneself, but merely becomes more aware of one's imperfection. This is drawn from a common teaching of Pure Land Buddhism called “the doctrine of the salvation of evil persons” (*akunin shôki setsu*) which states that “even good people will attain Buddhahood, what more evil people.” Evil people, because of their evilness, need the salvation of Amida Buddha more. Thus, this ethics does not destroy sin but transforms it into an opportunity for repentance.

The latter, ethics as witness, is the overflowing of this repentance in gratitude. Overjoyed by the experience of salvation, one tries to help others realize their own sinfulness, repent, and experience that same joy. One becomes an existence as “expedient means” (Skt. *Upāya*), an expression of nothingness that allows others to awaken to nothingness as well. This is necessary because the absolute is not being, it does not act independently as a “savior,” but saves people only through the mediation of the relationship between relative beings. This is an ethics of love, of absolute mediation, where one's awareness of one's finitude makes space to be loved by others and to love them in return. Additionally, Tanabe develops this interpersonal ethics into a social ethics, attempting to unify *liberté* and *égalité* with a *fraternité* that is transformed by the idea of love above, and calling for national *zange* in postwar Japan.

Neither ethics as practice nor ethics as witness brings the self closer to the absolute, nor aims at the absolute. Rather, ethics moves outward *from the absolute*, as absolute “other power” that is mediated by the self-power of finite beings. It is *a-telic*, an “action of no-action,” radiating from nothingness, through the self, and to others.

Communitarian Religiosity

The third strategy for non-theistic ethics is decentering the self through surrender to the moral community. Watsuji Tetsurô (1889–1960) demonstrates this approach in his magnum opus, *Ethics*, which he wrote in three volumes from the beginning of the war up until right after Japan’s defeat. This system had a strongly Confucian tone. (Watsuji never claimed to be Confucian, or even religious for that matter. But Confucian scholars like Takashima Motohiro argue for the similarity of Watsuji’s ethics to Confucianism, particularly that of Itô Jinsai.)

Having written books on early Buddhism and Zen Buddhism, Watsuji was fundamentally sympathetic to the need for personal awakening. But when he developed his systematic ethics, he found personal awakening to be too individualistic. He saw the human being (*ningen*) as a combination of individuality (*nin*, person) and communality (*gen*, relation) and argued for a return to relational ethics. In other words, instead of arguing for the (Buddhist) approach of transcending the self toward the transpersonal and then subsequently engaging society, he took the (Confucian) approach of transcending the self *directly* toward the interpersonal. One learns to let go of one’s egoism, one’s selfish desires, by considering others, working for the group, trying to respond to the trust others have placed on oneself.

Furthermore, individual and totality do not form a simple binary relationship. Similar to the Confucian classic, *The Great Learning*, Watsuji saw the individual as emplaced within a cascade of relationships – the family, the local community, the cultural community, the state, and the international community. In each community, one has distinct trust relationships to fulfill and virtues to embody. And each community is emplaced within a larger community that it must in turn respond to selflessly. Additionally, this outward movement toward community is balanced by an inward movement that tries to value the individual’s realization of his/her own uniqueness and capacity to contribute, or even transform, communities. (The Buddhist idea of individually realizing emptiness returns in this inward movement.)

An important point, however, was that this ethic was not “secular.” During the premodern period, many Japanese Buddhists appropriated Confucianism in such a way that Confucianism provided for rules governing social structures, and Buddhism answered to individual spiritual needs. For Watsuji, however, community life was itself a source of ultimate meaning – something to live for, to even die for. He saw the Buddhist ideal of emptiness expressed in people’s trust and sincerity toward each other, the source of virtue in every level of social relationships. (This also contributed to his unfortunate involvement in the Pacific War, a foray that is well documented.)

More than merely providing an alternative to theistic ethics, Watsuji also provides an interesting *critique* of monotheism as a whole, in several articles on “National Morals” written in the 1930s. Drawing from the sociological work of Émile Durkheim, particularly *Elementary Forms of Religious Life*, Watsuji argues that originally, even the God of monotheism was merely a god of a particular tribe. Individuals felt the totality of their tribe to be infinitely powerful compared to the individual, and this awe was the origin of theism. However, with the rise of empires, the community was no longer a small community

the individual could actively participate in, but transformed into a large, unnavigable empire. This uprooted the individual from the lived totality and gave rise to a new way of thinking. Cosmopolitan religions abstracted God from the community, and tried to bypass community, bringing the individual directly before God.

This genealogy presents a double critique of monotheism: First, monotheism is abstract. It ignores the actual totalities an individual is part of in order to deal with the individual directly. Second, monotheism can be imperialist and intolerant, presuming that values and worldviews are universal, independent of communities, when in fact they are culturally relative.

Avoiding imperialistic or individualistic ethics, he advocated for ethics as expressions of emptiness (the negative – tensional – relationship between individuals and communities) that are culturally and historically unique. He saw multiple centers to moral life, unified by this shared structure of individuality-communality. However, there was also a dark side to this argument: Watsuji was eager to praise Japan's polytheism and philosophy of emptiness as superior to the Western model, an argument that fit well with Japan's imperial aggression. But despite these dangers, he presents a clear account of how ethics can be drawn not from God or from reason but from the various communities we live in.

Spectrums of Religion and Trans-Ethics

Above, we see that there are different ways of finding a sense of ultimate meaning and aligning morality to that, without relying on theistic ethics. The strategy of emptying subjectivity denies the grasping, willing self entirely, allowing for morality to emerge not from a single divine point, but from a field of emptiness. The strategy of absolute mediation relies on an absolute other power (that may or may not be a god) to dislocate the ego, without making the Other the telos of ethics. Finally, communitarian religiosity decenters the self via finite communities.

Perhaps one has been wondering what the word “god” even means. From the discussion above, perhaps it is better to think of “religion” and “theism” as spectrums and not as binaries (religious vs non-religious, theistic vs non-theistic). Ethical systems vary in the degree to which they decenter the everyday existence of the human being. Pragmatic and utilitarian ethics do not stress this decentering at all. Watsuji decenters the self, but not as strongly as even Kantian ethics. This transcendence becomes acute in overtly religious ethics. This transcendence also varies in “shape” and can be diffuse, as a field of transcendence – emptiness, the way, nature. Or it can be focused – avatars, bodhisattvas, Buddhas, lesser deities, impersonal *kami* in Shinto. As this focus comes to a point, as it does in some views of Amida Buddha, non-theistic ethics can draw very close to theism, without necessarily giving the Other traits ordinarily given to the God of monotheism (omnipotence, transcendence from time, etc.).

In *Religion and Ethics at Odds*, Buddhist philosopher Sueki Fumihiko (1949–) suggests his own “spectrum” of religiosity. Inspired by the history of Japanese religion, he places the human being within a world that ranges from the clearly exhibited (*ken*) to the dark and concealed (*myō*). On the side of *ken*, he places ethical relationships between person and person, which are governed by reason and clear rules. But the human being lives in relationship with a shadow as well. There are aspects of oneself that one does not even understand. Even more concealed are the innermost thoughts of others. And at the borderline between the secular and the religious, we have the dead – people who we continue to relate to, to long for or to fear, but who are no longer “being.” As we go deeper into the recesses of *myō*, we have *kami*

(gods) and Buddhas, and at the infinite depths, God and nothingness. On one hand, this model can allow us to situate the range of religious ethical orientations – centered on reason, on communitarian sentiments, on responding to the irreducible other, responding to the dead, responding to Buddhas, awakening to nothingness, theistic ethics, and so on. But on the other hand, this model presents a *critique* of religious ethics itself.

Sueki's (2016) idea of religiosity, what makes religion “comprehensive,” is how religion addresses the shadowy aspects of life, where things are no longer reducible to reason – dealing with one's inescapable moral frailty, with death, with one's continuing relationship with those who are no longer physically present. It is only by dealing with *myô* that religion emplaces the person (and his/her finite range of understanding) within a context that exceeds understanding.

As we have seen in this entry, religion can lead to and support ethics – self-discipline, social rules, compassion. However, if ethics is narrowly defined as that which can be grasped by reason and can be ordered, then religion is fundamentally constituted by a “trans-ethical” moment. Because religion deals with *myô*, religion can lead to a surrendering to sinfulness rather than an ethical rejection of sin. Or, in focusing on selflessness and becoming one with others, it can fall into dangerous forms of nationalism. The problem of relating with the dead can bring religion into tension with politics and justice, as it does in the debates on Yasukuni Shrine and the Hiroshima atomic bomb commemoration. Therefore, while Japan provides us with a rich history of non-theistic religions giving rise to ethics, it also provides a history of religion's trans-ethical side, a history we would do well to keep in mind as we explore religious ethics.

CHAPTER 6

Language and Morality

Per Sundman

Language relates to morality in numerous ways. The aim for this entry is to suggest a structure for thinking about these complex relations. After a short introduction about the nature of language, this entry offers a brief investigation of how language relates to morality on three interrelated yet basic levels, namely ontology, epistemology, and meaning. Along the way, an account of how these relations ought to be interpreted, labeled linguistic constructivism, is presented and defended.

There are many conceptions of language. An overview aiming at completeness is impossible. Instead, a core definition borrowed from the well-known linguist Noam Chomsky is stipulated. According to him, language is “[...] a system of rules and principles – a ‘generative grammar’, in technical terms – that associates sound and meaning in some specific fashion” (Chomsky 1987, 140). In reality, a generative grammar typical of language does not only associate sound and meaning, but also signs and bodily movements and meaning. There are meanings of different form. Words are used to describe, express, and prescribe. Given patterns of signs, bodily movements and sounds are used by us to communicate. As we grow up, we learn how to use them, and to participate in the collective inventions of new meanings, as well as, in some cases, in the gradual change of inherited meanings. At the center of the systems of rules and principles that constitute a language are concepts, or better, the rules that determine how given norms constitute concepts, say the often tacit rules about the correct use of the words “true” and “truth” that users of English adhere to in order to distinguish true from false, or truth-telling from lying.

Concepts are constitutive in virtue of making it possible for us to identify things, and to distinguish them from each other. Looking up we can see clouds and distinguish them from the sky and from raindrops. Looking at the being next to us we can see our neighbor, we can see a stranger, or we can see something completely alien, depending on the conceptual skills we have acquired through using words (Butler 2005, 35).

Thus, we orient ourselves with the help of concepts. Without them, we are lost. We would not be able to identify what we see, hear, and feel. We arguably could not even tell the difference between seeing and hearing, although there most likely would be stimuli of different kinds. According to this, an infant can be overwhelmed by displeasing sensations, yet it will take some time before she learns that sensations of a particular kind constitute what she later will refer to as hunger, and perhaps even more time before she learns to choose between alternative ways of acting upon sudden feelings of hunger.

Moral Ontology

Let us now turn to how language relates to ontology. *Ontology* is a label for accounts about the nature of being. It concerns the kinds of things that have existence, and how they exist. Arguably, some things, say elementary particles, exist independent of human activity. Whereas the existence of items such as money and clothes depends on human activity. We can say that the latter kind of things are constructed, though the metals used in coins might not be. Arguably, language belongs to a category of socially constructed “things.” The system of rules and principles, that constitutes concepts, and that defines language, would not be there were it not for language users. The ontological problem concerns whether there is a moral reality beyond language.

One great divide as well as a longstanding theme for philosophical debate concerns whether moral language denotes an independent moral reality, or if moral language is self-referential in the sense of referring to a socially constructed reality essentially constituted by language itself. One could say that in virtue of being “manmade,” tables are socially constructed, but that their existence is inextricably linked to material items such as wood, metal, or glass, for example. Analogously, philosophers such as Jeremy Bentham, Richard B. Brandt, and Sam Harris, argue that the existence of values is reducible to certain natural facts such as biochemical aspects of happiness, and pain, or to a scientific description of life. Yet others, such as David McNaughton and John McDowell, claim that values refer to qualities that exist partly separately from natural facts, analogously to how the existence and nuances of colors are irreducible to the wavelengths of light. The point is that values in both cases can be claimed to exist in a way similar to how furniture exists. Their existence would either supervene on or by itself be something real, something that exists independent of human activity and language.

If on the other hand the only reality moral claims and beliefs refer to is constituted by language, then moral words would, in spite of what their users might think, not denote anything beyond language itself. We can call this linguistic constructivism. Though the absence of an independent moral reality might seem disturbing, it can be on its place to remind one that sitting on wood or brute iron might be quite an uncomfortable experience, whereas sitting on a chair probably is much better. Thus, it is the conceptual content that is of use to us, not the material, only.

Nevertheless, there are significant counterarguments to linguistic constructivism. In the context of this entry, one is of particular interest, namely the possible incoherence between ordinary language use and a constructivist ontology. An alleged incoherence builds on common descriptive usages of moral words. It appears, that moral language at least occasionally *describes* characteristics that belong to a world that exists on the outside of the communicating subject, and possibly, on the outside of language. The word “good” is, indeed sometimes used to denote qualities that belong to fellow human beings, perhaps in the form of qualities of character, as if these qualities exist independently of the language-bound concepts we use to identify them.

The fact that language sometimes is used as if there is an external moral reality, does, however, by itself not establish the existence of that reality. Explicating all remaining language related arguments pertaining to this matter is beyond the reach of this text. Nevertheless, besides descriptive language use, which can be interpreted as a significant part of an argument for believing in a moral reality independent of language, there is a potential counter argument to realism that needs to be mentioned. I am thinking about the difficulty of showing not merely that something exists independently of language, but the problem of establishing that our moral concepts are more or less correct images, or mirrors, of that moral

reality. Any interpretation of the nature of reality will namely, by necessity, make use of concepts that cannot be explicated in any other way than through the use of some language. If we think about it, without concepts we would not be able to distinguish anything. This, of course, does not entail that there is nothing to distinguish, or put differently, to mirror more or less correctly, it does entail though that the nature of the reference is not attainable independently of the very notions spoken of as mere mirrors. Put differently, the fact that there is a difference between how Mount Everest appears to us, as a gigantic mountain, and what our image refers to, namely stone, minerals, perhaps patterns of atoms or relations among even smaller artifacts, is not problematic. But, the seeming opaqueness of the difference between the appearance of moral goodness and its possible denotations is problematic since whereas material or natural micro particles seem relevant for our image of Mount Everest, they are not similarly relevant for images of the morally right, good, or what in general ought to be the case. It is simply difficult to argue that rational adults, in the same manner as they see a mountain are able to see a normative layer of reality that somehow supervene on the common brute particles that our bodies, mountains, and all dust consists of. The simple point is that it is uncertain whether we should claim the existence of something that we cannot grasp.

To summarize, language can be seen as exhausting what moral beliefs are about, what they refer to. And, language can be seen as tools of communication that we use to refer to realities beyond itself and ourselves. Settling this issue is complicated and perhaps impossible. This is so since whether there is a moral reality beyond language cannot be determined by means of perception that is not simultaneously an interpretation, which is inseparable from the conceptual glasses worn by the interpreter. Therefore, it probably is wise to allow room for the possibility that there might be a moral reality beyond language. Still, assuming that there might be something is of limited use if we have no way of inter-subjectively redeeming claims about the nature of that reality. In the following, we shall return to how this alleged difficulty to reach outside language in order to grasp an external moral reality relates to moral epistemology.

Moral Epistemology

In epistemology, justified true belief constitutes the necessary and sufficient criteria for knowledge. According to this, we are entitled to claim that we know X, if our belief that X is the case, is justified and true. When we believe that Y is the case, but we have no justification for this and when its truth is uncertain, then we can say that we have the opinion that Y is the case, but that we do not know, at least not yet. Moral epistemology consequently concerns the conditions for moral knowledge. Simply put, a person has moral knowledge if at least one of her moral beliefs is supported by reasons that establish its truth.

Language relates to the criteria of knowledge in many different ways. Space does not allow for more than a short explication of the account preferred by the author of this entry. Let us begin by addressing the plausibility of writing about moral beliefs, and subsequently turn to the problem of justification. The issue of the relations between language and moral truth can unfortunately not be addressed here. It is believed though that a coherentist interpretation of moral truth can complement the subsequent brief account of moral justification. A coherentist account of moral truth states that moral truth is constituted by being part of a perfectly coherent system of beliefs. Put in other words, here moral truth is interpreted as similar to logical rather than empirical truth. Justification, on the other hand, consists of the reasons that establish the location of a certain belief in a coherent system of beliefs.

It is not obvious that moral words are used to articulate beliefs. Prominent philosophers such as Charles Stevenson have argued that this is not so. Some hold that it is more accurate to claim that moral utterances reflect subjective reactions to certain events. Such reactions consist of subjective emotions that lack cognitive content, i.e. they are not about anything, and there is nothing external to them that can make their arousal more or less accurate. There is only the plain naming of the presence or the absence of an exchangeable, pleasant, or not so pleasant feeling. There are many good reasons not to accept this account. The first is that the fact that people often have strong feelings about moral matters, we might feel disgust when reading a story involving torture for example, does not support the contention that feelings are all there is to it. The torture example shows that we can have feelings of disgust, and that they depend on both our ability to interpret certain external events as instances of torture, and that they relate to a general conviction that torture names a moral wrong. This conviction is difficult to separate from the ability to master the notion of torture. Understanding what torture is simply seems to entail grasping that it helps us to identify particular events as (very) wrong. The latter is not to be confused with claims saying that torture in some extreme circumstances can be permissible due to imagined catastrophic alternatives. Such claims take the general wrongness of torture for granted.

So far, we have looked at the language of subjective emotions as an alternative to the vocabulary of beliefs. There are additional alternatives. One in particular needs our attention, namely the terminology of moral judgments (Hare 1988; Lynch 2009). The idea here is that since morality relates to action, more particularly performing the right action, it makes more sense to talk about judgments than beliefs. Presumably, beliefs are about what is and is not the case, rather than about what to do. We may decide what to do but allegedly we do not believe what to do. Our decision can depend on beliefs, say concerning the probable effects of a particular bodily movement, but the decision itself is not a belief. Allegedly, moral justification therefore should be interpreted as being about good reasons for judgments, rather than reasons for beliefs.

Nevertheless, this is not a necessary conclusion. On the contrary. It coheres well with ordinary language to say: "I believe that sheltering refugees is the right thing to do." We might also think: "I believe torture is wrong!" Or write, "I strongly believe that intelligence services ought not to torture people." We can even say: "I know torture is wrong!" Thus, moral language can be used to express beliefs, about what ought to be the case, and it can be used to express claims about moral knowledge.

Is the belief-terminology preferable then? An either/or situation is too simplistic. We obviously make moral judgments, primarily in the context of concrete action. We sometimes must judge among alternative actions. We might have many beliefs relevant for the case. We might believe that it is wrong to lie. We might have convictions about what it is about lying that makes it wrong. And, we might believe that it is right to save innocent life. In a concrete situation, a rescuer makes the judgment that it is right to lie in order to protect. This judgment can be scrutinized, and the ethicist can ask whether this was the right thing to do, given a particular mix of complex circumstances. We can also ponder on whether there are inter-subjectively valid reasons for believing that lying, when seen in isolation, is in fact wrong. The upshot is, if talk about moral belief is to the point, then one condition for moral knowledge is at hand.

However, merely having a belief is obviously not enough for knowledge. We cannot say that we know X just because we believe X. Many of our beliefs might be uncontroversial, and demanding justification for all of them might be implausible. But, some of our beliefs are prejudiced in a problematic way, and yet others might be controversial due to known counter arguments. Arguably, believing that mother earth is 8,000 years old, or that man-made global warming is not happening, belongs to the latter kind

of controversial beliefs. In globalized pluralistic societies it is also the case that beliefs about how we ought to live together are contested. Therefore, we need a justification, i.e. an account of how it can be shown that a particular moral belief is right. This is not to be confused with an explanation of why Donald believes X (Searle 2001, 110). It might be because he was manipulated to do so, or just because most of his friends and colleagues took believing X for granted. No, the interesting thing is whether and how Donald can explain the rightness of X. Searle (2001) writes: “The reasons that justify my action, and thus explain why it was the right action to perform, may not be the same as the reasons that explain why I in fact did it.”

In summary, moral language has multiple usages. It has been shown that these need not exclude each other and that talk about moral beliefs is one example. It is an important example since it indicates that asking about the conditions for knowledge are as relevant within the sphere of morality as it is for beliefs about descriptive facts and predictions only.

Justification and Meaning

So how does language relate to the justification of moral beliefs? In the following, it is suggested that language relates to moral justification in two distinctive ways. The first concerns the plain fact that we need to know what exactly it is that we need to justify. We need to know what the belief is about. The second is that a process of explication of meaning plays a significant role in justifications of moral beliefs. This entails that the belief in the need for justification can be justified by showing that its meaning coheres with the articulated meaning of related moral notions. Justifying the beliefs like “it is important to respect the agency of vulnerable persons” can, according to this, be justified through an explication of how it relates to concepts of human dignity and the concept of being a subject as opposed to a mere thing.

The plain observation that the question, whether moral convictions can be justified, cannot be handled if we have no idea about what a moral conviction is, what its distinctive traits are, illustrates the first way language is relevant. Let us therefore reflect on important differences between moral beliefs and other kinds of beliefs. The belief that global warming actually happens can arguably be justified with the help of the empirical science of meteorology. The belief that we human beings *ought* to change our carbon dioxide generating way of living, however, cannot be justified in the same way. Some of us are both relatively old, and live privileged lives in cool and wealthy parts of the world. We will probably not suffer from the consequences of global warming. Things might even get better, with less snow in Sweden. Therefore, it might not be rational for all carbon dioxide producers to adjust their behavior, unless of course all have children, care for human beings in general, or for the whole planet. Thus, the belief that we human beings ought to change our climate related behavior, needs explication. It can mean, changing one’s behavior is the most rational means toward the end of realizing what we care about. This can be supported by reasons stating that if all, or most, persons act upon the idea that “my individual action does not matter,” and change nothing, then certain things that we really care about, such as a safe and healthy future for our children’s children, will be jeopardized. Therefore, we ought to start making changes, to make sure that we did what we could in order to honor the importance of what we (happen to) care about. Thus far we have encountered the *ought* of instrumental rationality.

Interpreting the *ought* as moral in kind constitutes an interesting alternative. Though being different from the ought of rationality which essentially says “you ought to do it because it is rational,” the distinctiveness of the moral has been given many interpretations. A straightforward example is formulated here. Basically, the justifying reasons relevant for a moral ought establish the correctness of thinking that adjusting one’s behavior is the right thing to do. According to our suggested conception of moral justification, doing nothing about climate change is morally wrong by virtue of being incompatible with showing each and every human being equal concern and respect. The ethical egoist argues there is no stronger, moral duty than to satisfy one’s own desires, because they are mine. One problem with this position is that it does not cohere well with ordinary language. Arguably, labeling someone “egoist” is different from calling her just or good. Supposedly, acting against climate change is a matter of treating oneself as an equal to others, friends, and strangers. Treating people as equals is outlined here as a normative idea. The point is not to say that people are equal, which appears descriptively false, but to state that all human beings ought to be treated *as equals*. Thus, the alleged point is, we ought to change our climate related ways of living because moral equality ought to be recognized (Kant 1991, 254). Kant wrote: “The respect that I have for others or that another can require from me (*observantia aliis praestanda*) is therefore recognition of a dignity (*dignitas*) in other men, that is, of a worth that has no price, no equivalent for which the object evaluated (*aestimii*) could be exchanged.” Adjusting one’s behavior to this moral ought, can be rational, if we care strongly about what we allegedly ought to care about. This, however, is not certain.

So far, we have looked at the importance of language for the delineation of what we need to justify, i.e. the distinguishing properties of the moral ought. The previous, however, also shows that an attempt to distinguish the defining characteristics of a *moral ought* will entail embarking on the endeavor of explicating the meaning of acting right, in terms of showing equal concern and respect, for example.

Furthermore, the reasons that explain why it is morally wrong to torture someone must not explain the particular strength or binding nature of the moral ought in the terms of some other ought, say of prudence or rationality. Accounts that utilize references to self-interest, claiming that it is in our own self-interest to uphold moral norms, might offer reasons for action given the creditability of certain assumptions, say that everyone benefits from acting in the right way and that people in general are more interested in themselves than in doing the right thing. Such an account does not justify moral beliefs, if successful, it merely establishes that acting on certain moral beliefs can be rational.

Given the soundness of these claims, the justification of moral convictions is best understood in self-referential terms (Sundman 2010, 70–79). On the linguistic constructivist view defended here, it arguably is the moral meanings internal to Koine Greek, and English, that serve as the necessary background to the explication of the meaning of being someone’s neighbor that is achieved by the narrative of the good Samaritan. The narrative arguably conveys moral content that “[...] I acknowledge as constraining me and by that acknowledgement *make* into a normative *constraint* on me in the sense of opening myself up to normative *assessments* according to it [...]” (Brandom 2009, 64). Presumably, after hearing or reading the classic parable, many have asked themselves whether they really are a neighbor, and to whom. The explication of content is achieved by, among several narrative ingredients, putting the goodness of being someone’s neighbor in the recognizable context of an exclusive *us* versus a despised *them*, and by utilizing a tacitly shared commitment to the praiseworthiness of recognizing the badly beaten stranger as worthy of our concern.

Furthermore, reasons for believing in the rightness of say a public policy aiming at making society more just, depend upon the concept we use to describe the characteristics of that very act, for example, fairness or in other cases torture. The fittingness of calling certain relations unjust is, according to this, not merely the only but the best reason there can be for believing that such relations are morally wrong.

To summarize, this entry has shown that an inevitable dependence on moral language is coherent with talk about justified moral belief. Moreover, it has been argued that, explication of moral meaning together with shown coherence, constitute the backbone of a promising linguistic constructivist account of the justification of moral beliefs.

CHAPTER 7

Embodied Moral Inquiry

Kevin Schilbrack

The academic study of religious ethics, like the academy in general, has often operated with an unspoken mind/body dualism according to which inquiry is done by the mind which then directs an unthinking physical body. Ethicists who study moral inquiry, problem-solving, and reasoning have typically attributed these cognitive tasks to the mind, and the body has been either ignored or treated as the recalcitrant material that the ethical person, unfortunately, must manage. But over the course of twentieth-century philosophy, this mind/body dualism has been increasingly undermined. The question pursued in this entry therefore is: how might the body contribute to moral inquiry?

To focus on the contribution of the body in ethical thinking is part of the growing material “turn” in the academic study of religion, a turn, that is, from a primary focus on texts to an appreciation of the role played in religions by stones, water, hair, food, clothes, temples, mountains, and other aspects of the bio-social environment. In order to answer the question posed by this entry, however, it is crucial for scholars to distinguish between two general ways that one might include the body in one’s theories. We might call the first “the body as object” and the second “the body as subject.”

In the first way, one recognizes the body as a site of text-like inscription. As argued by the philosopher Paul Ricoeur (1991), whose work was influentially adopted for anthropology of religion by Clifford Geertz (1973), one can understand embodied actions on the model of a text and one can then “read” social practices and interpersonal gestures for their meanings, for what they “say.” This would be a hermeneutical approach to the religious body. But even though it is the embodied person who engages in the practice or makes the gesture, it is often the case that the individual is not the conscious author of her or his actions. As argued by the philosopher Michel Foucault (1979), whose work was influentially adopted for anthropology of religion by Talal Asad (1993), one can understand regimes of discourse and power as an apparatus that acts on the body, disciplining it and “inscribing” or “imprinting” it with cultural messages. This would be a genealogical approach to the religious body.

These two approaches differ in that the hermeneutic approach treats persons as purposive subjects and therefore tends to interpret what the body communicates in terms of the embodied person’s aims, whereas the genealogical approach focuses on the process of how subjects are constituted, and therefore eschews interpreting what agents mean in favor of explaining how the body is trained by mechanisms of social control. Whether the body/text is seen hermeneutically as a tool of the subject or genealogically as a tool of the society, however, it is conceived of as passive, merely “a depository of deferred thought,” to use Pierre Bourdieu’s phrase (1990, 69). On either approach, the body is a medium through which or on which

thinking works, thinking that is done elsewhere. Both approaches make the material turn to consider the body significant and both approaches speak, in their different ways, of “the thoughtful body,” but neither argues that the body itself contributes to inquiry, problem-solving, and reasoning. This is the second way that scholars might include the body in one’s theories, namely the body as subject.

What does it mean to think of the inquiring person as an embodied subject? This entry makes two proposals for how one might answer this question and connects each proposal to moral inquiry in particular. The first proposal concerns the idea of embodied cognition, and the second concerns the idea of affordances.

Embodied Cognition

Embodied cognition takes the view that human thought is deeply and inescapably rooted in the nature of the body and its interactions with the world. Our cognitive processes are, at their core, sensorimotor, situated, and action-relevant. At least at present, embodied cognitive science as a movement is probably best grasped not as a single, unified theory but rather as a research program consisting of disparate and perhaps irreconcilable elements (Shapiro 2007). To see the relevance of those elements to moral inquiry, consider these three ideas: that the body often structures thought, that minds often offload mental work onto the physical environment, and that thinking is often divided and shared among a team of inquirers.

Cognition is embodied, first, in that moral inquiry often presupposes that the agent has a body. Of course, it is relatively uncontroversial to claim that a person cannot *be* ethical without a body. It is hard to wage a just war or care for the needy without arms and lungs and eyes. But the argument here is that not just moral action but moral inquiry – that is, the mental processes of weighing and deciding moral questions – are often structured by the kind of body one has and how one interacts with one’s environment. In some cases, this is because the categories with which one thinks are developed from metaphors that draw their sense from concrete embodied experiences. As George Lakoff and Mark Johnson (1999) have detailed, an enormous amount of mental work is possible only as thinkers recruit what are originally physical concepts (such as up/down, dark/light, or towards/away) to help conceptualize the abstract character of people, events, actions, and things. To categorize a greeting as “warm,” one’s mood to be “up,” or a movie that “stinks,” involves taking concepts first used for motion or for sensory experiences and stretching them for use as evaluative terms. Ethical categories are the same. To categorize someone’s character as “upright,” one’s motives as “pure,” or one’s will as “strong,” recasts embodied experiences in a way that structures how one conceives of what a person ought to be (Lakoff and Johnson 1999, Chapter 14 in particular). As Maxine Sheets-Johnstone says, in languages all around the world, the body is “a semantic template” used to map what is good and bad (2008, 12). Moreover, the mental processes of thinking, weighing, and deciding moral questions can also be structured by the nature of one’s body and its interactions with the world without the mediation of metaphor. For example, some feel disgust when thinking of immoral behavior. In this way, a gustatory emotion that evolved to motivate people to avoid eating contaminated substances is co-opted to avoid social dangers such as moral transgressions (Strejcek and Zhong 2014, 223–224). The embodied response to the perception of rotten food and the perception of an action that is ethically rotten draw on the same neural patterns. Moral cognition conscripts capabilities shaped for the physical environment to a moral use. In both of these ways, it would be difficult even to think about moral issues without using metaphors drawn from the bodily domains of health, of freedom of movement, of strength, of cleanliness.

Cognition is also embodied, second, in that some aspects of a cognitive process can be “offloaded” onto one’s material environment. For example, some problems get solved by manipulating physical things outside the brain. A person might count on her fingers or, moving beyond the body, use pencil and paper to multiply larger numbers. Though she cannot solve the equation “in her head,” she can solve it when she uses the pencil and paper as cognitive prosthetics in a feedback loop between her brain and the steps that she takes on paper. People take advantage of cognitive prosthetics when solving moral problems as well. Think of religious iconography representing moral exemplars such as a statue of a half-lidded Buddha. As the Venerable Balangoda Ananda Maitreya, the Sri Lankan bhikkhu in *The Long Search* (1977), says, the statue wordlessly teaches restraint of one’s eyes. Those struggling with self-restraint – even if they cannot read or have never heard a sermon – can emulate the statue’s comportment and learn control of their mouths, hands, feet, the whole body: “there is the real dharma ... doctrine symbolized.” One can return repeatedly to the statue as a role model for working on one’s lack of restraint. Think too of the religious music that is used to create a musical space fashioned specifically to elicit and scaffold certain emotions, beliefs, memories, and behavior. The affective atmosphere created by a somber hymn at a funeral nudges listeners toward quiet grief and introspective remembrance, and it contrasts with the music at a New Orleans jazz funeral that might begin with mournful hymns but transition musically to a joyful celebration of the deceased’s reunion with Christ, complete with shouting and dancing that spills out of the pews (Krueger 2018). The music is not separate from how a group of people come to memorialize a life. Think too of the cognitive prosthetics supplied by religious narratives of moral heroes and villains when these narratives are performed on stage, written in books, recited in song, or represented in art. What is the virtuous way to act when one is denied an inheritance, when oppressed by a tyrant, or when one comes into fortune? Such narratives are often presented by religious communities explicitly to structure the moral thinking of their members. In all these material, musical, and narrative ways, one’s attempts to solve ethical problems are assisted by one’s embodied religious practices and often in a pre-reflective mode.

Cognition is also embodied, third, in the sense that it can be socially distributed. Some cognitive problems are so complex that they require for their solution a division of labor. Edwin Hutchins, for example, famously argued that a navigation team that brings a large naval vessel into port can be seen as a cognitive and computational system. One might therefore make a “two-level” distinction between the cognitive properties of an individual and the cognitive properties of a system of which the individual is a part. More strongly, many of the cognitive processes in which an individual engages, such as interpreting and making a judgment, presuppose the existence of certain social arrangements or institutions. The individual’s thinking is then undergirded, structured, and made possible by the cognitive work of others. Take the example of a decision made by a juror in a trial. The decision is not simply produced “in the context of” the legal system but rather presupposes prior collective agreements about what counts as evidence, about what questions can be asked, how, and by whom, and about the range of possible conclusions – all of which guide the way an individual juror thinks and decides but none of which is created or even chosen by her. In this way, one can see a family, a legal system, a scientific laboratory, a military base, a university, or other social arrangements as “mental institutions” in that they serve as social cognitive prosthetics, social extensions of the mind (Gallagher and Crisafi 2009). It is not hard to see religious institutions playing the same role when the members of religious communities make ethical interpretations and judgments. In this way, one’s social world can

come to structure one's moral inquiries, both conceptually, as one thinks using the language game of a particular form of life, and physically, as social interactions gradually build dispositions describable as virtue into the individual's neural pathways.

In sum, then, cognition about ethics is embodied when one's thinking leaks out of the brain to involve bodily movements, cultural artifacts, and coordinated teams of problem solvers. There is a debate among cognitive scientists and philosophers of mind today whether scholars should adopt *the embedded mind thesis* that considers these movements, artifacts, and allies as tools with which the mind reasons, that is, as contributing sources of information needed for the mind to do its reasoning, or whether one should adopt *the extended mind thesis* that revolutionizes the traditional concept of the mind so that these thinking aids come to be recognized as constituent parts of the mind itself. On the former view, the mind is embedded in yet remains distinct from the social and material environment it uses but, on the latter view, the boundary that limits the mind to the brain is blurred and what counts as "the mind" extends into the body and perhaps also outside the embodied person into her social and material environment. The debate in religious ethics would be whether we would speak of, say, a monk's posture during meditation, his mudras, the spiritual discipline of his begging, as well as the iconography and architecture of the monastery, and the hierarchy of the monastic order itself as enabling conditions for his moral inquiry or as actually constitutive elements of it. For the purposes of this entry, we do not need to settle this question since, however that question about the metaphysics of the mind is decided, both interpretations support the view that religious bodies play a crucial role in moral inquiry.

Ethical Affordances

Here is the second proposal for how one might see the body as itself the inquiring subject. This way draws on the notion of "affordances," a concept introduced by the psychologist James Gibson (1979) in what he called an ecological approach to perception. Gibson's proposal opposes most contemporary ways of thinking of perception, since he treats the senses not as passive receivers of sense data which the mind then assembles and uses to make inferences about the "external world," but rather as active, tentacle-like grabbers that evolved in order to extract information from the organism's environment about dangers and benefits (Gibson 1966). His approach is "ecological" in that it embeds the perceiving animal in surrounding value-laden information as gravity pulls it in one direction, light reflects off various surfaces, and sounds, smells, and temperatures are picked up.

Gibson introduces the term "affordances" to name opportunities for action that an organism can perceive in its environment. The structure of one's environment affords (or solicits or invites) action. Some of these affordances are physical: the more gradual slope affords an easier climb than the steeper one; the sunrise affords better visibility; the tree branch affords climbing. Human animals would share many of these physical affordances with nonhuman animals. But one can develop Gibson's idea to recognize that some affordances are social, created by convention or collective agreement. For example, the lull in the conversation lets the bystander join the group; the loophole in the law permits a break in taxes for the corporation. Moreover, some of these social affordances are also ethical, taught by a given community as opportunities for actions that are morally virtuous or even morally obligatory. Injustice, they say, calls out for remedy. Seeing a hungry person provides one with an opportunity for benevolence. One can speak therefore of the perception of ethical affordances, that is, opportunities for moral action, provided

by one's natural and social environment (Keane 2016). An affordance-based way of thinking of the body as contributing to moral inquiry, then, will focus on the community member's limited or skillful ability to perceive the opportunities for ethical action that exist in the world.

The affordances that exist for a given agent depend on the agent's embodied abilities, on what one physically can do. A tree branch exists as an affordance for sitting for a bird but not for a human, for instance. But affordances do not depend for their existence on being perceived. The affordance is there in one's field of action even if one fails to see it. Though the ontology of affordances is debated, perhaps the best way to understand affordances is as relational properties. That is, just as the fact that X is taller than Y is a relational property of X that is not independent of Y's height, the fact that A affords an opportunity for B to act in a certain way would be a relational property of A that is not independent of B's bodily structure and capacities. Relational properties do not exist independent of their relata, but they do exist independent of being perceived.

Moreover, an organism's relation to its environment is not static: if one grows in one's embodied abilities, more affordances appear. If one becomes stronger or faster, one can discover or create new opportunities for successful action. The possibility of discovering or creating more opportunities for action is just as true for social affordances: as the lawyer learns the intricacies of the law, she becomes better able to find the loopholes. As the introvert becomes more adept at social exchanges, he finds more chances to introduce himself to strangers. In this way, one becomes better able to perceive the opportunities that exist in one's environment. Whether one is learning a more mobile activity like driving a car or a more cerebral activity like playing chess, as one achieves higher levels of skill, one's ability to recognize and discriminate between the particular solicitations offered by a concrete setting of action increases (Dreyfus 2014). This improvement in one's ability to perceive affordances often requires a teacher and training of the relevant kind. But the existence of the affordance is not subjective: the possibility of avoiding a car accident is there on the highway and the possibility of checkmating one's opponent is there on the chessboard, whether or not the person realizes it.

The same is true of ethical affordances. As one participates in social practices, perhaps with a teacher and training, one becomes better able to recognize the opportunities for ethical action taught by one's community and present in one's environment. As a consequence, scholars of religious ethics can come to see practices, rituals, and spiritual disciplines not merely as inscribing on religious bodies the marks of moral purity, adult status, proper deference, or some other culturally sanctioned message, as in the genealogical approach mentioned above, but also as developing the participants' abilities in ethical perception. Ethical perception involves a response to solicitations from one's surroundings and so it presupposes the cultivation of one's moral sensibilities. Think for example of the Confucian teachings that encourage practitioners to develop filial piety and humaneness. For these Confucians, a tremendous opportunity for ethical behavior, which one should not overlook, arises in the death of one's parents. Think of the Buddhist teachings that encourage practitioners to cultivate detachment and loving kindness. For these Buddhists, an opportunity for ethical behavior is present, if one can see it, when one finds oneself provided with an abundance of food. Think of the Christian teachings that encourage practitioners to cultivate charity and courage. For these Christians, an opportunity for ethical behavior exists in the needs of orphans, widows, and prisoners. Given the concept of ethical affordances, one can see that moral inquiry is not separate from participants' ability to perceive the ethical dangers and ethical

opportunities that exist in violence, food, sex, money, family, and so on. In these ways, a religious practice, ritual, or spiritual discipline not only serves as an apparatus that works on a passive body, treating the body as a site of inscription, and not only as a text through which the practitioner communicates, but also as a school for virtue, treating the body and the senses of the participant as a learning subject. On this approach, the spiritual life and moral inquiry are realized in terms of how one takes hold of and attends to the sensory world as religious concepts enter into and shape the phenomenology of everyday experience. And this concept of the perception of opportunities for moral action in one's environment lends itself easily to the distinction in a given community between those who are ethical novices and those who are ethical experts, and how to move from one to the other.

Since ethical affordances are opportunities for action whose existence depends on what one is able to do, one should expect to see religious practices, rituals, and spiritual disciplines not simply teaching doctrine developed elsewhere but working directly on participants' embodied capacities. In this light, it is not surprising how often the Biblical Book of Proverbs teaches one to turn one's eyes and ears away from the honey-dripping words of seductive women and the appeals of wine to attend instead to the teachings of the sage and to the poor person's pleas for help (Goering 2015). In these ways, a religious community seeks to educate the senses and to instill the skills that constitute "a sapiential habitus" (Goering 2015, 257). One could rightly speak of ritual participation, in Foucault's terms, as a process of subjection. But insofar as the subjects are moral agents, it would be misleading to describe ritual practices as forming subjects in the way that a factory produces widgets. Religious participation may teach one how to perceive ethical affordances, but affordances merely solicit action; they do not determine what the agent will do. Insofar as the aim of a given religious practice is to form subjects who are virtuous, therefore, they involve the cultivation of powers of perception, discrimination, and choice.

Conclusion

When one engages in moral inquiry, one develops and tests hypotheses, applies categories, and makes evaluations. This entry has explored a holistic view according to which cognitive activities like these are best understood as performed not simply by minds but by embodied persons. In closing, it is worth noting two implications of this holism for the study of religious ethics, one methodological and one metaphysical.

First, adopting the concept of embodied moral inquiry helps us see the extent to which moral inquiry pervades any given social group. The point is not only that moral questions are often raised and settled without conscious reflection. The point, rather, is that most moral inquiry is done in the course of everyday activities whenever people argue with themselves and others about what does and does not feel right, morally speaking, and most of these people have never read philosophy or theology. They are not "ethicists." In this way, to break down the mind/body dualism of moral inquiry implies a breakdown of the theory/practice divide according to which moral theorizing is done only by those, typically male and leisured, with the appropriate training and others simply put that thought into practice. Insofar as moral inquiry is embodied, it will be found in the marketplace, the workplace, and the home. Insofar as scholars of ethics recognize the ubiquity of embodied moral inquiry, they will need to move beyond the study of

texts to engage with historians, anthropologists, and other scholars who observe the quotidian social practices where that inquiry is constantly taking place.

Second, the concept of embodied moral inquiry raises questions about the nature of personhood. This entry argued that moral inquiry, typically understood as a mental activity, is better seen as a process of embodied cognition, and this entry presented that idea in a way that one might accept it while continuing to hold a dualism of mind and body. That is, one might adopt a holistic view of moral inquiry without giving up the idea that a person is essentially a mind or soul only accidentally in a body. But this entry also removes some of the reasons that motivated that dualism. This entry's claim that thinking – including thinking about ethics – is rooted in the body fits easily with the monistic view that human persons are entirely physical beings without nonphysical souls or minds. When that view is adopted, the metaphysical debate becomes that between those reductive physicalists who hold that the behavior of human persons is not different in kind from that of chemical reactions or, say, falling apples, and those non-reductive physicalists who hold that human persons have emergent cognitive properties that have “top-down” effects of their own. A reductive physicalism would presumably make the notion of a spiritual or moral life impossible, but the same is not true of a non-reductive physicalism. If this is right, then embodied moral inquiry strengthens the idea of bodies as subjects.

CHAPTER 8

Reason, Emotion, Ethics

Elena Namli

What is moral knowledge? Is there moral *knowledge*? When dealing with these perennial questions, philosophers and theologians utilize several fundamental categories. Reason is the most important category, time and again constructed, reconstructed, and deconstructed by thinkers of different cultures and traditions. How should reason and moral reasoning be understood? How does reason relate to other instruments and dimensions of morality? What is the relationship between reason and emotions? What is the role of emotions in moral reasoning and how should we deal with the challenge they pose to rationalist theories of moral judgment?

Upon entering the discussion, we immediately find ourselves in the domain of ethical theory; i.e. enquiry about the function and ontological status of moral language and moral judgment, as well as about whether and how moral judgments can be justified. While normative ethics deals with theories about the right actions, moral principles, or different visions of the good society and the virtuous person, the focus of ethical theory is a meta-analysis of the very phenomenon of moral judgment. Therefore, the first section of this essay offers a short overview of the most important, albeit generalized, positions in ethical theory with regard to the issue of the character of moral judgment. The differences between cognitivism and non-cognitivism are presented and discussed in the second part of the essay.

In the third section, the issue of justification is our main concern. Different theories of the justification of judgments about obligations and values are elaborated upon. Scrutinizing several forms of rationalism and critiques of it, it will be argued that reason, as a universal capacity for justification and critique of moral conventions, can be understood and constructed in several ways. Emotions, as well as other resources of moral insight, are part of different constructions of the meaning of practical reason. The position defended here is that moral judgment should be a matter of rational deliberation, which does not demand cognitivism as its foundation.

Ethical Theory

In the center of ethical theory is the question of how to explain the phenomenon of conflicting moral judgments. There are two general forms of such a conflict – one is the case of contradicting judgments about the same issue made by different subjects, and another is contradicting judgments about the same issue that appear equally plausible to the same subject. Hare (1981, 26) starts his *Moral Thinking* by highlighting the importance of the conflict of the latter type: “[...] it is sometimes the case that a person thinks

that he ought to do A, and also thinks that he ought to do B, but cannot do both.” In order to resolve the dilemma, Hare introduces and develops his theory about the critical (level of) moral thinking. Another, possibly more urgent, form of conflicting reasoning is that of different subjects offering justifications of conflicting moral judgments. Is it justified to grant a right to asylum even if it brings serious challenges to the societies that asylum seekers try to enter? Are there rational arguments that support the idea that the values of the traditional heterosexual family justify some forms of gender inequality? The nature of conflicting reasoning about these kinds of moral judgments is the ultimate subject of ethical theory. Therefore, when we evaluate different framings of such a theory, their capacity or incapacity to address and deal with the issue of conflicting moral judgments should be the most important criterion.

To address the phenomenon of conflicting moral judgments, we need to answer three interrelated sets of questions. The first one is whether moral values have some kind of objective status. Are there moral facts? Is there such a thing as the right to enter a safe social space? Or is it, possibly, a matter of social convention that differs with contextual factors? The second question is about the character of moral judgment. Are moral judgments descriptive propositions which can be either true or false? Suppose that Anna believes that gender equality demands similar settings of rights for both men and women, but Maria claims that gender equality can include different sets of rights and duties. Is one of these two beliefs true and another false? The third basic issue of ethical theory is whether moral judgments can be inter-subjectively evaluated and rationally justified. If Anna and Maria disagree on important moral issues, are there tools and criteria that enable a rational dialog between them?

To make the situation even more complicated, theological perspectives add further dimensions to all these questions. What does it mean for moral reasoning if Anna in our scenario is a Catholic and Maria is a Muslim? What if Anna is also a feminist and Maria is a neo-Marxist?

In the following, we will mainly focus on the second and third areas of ethical theory; namely, questions about the character and justification of moral judgments. However, we must keep in mind that the philosophical and theological positions within these spheres are combined with either realism or non-realism. Realists argue that there are moral facts independent of moral judgment, and non-realists reject the existence of moral reality beyond moral evaluation. Non-realism usually takes a form of social constructivism that understands norms and values as products of social interaction.

Cognitivism and Non-cognitivism – Is There Moral Knowledge?

Let us start our deliberation on how ethical theory can help Anna and Maria by making a distinction between cognitivism and non-cognitivism. Cognitivism appears in different forms but always interprets moral judgments as propositions that can be either verified or falsified. It views moral beliefs as descriptive propositions similar to propositions of non-moral knowledge. Non-cognitivism rejects the idea of moral knowledge and views moral judgments as having practical functions; i.e. as expressions of emotions or volitional prescriptions.

Natural law theory is a classic example of cognitivism. Being a theological form of naturalism, this Christian tradition claims that a moral judgment is true when it adequately reflects natural law; i.e. the true order of being that is independent of human evaluation. In its religious setting, natural law is related to a belief in God as the creator of the universe and humanity. Reason is interpreted as the faculty that enables human beings to understand the given law of creation (*lex naturalis*). To utilize moral reason is

to understand the nature of creation and to act according to this nature. In the center of the cognitivism of natural law is the idea of universal human nature that can be recognized by reason both through and beyond moral conventions of a given society. If a moral or legal convention of a society contradicts a reasonable understanding of human nature, it can and should be questioned. Precisely this critical, universalist component of natural law is described by Jean Porter, one of the leading contemporary specialists on natural law, as its great appeal. She writes, “The great appeal of the official Catholic version of the natural law lies in its confidence in the moral capacities of the human race and its optimism about the possibilities for building a moral community among all persons of good will” (Porter 1999, 30).

Naturalistic cognitivism can be developed without theological connotations. Some philosophers claim that humans, regardless of their social and cultural contexts, are capable of understanding the essence of humanity and use it as a criterion for moral judgment. The most common current form of non-theological naturalism is the naturalism of human rights. The United Nations Universal Declaration of Human Rights famously stipulates, in Article 1, “All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.” If interpreted literally, this article expresses the belief in a universal human nature that can be recognized and acted upon by means of reasoning. Some contemporary theorists of human rights reduce this capacity to negative recognition; i.e. reason’s universal capacity to recognize norms and actions that violate human dignity and, therefore, must be globally prohibited (Miller 2012, 166).

In its different forms, cognitivism agrees that moral judgments are descriptive and, therefore, either true or false. One of the advantages of this position is its capacity to interpret and encourage moral reasoning as a critique of normative conventions, conventions that can be false. If we view the principle of equality as true, we can powerfully question conventional norms and practices that contradict it. Both Anna and Maria can strongly condemn different patriarchal norms and practices if they believe that patriarchal morality is false. Conversely, cognitivism implies the risk of overlooking the possibility of reasonable differences in moral judgment and, thus, become suppressive of the other. If Anna believes that her understanding of equality, which differs from Maria’s, is true, she has little motivation to listen to Maria. Cognitivism in ethics can, and often does, justify “[...] the violent imposition of an order that is declared objective and natural and therefore cannot be violated and is no longer an object of discussion” (Vattimo 2007, 93).

Critics of cognitivism differ in many regards, but are united in their firm rejection of moral judgment as a form of descriptive knowledge about moral reality. Non-cognitivists claim that moral judgments are practical and, therefore, neither true nor false. They interpret moral judgments as either expressions of emotional attitudes (emotivism) or volitional prescriptions (prescriptivism). Although without logical necessity, these two positions often take different stances on the question of whether and how moral judgments can be rationally justified.

Emotivism understands moral judgments as expressions of emotional attitudes and claims that such judgments can be neither verified nor falsified. In the words of Alfred J. Ayer, “[...] the function of the relevant ethical word is purely ‘emotive.’ It is used to express feeling about certain objects, but not to make any assertion about them” (Ayer 1946, 108). A contemporary version of emotivism is expressivism, which states, “Questions of moral right and wrong, on this picture, will be questions of what to do, but with a particular kind of emotional flavor. [...] Moral questions [...] are questions of how to feel about things, where the feelings in questions are the moral sentiments” (Gibbard 2006, 117f).

When Anna states that equality demands similar settings of rights and duties for both men and women, she is expressing her positive emotion about these settings and simultaneously trying to evoke the same

emotion from Maria. Emotivism is plausible in that it captures the practical character of moral judgment and, of course, the importance that emotions have for moral judgment and moral action. In other words, emotivism captures the intimate relationship between moral judgment and moral action. For most of us, it is intuitively evident that emotions “color” attitudes and indicate a special kind of seriousness of moral positioning. Thus, emotivism challenges rationalistic theories of moral judgment and rightly emphasizes the role of emotions within morality.

Further, emotivism counteracts the lack of tolerance that often follows moral cognitivism. If a moral judgment is neither true nor false, no one can legitimately use it in order to silence the other. In our example, Maria can try to tell Anna about her experiences of being a Muslim feminist and change Anna’s emotions about different forms of gender relations.

However, the reduction of moral judgments to emotional attitudes is problematic in many regards. In the description of emotivism, as well as in the summary of the critique against it, the Swedish ethicist Carl-Henric Grenholm (Grenholm 2014, 54–68) is followed. The most important objection to emotivism reminds us that moral judgment is not just about the expression of emotional attitudes. Crucial for moral judgment are volitional prescriptions such as “Do this!” and “Do not act like that!”. Further, critics of emotivism are rightly concerned about the fact that emotivism underestimates the human capacity to reason about moral issues. Emotivism leads naturally to a strong relativism on moral issues. It lacks the tools for discriminating between justified and unjustified moral attitudes. Such strong relativism contradicts the fundamentally social character of morality. Moral norms and values guide the coexistence of human beings and of societies and, therefore, demand a substantial amount of agreement. While we can and should live with some moral disagreements, there are many disagreements that must be resolved.

A theoretical position that modifies non-cognitivism in order to avoid emotivism’s reduction of moral judgments to emotional attitudes, as well as its tendency toward strong relativism, is prescriptivism. Let us recall the abovementioned classical version of prescriptivism, that of Hare. Hare argues that moral judgments have two fundamental logical properties; namely, universalizability and prescriptivity. The proper usage of “ought” logically demands a prescription that includes universalizability. It is further demanded that moral judgments be strong and override other judgments and concerns (Hare 1981, 21–24). It is of crucial importance, for Hare, that universality does not mean a higher level of generality; rather contrary, moral judgments are judgments of particular situations – but only judgments that equally bind all subjects in similar situations. Hare writes: “If a person says ‘I ought to act in a certain way, but nobody else ought to act in that way in relevantly similar circumstances,’ then [...] he is abusing the word ‘ought’” (Hare 1963, 32).

The main advantage of Hare’s and other similar prescriptive theories is the combination of the demand for universalizability and the practical understanding of moral judgments. This kind of theory does not support naturalism; instead, it is compatible with the belief that norms and values are social constructions, which explains the existence of reasonable variations between norms and values. However, it is still possible to approach norms and values critically by means of the criterion of universalizability. In our example, Anna and Maria disagree about what we ought to do in regards to gender equality. Prescriptivism can help them to handle the disagreement by, firstly, removing the burden of truth and, secondly, by asking both to argue within the frame of universalizability.

It is beyond the scope of this essay to offer a more nuanced analysis of the positions presented above. However, if we can agree that a legitimate metaethical position must constructively address the issue of

conflicting moral judgments, non-cognitivism combined with a clearly articulated view of how moral reasoning should be justified appears to be a plausible position.

Reason, Emotions, and Justification

Thus, it is argued that a tenable ethical theory both rejects cognitivism and offers an instrument for a rational approach to conflicting moral judgments. Such an instrument is a theory of justification that does not view moral judgments as descriptive propositions. How, then, should we justify moral judgments if they lack truth value? What role does reason play in such a justification? How does practical reason relate to traditions, religious as well as secular? Are emotions of any value, or do they constitute an obstacle for the project of justification? How should we approach the challenge to rationalistic ethics posed by emotion-based theory of moral judgment?

As already stated, the great advantage of rationalism is its claim of universality – in our case, the claim that a proper justification of a practical judgment must be valid for any subject in similar circumstances. In the most famous formulation of rationalism, the categorical imperative of Kant, we read, “Act only in accordance with that maxim through which you can at the same time will that it become a universal law” (G 4:421).

In original Kant, it is reason in its pure form that decides whether judgments pass the test of universality. Two important objections against this rationalism have furthered the development of Kantian ethics. One objection highlights the fact that even when trying to reason with the aim of universalizability, we reason differently. Another one states that Kant’s practical reason is, in fact, too abstract in that it disregards the very foundation of morality, its social and relational character. If Anna and Maria are to find a solution to their disagreement, they cannot remain in the sphere of pure reason. They should engage themselves in a dialog with each other, rather than in Kantian theoretical inquiry, a critic would say. Informed by such critique, contemporary Kantians such as John Rawls and Jürgen Habermas have introduced modified forms of rationalism that seek to overcome the challenge of differences as well as that of the sociality of practical reason.

Rawls famously believes that the core idea of Kant’s theory of justification is, in fact, the normative ideal of personal autonomy and equality. Rawls writes, “Kant held, I believe, that a person is acting autonomously when the principles of his action are chosen by him as the most adequate possible expression of his nature as a free and equal rational being” (Rawls 1971, 252). Therefore, Rawls offers a theory of justification in terms of a contractarian “original position” that demands fundamental equality when social principles are elaborated upon – “all have the same right in the procedure for choosing principles; each can make proposals, submit reasons for their acceptance, and so on” (Rawls 1971, 19). Rawls argues that the human capacity to reason freely is fundamental to the existence of any legitimate social contract; i.e. the fundamental principles of social morality.

While Rawls’s reason remains a “monological” and theoretical construction, communicative ethics as developed by Jürgen Habermas and Seyla Benhabib offers a theory of justification, which positions reasoning in the practical social deliberations of agents with contextually formed interests. In other words, the fundamental idea of the communicative theory of justification is that norms should be proven by means of actual discourse that involves all those affected by the proposed norms (Habermas 1990).

If Anna and Maria would adhere to this kind of theory, they would not try to reason from outside of concrete social and political positions. What they should do, however, is organize the very deliberation in such a way that both of them have an equal opportunity and reciprocal duty to explain their view to the other. A justified view of gender equality is, thus, a view that both Anna and Maria accept within the framework of a just dialog.

Despite the many differences, all the Kantian positions presented above are variations on rationalism. Justification of moral judgment is explicitly linked to the exercise of reason. This rationalism is challenged by those who believe that moral deliberation, be it individual or social, is and should be conducted with attention paid to the emotional dimensions of moral judgment and moral action.

Defense of emotions as a tool for moral judgment and moral action can be developed in several different ways. Most philosophers, as well as most moral theologians, recognize the importance of moral emotions. According to Jesse Prinz, there are mostly two meanings of such a term. It can refer to either emotions as a dimension of moral judgment or emotions as a dimension of motivation (Prinz 2010, 520). The view that emotions are involved in motivating moral behavior is relatively uncontested. How, then, can emotions be understood as an instrument for moral judgment and moral justification?

We have already discussed two positions – emotivism and expressivism – that interpret emotions and sentiments as constitutive for moral judgment. In her *Upheavals of Thought* Martha Nussbaum offers another approach, a neo-Stoic account of emotions as an instrument for moral judgment. Nussbaum's position should be interpreted as a critique of the rationalistic ethic. This ethic, according to Nussbaum, underestimates what she calls the personal dimension of moral judgment. Contrarily to such a rationalism, "[...] emotions look at the world from the subject's own viewpoint, mapping events onto the subject's own sense of personal importance or value" (Nussbaum 2001, 35). Additionally, Nussbaum believes that a Stoic interpretation of emotions as "evaluative appraisal of the world" is plausible in that it does not view humans as strangers in the animal world. Rather it can include non-human animals into moral considerations (Nussbaum 2001, 125).

At the same time, Nussbaum understands emotions as a kind of reasoning, a dimension of practical reason (Nussbaum 2001, 3). In order to grasp this dimension, she engages in an enquiry of European literature and argues that moral emotions include not just a cognitive component, but also can be critically approached and developed. How is it possible to critically approach different emotions in a social space? If emotional judgment is based on unique points of view of different subjects, how can we discuss their plausibility? Nussbaum seems to regard pluralistic societies as granting all citizens basic entitlements of opportunities for functioning (capabilities), which offers a platform for such a critical evaluation. The belief that capabilities should be secured is, in her view, the core of morality. Emotions help us to understand that a loss of capabilities would be a tragic loss of humanity.

Nussbaum's theory of emotions as a crucial dimension of moral judgment is thought-provoking. It rightly emphasizes that moral judgment is related to such points of view that involve our personalities – on the mental as well as the bodily level.

However, it's believed that, like emotivism and expressivism, it lacks tools for dealing with substantial moral disagreements. The main challenge to emotion-based theories of practical reasoning is the fact that normative differences, if expressed in terms of emotions, are highly contextual, even personal, and difficult to scrutinize. Emotions, such as anger, empathy, or disgust are not entirely conscious, they are related to contingent personal conditions, and difficult to approach in a transparent way. Even

in a pluralistic society with a high level of tolerance, there are important moral disagreements that demand a procedure for moral judgment that are transparently interpersonal.

Moreover, it has been questioned whether there are emotions that can be classified as “moral emotions.” We agree with Jesse Prinz who argues that “[m]oral emotions seem either to serve additional functions that are not moral or derive from emotions that are not moral” (Prinz 2010, 535). If Anna in our scenario gets angry at Maria’s take on equality, what is it that makes her anger moral? It is believed that it is the object of the emotion rather than some inherent component of it that deserves to be described as moral. This “object” brings us back to a more traditional view of practical reason. In order to deal with the very moral judgment about the meaning of equality, Anna and Maria need to engage in a process of justification – exchange reasonable and inter-subjective arguments. Emotions can or even should be present in such an exchange. However, they cannot replace it.

CHAPTER 9

Feminist Epistemologies

Morny Joy

Introduction

Since its beginnings in Greek philosophy, epistemology has had a strong influence on much of the Western world's reflective exercises. Epistemology is concerned with the theory of knowledge, insofar as it examines aspects of human thought, especially reflections that involve the scope, methods, and implications of human reasoning. The relation of reason to human activities is of prime importance, especially because of its strong influence on ethical ideals and conduct. The Greek legacy also includes virtue ethics with its emphasis on the fostering of a good life. Traditionally, morality has been more concerned with issues of behavior, regulating the approbation and implementation of human actions.

In recent years, however, epistemic issues have become a topic of heated debate. Since the second wave of feminism, women have realized that, over the centuries, they have not been accorded due respect and/or equal status with men in matters of philosophy, religion, and politics. Many women have contested the accepted disparity in the relationships of men and women. The resultant feminist activism has inspired the development of feminist epistemologies. This entry will focus principally on the work of such feminist scholars as they introduced unanticipated changes in both philosophy and religion.

It will provide a short overview of recent developments in the late twentieth and early twenty-first centuries when feminists undertook to challenge the disregard and even belittlement with which their contributions to philosophy, philosophy of religion, and theology have been treated. Traditional values and morals have since come under severe scrutiny with the evaluation of long-held attitudes and beliefs. At this stage, a basic definition that distinguished ethics from morals would describe ethics as initiating a teleological aim, for example, an aspiration to live a good life. In turn, however, according to societal rules, such an ambition needs to be assessed according to a moral norm. However, women have come to realize that such ideals and practices have not been particularly propitious for them. The impact of the term “gender” employed in both ethics and morals has also had ground-breaking consequences. Formerly, it had simply been used as a grammatical attribution, but now women scholars, such as Joan Scott ([1988] 1999) began to employ “gender” to disassemble the basic meaning of the term.

The first female protesters in the late 1960s and early 1970s began to confront the disparaging attitudes displayed by male philosophers in their rebuttals of women's attempts to be recognized as proficient scholars in their disciplines. Astute women began to identify themselves as feminists in the study of religion, philosophy of religion, and theology. Feminist scholars of religion, such as Mary Daly ([1968]1985);

Rosemary Radford Ruether (1967); and later Elizabeth Schüssler Fiorenza (1983) all expressed their dissatisfaction with the major role that religion had played, with its hierarchical structures and dismissive fiat, in the debasement of women. These women's thorough research exposed the injustice that women had suffered, though they did not expressly address what today is named "epistemic issues." This is a term that refers to whether our perceptions might possibly be fallible. These women were more concerned with investigating the dynamics of power and control that had excluded them rather than debating empirical problems about potential irregularities.

The publication of a volume, *Feminist Epistemologies* (Alcoff and Potter 1993), introduced an in-depth examination of the then most recent philosophical developments. It also marked the naming of a number of feminist epistemologies: feminist standpoint theory, feminist empiricism, and feminist postmodernism, though their respective approaches were not necessarily compatible. Only in the last twenty years have terms such as "epistemic responsibility" and "epistemic ignorance" been admitted into the lexicon of terms that identify epistemological misconceptions that were responsible for the dismissal of women. In 1998, Pamela Sue Anderson's book, *A Feminist Philosophy of Religion* appeared, providing a rigorous analysis of the situation at that time, including a request for a much-needed overhaul of dogmatism in both philosophy of religion and theology. Anderson's own work had also been influenced by the writings of feminist philosophers, most especially Miranda Fricker. It is such foundational treatises that first need to be acknowledged. Anderson's later recommendations for further innovative reforms in philosophy of religion will then be considered.

One of the more interesting facets of the early investigations of epistemology was the lack of the term "morality," and any in-depth analysis of its effects on women among secular feminists. Many feminists were convinced then that such discussions as morality did not belong in philosophical circles because of their traditionally restrictive rules for women. Religiously oriented women were also initially reticent because they feared harsh retribution. Nevertheless, later volumes did begin to appear such as: *Caring: A Feminine Approach to Ethics and Moral Education* (Noddings 1984); *Moral Boundaries* (Tronto 1993); and *Feminist Moral Philosophy* (Brennan 2002). In a number of these books, ethics and morality were understood as being mutually interactive.

Epistemic Interventions

One of the first philosophical books to alert contemporary women of their inferior status in philosophy was Genevieve Lloyd's *The Man of Reason: Male and Female in Western Philosophy* ([1984] 1993). Lloyd was one of the first women philosophers to introduce what could be regarded as a form of epistemological criticism that questioned the strong connection of rationality with modalities of masculinity. In the Preface to the second edition of *The Man of Reason*, Lloyd focused on the relationship between minds and bodies and their connections to symbolic representations of men and women (Lloyd 1993, xii–xv). In investigating this link, Lloyd undertook a philosophical journey that extended from Plato and Aristotle to Spinoza, Bacon, and Descartes, reviewing their attitudes toward women. Lloyd's initial reflections on the Cartesian division of mind and body that also symbolized the distinction between reason and its opposites were crucial (Lloyd 1993, 39–52). Her concern continued with further explorations of the views of Hume, Rousseau, Kant, and Hegel. These results revealed similar divisions between male and female anatomy that presumed women as deficient in reason, thereby relegating them to a subordinate role.

Lloyd's own diagnosis was that male domination had led to the standardization of reason. Such standardization effectively sanctioned philosophy as being a product entirely supervised by men (Lloyd 1993, 108). This was indeed a striking indictment, and Lloyd then suggested a number of remedies that could assist in amending such an imbalance. One of these proposals appeared near the end of the first edition of *The Man of Reason*. Lloyd remarked that if a wide diversity of human behavioral patterns, which encompassed both private and public spheres, were to be made accessible to everyone, sexual difference would no longer be held responsible for the harmful stereotypes that have damaged both men and women (Lloyd 1993, 106–107). Lloyd also indicated that such a move would help to mitigate the stark binary division that had informed the requisite conduct expected of both men and women.

In her Preface to the second edition of *The Man of Reason* (1993), Lloyd further expanded her observations in response to criticisms of her views in the first edition. While Lloyd conceded that the metaphor of “maleness” still remained entrenched as a hallmark of reason, she deliberated how to reform “the male-female distinction” (Lloyd 1993, x). She was adamant that she did not equate men literally with rationality; rather, it was basically a metaphorical association. Lloyd also made it clear that her intention was not to idealize or essentialize women. In addition, Lloyd also rejected the separation of “sex” and “gender,” which she viewed as simply another format of Cartesian dualism.

It was quite obvious that Lloyd was more interested in exploring the dynamics of the symbolic influences of maleness and femaleness that had become implicated in philosophical works from Plato to the present. Her explorations have helped discern how such symbolic effects can influence the way that human beings identify themselves as male or female (1993, xi). In making such a move, Lloyd's work raised many important issues that were vital for the early stages of feminist philosophy. As a pioneer in feminist philosophy, Lloyd can be credited as laying the foundations for what would, in time, develop into feminist epistemological criticism.

Another important feminist advocate was Canadian philosopher Lorraine Code, whose earliest publication was an article, “Is the Sex of the Knower Epistemologically Significant?” (Code 1981). This article was described by Code herself as an “outrageous question at the time” (Code n.d., 1). The responses she received were mixed. Nevertheless, Code pursued her query, which later featured in what was perhaps her most influential book, *What Can She Know? Feminist Theory and the Construction of Knowledge* (Code 1991).

Code also reports that another early publication, *Epistemic Responsibility* (1987), had an extremely negative reception and soon went out of print; it has since been reprinted. Yet Code does not hesitate to state that “epistemic responsibility” has been a central element, even if tacitly, in all her work (Code n.d., 2). Code states that this concept introduced crucial ethical and epistemological issues. She also affirms that it supports the focal elements of her own work: epistemology, ontology, ethics, and politics, in addition to what she terms “everyday life” (Code n.d., 2).

Code appraised the orientation of her work from 1981 to 1991 in a retrospective article, “Ignorance, Injustice, and the Politics of Knowledge” (Code 2014). Here she concedes that, while feminist philosophy evolved slowly, definite progress had been made, including quite radical and innovative ideas. Subsequently, these developments helped to remove many of what Code regards as the sexist, racist, and classist obstacles that had previously impeded many potential women knowers. Nonetheless, Code admits that she has become seriously concerned about the recent reassertion of the political right, which aims to reintroduce its own brand of androcentricity.

In this context, it is telling that one of the topics that has preoccupied Code throughout her work is what she terms the “S” word, as in the statement “S-knows-that-P.” She is particularly concerned that

what she describes as “S’s subjectivity” continues to be accepted as a staid white male (Code 2014, 150). At the same time, any attempt to introduce “S” as a female, identifying details such as her sex, gender, or location, is regarded as a perilous fall into subjectivism, thereby canceling out any chance of objective knowledge. Code worries that the dominance of objectivity still surfaces in Anglo-American philosophy with its focus on individualism. Such a stance, according to Code, would indicate a severe case of what she names “epistemic ignorance.” Her graphic depiction of this bias emphasizes its negative applications, where it is regarded, not simply as a deficiency, but as defining a position that is unequivocal in its rejection of knowledge itself (Code 2014, 154).

Code extolls the appearance of social anthropology as a mode of studying cultural behaviors. It came to the rescue when, in her early career, there had appeared to be no conceptual means available for her to articulate and discuss “epistemic responsibility.” Code also praises Helen Longino’s *Fate of Knowledge* (2002) for providing an approach that helped her to incorporate social elements at the same time as allowing that rationality could maintain its deliberative faculty (Code 2014, 151). Such support helped Code to explain the meaning of an “epistemology of ignorance” as well as issues of “epistemic injustice” in her teaching. Another positive impression that Code acknowledges is the progress made by both moral philosophy and psychology. By introducing such difficult issues, involving gender, race, sex, and location, Code’s work stimulated a deepening awareness that specific subjects, especially those connected to immutable moral judgments, needed a thorough re-evaluation (Code n.d., 3). Many of the issues that Code had raised over the years, together with her delineation of their epistemic effects, have helped to disassemble the barriers that had separated epistemology from ethical, moral, and political interchanges. Code also helped to establish a model of human knowledge that could accommodate both ethics and politics. Further advances in epistemic inquiries ensued. Ever vigilant herself, however, Code recommended remaining alert so as to prevent threatening incipient movements with their hostile and fallacious intentions.

Amanda Fricker and Epistemic Injustice

In her 2014 article, Code introduced the work of British philosopher Miranda Fricker, whose book, *Epistemic Injustice: Power and the Ethics of Knowing* (2007), further advanced the epistemic conversation. Code praises Fricker’s own careful analysis of “epistemic ignorance,” acclaiming it as a major breakthrough. Fricker explains her motivation for enlarging on this concept. In reflecting on what she calls “epistemic pluralism” and its relation to the social world, Fricker states that she determined if one social group’s epistemic position is defeated by another group who exercises greater strength, it is patently obvious that an act of injustice has been committed (Fricker in Dieleman 2012, 254). Such an observation indicates that Fricker is intensely engaged with the dynamics of power and its negative disjunctions.

At their core, Fricker’s explorations are concerned with “dysfunctional” issues, especially those that illustrate a spectrum of deprivations experienced by human beings. The consequences of such experiences can be damaging for both mind and body. Fricker cites ethnic minorities and women as groups that are particularly vulnerable. She admits her dismay at the various repercussions of epistemic injustice, and recommends a concerted effort be undertaken to help heal those who have been ignored and left in distress. Fricker’s own suggestion, in addition to exploring the effects of the two main categories of “epistemic injustice,” which she names, respectively, “testimonial injustice” and “hermeneutic injustice,” is

an appeal to a restorative Aristotelian mode of virtue ethics. She proposes that such a practice would be undertaken principally by those who have caused the distress, though it also has wider intimations.

In explaining the first category of epistemic injustice, “testimonial injustice,” Fricker views it as happening on a personal level, when people, who are in need of help from others, are rejected as a result of prejudicial or discriminatory classifications (Fricker in Dieleman 2012, 257). The second category, “hermeneutic injustice,” applies to structural impediments that can compromise a person’s articulation of a problem. In this instance, Fricker describes the graphic example of a woman who has been sexually assaulted and is incapable of describing her experience. The woman’s lack of words reflects the fact that her experience occurred at a time when the term “sexual harassment” had not been recognized as a concept (Fricker in Dieleman 2012, 257).

In keeping with her recommendation of Aristotelian virtue, Fricker states that such virtuous cultivation can help restore balance. Yet there are scholars who have registered concern about this move. While Rae Langton’s review of Fricker’s book *Epistemic Injustice* (Langton 2010) confirms Fricker’s observation that epistemological virtues can be just as necessary and effective for moral virtue as they are for ethics in a more restrictive sense, she remained troubled. It is not as if Langton rejected either ethical or moral virtues *per se*, as she did not have any trouble in admitting her respect for Aristotelian virtue ethics. Langton’s concern is whether such a mode of virtue as “testimonial justice” is sufficiently robust to heal what has been a traumatic experience (Langton 2010, 462). She describes the experience of a woman who has been “epistemologically damaged” and suffers “a credibility deficit” (Langton, 461) as virtually incapable of the refined moral insight and perceptiveness that Fricker recommends for such a task. Langton’s immediate question to Fricker is whether the two categories of epistemic injustice can be successfully healed by the application of the two epistemic virtues.

Fricker does respond, admitting that she had initially determined to concentrate on the complications of the ethical when it interacts with epistemic categories. However, Fricker has since become aware that any such explications would also need to include political engagements in addition to ethical elements. Conceding that she is a newcomer to political philosophy, Fricker declares that these matters will be subject to investigation in her future writings (Fricker in Dieleman 2012, 259). This development, however, is beyond the scope of the present project.

Fricker’s continued work on “epistemic injustice” has inspired many other scholars, including female scholars of religion, such as the late Pamela Sue Anderson. Anderson elaborated on Fricker’s foundational position on the need for epistemic justice. She also endeavored to incorporate certain innovative developments about “epistemic ignorance” in the study of religion and morals. Anderson’s reflections, with its epistemic ethical ideals, introduced an innovative dimension of reflection to their connection with religion.

Pamela Sue Anderson on Love and Morality

In one of the chapters in her book, *Re-visioning Gender in Philosophy of Religion: Reason, Love and Epistemic Locatedness* (2017a), entitled “Gendering Love in Philosophy of Religion,” Pamela Sue Anderson reflects on the proposition that “the identities of women and men have been shaped sexually, socially, spiritually and ethically by philosophical conceptions of love and morality” (2017a, 89). This observation leads her to examine her own views on these topics, given their development during the

course of her academic career. Anderson deliberates about love and morality as they are regarded currently, where they still exert a strong influence on theory and practice. Yet, in such changing times, there are many other issues to address that can render any such reflections and debates especially controversial. Given Anderson's status as a leading feminist philosopher of religion, it is not surprising that she states that most philosophical reasoning is not particularly effective when it comes to making decisions about topics that involve religion, sexuality, gender, race, and ethnicity (2017a, 89). Anderson has contributed many impressive judgments on the status of women in religion and on the obstacles that they have encountered. As a result, it is particularly instructive to undertake a review of Anderson's own considerations, both negative and constructive, on certain of these issues.

It was during the early stages of her teaching career in both the United States and the United Kingdom, in the late 1980s and early 1990s, that Anderson became aware of the difficult situation of women who taught philosophy of religion. Although they were well-qualified, many found it very difficult to find and hold teaching appointments. Anderson then determined to focus on the areas of ethics and feminism in philosophy, including the epistemological issues. She was also passionately interested in certain topics that queried the rationality of religious belief. Anderson's concern in this connection was that the gender-neutral language and constructions of rationality totally excluded women's issues.

As a result of Anderson's numerous publications and presentations in this area, she was invited to publish her ground-breaking volume, *A Feminist Philosophy of Religion* (1998). In its *Introduction*, Anderson cautions the reader not to expect that she will present a new doctrine or belief, nor will she make a defensive move in support of a single god, or even celebrate a gathering of goddesses. Instead, Anderson's intention is to offer what she has called a "philosophical framework which can generate less biased, less partial, and so less false beliefs" (1998, 20). A tall order. Yet Anderson was living at a time when extraordinary changes were being implemented both by and for women in philosophy of religion, not to mention other disciplines. These innovations allowed Anderson and other women scholars to gain a deeper awareness of their ambitions. It also enabled them to question unjust or degrading experiences that had prevented them from attaining their goals. It is a formidable task to begin detailing Anderson's many contributions to the development of feminist philosophy of religion. The task at hand is to acknowledge a selective number of her achievements.

One of the more interesting explorations during the middle period of her work was Anderson's evaluation of contemporary morals. It made its first appearance in an essay entitled, "The Case for a Feminist Philosophy of Religion," where she observed the "deeply gendered – often sexist and racist – nature of our social and physical locations" (*Ars Disputandi* 2002, 4). In response to such a charge, Anderson began to implement a transformative mode of philosophizing in religion. This, she believed, would help to encourage an appreciation of the notions of sex/gender as well as the diversities of race, class, ethnicity, and sexual orientation. However, Anderson understood that this demanding task, with its goal of "epistemic justice," would not be able to be achieved without a definite epistemological strategy. This would involve "thinking from the lives of others, and reinventing ourselves as other" (2002, 3).

An early influence on Anderson's work was that of Sandra Harding and her approach of standpoint theory which strongly influenced Anderson to form her own understanding of a "feminist standpoint theory." Harding herself argues that "objectivity is maximized not by excluding social factors but precisely by 'starting' the process of inquiry from an explicitly social location: the lived experience of those persons who have traditionally been excluded from knowledge production (for example, women)" (1995, 193). Anderson qualified her understanding of Harding's theory by stating that one does not simply achieve this position by virtue

of being born a woman, nor by merely experiencing life from a woman's perspective. Instead, Anderson defined her own position as one that was an "epistemically informed perspective" that resulted from thinking about other peoples' lives. In adapting Harding's theory, Anderson formulated a specific understanding of "otherness." Anderson does not solely restrict standpoint theory to women but expands her range to embrace all, though her own particular focus is that of women. In this connection, Anderson also observes that women may also have been oppressed by harmful rules of rigid doctrine (2002, 6).

Anderson, however, had other aspirations that were wide-ranging. Her attention was directed to alleviating people's suffering resulting from what she regarded as imposed strict moralistic rules and doctrinaire intrusions. In a 2003 article entitled "Autonomy, Vulnerability, and Gender," Anderson declared her intention was to resist what she regarded as a severe form of utilitarian ethics that had prevailed in recent moral theory. She also suggested that feminist ethics should undertake a serious re-reading of modern moral philosophy and critically address its defects. Another recommendation Anderson introduced was a gendering of autonomy. Such a task did not imply separate gendered roles or total independence. It was an indication that Anderson regarded Kant's view of autonomy as being only partially correct. In its place, Anderson would support Paul Ricoeur's construct of narrative identity as supplying a form of "fragile coherence" (2003, 153).

In 2004, however, another article by Anderson appeared, entitled: "'Moralizing' Love in Philosophy of Religion." (It was later revised and republished as Chapter 5 in Anderson's final book, *Re-visioning Gender in Philosophy of Religion: Reason, Love and Epistemic Locatedness* (2017a). However it then appeared with a different title: "Gendering Love in Philosophy of Religion.") There were a number of differences between the two essays but, the most crucial items in both articles were "love" and "morality." These terms would guide Anderson in a new direction. In the initial essay, there was a definite negative quality associated with what Anderson had termed the "moralization of love" (2004, 227). Anderson explains how she understood this term: "Moralizing can imply an imposition of moral judgment onto a non-moral phenomenon, or the intrusion of moral concerns where they do not rightfully belong" (2004, 227). She also questioned if feminist philosophers were to make a moral judgment or simply suggest a problematic issue about a moral topic, for example, love in philosophy, could they also be accused of moralization? In time, Anderson would respond more fully to these subject matters. Her central concern at this stage was that certain philosophers had declined to foster love as part of becoming "fully embodied human beings" (2004, 228).

Anderson then added another personal insight, stating that, when pure reason is associated with "moralization," it could lead philosophers astray. In fact, "the moralization of love" implied that reason would take control of emotions, instead of approving of emotions such as love. Other results Anderson mentioned were also not reassuring. She tried to question such resistance by asking: "What would be the relevance of 'moralizing' love and personal pledges in contemporary philosophy of religion?" At that period, there were obviously no clear-cut responses. Anderson herself stated that human love can indeed be messy and that its unpredictable episodes had probably instigated the call for control or "moralization." While Anderson was well aware that other attempts at integration of the two entities love and philosophy had failed, she still intended to introduce such an approach to the study of women and religion. This is because Anderson had realized that strict Enlightenment reasoning need not be automatically approved as supplying solutions for problematic cases, including religious disputes. Anderson was aware that other approaches, such as that of vulnerability, also provided constructive insights that needed to be explored.

Conclusion

Unfortunately, Anderson's life was cut short and she did not have time to complete her other exploratory ventures in great detail, principally that of "vulnerability." Her final article, "Arguing for 'Ethical' Vulnerability: Towards a Politics of Care" (2017b), revealed a number of Anderson's most recent discernments, addressing the seemingly unattainable reunion of love and morality. Anderson also divulged a number of her thoughts about the impasses that continued to trouble her. Both of these declarations witness to the difficulties that would have lain in wait ahead of her intended undertakings. The following paragraphs constitute a short overview of Anderson's proposals that she hoped could transform the divisiveness between philosophy of religion and a reanimated understanding of morality. These proposals represent a challenging addition to the projects informing Anderson's final research, where vulnerability and an ethics of care had become a central part of her philosophical and religious interests.

In explaining her views in these supplemental statements, Anderson nevertheless still appeared somewhat perturbed. Her own revisiting of "moralization," disclosed its continued "excessive moral demandingness" and also its connection with a form of "moral invulnerability," which she previously rejected (2017b, 149). In distinguishing "moralization" from "ethical," Anderson declared that she still had reservations about "moral" as potentially having an "unethical meaning" (2017b, 151). This suspicion can be traced to her earlier understanding of "moralization" as being a control mechanism, that can mislead people's attitudes toward marginal and vulnerable human beings. Nevertheless, morals, presented in a non-pejorative sense, would be something that she would welcome, if it were presented as a non-dogmatic and non-controlling element.

Anderson, however, does not depart on a pessimistic note. She affirms a revised meaning of "ethical vulnerability" as a positive introduction toward others. The result is that vulnerability can co-operate with an "ethics of care" and an "ethics of justice" to help diminish the fragility of human beings. At the same time, Anderson attests that "ethical vulnerability" can also provide a space that has a restorative influence on those who have been wrongly excluded. Finally, Anderson's expansive orientation allows that care, epistemic justice, and love could prevail.

These concluding remarks about Pamela Sue Anderson's work are in keeping with the other powerful women who are philosophical pioneers, Genevieve Lloyd, Lorraine Code, and Miranda Fricker. They have all contributed their own wisdom and concern to help establish a form of feminist epistemological knowledge. These women have proposed advanced new ways of insight. As a result, women have gained acceptance and respect that encourages them to continue their pursuit of wisdom unimpeded.

CHAPTER 10

Natural Law

Elisabeth Rain Kincaid, Ebenezer Akesseh, and David A. Clairmont

Introduction

Philosophers and religious thinkers concerned with moral theory have long been interested in the moral significance of nature. From ancient times, people have wondered about the relationship between human life and the rest of the natural world. Does the natural world hold some useful knowledge that can, if accessed and used appropriately, help people to live a good and fulfilling human life? What exactly is our human nature, how can we know it, and what if anything does it teach us about leading a good and fulfilling life? Does the human capacity to reason mean that we are basically freed from the constraints imposed on us by our animal natures? Through reason might we be able to discern our true nature and purpose and act in accordance with it or are we free to determine our own natures and purposes through reason? Do nature and reason have any role to play in organizing human societies and establishing appropriate rules and forms of governance? These and other questions are at the heart of debates in moral theory but these questions also are deeply religious questions. Is the world random or purposeful? What if anything establishes that purpose? Are we free to select our own purpose or is that purpose, and the particular choices we make to fulfill that purpose, governed by some source other than ourselves?

Natural law is one approach to thinking about the moral life that offers answers to these questions. Although one finds a diversity of interpretations about the meaning of natural law and the extent to which it offers specific guidance for making moral decisions, natural law approaches agree that there exist at least provisional answers to these questions which establish some meaningful connection between human nature, the wider natural order, and the use of human reason to guide the moral life. Natural law is a deeply interdisciplinary topic, rooted in philosophy, theology, and law but also in the natural and human sciences, affecting discussions in the fields of politics, economics, and comparative religion among many others.

Natural Law and Moral Theory

Natural law approaches to ethics stress the power of human reason to discern naturally existing (so called “pre-rational”) goods that all human beings share and to examine how those particular goods relate to the proximate and ultimate purposes of human life. Jean Porter has offered a useful summary of what natural law approaches have in common. She writes that “There have been many forms of natural law morality,

including both moralities that stress the intrinsic moral significance of pre-rational natural processes, and those that ground it in the exigencies of reason. What these have in common, however, is a view of morality which grounds it in intrinsic, ordered structures of being, in contrast to approaches that emphasize authoritative will” (Porter 2005, 229). Natural law approaches to ethics affirm that the natural world and human beings as a part of the animal order are intelligible, that living ethically involves at least some knowledge of those intelligible structures and a resolve to live in fitting response to them, and that it is more or less reasonable to speak of basic goods and purposes of human life as such. Different kinds of creatures have different purposes and these purposes may be known inductively through the study of the kinds of capacities that characterize each kind of creature and the ability of each creature to reach a certain level of flourishing to the extent that its basic capacities are actualized.

In discussions about moral theory, natural law has traditionally been classified as a kind of moral realism. As Maria Antonaccio explains, “In its strongest (traditional) form, moral realism holds that moral facts exist independently of our beliefs and theories about morality. . . that is, independently of our “mental machinery” or our cognitive frameworks” (Antonaccio 2005, 29). As one version of moral realism, natural law theories hold that what is real, what is natural, and what is moral are somehow related. One topic of debate among natural law theorists is exactly how these three aspects of reality, nature, and morality are related. To give one example, those who would affirm some religious basis for natural law must reconcile potentially contradictory claims that a creator god who instilled in human beings a power to reason and therefore to know something about what constitutes their own basic goods and the fullness of their flourishing could in theory command something that is against that good. Yet this traditional opposition between divine command and natural law approaches can be reconciled in a number of ways. As Neil Arner explains, “some philosophical theologians are turning to natural law theory to handle the objection that the typical Protestant approach to ethics – some form of divine command theory – makes morality arbitrary. According to standard divine command theory, it is God’s prescribing humans to act in a discrete manner that constitutes the rightness of the behaviour enjoined. Critics of this theory, who are often advocates of a natural law alternative, object that God’s commands bear no necessary connection to the wellbeing of humans” (Arner 2016, 377). As Arner goes on to explain, some who might otherwise worry that natural law does not sufficiently guard against eroding the sovereignty of a divine creator and lawgiver, are still open to “an account of natural moral goods that provides a criterion according to which humans can ascertain the goodness promoted by obedience to divine commands” (Arner 2016, 378). Yet there exist both religious and non-religious forms of naturalism in ethics. Those who reject a religious perspective from which to evaluate the moral status of the natural, for example in some versions of utilitarianism and virtue ethics, still look for ways to link the natural with the moral in ways that do not assume that what occurs naturally is itself moral. Whether through rational utility maximization of naturally occurring goods or judgments of self-interest (Singer 2000), or in developing human capacities to pursue characteristic forms of human excellence through rational ordering of premoral goods (Nussbaum 1986), the ethical significance of the human connection to the natural world remains.

Natural Law – A Short History

Both Plato and Aristotle ground much of their philosophical speculation in a clear sense of some type of ordering principle of reason governing the universe. Although both of them use the phrase “natural law” itself only in a few scattered instances, this conception of ordering principles of reason appears

throughout their works. Plato establishes a relationship between the form of the good and order in the universe in the *Republic*. In a similar way, Aristotle identifies natural standards of justice, which are applicable everywhere and not established by human decisions, as opposed to legal justice which is established by local practices and only applies in a specific community (Aristotle, *Nicomachean Ethics*, 5.7). Aristotle's naturalistic theory of the human good and happiness in accord with human nature would also have an important impact upon the development of natural law theory. In early East Asian philosophy, Confucius shows a similar conception in his discussions of social harmony. In the Hebrew Bible, the creation narrative in Genesis, ending with God's evaluation of creation as "very good" provides a more explicitly theological description of the principles of good and order within the universe. The creation of humans in God's own image, usually interpreted to include the capacity for reason and seeking the truth, demonstrates the human capacity for engagement with God's ordering of the universe. In the book of Wisdom, wisdom as "a breath of the power of God" is described as a spirit which "pervades and penetrates all things" again conveying a sense of the intrinsic order of the universe, grounded in God's creative activity but intrinsically good in and of itself (Levering 2012, 63).

However, the explicit theorization of a "natural law" did not develop until the philosophy of the Stoics. In *De Republica*, Cicero provides a Platonically influenced analogy comparing the universe to a commonwealth, and describing natural law as the "one eternal and unchangeable law," transcending time and the same "at Rome and at Athens" (Cicero 2006, *De Republica*). Philo provides a similar description. Both Cicero and Philo ground this natural law in a theory of transcendent divine reason, in short a divine law giver. In Philo, we see an explicit connection between the development of this concept and the Hebrew Bible, especially the creation narratives in Genesis and the laws of Moses, which, while not always identical with natural law are always complementary and harmonious (Sterling 2016). While the historical assumption, dating back to Ernst Troeltsch, has been that the Greek concept of natural law had a greater influence than the Hebrew Bible on the development of a more explicit theory in the Pauline corpus, recent scholarship has indicated a development of the natural law theory within the Mediterranean world that consisted of a cross-fertilization between Jewish and Greek sources in discussing natural law (Horsley 1978). In St. Paul's reference to the law of the Gentiles in Romans 2:15, he argues for God's justice by claiming that the Gentiles have a law within themselves "by nature" which guides them in discerning in their conscience whether their actions should be condemned.

Most significantly in the patristic period, Augustine engages with St. Paul's theory of natural law to argue that Paul means that natural law provides every person with some access to a natural understanding of morality. This common moral knowledge is not even over-ridden by the different orientations and different loves which Augustine identifies as governing the true city. The natural law can still perceive the goods of society which direct even in an incomplete way to the earthly peace which both the heavenly and earthly city share. Thus, Augustine viewed the natural law both as an intrinsic principle of order as well as an order given by the divine creator and ruler, God's eternal law springing from God's wisdom and will (Augustine 1998). In the medieval period, Aquinas brought together scripture, Aristotle, and Augustine in a grand synthesis which set the terms for the discussion until the present day. His contributions are notable for his emphasis on the rationalist rather than voluntary establishment of natural law, as well as his emphasis on the role of natural instincts and the goal of establishing natural happiness (Porter 2005).

In contrast, Duns Scotus (1997) presents a more restricted view about humans' epistemological access to the natural law and how it relates to the will of God than Aquinas. Whereas Aquinas argues that all the of the precepts of the Decalogue are encompassed in the natural law, Scotus argues that they are

simply aspects of divine positive law, which follow from the principles of the natural law but are not required by it. This means that God can grant exceptions to them, or in fact make them non-binding. According to Scotus, “God can act otherwise than is prescribed not only by a particular order, but also by a universal order or law of justice, and in so doing he could still act ordainedly, because what God could do by his absolute power that is either beyond or runs counter to the present order, he could do ordainedly” (Ord. 1.44). This also is related to Scotus’ voluntarist claims, which ground God’s issuance of the natural law in God’s will and total freedom, rather than in God’s determination about what is best. Ockham develops the claims of Scotus further to argue that God’s establishment of right reason which undergirds the natural law could have been otherwise, in fact it is completely dependent on God’s will and God could change what constitutes a human’s good, despite the imperatives of human nature. Out of this nominalist/naturalist debate arose important questions about the nature of obligation and law which were to inform later natural law theory. Is there such a thing as intrinsic moral rightness and order which is expressed in natural law or does natural law’s authority depend upon only the command of an authoritative legislator?

In the early modern period, natural law theory was developed in several different important directions. The scholars of the School of Salamanca, such as Vitoria, de Soto, and Suárez used natural law theory to oppose the abuses promulgated by the Spanish Empire in the New World. Francisco Suárez also developed a theory of natural law which upheld the concept of intrinsic goodness while also emphasizing the importance of the legislator. Many theologians of the Reformation did not abandon natural law theory, but also continued to engage with the scholastic questions stemming from Aquinas and Scotus related to natural law. Looking across the Reformation traditions, Calvin, Melancthon, and Hooker reject the extreme voluntarist positions and return, in various degrees, to emphasizing the intrinsic principles of order of the natural law, along with God’s legislative action in establishing it (Irwin 2011). Calvin, for example, incorporated natural law in his theory of the three uses of the law.

However, later developments of natural law were characterized by a shift, whether intentionally or not, away from the divine basis of natural law and the Aristotelian naturalism which characterized the Thomistic approach to a more secular understanding grounded purely on the capacities of reason. Both Thomas Hobbes and Hugo Grotius describe natural law in more secular terms, as not necessarily dependent upon God but rather natural functioning and determined through reason alone. Grotius develops this account to provide a grounding for a theory of international law and rules governing conduct on warfare, all of which he hoped could contribute to peace in a warring Europe. In addition, Grotius is also often credited with the most decisive shift and development from a theory of natural law as an objective standard to a subjective approach based on a concept of individual rights. Hobbes was also motivated by a desire for peace. However, where Grotius’s natural law theory was more aligned with theories of political liberalism, Hobbes turned instead, in *Leviathan*, to natural law theory to underlie the theory of the autocratic government he felt necessary to preserve peace. He describes two tranches of natural law, the first to seek peace and the second self-defense. In seeking peace, a person may surrender her liberty or even natural law right of self-defense to a supreme ruler, the Leviathan, capable of keeping peace in the kingdom (Hobbes 1996, Ch. 14). For both of these authors, the natural law is no longer about seeking a vision of the common good but simply avoiding injury to others.

“Modern” natural law theory is often described as building upon this secularization instituted by Hobbes and Grotius, and exemplified in the work of Samuel Pufendorf and John Locke. Both Pufendorf and Locke separated further obligation from natural instincts and concepts of natural or supernatural

fulfillment. Both completed the voluntarist turn to argue that morality depended only upon law imposed as a command and emphasized the relationship between law and rational nature (Finnis 2004). According to some estimates, this turn to a purely rationalist and rule grounded theory of natural law reached its apex (or nadir) in the claims by Immanuel Kant in the *Groundwork of the Metaphysics of Morals*, where Kant attempts to reduce “all moral rationality to logic, but with the obligation imposed not by the will of God, but by ourselves” (Finnis 2004). A complete theological rejection of natural law followed a few centuries later, with Karl Barth’s resounding “Nein!” to a theological principle which, along with natural theology, he saw as grounded in idolatry.

However, the last seventy years have seen a resurgence of interest in a more classical Thomistic natural law theory, among secular thinkers as well as Protestants and Catholics. For example, the work of Jacques Maritain and others involved in the Thomistic renewal had a great impact upon the formation of secular doctrines of natural rights following World War II. Debates between neo-Thomists, proponents of the new natural law theory, and Thomists who take a more historical retrieval approach, have continued to generate literature and debate as well as reclaiming the original theological grounding of natural law theory. Protestants as well have sought to reclaim the Calvinist theories of natural law. In addition, revisions of Thomistic natural law in philosophical circles, as reintroduced by philosophers such as Elizabeth Anscombe, Peter Geach, Philippa Foot, and Alasdair MacIntyre have expanded the discourse and questions to bring in new audiences even from outside theological perspectives.

The history of the natural law must also account for how communities in the West have applied the natural law to their historical and social problems in the past and how the natural law tradition still offers ways of addressing the present conundrums that those communities face. Lloyd has argued for the relevance of what he refers to as black natural law in solving the manifestations of racial inequality faced by blacks in North America. He also proposes the method as useful for other communities which are riddled with various forms of injustices. In explaining the contours of black natural law Lloyd states, “Black natural law most centrally entails: ideology critique and social movement organizing. These are the responses that necessarily follow from proper reflection on human nature and its distortions” (Lloyd 2016, 146). Lloyd further notes that “Black natural law is embodied in African American tradition; it is the style of political engagement characteristic of that tradition. It is self-evident to poor black people that they are not who they are told they are on a daily basis, that the wisdom of the world is wrong” (Lloyd 2016, 159). In explaining the method of black natural law, Lloyd emphasizes that “black natural law has a distinctive way of identifying and prioritizing what counts as a social problem” (Lloyd 2016, 153). The process begins with “reflecting on how human nature is distorted by institutions, laws, and social norms” (Lloyd 2016, 146). It then critiques those institutions and norms using the natural law tradition. He also emphasizes the importance of practical wisdom and patience in constructions and implementation of black natural law (Lloyd 2016, 147–148).

Natural Law and Religious Ethics

Although natural law’s contribution to moral theory originated in the classical Western tradition and was developed with special urgency among medieval Christian thinkers, correlates both structural and substantial may be found in other religious traditions as well. Here we explore two: Buddhism in the Southeast Asian Theravāda tradition and African Traditional Religions (ATR) in the tradition of the Akan of Ghana.

While Buddhist scholars are, for the most part, reluctant to classify Buddhist moral thinking according to standard classifications in Western moral theory (Hallisey and Hansen, 1996), there are certain features of Buddhist thought and practice that suggest at least initially useful comparisons. For example, some have argued that Buddhist thought most closely resembles a form of utilitarianism while others suggest that Buddhism most closely resembles an Aristotelian virtue ethic (Keown 1992, 14–23; Harvey 2000, 40–46). Damian Keown offers a helpful interpretation of Buddhist approaches to ethics broadly understood in light of a number of issues in moral theory, noting that “Buddhist ethics is altruistic, a form of qualified absolutism, objectivist, naturalist, and teleological (but not consequentialist)” (Keown 1992, 23). Others, such as Sallie King, have suggested that we can offer additional comparisons if we select individual Buddhist thinkers whose ethical writings reflect some of the basic commitments of some rather than the full range of Buddhist writers.

Discussing the writings of the Thai Theravāda monks Buddhadasa Bhikkhu and Phra Prayudh Payutto, King suggests that we find “elements that express a natural law type of thinking” in their Buddhism, not to say that this is the only kind of ethical thinking to be found in the work of Buddhadasa and Payutto. According to King, “The idea of natural law is ‘the view that there is an unchanging normative order that is a part of the natural world’. . .contrary to the view that ethics are merely the invention of human beings, and contrary to the view that ethics derive from a supernatural source, God, natural law theory holds that ethics ultimately derive from the natural world. Thus, on this view, ethics are not arbitrary, nor conventional, nor culturally relative; they are part and parcel of the structure of the cosmos, hence universal and objective” (King 2002, 276). In this Buddhist view, the cosmos and all things within it exhibit three basic characteristics: they are impermanent (*anicca*), without an unchanging essence or self (*anatta*), and ultimately unsatisfactory (*dukkha*). As King puts it, “Rather than declaring that the natural world contains within itself a normative moral law, they instead see the natural world as containing within itself certain features that, when we understand the nature of sentient beings, mandate for us a set of ethical behaviors. Thus. . .while ‘good’ and ‘bad’ are not part of the structure of the universe, ‘skillful’ and ‘unskillful’ are certainly part of the human response to the way the universe is, and in this skillfulness and lack thereof lies morality” (King 2002, 277).

Like their Buddhist counterparts, some African scholars such as Bujo are also cautious of strict classifications of African ethics along Western categories. Odozor has argued that “African ethical method tends to be a mixture of many things: deontologist on some issues, teleological on others, and pragmatist when it matters” (Odozor 2014, 240). Akan understanding of natural law emphasizes the goodness of nature and the capacity of human beings to know the truth. As would be evident in the discussion below, the processes through which Akans come to know and live by the truth privileges creation and community, as two important interrelated themes which serve as foundational blocks for thinking through constructions of normative standards of what constitutes formulations of the good.

The Akan, like other African societies, believe in the Supreme Being as the creator of all that is. The notion that the universe is created and ordered by God guides how people relate to one another and to the created order. The Akan also affirm that human beings have a divine spark, the soul, given them by God. Hagan notes that the idea that “the individual is endowed with some essence, personality or identity derived from beyond community . . . is institutionalized in the Akan day names called *kradzɔn* (the soul name)” (Hagan 2010, 36, 43). This belief which implies that each person has an intrinsic worth that must be respected at all times has moral relevance both for the individual and the community (Gyekye 1996, 150).

Among the Akans, the community plays an important role in prescribing and proscribing what constitutes the good by taking into account what humans share with the natural world and what is proper to human beings. The members of the communities are required to preserve and protect life as well as refrain from acts that destroy life. Community members are also expected to understand that their flourishing is bound to the flourishing of their communities and their environment. The community helps the individuals to appreciate their roles by inculcating in them virtuous practices that respect the good which ought to be accomplished and the evil which should be avoided.

The relationship between creation and community is exemplified in the Akan understanding of justice. The word “justice” translated in Akan as *atenterenee* is made up of the words, *aten* which means judgment and *terenee* which means right and straight (Kotey 2007, 244). Majeed identifies another pair of words, *pɛ yɛ*, which explain the concept of justice. “*Pɛ*” means, equal and “*yɛ*” means, “to be” (Majeed 2014, 104). From the etymological considerations, the Akan concept of justice hinges on the notion of fairness or rendering others their due as demonstrated in right relations. This idea is rooted in the understanding that all humans created by God have an inherent dignity and, therefore, must treat others fairly and be treated equally and fairly. The standards of equity and fairness are laid down by the community with the good of both the community and the individual in mind and the individual through the processes of rational deliberation is expected to observe what is fair and just.

Conclusion

Natural law presents an approach to moral theory that is especially amenable to both multi-disciplinary and inter-religious inquiry. Natural law is not, as we have seen, coterminous with a description of the laws of nature although various religious and non-religious accounts do consider what, if anything, constitutes nature’s moral significance. As a version of both moral realism and moral naturalism, natural law seeks to understand not only the intelligible structures of human life and respond appropriately to them, it also seeks to understand the meaning and significance of widely shared social conventions and the history of the many culturally specific forms of legal, political, economic, and social-familial organization, insofar as these have contributed to or interfered with the authentic flourishing of human communities. As a religious approach to ethics, natural law seeks to understand how religious accounts of creation and cosmic order, redemption and suffering, relate to the human capacity for self-understanding and reflexive moral action and the trans-historical and intercultural quest for the human good, individually and in community with others.

CHAPTER 11

Divine Command Theories of Moral Obligations

J. Harrison Lee and C. Stephen Evans

A divine command theory of moral obligations, or DCT, maintains that moral obligations are caused by, constituted by, or identical to, divine commands. Although this view of moral obligations has historically been influential, since morality has seemed, to many, to have a “law-like” character, it has been widely rejected by modern philosophers and even theologians. The main reason for this is that the theory is often identified with “theological voluntarism,” the doctrine that God’s will determines all moral truths. Such voluntarism is often thought to imply that moral truths have an arbitrary character, a view incompatible with the seeming necessity of moral obligations.

Divine command theory has recently been revived and defended by such philosophers as Phillip Quinn, Robert Adams, John Hare, and C. Stephen Evans. The latter three have argued that it is a mistake to equate a DCT with theological voluntarism. These philosophers argue that God’s commands might be constrained by prior considerations about what is good – but not yet obligatory – for us to pursue. This view clearly rejects voluntarism, since it presupposes that there are truths about the good that do not depend on the divine will, and it allows them to respond to the charge that a DCT makes moral obligations objectionably arbitrary.

This entry surveys the present state of the debate surrounding the DCT, focusing especially on how it has been impacted by the aforementioned attempts to distinguish the theory from theological voluntarism. We will begin by exploring R. M. Adams’ “social theory of obligations,” an attempt to show that obligations in general – not just the moral ones – are grounded in relations between persons. Next, we will outline four central *desiderata* for theories of moral obligation and the ways in which a DCT arguably fulfills them. Finally, we will conclude by discussing several important objections to the DCT and looking at the strengths and weaknesses of replies to those objections.

The Special Character of Obligations: The Social Theory of Obligations

As already noted, a DCT differs from general theological voluntarism by denying that God’s will determines all normative truths. Instead, a DCT claims that God’s commands (God’s will insofar as that will is expressed or communicated) is the ground of one type of normative truth, those expressing moral obligations. For this to be plausible, there must be something special about moral obligation as a normative category.

Robert Adams has argued that all obligations, including moral ones, do have a distinctive character, and he has claimed that this special character requires us to understand obligations as linked to social relationships and institutions (Adams 1999, 231–248). For Adams’ defense of this social theory of obligations, see his *Finite and Infinite Goods*. Moral obligations is only one species of obligation. There are legal obligations, family obligations, and the obligations connected to joining a club, as well as many obligations linked to specific social roles and offices that people may occupy. A baseball umpire, for example, is obligated to call balls and strikes in a way that conforms to the rules of the game of baseball, a social institution.

Obligations in all these contexts have a special character. Semantically, as Adams argues, the concept of an obligation is linked to social responses. When I do not do what I am obligated to do, others may rightly blame me for my failure. They may reproach me or even desire that I be punished. Thus, a social theory of obligation holds that “having an obligation to do something consists in being required (in a certain way, under certain circumstances or conditions), by another person or a group of persons to do it” (Adams 1999, 242). This account of obligations also provides an explanation of why we have reasons to do what we are obligated to do, even if keeping the obligation does not lead to the best possible results. We should fulfill our obligations because of the value we place on the social relations that undergird those obligations. I ought to obey the laws of the state if I value being a citizen of the state. I ought to fulfill my duties as a husband or parent if I value those familial roles.

Of course, not all human obligations are moral obligations. Some obligations are in fact immoral in nature. For example, there are youth gangs that require members to carry out gratuitous violent acts against perfect strangers. Obviously, a government or private club or even a family might have systems of social requirements that go against morality at points. A person living in Nazi Germany might have had a legal obligation to discriminate against Jews, even though such discrimination is morally forbidden. The point is that obligations in general seem to be grounded in social relations in which people make demands of a certain sort on each other. If this is the case for other types of obligations, it seems plausible to think that it will be true of moral obligations as well.

If this is right, then what social relation or institution might be the basis of *moral* obligations? One might think that the moral demands made on a person simply are those made by other human persons. Perhaps, for example, to say that an act is morally forbidden is simply to say that it is one that other people will condemn me for doing. However, it surely cannot be the case that the judgments of just anyone will suffice. If I live in a racist society, and I am condemned by my peers for not being a racist, I am not violating my moral duties. In response, one might say that what matters would be the judgments of an ideal person, an “ideal observer,” who is completely good. However, if this “ideal observer” does not exist, it is not clear why the “demands” made by such an individual should have any force. A purely hypothetical being who does not exist cannot really make any demands, and it is not obvious why anyone should care about the judgments such a being *would* make, if that being existed.

The appeal of a divine command theory of moral obligation can now be seen. Briefly, such a view says that moral obligations are grounded in the demands made by God, understood as a necessarily good being who is the creator of the universe. Since God is actual, not hypothetical, he can require things of humans. Since God is completely good, his requirements, unlike the requirements of a human politician or gang leader, will always be for the good. Theists from the Abrahamic faiths typically believe that God, as the creator, has given humans every good they have, and thus humans owe God an enormous debt of gratitude. Theists usually believe as well that God desires to have a relation with humans that makes it possible

for them to enjoy eternal life and happiness. It seems then that humans would have very good reasons to value a relation with God, and thus reason to care about God's requirements for such a relationship.

The Case for a Divine Command Account of Moral Obligations

The Desiderata

One of the appealing features of the DCT is its ability to persuasively satisfy four central *desiderata* for any theory of moral obligation: objectivity, authority, motivation, and universality. Defenders of a DCT typically argue that a DCT offers a better explanation of how and why morality has these features than do rival theories. Our discussion of the desiderata for theories of moral obligation and how the DCT fulfills them draws heavily on Evans (2013, 29–32).

Objectivity

Moral obligations are traditionally regarded as objective. On this understanding, whether we are morally obligated to perform an action is not a function of whether we believe or desire ourselves to be so obligated. Rather, our moral obligations come as it were “from the outside.” Thus, we have many moral obligations regardless whether we believe in them and regardless whether we want to comply with them. For example, under ordinary circumstances, a father is morally obligated to take care of his children whether he recognizes it or not and whether he wants to or not. And, according to a common way of developing this traditional, “objectivist” outlook, everyone is obligated to refrain from certain “intrinsically evil” actions like murder, theft, and adultery, regardless our subjective attitudes towards these types of actions.

Authority

Moral obligations provide authoritative reasons for action. Once an agent has realized he has a moral obligation to perform an action, it is no longer reasonable for him to consider refraining from performing that action. For example, if a father recognizes that he has a moral obligation to watch over his son for the evening, it is not reasonable for him to consider pursuing other plans, whatever the merits of those plans may be. For, at least as long as we remain capable of fulfilling our moral obligations, they can be overridden only by other, more fundamental moral obligations. And if a more fundamental moral obligation overrides the father's obligation to watch over his son, then contrary to our stipulation, he does not recognize that he has a moral obligation to watch over his son for the evening because he has no such obligation! In this way, we are never exempt from moral obligation as such, but only from particular moral obligations. By contrast, a man living in an unjust regime may be exempt from all of his legal obligations, since the dictates of his moral conscience may override them.

Motivation

Moral obligations bind not only our actions, but also our passions; a morally virtuous person feels motivated to fulfill his obligations. Hence, the father who fulfills his duty to watch over his son, but only

begrudgingly, is less virtuous than the father who carries out the same duty with a joyful disposition. The desires and attitudes of virtuous agents do not conflict with dutiful behavior but support it.

Universality

Moral obligations are universal in a twofold sense. First, at a certain level, they apply equally to everyone. No agent is exempt from moral obligation in virtue of social, political, familial, or legal status. To be sure, different social and political roles might bring with them different moral obligations. A schoolteacher plausibly has various moral obligations to her students and their parents including showing up to work on time and equipping her students with the knowledge they need to succeed academically among other ways. On the other hand, the president of her country does not share these same obligations to these segments of the population. But not even the most powerful king is exempt from moral obligation as such. Hence, we ordinarily think of tyrants as morally vicious people who violate their moral obligations toward their citizenry. Indeed, from this perspective it emerges that those in positions of political authority have moral obligations of leadership and stewardship not shared by the rest of the population.

Second, our obligations bear on our behavior toward all human beings, regardless of their particular identity and circumstances, and regardless of their relation to us. We have at least some obligations to all humans we might encounter, regardless of whether or not they are family members or members of our own social group. We are obligated to refrain from deliberately killing innocent persons regardless of their race, religion, and nationality. Positively, we are obligated to will the good of others by respecting their basic rights and dignity.

The Desiderata and the DCT

Objectivity

The DCT offers a straightforward explanation of why moral obligations are objective. Whether God has commanded Jones to ϕ does not depend upon whether Jones believes that he has a moral obligation to ϕ . For example, God might command Jones to take care of his children regardless whether Jones believes he is obligated to do so. Similarly, God might command Jones to refrain from murder, theft, and adultery regardless whether Jones believes he is obligated to refrain from these sorts of actions, and regardless whether he wants to refrain from them. Thus, on the DCT, Jones' beliefs and desires can conflict with his moral obligations for the simple reason that they can conflict with what God has commanded of him. Therefore, it is easy to see why moral obligations are objective if they are divine commands.

Authority

Divine commands can also ground the authority of moral obligations. There are several alternative views a proponent of a DCT might give for why God has this authority. First, one might think that God as the creator of all things that exist other than himself simply is the rightful ruler of the universe. It is his universe since he created it. Or, the proponent of a DCT might appeal to the principle of gratitude noted above. A giver of good gifts is owed gratitude by the recipient. However, every good a human person

enjoys, including every gift given by other humans, is ultimately a gift from God. Hence the debt of gratitude humans owe God is immeasurably greater than what is owed to any human benefactor. Living in accordance with God's requests would be one way of recognizing this debt and responding appropriately to God.

Motivation

If God exists, then it is plausible that the highest good of human existence can be enjoyed only within the context of a friendship with God. For any agent to enjoy a friendship with God, however, that agent's will must be aligned with God's will. This requirement falls out of the more general principle that for any two friends to have a perfect friendship, their wills must be aligned at least in essential respects. For major disagreements diminish the strength of a friendship. Divine commands, however, are nothing other than manifestations of the divine will to humans. Therefore, one could plausibly argue that if God exists, and if he issues us commands, then humans have very good reasons to obey God's commands, since we must follow them in order to attain our highest good.

Many philosophers hold that if we have good reasons to act in a certain way, then we should be motivated to act in that way. However, even if one doubts that good reasons are inherently motivating, there would be motivation for obeying God if we want to be his friends. For a perfect friendship requires not only harmony of the will but also harmony of the passions. This constraint explains why a husband who begrudges his duty to supervise his son while his wife enjoys a night out damages his relationship with his wife. Even if he fulfills the relevant duty, his disordered passions detract from the joy of their marital friendship. In the same way, a perfect friendship with God requires not only that we follow his commands, but that we delight in doing so, knowing that we are pursuing the greatest good available to us.

Universality

If God's authority is grounded in his role as a creator, then that authority must be universal, since all humans are his creatures. Similarly, if his authority is grounded in the debt humans owe him for the goods he has given us, then this authority will apply to everyone. Moreover, if God exists, it is very plausible that one must be friends with God in order to possess the highest good attainable to him or her as a human being, as we noted above. It follows from this assumption that, if God exists, one has good reason to do whatever is necessary to attain such a friendship. So, plausibly, if one must follow God's commands in order to have a friendship with him, as we have argued, all humans have good reasons to obey God's commands.

Moreover, theologians working within Judeo-Christian traditions maintain that human beings, as creatures who aspire to knowledge through reason, are made in the image and likeness of God who is perfectly wise. Therefore, these theologians argue, God has ample reason to command us to will the good of all other human beings, respecting their dignity as a reflection of his dignity. Christian scriptures moreover maintain that God has done this, commanding us to love our neighbors as ourselves, with all humans counting as neighbors, even enemies. So, the DCT works in both directions; it explains not only why every human being might have moral obligations, but also why moral obligations might govern our behavior toward every human being.

Rival Metaethical Theories

Of course, the fact that a DCT seems to satisfy these *desiderata* does not prove that it is correct, although it does show that it is a view that deserves consideration. It is possible that other moral theories can explain them equally well, so a comprehensive case for a DCT requires an examination of rival metaethical theories. An entry of this length cannot possibly undertake such a task in a comprehensive manner. For a start at the task, see Evans (2013, 118–154).

However, we will briefly point out some obvious weaknesses on the part of some rival theories. For example, many philosophers embrace “anti-realist” accounts of morality, which simply deny that there are statements of moral obligation that express objective truths. According to such views, moral claims do not express propositions that can be true or false, but rather express emotions, or imperatives, or projections onto the world of subjective attitudes. Such views deny and therefore cannot explain the objectivity of morality.

There are also some obvious problems with “social contract theories,” which view morality as a kind of bargain or agreement that humans make with each other. The idea is that a person affirms the proposition, “I agree to abide by certain rules (the ones we call morality) *if* others do the same.” One problem is that it is not clear why humans should keep (or even make) such an agreement, given that many others do not abide by the rules of morality. The “if” in the agreement is problematic. A second problem concerns whether the agreement is actual or hypothetical. If it is only hypothetical, it is not clear why it is binding on actual persons who have not made any such agreement. However, if the agreement is actual, it is not clear who the parties to the agreement are or what the terms of the agreement are. Some philosophers who defend such a view have thus embraced the idea that morality is relative, since there are many possible agreements made by different groups with different rules. See Harman (2005, 3–77).

There are of course other moral theories, and there is more to be said about even the ones briefly discussed here. However, we have here tried to show why a DCT appears superior to at least some of its competitors. There are of course also criticisms that have been made against a DCT, and it is to those that we now turn.

Objections and Replies

In this section, we will briefly explain some of the main objections that have been made to a DCT and sketch the outlines of a response to each.

The “Horrible Acts” Objection

It is often argued that if the DCT is true, then no acts are good or bad before God commands them, so God has no reason to command us to perform or avoid any actions. This leads to two problems. One is that it seems to imply that if God commanded us to kill innocent people, then this would become our moral obligation. The second problem is that it seems to imply that God’s commands would then be arbitrary in nature.

This kind of objection is often discussed by philosophers as what is called the “Euthyphro objection,” named for a Platonic dialogue in which Socrates offers arguments against the view that “piety” is grounded in divine attitudes. In the dialogue, Socrates argues that if the gods love what is pious because

it is pious, then piety must be something independent of the gods' love. However, if something is pious simply because the gods love it, then the gods' love would seem to be arbitrary. Many philosophers have thought that a parallel argument could be given against a divine command account of morality.

However, this kind of objection will not work against a DCT of the type we have explained. The objection simply rests on a misunderstanding of a DCT. A proponent of a DCT agrees that acts are good or bad prior to God's commands. Far from this being a problem, a DCT requires an independent account of the good. God is himself essentially good, and his commands are guided by his knowledge of the good. Thus, God's commands are not arbitrary. The criticism would have force against general theological voluntarism, which holds that all moral properties are determined by God's will. God would on that view have no reason to command any action rather than another, but a DCT is entirely different.

On the DCT we have outlined, it is only moral *obligations* that are grounded in God's will. A DCT presupposes some view of the good that must be in place to guide God's actions. Possible accounts of the good include Platonic-type views that identify the good with God himself, and/or Aristotelian views that see the good in terms of the created natures of things, which have natural ends or purposes. Since God is necessarily good, his actions must be directed to the good and are therefore not arbitrary.

Does this allow God some discretion in what he wills? Here the proponents of a DCT disagree. Many follow Duns Scotus and Robert Adams in holding that, although God must will the good, at least sometimes there are alternatives that are equally good, and in those cases, God might choose one alternative rather than another. Others hold that God's knowledge of the good completely determines his commands. In both cases it is clear that actions will be good or bad independent of God's commands. However, when God issues a command, then the object of the command (such as an act-type) takes on a new moral quality. The act was already good or bad, independent of the command. However, the command means that the action is now also *required* or *forbidden*. It is good or bad in a new way, since violating God's will harms one's relation to God.

The Promulgation Objection

Some philosophers have also objected to the DCT by arguing that God does not communicate his will to everyone. Although he might communicate his will to members of particular religious traditions through sacred texts or other forms of supernatural revelation, he does not communicate his will to everyone through these sources, since not everyone belongs to any given religious tradition. So, if God does communicate his will to everyone, he must do so apart from supernatural revelation – which is to say, through a natural revelation of some sort. According to some philosophers, however, it is not clear how God would communicate his will to us through nature, and at any rate we do not observe him doing so. Furthermore, everyone, save perhaps a few exceptions that we can safely ignore, has moral obligations. It follows that some people have moral obligations even though God has not given them any commands. So, the objection concludes, the DCT is false.

Further strength has been lent to the promulgation objection by the following analogy brought forth by Erik Wielenberg (2005, 60–62). If your friend Dave has done you a favor and wants you to repay him by loaning him your car for an evening, you may be obligated to loan it to him. If, however, he leaves you an anonymous note requesting the car, you would not have any obligation to leave the keys out for him. In order to have an obligation, you need to know not only that it is somebody's desire to borrow your car, but that it is *Dave's* desire.

In the same way, Wielenberg argues, “[I]f God is to impose moral obligations on humans by way of his divine commands, he must get his intended audience to recognize that the commands are coming from him” (Wielenberg 2005, 61). That is, even if we owe God an infinite debt of gratitude, his commands mean nothing to us if we do not know they are coming from him. Wielenberg contends that it appears as though God does not communicate his commands in this way to everyone who has moral obligations. Most conspicuously, God does not let atheists know that he is commanding them of anything, but atheists have moral obligations. So, the objection concludes, the DCT is false.

Some philosophers have responded to this objection by arguing that we need not be able to understand *why* we have moral obligations in order to understand *that* we have them. Since, moreover, the DCT is a theory about why we have moral obligations, we need not understand that it is true in order to understand that we have moral obligations. The general principle here is surely sound. For example, we know through scientific observation that the corona of the sun is hotter than its surface, but we do not yet know why. In a similar manner, proponents of this response argue, perhaps our conscience or some similar faculty allows us to directly perceive our moral obligations even if we do not know they come from God.

At any rate, most people do experience strong emotional indications of the rightness or wrongness of actions. For example, we tend to be pleased by the thought of morally good actions and disgusted by their opposites. We also tend to feel proud when we have fulfilled our moral obligations and ashamed when we have not done so. It could be argued that these features of our emotional lives inform us of what our moral obligations are without necessarily letting us know their source. For example, the discomfort we tend to experience when we have done wrong discourages us from performing the same action again in the future, presenting it to us under the aspect of something evil or shameful. It is open to the proponent of a DCT to argue, however, that this discomfort does not present to the agent a complete explanation of why his or her action is evil or shameful.

A DCT does not claim that a person must understand that an action is commanded by God in order to know that it is wrong. It is a metaphysical thesis about the source of moral obligations, not an epistemological thesis about how we gain our moral knowledge. Perhaps God can communicate to us a moral principle *as having authority* without necessarily communicating to us the basis of that authority. A DCT provides an attractive explanation of why moral obligations have authority, but some philosophers have argued that it is not necessary for a person to know how to explain morality in order to recognize moral obligations as authoritative.

The proponent of a DCT can then respond to Wielenberg’s analogy by affirming that, unlike someone writing an anonymous note requesting to borrow your car, God can make it clear to humans that they have moral obligations even though they may be unclear about the source of those obligations. Many theologians have in fact thought that God may have good reasons for not making his reality irresistibly obvious. If God’s existence was completely obvious, then humans might well feel coerced to obey God, since God is both all-powerful and all-knowing. If God wishes humans to serve him freely out of love, that situation would be undesirable, so it makes sense that God might communicate his will to humans *as having authority*, even if God does not make it fully clear to all that he is in fact the source of that authority. What is essential is that God has the rightful authority to issue commands, and that he successfully communicates (through conscience and other means) the content of those commands as requirements.

The Prior Obligations Objection

The “prior obligations objection” tries to show that even if divine commands are sufficient to establish moral obligations, they are not necessary. Perhaps we are obligated to obey God’s commands. However, this objection holds that not all of our moral obligations are grounded in divine commands. For example, a natural law ethicist may hold that what is good and bad rests on the natures of things. What fulfills the nature of something is good, and what thwarts such fulfillment is bad. Moreover, it is self-evident that we should seek what is good and try to avoid what is bad. The natural law ethicist might conclude on the basis of these premises that we are morally obligated to seek the good and avoid the bad, and thus that some moral obligations hold regardless of what commands God gives.

Another version of the objection might simply begin from the premise that we have a moral obligation to obey God’s commands. It would be circular, however, to say that we should obey God simply because God commands us to obey him. So, there is at least one moral obligation that holds prior to God’s commands. This objection gains some force from the fact that the proponent of a DCT agrees that there are normative truths, such as truths about the good and the bad, that do not depend on God’s will. If there are normative truths that do not depend on God’s will, why should this not be true for some normative truths about moral obligations?

The response of a proponent of a DCT to this type of objection must be to point again to the special character of moral obligations. The DCT proponent agrees with the critic that there are normative truths that do not depend on God’s expressed will, and also that some of those normative truths will include statements about how people ought to behave. If it is good for a person to be healthy, and if smoking tobacco impairs a person’s health, then there is a perfectly straightforward sense in which a person ought not to smoke. Smoking seems irrational, and one might naturally say that it is “wrong” to smoke. Nonetheless, the proponent of a DCT will argue that *this* kind of wrongness, being grounded entirely in natural normativity, does not amount to a genuine moral obligation.

To say that an act is a moral obligation is to say that it is an act that someone can rightly expect or require of me, and that a failure to perform the act rightly calls for sanctions and disapproval, if not outright punishment. According to a DCT, this social dimension of morality is not fully captured or explained by natural law theories, or indeed by any account of what is good and bad. For an act to be morally required or forbidden, it is not enough that it be good or bad. There must also be some being who has the authority to require or forbid the action. The DCT says that God is the most plausible candidate to fulfill this role. Of course, God’s commands according to a DCT are aimed at the good. If what is commanded is good, and it is reasonable to pursue the good, then one would have reason to act in accordance with the command, even apart from the command. However, when God commands an act, it takes on a new dimension of value: it becomes required of us as subjects of God’s legitimate authority.

The proponent of a DCT will agree with the critic that humans ought to obey God’s commands, and that this is true prior to God’s giving any commands. For example, one can say that we ought to obey God because our relation to God and our ultimate happiness depends on our doing so. This is essentially to give a natural law type explanation of the “ought” in this case. However, as G. E. M. Anscombe pointed out, this “ought” does not have to be understood as a moral obligation. It could be described as an “Aristotelian ought,” where an “Aristotelian ought” is an “ought” that is grounded entirely in what is required for something to function well. Just as automobiles need oil to function well, humans may need

to behave in certain ways to function well and achieve their ultimate destiny. Anscombe acknowledges the possibility that humans ought to fulfill their moral obligations for these kinds of reasons. However, as Anscombe contends, that kind of “ought” seems different from the “ought” that is embedded in a statement of moral obligation. It is worth noting moreover that Anscombe defends this conclusion in a manner consistent with the social theory of obligations discussed above in connection with Robert Adams, namely, by arguing that one cannot be obligated in any way without being obligated to someone in a position of authority (Anscombe 1981).

At least, this is how things seem to the proponent of a DCT. In the end, the acceptability of a DCT may depend on semantics. A proponent of a DCT accepts that there are actions that one ought to do or not do independently of God’s commands but thinks that the “oughts” in this case are not the “oughts” of moral obligation. The DCT proponent holds that God’s commands create a new and rich moral quality. Now an act that would already have been good or bad is required or forbidden; it is good or bad in a new way. The proponent of a DCT thinks that our language of moral obligation is what enables us to mark out this new moral quality.

A DCT has many strengths. It is congruent with the parsimonious theory that moral obligations must be, like all other obligations, grounded in social relations or social institutions. Moreover, there are very plausible reasons to believe that divine commands would generate obligations with all, or at least many, of the central features of moral obligations. It is also attractive for theological reasons. For example, a DCT explains why all wrong-doing is *sin*, an offense against God, even if the wrong-doing is directed against persons other than God. For Christians, a DCT also fits well with the prominent role that law and divine commands play in the Christian Scriptures. To be sure, a DCT does face problems, as we have seen, and some will see those problems as serious enough to reject the view. However, the proponent of a DCT does have plausible answers to these, and thus it is an account that certainly merits continued discussion and consideration, at least for those who are theists.

Ethics and Authority: The Twentieth-Century Crisis

The question of the relationship between ethics and authority is as old as civilization, but the events of the nineteenth and twentieth centuries seem to have raised our consciousness of it to a new level and in ways that make us sensitive to issues of cultural diversity. For the nineteenth century brought the colonial conquest of the globe in the name of Western religious and cultural “superiority” and was followed by the twentieth century, which brought us the global tragedy of two world wars, culminating in the attempted Nazi genocide of the Jews and numerous lesser wars since, intent on “ethnic cleansing.” Fascism, Nazism, colonialism, racism, sexism, and religious prejudice are part and parcel of the human journey through these centuries.

What was learned from the Nuremberg trials after World War II is emblematic of these centuries, namely, that morality can be dangerous. For the crimes of war perpetrated in the death camps and elsewhere were too often “crimes of obedience.” These were crimes in which the humanity of others was violated in the name of a morality of unquestioning obedience to higher authority that defined its victims as less than human and not worthy of life. In the aftermath of World War II, reacting to these crimes, the nations of the world took the unprecedented step of establishing a covenant of nations pledged to an ethic of human dignity and human rights – an ethic that makes a claim to be binding on persons of all religions and cultures. The founding of the United Nations in 1946 and the creation of the Declaration of Human Rights in 1948 were major milestones in the global history of human morality, marking an ethical revolution that declared limits on all authority, especially political authority.

In the aftermath of World War II, a microcosm of this global revolution in religion and ethics took place in the United States. A community of ethical revolutionaries inspired by the example of Mahatma Gandhi and led by M. L. King, Jr., Abraham Joshua Heschel, Thich Nhat Hanh, and others of the Civil Rights/Vietnam War era demonstrated that it was possible for persons of diverse religions and cultures to share a common ethic of human dignity, human rights, and human liberation. It was an ethic not of unquestioning obedience to authority, but of disobedience – civil disobedience in defense of our common humanity across religious, cultural, and racial divisions. What such social activists from diverse religious traditions have demonstrated is that there can be ethical cooperation while sustaining religious diversity and that the essence of the ethical life lies in challenging authority in order to promote justice and compassion for all. What is striking is that each could find precedents for this understanding of the essence

of ethics not only in their own traditions (in figures like the Buddha and Abraham) but also in each other's traditions, and all found inspiration in the life and death of Socrates. The story of the trial and execution of Socrates attracted these social activists because it offered them an ancient and authoritative example of the ethical life as a challenge to authority.

Our words "morality" and "ethics" are derived from Latin (*mos, mores*) and Greek (*ethos, ethike*) terms which originally meant the "customs" of the people – the sacred customs. It was Socrates who gave new meaning to the term "ethics," for his religious experiences led him to practice philosophy as the pursuit of wisdom through the questioning of such customs. Although the terms "ethics" and "morality" are often used interchangeably, I find it useful to give privileged status to the Socratic usage for the term "ethics" while reserving for the term "morality" the pre-Socratic meaning of "sacred customs." Thus we shall understand sacred customs as the traditional morality of a community and ethics precisely as the questioning of that morality.

Ethics as the Religious Compulsion to Question Sacred Morality

If, as is likely, the Latin root (*religio*) for our word "religion" comes from *religare* (to tie or bind), it is because the Romans used the term to refer to their sense of being "tied" or "bound" in relations of ritual obligation to those powers they believed governed their destiny. In their case these were the gods and goddesses who ruled the forces of nature.

Just what powers (or power) a people believe themselves to be "tied and bound" to, and what these powers expect of them, is defined through the myths (stories) and rituals (obligatory actions) passed from one generation to the next. Religion is always about a sacred way of life. Humans tend to treat as sacred whatever power or powers they believe govern their destiny and the way of life these powers originate. In primal societies, the right way to live is the rite way. And in all societies myth and ritual deeply influence the customs or way of life that ties and binds a people to its sacred ancestors and/or gods. Through myths and rituals such sacred powers speak with authority and are taken with utmost seriousness.

To speak with authority, according to the *Oxford English Dictionary*, is to speak with a "godlike manner" – a manner which is commanding, imperial, perhaps even dictatorial. To speak with authority is to speak as (or for) the author, the originator. In the beginning were the ancestors, the spirits, and the gods who authored a sacred way of life and provided an originating model of how things ought to be.

Since the beginning of recorded history there has been an intimate connection between religion and authority. In primal cultures authority seems to be primarily tied and bound up with stories and rituals of creation or originating power. The gods and the sacred ancestors speak with authority because they defeated the forces of chaos and death and created the sacred order of the cosmos that makes life possible. Priests and shamans mediate that authority. There is a taboo that surrounds the sacred that forbids all questioning. The way things are, as reflected in the sacred customs of the people, mirrors their sacred origins. Consequently, the hierarchy of status, power, and authority in a society is given and not open to debate. One cannot argue with "the way things are." The way things are is the way they ought to be (Is = Ought). In such societies we have morality but not yet ethics.

Throughout the history of the use of the term "authority" there has been an ambivalent tension between the "authoritative" and "authoritarian" as aspects of its meaning. Authoritative power, we could

say, is that power which commands through the spontaneous respect it elicits from others, whereas authoritarian power is that power which commands through raw force, even at the price of respect. This distinction has led to the common contrast of authority with power (as coercion). From this perspective, authoritarianism as a resort to power is really the reaction of one who has lost authority and so is no longer accepted spontaneously by others as worthy of respect. In such cases, respect is replaced by fear as the motivation for taking a command seriously.

Socrates, however, insisted that no one could be ethical who succumbs to the final fear – the threat of death. For Socrates, ethics involved questioning the authority of Athenian sacred customs by asking: Is what people call “good” really the good? Socrates was put on trial and executed for “impiety towards the gods” and “corrupting the youth” because he dared to question and teach others to question the sacred way of life of Athenian society.

Socrates’ goal was not to demean the Athenian way of life but to raise it to a higher level. The paradox of Socrates’ criticism of the sacred morality of Athenian society was that it was rooted in religious experience – an alternative form of religious experience to that which had shaped Athenian society. Responding to his accusers, Socrates insisted that he was neither irreligious nor an atheist. On the contrary, he said he was commanded to doubt and to question the Athenian way of life by his own “daimon.” This God, he said, sent him as a “gadfly” to the citizens of Athens to teach them to lead virtuous lives and seek justice. To doubt, and to teach others to doubt and to question, he says, “is what my God commands; and it is my belief that no greater good has ever befallen you in this city than my service to my God” (Plato 1969, 62).

The trial of Socrates represents an important moment in the history of Western religious ethics in relation to the question of authority. Socrates’ challenge to the religiously grounded polity of Athenian society presents one of the first recorded acts of civil disobedience. Here, the sacred law and order of Athenian society was called into question in the name of a type of religious experience that claimed the authority to *transcend* (in the literal sense of “going beyond”) a given sacred way of life and offer a “higher” vision of the good life. In the Socratic model “the way things are” is challenged in the name of the way they ought to be (Ought vs. Is), where the “ought” appeals to an authority that transcends sacred order – namely, the god who compels him to question. Socrates suggests that the authoritativeness of this divine compulsion is testified to by his poverty – that he was willing to sacrifice personal advantage (even his life) to respond to this call.

Model Ethical Activists

It is significant that the social activists of the mid-twentieth century, the spiritual children of Gandhi from diverse religious religions and cultures, who challenged the authoritarian systems of their time, cited Socrates as a model. But Socrates was not the only such model, nor the earliest. They also had other examples of the religious challenge to sacred authority available to them from both East and West. Martin Luther King, Jr., cited Jesus and the prophets. Abraham Joshua Heschel cited not only the prophets but especially the biblical patriarch Abraham as a model for challenging the authority of President Lyndon Johnson to conduct the Vietnam War. When Abraham fears that God will slay the innocent along with the guilty in the city of Sodom, he has the audacity to say: “Will you indeed sweep away the righteous with the wicked? ... Shall not the Judge of all the earth do what is just?” (Genesis 18:23, 25). If Abraham did not shrink from challenging God in the name of justice then the president, said Heschel, was hardly

above questioning. For Abraham and for Heschel, authority is authoritative only when it meets the requirements of justice.

Gandhi and Thich Nhat Hanh could also find inspiration in the life of the Buddha, who insisted that even his own teachings be questioned by his followers: “Just as the experts test gold by burning it, cutting it and applying it on a touchstone, my statements should be accepted only after critical examination and not out of respect for me” (Unno 1988, 129–147; quoting *Tattvasamgraha* 1926, 3588). The internal structure of the Buddha’s monastic community took the form of a democracy in which each monk had an equal vote. This community expressed the Buddhist consciousness of the equality of all selves (for all selves are empty) and stood in stark contrast to the hierarchy of the caste-structured sacred society of India. The authoritativeness of the Buddha’s teaching is attested to by his refusal to be authoritarian.

All religious communities (indeed, all human communities) embody a morality, but the emergence of an ethic requires a further step. The relation to authority is not just a problem for ethics to solve, it goes to the heart of what ethics is. Ethics involves the transcendence of morality through the questioning of the authority upon which that morality is founded. As with the story of Socrates, so with those of Jesus, Abraham, and Siddhartha: ethics begins with a type of religious experience that questions sacred authority and its expression in traditional morality. Ethics, so conceived, is paradoxically both a religious and an impious desacralizing activity at the same time. In my work (Fasching 1993; Fasching and deChant 2001) I have called this category of religious experiences, experiences of the holy in contrast to the experiences of the sacred.

Following a suggestion made by French sociologist Jacques Ellul (1975) in his analysis of the social dynamics of religion, the terms “sacred” and “holy” are used here as antonyms rather than synonyms. This deliberately goes against the common practice of using the two terms interchangeably. Separating the uses of “sacred” and “holy,” and in a parallel manner “morality” and “ethics,” in this way makes it clear that the collection of social behaviors that are generally labeled “religious” are not all religious in the same way. As Max Weber pointed out, religious experience has the power to sacralize but also to desacralize. Giving separate meanings to terms that have been used interchangeably accents these different functions of religion.

In a sacred order the way things are (as established by sacred origins) is the way they ought to be and so persons are defined by and confined to their place in the sacred hierarchy of society as legitimated by myth and ritual. Religious experiences fit the category of the holy when they prompt the questioning of the authority of such sacred ways of life. The difference between the sacred and the holy is not a difference to be found between religions, as if some were pure models of one and some pure models of the other. The sacred and the holy should be seen as opposing tendencies, or ways of experiencing life, to be found in all persons and all communities. Every actual culture and religion is likely to embody aspects of both the sacred and the holy in a complex and sometimes self-contradictory way of life.

Ethical Consciousness: Authoritative or Authoritarian?

Wherever ethical consciousness emerges, sacred order is called into question. It is legitimate to ask “by what authority” is existing sacred authority questioned? The answer, of course, can hardly be found by appealing to some “authority,” but only by appealing to the authoritativeness of ethical experience itself. Wherever ethical consciousness emerges, the authority of sacred order will come to be seen as authoritarian if it is not modified by the authoritative ideal of selfless compassion. It is selfless compassion which authoritatively puts sacred order/authority in question. A good society must be more than the

“cosmos writ small” providing an orderly world in which to dwell; it must also provide an order that is just and compassionate for all its members.

Nathan's challenge to King David's authority

A story of the ethical confrontation with authority of comparable importance to that of Socrates is found in 2 Samuel 11 of the Tanach, the Jewish Bible (later incorporated into Christianity as the Old Testament). It is the story of how David, King of Israel (ca. 1000 BCE) lusted after Bathsheba, the wife of one of his soldiers, Uriah. David had Uriah sent to the front lines of battle so that he would be killed, allowing David to take Bathsheba for himself. According to the story, the God of Israel then sent the prophet Nathan to confront David by telling him a story about a rich man who owned a very large herd of sheep. But when a guest came he took the only lamb of a poor man (for whom the lamb was as if a member of the family, loved like one of his own children), slaughtered it, and fed it to his guest. When David heard the story his anger flared and he said: “‘As God lives, the man who did this deserves to die. He must make fourfold restitution for the lamb, for doing such a thing and showing no compassion.’ Then Nathan said to David, ‘You are the man’” (2 Samuel 12:5–7).

Because the story Nathan tells David is a “story” – either fictive or at least about someone else – it disarms David. It places David in the situation philosophers would typically identify as the ethical point of view, that of the “disinterested observer” who can be objective because he is not personally involved. From this perspective, David sees immediately that an injustice has been done. But then, in a second step, the story quickly moves David emotionally from disinterestedness to empathy. That is, it creates in him a sense of identification with the victim which outrages him and compels him to act. Only then is David prepared to reason “objectively” about what is good and what is evil and unwittingly stand in judgment of himself. For Nathan's abrupt turning of the story into an allegory for David's own situation forces David to confront his own actions. Ethical insight occurs when David identifies with the pain of another. Genuine ethical insight occurs when we see and judge our own actions through the eyes of the one who will be affected by our actions, as if we were that person. This is what Nathan's story enables David to do.

As king, David had the power to impose his own morality on the situation and yet he is unable to excuse his own actions with either the authoritarian claim that the king decides what is right and wrong, or with the libertarian claim that every individual has a right to make their own rules, deciding for themselves what is right and what is wrong. He tried that and failed. He failed because the story seduced him into identifying with the victim of his actions, which enabled him to see the injustice of his actions by enabling him to empathically identify with the victim's experience of injustice – of being wrongfully violated. The ethical point of view induced in David by Nathan's story transcends both authoritarianism and libertarianism and speaks authoritatively. As such it leads David to condemn himself in spite of himself. When David identifies with the victim, he realizes that what he has violated is not a rule or a principle but another person like himself. He recognizes the humanity of the stranger and the authoritative claim that humanity makes on his own conscience.

Ethical Consciousness as Authoritative

What separates religious ethics from purely philosophical ethics is the notion that our ordinary state of consciousness is distorted and disoriented by deeply (unconscious) selfish emotions. Therefore, until the self has undergone a profound spiritual transformation of personality, it is not capable of seeing, under-

standing, and reasoning correctly. Thus, unlike philosophical ethics, religious ethics usually entails engagement in rituals and spiritual practices in combination with powerful orienting stories (stories of saints and heroes, parables of ethical insight, etc.) intended to bring about such a reorienting transformation through which the individual, like David under the influence of Nathan's story, comes to identify with the pain and suffering of the other.

That kind of awakening of ethical compassion is not unique to any one religious tradition. It is, for instance, described in Mahāyāna Buddhism as "becoming the other." According to the *Bodhicharyavatara* of Santideva: "All have the same sorrows, the same joys as I ... so likewise this manifold universe has its sorrow and its joy in common ... Why should I not conceive my fellow's body as my own self? ... I will cease to live as self, and will take as my self my fellow-creatures" (Burt 1955, 139–140). A similar sense is expressed in the writings of Paul in Christianity, when he says that in Christ the whole of creation forms one body and the faithful community are those who are aware that all are "members of one another" such that if one experiences pain, so do all and likewise with joy (1 Corinthians 12).

Gandhi's Challenge to Authority: A Model of Ethical Consciousness

Finally, nowhere is the link between such compassion and ethics as the challenging of authority clearer than in the teachings of Gandhi on the *Bhagavad Gītā* and nonviolence. The *Gītā* tells the story of Arjuna and his brothers, who are about to enter into battle against their cousins who attempted to cheat them out of their fair share of their deceased father's kingdom. As the *Gītā* opens, Arjuna is on the battlefield in his chariot with his driver, Kṛṣṇa, awaiting the beginning of the battle. Arjuna confesses to Kṛṣṇa that he has no taste for the fight. He wishes neither to kill nor be killed. Much of the *Gītā* is then taken up with Kṛṣṇa attempting to persuade Arjuna that it is his caste duty to fight and even kill. Killing another, he is instructed, will not lead to negative karma or moral culpability, if he does so out of selfless duty rather than attachment to personal gain. Then in Chapter 11 Kṛṣṇa reveals his true identity as the all highest deity, Viṣṇu, lord of life and death. In a rather violent vision he is shown that not he (Arjuna) but Viṣṇu decides who lives and who dies. By the time the *Gītā* reaches its conclusion, Arjuna is ready to stand up and fight in obedience to the authority of the all highest power, Viṣṇu.

A literal reading of the *Gītā* seems to lead to a morality of unquestioning obedience. What is astonishing is that Gandhi found authorization for just the opposite, the questioning of authority and the practice of non-violent civil disobedience. He accomplished this through a three-point strategy. First, he insisted that the *Gītā* must be read spiritually rather than literally. It was, he said, an allegory of the struggle of good and evil within the self. Second, he argued that the spiritual essence of the *Gītā*'s teaching (and of Hinduism) is the "oneness" of all humanity. His practice of *satyagraha* was a spiritual clinging to the truth of this oneness. Such a clinging gives birth to compassionate identification with the suffering of all others and leads to *ahimsā* or non-violence. Non-violence, here, does not mean a passive surrender to suffering and injustice, but an active transformative mode of civil disobedience as a strategy for alleviating them. Third, he argued that the test of all authority, including sacred scripture, was ethics derived from authoritative experiential insight. He recognized that there were other interpretations of the *Gītā*, but argued that forty years of putting his life on the line, endeavoring to live by the deep truths of the *Gītā*, gave him the authority to call more superficial or literal readings into question.

Like Socrates, Gandhi offered his own life of poverty and self-sacrifice (*brahmacharya*) as an authoritative justification of his challenge to all authority (whether of sacred Hindu scriptures or of British

political domination). In this way Gandhi offers us our final dramatic example of religious ethics as the power of ethical consciousness, through identification with the other (becoming the other), as the authoritative basis for challenging authority.

CHAPTER 13

Ideas of Ethical Excellence

Lee Yearley

Humor, much less humility, may not be central to most ideas of ethical excellence, but they surely must inform the efforts of anyone who attempts to write briefly about the subject. One reason is that dramatically diverse practices have been taken to exemplify such excellence; for example, the purported excellences of celibacy and of parenthood. Another is that a significant if perhaps less dramatic diversity attends theoretical accounts of what excellence consists in and how, therefore, it is to be attained; for example, by the dogged nurture of inchoate capacities or by the abandonment of all dogged activities. Further, no single person can grasp well all the various kinds of human excellence that humans have displayed in their practices and manifested in their theories. (The ignorance of this writer about areas other than East Asia and the West is vast enough to make his only imperfect knowledge of those two areas seem substantial.)

To emphasize the diversity of the phenomenon and the necessity of ignorance ought not, however, lead the reader to query the worth, or even viability, of an endeavor like this one. Not only can some things be said with reasonable assurance, but the subject is also, to my mind, as important a topic of inquiry as we have. The character of the subject, however, means that any treatment of it must contain a normative dimension. It must not just describe what people have thought about human excellence. It must also examine what those thoughts may mean for us today, however slippery is any idea of a single “today.” An examination of those normative considerations will appear in due time, but let us now turn to a few general observations about human excellence, focusing on how the notion of virtue and those subjects that follow in its wake, most notably conceptions of the self, help us to understand it.

Features of Human Excellence

The specific features of human excellence can best be described as virtues: perfections of discrete human functionings that manifest the distinctive aspects of the laudatory state. The notion of virtue has, of course, a specific set of meanings inside the Western tradition, but all traditions or groups of which I know have terms that resemble, sometimes closely, Western uses of the term. To treat fully such specific excellences we must also, and more controversially, speak not only about ordinary virtues but also about religious virtues. We need, therefore, to differentiate the sphere of virtues into two realms, realms that share some characteristics and have others that sharply divide them. But let us begin with what is shared (Yearley 1990, 2011).

In virtually all cultures, those specific features that exemplify human excellence could fit within a list of virtues that is ordered in a hierarchical fashion. The list defines what qualities are virtues, are instances of human excellence, and by implication what qualities are not. The list tells us, for instance, that courage is a human excellence and cowardliness is not. The hierarchical rank helps a person determine in which situations one or another virtue should be manifested. It allows a person to know, for example, that being patient rather than assertive, ironic rather than flamboyant, is the correct behavior when you are told a friend has been slandered. Grasping how the hierarchy operates and manifesting that grasp fluently can be a difficult task – especially for a beginner – but it is often fairly easy for members of the culture and is crucial to the full expression of human excellence.

Even granting all this, we must also realize that for many today the word virtue has an even more archaic ring than does the notion of ethical excellence. It often seems to be associated with problematic ideas like priggish scrupulosity; or to be restricted to narrow areas like sexual activity; or to reflect fixed unjust social hierarchies like the ones found in virtually all traditional societies. (The old saying puts such concerns pungently: “When they begin to talk about virtue it’s time to emigrate.”) Nevertheless, the idea has the significance it does because virtues seem to be necessary if humans are to operate well in the various areas in which human excellence must function. It is unsurprising, given this, that we find certain virtues in the lists of many cultures. Individuals need qualities such as courage or self-control if they are to thrive, and probably even survive; societies need people to have them if they are to survive, much less thrive.

This illustrates how many, perhaps even all virtues, and thus notions of human excellence, can productively be thought of as being *corrective*. Ideas of virtue, and thus of human excellence, rest on pictures of human weakness and need. Virtues correct some difficulty thought to be natural to human beings, some temptation that needs to be resisted or some motivation that needs to be made good. Industry, for example, corrects a propensity to idleness; perseverance a tendency to give up before it is necessary to do so; and courage the inclination to be dissuaded by fear from doing what should be done. Virtues, to put it more abstractly, display some characteristic pattern of desire and motivation, some disposition toward action. They are not simple thoughts that occur and pass. I do not manifest a virtue if I think how compassionate it would be to invite those lonely people to dinner as I walk on past them. Nor are they emotional states that pass quickly. I am not virtuous if I feel very strongly that I should at least talk to my troubled relative but realize the game is about to start and leave.

A virtue, then, is a human excellence or an example of human flourishing. It is a permanent addition to the self, part of what makes people who they are, a feature of what we call character. Unlike some character traits, however, there must be evidence of what we can call “thought and will” if a quality is to count as a virtue, even within perspectives that emphasize the problems that beset ordinary thinking and willing and therefore often favor more literary accounts. Almost all agree, of course, that the processes may not be conscious; “to think a little and then act” is an absurd picture of human behavior even if we are talking only about academics. Nevertheless, judgment or thinking occurs in the sense that, at minimum, I can explain (at some point, in some fashion) to myself or another person why I do something or value some trait. A virtue, then, is a disposition to act, desire, and feel that involves the exercise of judgment.

Motives and Models

Virtuous activity also involves choosing virtue for itself. I do not possess the virtue of generosity, but a semblance (or even counterfeit) of it if I act because of some ulterior motive such as that if I help specific people now they will think well of me, or help me later, or convince their rich relatives to give me money. Indeed, the differences between *semblances* of virtue and true virtue are crucial in almost all theories of human excellence because semblances generate activities that resemble the activities of real virtue but lack important elements in it. People who manifest semblances do a virtuous act not for its own sake but for consequences that a non-virtuous person would desire. Or they choose it not for their own reasons but because of some secondhand support such as custom, unexamined authority, or the inertia provided by accepted, routine reactions.

This difference also illustrates how virtuous activity involves choosing specific virtues in light of some justifiable life plan. I believe, for example, the best kind of human life involves generosity not selfishness, giving not just taking and possessing. I have a general view, and good reasons (of some sort) for it, that lead me to think that kind of life is better than one that lacks it. The significance of such an overall view of life underlies our last theoretical comment about those features of human excellence we call virtues: virtuous behavior has not only *acquisitive* but also *expressive* motives.

People choose a virtuous action not only because it contributes to goods they want to acquire, but also because it expresses their conception of human excellence. (The latter motive, as we will see, especially underlies many forms of religious virtue.) The essential characteristic of expressive virtue, then, is its response to one basic question: Why might, or even should, people embrace an ideal of excellence if they have severe doubts that it will have the kind of effects in the world they hope it will? The answer is that the best kind of human excellence simply demands such activity; no further questions about its contributions to the agent's or anyone else's happiness need therefore to be raised. This does not mean such choices are made recklessly; indeed, they must be well considered or grounded if they are to be fully expressive. Nevertheless, it is not the good benefits received or given but the good expressed that is the crucial motivating force.

These common features in ideas about virtue and thus human excellence ought not to mask the fact that the substantive variety we mentioned earlier is also present. We have already noted some dramatic differences in practice, but here I want to consider two significantly different theories about human excellence. One rests on a *developmental* model, the other on a *discovery* model. Each model defines the end of a continuum and the several variants in the middle of the continuum *mix* some qualities from each model.

The developmental model is common in many traditions and can have either religious or non-religious forms. In this model, human nature has an innate constitution that manifests itself in processes of growth and culminates in specifiable forms. That fulfillment occurs, however, only if the organism is both uninjured and properly nurtured. The basic conceptual model is, then, relatively simple and it draws on a naturalistic framework. A basic set of capacities exists and their unhindered, nurtured development generates qualities that lead to specifiable actions or characteristic forms. Those, in turn, provide the standard that allows an observer to determine a being's nature and to judge whether any specific action represents its nature in normal, exemplary, or defective fashion.

A discovery model differs fundamentally; somewhat less common, it also rests squarely within a religious framework. That framework is "monistic" in its purest form and "theistic" in its more mixed or

mented forms. (An inordinately rich thicket of questions and distinctions appears with any investigation of especially the extreme instance of the monistic and theistic forms, but I will avoid them lest they derail our main inquiry.) In a discovery model, true human nature contains a permanent set of dispositions that is coextensive, in some way, with a sacred being. Those dispositions are obscured by ordinary human qualities, but they may be discovered and then contacted in a fashion that allows them to animate a person. People do not, as in a developmental model, cultivate inchoate capacities. Rather, they discover a hidden ontological reality with sacred characteristics that truly defines them, whatever may be the apparently defining, regnant social ideas about human excellence.

The two models differ, then, both in the character of the ontological and religious ideas they rely on and in the ways in which their notions of human perfection depend on those ideas. The ideas of human excellence in a discovery model, for instance, are much more deeply embedded in specific ontological and religious ideas than are those in a developmental model. Further, that fact is of special importance today given that many moderns find it difficult to imagine a discovery model either generating a lively notion of pluralism or really separating itself from specific, and questionable, cultural guidelines – such as those concerning gender – about what human excellence is.

Either model generates different answers to an important question – to some people the most important question – to be asked about general notions of human excellence: What kind of training or cultivation, either by other people or by the individual, can best help people achieve such excellence? Specific answers to that question are multiple but each reflects the general contours of the model. Most important here, whatever may be the exact answers, they affect the character of many of the most significant social institutions (like schools or families), and therefore these models directly influence people's ordinary lives.

Religious Excellences and Normal Human Excellences

The distinctions between these two models highlight the difference that religious notions can make when we consider human excellence. That difference is also highlighted, and in a more concrete way, when we consider the role *normal* ideas of human functioning play in understandings of excellence. (“Normal” here means those kinds of ideas most people in a society would accept without much thought; for example, possessing some material goods; feeling acute emotions at certain kinds of loss or failure; participating both in a family and in many aspects of a culture's social life.) Religious ideas of human excellence, in contrast, often manifest a perspective in which such normal ideals appear to be either insignificant or relatively unimportant. These perspectives, for example, contain ideals like voluntary poverty, complete equanimity, and celibate withdrawal from society. Indeed, the disjunction can be pronounced enough to generate the normative criticism that such religious perspectives may manifest excellences but they are the excellences of a species other than the human species. Such criticisms are made both by those who oppose all religious perspectives and by those who defend one religion, say Confucianism, against another, say Buddhism.

These criticisms are reflected obliquely in a number of academic treatments. They argue that distinguishing between religious and ordinary virtues is either problematic or wrong-headed because those distinctions are not explicitly made by many traditions or groups. Some treatments, in fact, even argue that a few traditions' general conceptual frameworks not only do *not* lead to, but also literally *could* not allow for what in, say, Christianity, are called natural and supernatural virtues.

The issues here are as complex and vexing as they are important, if only because most traditions manifest, even if inchoately, the belief that some virtues have special characteristics that would seem to point to their inclusion in the category of the “religious.” These virtues produce actions and attitudes that both differ from normal virtues and change a range of normal actions in profoundly important ways. Sharp distinctions are made, for instance, among the kinds of objects pursued; among the goals of the intentions manifested; among the precise forms of behavior produced; and among the kinds of empowerment displayed. This also means, however, that such virtues cannot draw on too many normal presumptions and arguments (about the importance of, say, possessions, family, or a minimal concern for others) to defend or even to make plausible the virtue lest it cease to be a “religious” virtue. Nonetheless, they cannot simply disregard normal presumptions lest the virtue cease to be a human virtue, and thus a plausible human option.

Adopting the delicate balancing needed here seems to occur fairly effortlessly when most people think about topics like the significance of possessions, family, or a minimal concern for others. But more pronounced difficulties appear with the subject of the possible effect of some religious beliefs on the idea of human excellence. An especially significant example of this effect appears with the question of whether considerations of human excellence need to take account of the past or future lives that a person either may have lived or may live after a “natural” death. In thinking about the human excellence of a person must we attend closely not just to the features of the, say, 85-year life Sally lives, but also to the features of her past or future lives?

Proponents of the strongest version of the view that we must attend to those other lives argue that Sally’s excellence can be adequately judged only by focusing on them. They argue her excellences either were caused by acts she performed before her present appearance or can be truly evaluated only from the perspective of the life she will live after her “natural” death. Adopting the strong version of this position involves, of course, a robust claim about what people can know with assurance, namely, that Sally’s future life will be of a certain sort or that her past lives were not only of a certain sort but also formed her present life. Nonetheless, some religious people have not shied away from making such claims. Others, however, who still firmly believe in the idea of past or future lives, have thought a lack of clarity about the exact characteristics of those past or future states (and perhaps the causal links among them) meant that ideas about human excellence are not be much affected.

Excellence and Identity

More could, of course, be said about the implications of distinctions among religious and normal kinds of human excellence. But let me end by considering a crucial normative issue (at least for many moderns) raised by the very notion of human excellence: What genuine variety of excellences can such a notion allow? It seems clear that a muted recognition of diverse kinds of excellences (even if they are ranked hierarchically) will accompany a few of a culture or group’s notion. Most common and benign is the calibration of excellence to stages in life; for example, praiseworthy judgment will differ in a 5-year old, in a 25-year old, and in a 50-year old. Also common is the calibration of excellence to temperament or character, qualities that may in turn be said to manifest a person’s role specific virtues or even “class”. The excellences of the warrior, the teacher, and the religious recluse may indeed all be excellences yet still differ considerably, with the differences reflecting the distinctions inherent in the grounds from

which the excellences spring, grounds that may include the effects of a person's past lives. This remains true even if some general excellences, such as courage, appear in each.

This last kind of calibration with its notion that a person is, say, a "warrior" reflects the ideas that people have what can be called *necessary identities*, and that those identities control the kind and level of excellence available to them. The notion of necessary identities usually combines with two other ideas: first, that very few people have an identity that allows them to reach the highest excellence, and, second, that most groups cannot reach the most valuable excellence. The former notion is clearly defensible only in the sense that it reflects the obvious fact that very few people actually do attain to certain especially valuable states. Even granting that, however, we can still doubt both that the ability to attain such states is the privilege of just one group and that the usual causal accounts employed to explain people's capacities are adequate.

In fact, the notion that significant groups have severely limited abilities seems to be indefensible if only because, in almost all cases, one very large group with such purported limits has been women. This situation can lead people, as it has led many moderns, to question the whole notion of human excellence. Put one way, it brings that notion under the purview of ideas about justice and then, further, analyzes how and why specific instances function as they do. A telling analysis, for example, argues that *models of the self* and ideas about human excellence relate closely, and that such models are problematic. They distinguish and order opaque or inherently disorderly phenomena that provide neither decisive tests nor impartially collected evidence. People cannot, of course, invent any model of the self they might happen to want due to the constraints presented by some "natural facts" and current webs of belief.

Nevertheless, the models can best be seen as theoretical inventions, constructions made in order to achieve specific goals. This becomes especially clear when we attend to how both the distinctions among human powers and the hierarchical arrangement of them (matters crucial to the idea of human excellence) usually match the prevailing social structure and its justifying ideology. Perhaps the most striking example of this phenomenon is the traditional Western model of the subordination of raw desire to reason, the most familiar and notorious instance of which occurs in Aristotle. For Aristotle, reason should control other elements in the self, and it will if a person is a full human being who has been well formed by a proper upbringing. To lack reason's control means never being able to attain real human excellence and that unfortunate group includes three subgroups: those who completely lack the capacity to reason, such as natural slaves; those who lack the full capacity to reason, such as women; and those whose capacities were undeveloped by proper upbringing, such as most other people in the society.

Examples like Aristotle's draw on what can be called the *fallacy of false fixity*. Fixed features of the self are seen as part of the nature of things; they cannot be other than they are. These features limit human deliberation because sensible people do not attempt to deliberate about what cannot be changed; they think in terms of them. They do not think about them. Human history is, of course, littered with examples of false fixities, ideas that in retrospect appear to be social myths that protected specific ways of life. Our present thinking, however, is no less liable to be formed by them and searching them out is an essential if painful part of examining ideas of human excellence. In fact, the need to identify them is a major reason why it is helpful, perhaps even necessary, for any such examination to have both historical depth and comparative range.

The Current Demand

All this means, I think, that religious ethics must critically question and then develop traditional notions of human excellence if they are to be applicable today. Crucial to this development is a process that involves two enterprises: *elaboration* and *emendation*. Each of these enterprises draws on the results of modern scholarship and reflection, but they differ in noteworthy ways.

Elaboration, often a relatively benign activity, utilizes modern historical and textual scholarship to understand in context the language of texts and practices. It is especially important with examples of human excellence that appear in forms that either make them easily misunderstood or allow their challenge to be too easily overlooked.

Emendation, a complicated and possibly dangerous activity, utilizes modern theoretical analyses to clarify, test, and reformulate those traditional ideas and practices relevant to human excellence. It must reformulate these ideas and practices in a way that is appropriate to, shows appreciative fidelity toward, their meanings as judged by the most basic norms found in the tradition. But it must also reformulate them in a way that is credible to (meets the conditions of plausibility found in) our common contemporary experience, informed as that experience is by modern scientific explanations, historical consciousness, and ideas about the rights of all humans. Meeting both demands is difficult, and it may in some cases be impossible. It is, however, what is needed if most notions of human excellence are to remain truly alive.

CHAPTER 14

Agents and Moral Formation

Thomas W. Ogletree

Accounts of moral agency usually address three subjects: (1) a primal *disposition* to live a moral life; (2) the *capacity* to act morally; and (3) sound *moral judgment*. I will focus on classic Christian and Western philosophical treatments of these subjects, though there are corollaries in other religions and cultures. I will then note contemporary resources that enrich the classic traditions.

Classical Accounts of Agency

Classic Christian discussions of moral agency follow two major trajectories. The first employs a theory of natural law for articulating the moral requisites of human flourishing. Drawing upon Aristotle's work, Thomas Aquinas (1966) gave this approach its definitive theological expression. His thought remains pivotal in Roman Catholic moral theology. The second trajectory stresses the intrinsic authority of the moral law. Protestant reformers Martin Luther (1966) and John Calvin (1957) exemplify this trajectory in tradition-dependent forms, focusing on biblical accounts of divine commands. Immanuel Kant (1996, 1998) offered a philosophical parallel, stressing the human capacity to formulate universally binding moral principles. His inquiries have influenced Reformed Judaism and Protestant Christianity. Augustine's (1955a, 1955b) ideas are manifest in both trajectories, especially his attention to original sin, and to the human aspiration for union with God.

Moral Disposition

Interest in a *primal moral disposition* presumes that moral responsibility is integral to human life. Thomas Aquinas linked this disposition to natural human desires for happiness. We achieve happiness, he argued, when we live in accord with natural law principles that exemplify the kinds of beings we are. The first principle, *synderesis* or "conscience," founds moral agency. It is the human disposition to do what is right and to refuse to do what is wrong.

Aquinas embraced Augustine's earlier contention that the quest for happiness, though rooted in the goodness of creation, has been corrupted by humanity's lapse into sin. We seek happiness, but we no longer know what truly brings happiness, so we grasp after ephemeral pleasures that are finally worthless. It is by loving God for God's own sake, and by loving all creatures in conjunction with our love for

God, that we know blessedness. “Thou hast made us for Thyself,” Augustine confessed, “and our souls are restless until they find their rest in Thee” (1955a). In conjunction with this vision of ultimate fulfillment, Aquinas emphasized as well the role “natural” human dispositions play in moral formation. Augustine qualified his own sweeping dismissals of the illusory quest for earthly happiness. The human need for social order and for meaningful participation in community, he conceded, does require worldly approximations of “justice” and “peoplehood.” Still, his primary concern was to contrast the “justice” of this world with true justice, where all things are ordered according to God’s purposes.

Luther and Calvin traced the human disposition to do what is right and good to the goodness of creation, in particular, the creation of human beings in the image of God. They too stressed the broken state of humanity. Only fragments of God’s righteous decrees survived the “fall” into sin. Yet these fragments suffice to hold us accountable for our wickedness. In Paul’s words, we are “without excuse.” The good news is that God renews our hunger to do what is right and good.

Immanuel Kant sought to demonstrate the authority of the moral law in the context of the European Enlightenment. He saw no possibility of basing the moral law upon the “happiness principle.” This principle is the “death of morals!” It highlights human drives to satisfy bodily needs and to gratify selfish desires. Such behavior is in no case free. Kant stressed the “freedom principle” instead. Free acts require rational beings who can formulate the moral law for themselves. We act freely when we resolve to do what the moral law requires, not because we must or because of some advantage we might gain, but out of respect for its intrinsic rightness. Kant described the *supreme maxim* of the moral life as an agent’s *resolve* to subject all actions to the dictates of the moral law. This maxim is equivalent to Aquinas’ notion of *synderesis*. Kant lifted up the promise of a transcendent version of happiness, not as a foundation for the moral life, but as an affective accompaniment of moral virtue. Though we cannot prove God’s existence, moral awareness gives us grounds for “postulating” God’s existence, and for affirming a congruence between God’s will and the moral law. These beliefs awaken hope that moral virtue will lead to blessedness.

Moral Capacity

To function as moral agents, we need more than good intentions. We require strength to implement our intentions in practice. All human capabilities are relevant to the moral life: physical vitality, the ability to communicate, cognitive capacities, artistic gifts. Kant argued that we are morally obliged to develop our “powers” so that we can manage our lives. With regard to *moral* capabilities, classic sources stressed control over bodily appetites: hunger, thirst, sexual desire, combative energy. These appetites, which are common to all animals, are perfectly natural, and they have positive import for human well-being. Hunger and thirst impel us to secure the food and drink we need for survival. Sexual desire assures the propagation of the species. Combative impulses equip us to defend ourselves against assaults, or perhaps to escape our attackers. The same appetites can also be destructive. Hunger can lead to gluttony; thirst, to drunkenness. Erotic desires can drive us to promiscuity, adultery, rape. Combative impulses can unleash explosive fits of temper or unjustified acts of violence. Aristotle stressed a balanced response to bodily appetites. Guided by wise mentors, we adopt practices that form habits. These habits become a “second nature,” enduring over a lifetime. Good habits are “virtues.” They represent a “golden mean” between excess and defect. They channel bodily appetites in morally sound ways while constraining their destructive tendencies. Bad habits are “vices.” They manifest the extremes: a lack of control over the appetites, or their suppression, until they can no longer energize action.

Aquinas applied Aristotle's model to the four "cardinal" virtues: temperance, courage, justice, and prudence. Temperance is the golden mean with regard to bodily desires, especially for food, drink, and sexual gratification; courage is the golden mean with regard to our combative impulses. Justice and prudence are virtues governed by reason. Justice is the readiness to give each person what he or she is due, recognizing the dignity of all human beings. Prudence is the employment of practical reason in exercising moral judgments. Justice and prudence presuppose temperance and courage. Without these latter virtues, we cannot discern what is right and good.

Aquinas then subordinated the natural virtues to supernatural virtues infused in us by divine grace: faith, hope, and love. Faith is cognitive assent to church teaching. It marks the starting point in the human quest for understanding. Hope expresses confidence that God's purposes will be realized. Love is human aspiration toward union with God. We can properly love others and ourselves only in relation to our love for God. Supernatural virtues alone qualify as genuine virtues, and they have no limits. They can even override the "balance" of natural virtues, calling for times of fasting, for lifelong commitments to celibacy, for a readiness to suffer and die for Christ's sake. Yet they bestow qualified significance on the natural virtues as well.

Protestant thinkers, following Luther and Calvin, stressed the primacy of the will and volitional control over the passions. They did not believe that human sin resided in the passions, still less in malformed habits that Aristotle labeled vices. The root of sin is a disobedient will, the refusal to do what God commands. Because of our rebellion, our passions spin out of control, becoming destructive "works of the flesh." The result is the "bondage of the will," rendering us incapable of doing God's will. Our hope rests in God alone, who forgives us and empowers us to do his will. Luther spoke of how God's love flows through us and moves outward toward our neighbors, enabling us to love them truly. Calvin stressed growth in faith, which transforms our hearts. A new heart is the mark of God's healing presence.

Kant's account of moral virtue also centered in volitional control, the resolve to obey the moral law for its own sake. Only the good will, he argued, is good without qualification. Yet a good will must still contend with passions. The underlying problem is that natural inclinations get a head start over rational capabilities. Inclinations are present from birth, but we require time to develop practical reason. In *The Doctrine of Virtue*, Kant (1996) acknowledges that some emotions, which he calls moral dispositions, can furnish the *subjective conditions* of our receptiveness to duty. He cites good feelings that accompany actions consistent with duty, and bad feelings that follow violations of duty. He portrays love as a caring feeling for fellow human beings. We are obliged to help our fellow human beings achieve happiness whether we love them or not. Where love is present, however, our obligations become more bearable. Kant also mentions self-esteem, a positive feeling about oneself. Self-esteem invigorates duties to self, such as the duty to preserve one's life. Kant does not believe we are obliged to cultivate moral feelings, though they can support a good will. True virtue is solely my ability to do my duty. I acquire virtue by exalting the moral law and consistently doing my duty.

Moral Judgment

Classic traditions stress the human capacity to exercise sound moral judgment. For Aquinas, we first consider the things we have in common with other creatures; we then examine our distinctive qualities. Based on these reflections, we determine principles of natural law that will sustain conditions necessary for human well-being. Ideally, laws of the state will reinforce these principles. Laws revealed in scripture

supplement and correct deficiencies in natural law reasoning. Luther and Calvin begin with scripture, focusing on the Ten Commandments and the summary commands to love God and neighbor. Neither was content merely to apply the “letter of the law” to particular human practices. They sought deeper meanings in the commandments. Thus, the prohibition of stealing stimulates reflection on the significance of personal property within God’s providential care for human life. It leads the faithful to claim their obligations toward others, especially the poor and the marginal, so that all might have resources to live in decency. Recognizing the social necessity of holding sin in check, Luther and Calvin urged magistrates to construct human laws informed by biblical wisdom. Calvin stressed growth toward righteousness through reflections on the divine commands. Our ultimate destiny is to glorify God and to enjoy God forever.

Kant called for formulations of moral imperatives that are universally binding upon all rational beings. He distinguished “strict” and “broad” imperatives. The former prohibit inherently contradictory acts, such as lying or suicide. The latter state broad obligations, though with few specifics (e.g. to develop one’s capacities, and to promote the happiness of others). Broad imperatives have affinities with Aquinas’ account of natural law (i.e. obligations that foster human flourishing). Kant offered the “principle of humanity” as an all-encompassing “secondary formulation” of the moral law: “Act so as to treat humanity, whether in your own person or in that of any other, as an end in itself, never as a means only.” This formulation facilitated a shift in moral discourse from the classic focus on duty to the modern interest in human rights. Broad imperatives can in principle be elaborated in rules that govern more particular social practices. The Protestant theologian Paul Ramsey (1965) pressed for “exceptionless moral rules” for applying the commandment of neighbor love to particular practices. Kant’s method furnished a useful model for his reflections.

Recurring ethical controversies involve disputes about concrete applications of basic moral principles. Aquinas addressed this problem directly. The closer we move to particulars, he acknowledged, the more inexact our judgments become. Why? Natural laws address specific facets of human life, while concrete cases often involve multiple considerations that cannot be combined under a single principle. Aquinas gives many examples. We are normally obliged, for example, to return lost property to its owner, *unless* the property is a dangerous weapon, and the owner an enemy invader. Aquinas’ reflections have been expanded as *casuistry* and *proportionalism*. Casuistry involves the examination of particular cases in light of accumulated experiences in dealing with similar cases. Proportionalism stresses the quest for optimal balance in ordering competing values in concrete situations. Critics resist both strategies. They press for strict applications of natural law principles to concrete cases, lest the authority of the moral law be undermined by flawed reasoning.

Challenges to Classic Understandings of Agency

Contemporary additions to the classic traditions involve reflections on human sociality: the import of interpersonal relationships, established social structures, and prevailing cultural values for moral formation. The human sciences have made substantial contributions: ego psychology, object-relations theory, socialization theory. Contemporary theologians and philosophers also place greater emphasis on the relational composition of human persons.

Psychology and Identity Formation

Classic accounts of moral formation focused on basic human faculties: the will, practical reason, bodily appetites. Contemporary psychological studies direct attention to the self, and to relational processes that facilitate an emerging sense of personal identity. These studies suggest that the human disposition to do what is good and right cannot be derived simply from a general desire for happiness, or from a basic capacity for rational judgment. Instead, these dispositions arise from a child's feelings of "secure attachment" to an attentive caregiver, usually the mother, during the first months of life (Ainsworth et al. 1978; Bowlby 1982). Securely attached children begin to create a "coherent, enduring self-narrative" by the age of five. Simultaneously, their sensitivity to the feelings of others and their recognition of the "reciprocal nature of relational transactions" expands significantly (Thompson 2000).

Adolescence marks the turning point in the formation of identity (Erikson 1963, 1968). A stable personal identity is essential for purposive action and for critical moral judgment. It is only when we know who we are and what we stand for that we can act on our own. The primary threat to adolescent identity is "role confusion," not knowing who you are or how you fit into the world. Notions of "the will" or of "virtuous habits" are not obsolete, but they can no longer be abstracted from the complex processes that give rise to personal identity. In Erikson's theory, the attainment of identity positions young adults to form intimate relationships, and to establish homes of their own. Here the threat is isolation and loneliness. To flourish, human beings require highly personal, life-sustaining relationships. Nancy Chodorow's (1999) studies of adolescent girls disclose a complex interplay between an emerging sense of self and growing sensitivity to the feelings of others. She attributes this dynamic to the fact that females differentiate themselves from their mothers while also continuing to identify with them strongly. In contrast, boys tend to differentiate themselves from their mothers while competing with their fathers. Gender differences in studies of moral formation largely reflect times when mothers were the primary caregivers for infants, children, and even youths. One can anticipate changes in those patterns in a world of working mothers where fathers frequently play more active parenting roles.

These studies all give prominence to feelings: trust, attachment, self-confidence, empathy, self-esteem. Just as passions remind us that we are embodied selves, so feelings and affections bear witness to our social composition. Because feelings are closely bound to human relationships, they cannot be treated merely as secondary reinforcements of moral volition. Attitudes of respect and acts of beneficence toward others are cold and heartless if they are devoid of feeling. They can even be undermined by negative or ambivalent feelings that contradict their intended purposes: resentment, envy, disdain, contempt. Classic Christian theological perspectives took note of feelings: remorse, release from guilt, a new heart, hunger for God, blessedness. Such feelings were taken as signs of God's presence. Virtually exclusive attention was given, however, to the God relation, with little thought for the place of human relationships in moral formation. Yet caring human relationships are integral to the moral life, and they can serve as media for the redemptive purposes of God.

Cognitive Development

Studies of *cognitive* moral development parallel accounts of identity formation. Using hypothetical moral dilemmas to stimulate conversations, Lawrence Kohlberg (1971) charted the patterns of moral reasoning that children and youth employ at various ages. His results reflect Kant's view of moral

reasoning. In early childhood, children talk about avoiding pain and securing pleasure. In the middle years, they speak of conventional expectations for proper behavior. Adolescents and young adults stress mutual agreements, and a few appeal to principles of justice. For Kohlberg, the last response marks the highest stage of moral reasoning, a level males appeared more likely to attain than females. Carol Gilligan (1982) expanded Kohlberg's work by focusing on female subjects. She too found that females do not typically assess moral dilemmas by abstract appeals to justice. Instead, they strive to negotiate new arrangements that will overcome problems posed by the dilemmas. The moral reasoning of females, she suggested, is driven by "care" rather than justice, and it involves the give and take of discourse. Care presumes justice. Persons are to be given what they are due. Yet care moves beyond formal respect toward collaborative human relationships. Seyla Benhabib (1992) stresses principles of mutual respect that make discourse possible. Discourse enables us to honor human differences, even to cultivate shared understandings that reach across differences. In pluralistic societies, care and discourse are indispensable for civility.

In Erikson's theory, human development finally moves toward "ego integrity," where a maturing self gathers the experiences, insights, and discoveries of a lifetime into a more coherent whole. At this stage, the ultimate threat is "despair," where life appears empty and without meaning. Erikson's account of ego integrity calls to mind Augustine's portrait of the faith pilgrimage. God's eternity, Augustine reminded us, is not timelessness, but timefulness. God is able to encompass all of the moments and details of our lives, bestowing value upon them all. Our evil acts, our virtuous deeds, our sinful impulses, our spiritual hungers, our experiences of pain and loss, our moments of joy and fulfillment: all play roles in our formation as unique, irreplaceable individuals. Alfred North Whitehead (1929) elegantly captures Augustine's vision: "God is a tender care that nothing be lost."

Social Theory and Cultural Values

Socialization theory displays the transmission from generation to generation of established cultural values and institutionalized social practices. We internalize these values and practices through our interactions with parents, teachers, and mentors, until they become self-evident "givens" in our own perceptions of the world. This theory raises cautions about human claims to grasp moral standards that are absolute and universal in import. Our moral and religious convictions are inevitably filtered through taken-for-granted beliefs that reside in familiar social practices. Deeply entrenched racial, ethnic, religious, and gender prejudices can distort our moral judgments, though without our awareness.

In democratic societies, our lives are no longer framed by an encompassing, cohesive culture grounded in a religious establishment. We have a political culture that privileges individual freedoms and an economy that celebrates personal preferences. Beyond these common values, we live amid a rich plurality of communities and associations offering diverse, even conflicting, visions of human well-being. For many people, this new order has been liberating, opening the way for social mobility, and for bold new experiments in the quest for human fulfillment. It has facilitated movement beyond the racism of the past, and opened new opportunities for women to employ their capabilities in a wider social world. The same circumstances have also been destabilizing, weakening communal bonds that are essential for moral formation: strong families, close neighborhoods, vital religious communities, and overlapping associations that compose civil society.

A world of diversity and change has inspired renewed interest in substantive moral traditions. Alastair MacIntyre (1984) has given philosophical attention to the importance of tradition, narrative, and stable social practices for cultivating moral virtue. Stanley Hauerwas (1981) has emphasized a common faith narrative and shared communal practices in the formation of Christian character. The option of living in a closed, self-subsisting community is open to few. We normally participate in multiple social arenas, interacting daily with fellow human beings whose personal convictions and value priorities cover a wide spectrum of possibilities. The challenge is to uphold with integrity our own deepest convictions while honoring others who hold different views; it is to rebuild and renew our particular moral communities, while fostering broad social commitments to the common good.

Emmanuel Levinas (1969) traces the roots of moral formation to the “gracious face” of the feminine. At the same time, he contends that the full realization of moral responsibility requires the “radical face” of “the Other,” the stranger who exposes our prejudices, and jolts our confidence that we have all the right answers. The radical Other is also vulnerable, a person who cannot get a hearing unless we are prepared to listen. Openness to the Other becomes a pivotal feature of moral responsibility. It corrects our arrogant attempts to construct comprehensive views that render all things intelligible. It expresses our openness to the ultimate mystery of God, in whom all beings realize their destiny. Levinas displays moral maturity as a combination of personal integrity and respect for human plurality.

CHAPTER 15

Moral Development

Don S. Browning[†]

The phrase “moral development” suggests to many educated people the field of moral psychology that this is the academic discipline that is often thought to have the most profound insight into the processes of moral formation. Others, however, think of traditional religion; religious communities, they think, are the primary carriers of the ethical truths and processes of socialization needed to create moral people. Immediately, then, the term moral development raises the specter of the conflict between religion and science. Psychology, it is thought, is a science; religion, it is held, is about our relation to the ultimate about which science, some believe, can tell us very little.

Science versus Tradition

Behind the conflict between science and religion on the moral development of persons is the deeper philosophical conflict between what is generally called “foundationalism” and “non-foundationalism.” This is a conflict about how genuine knowledge, both moral and scientific, should be acquired. Foundationalists believe that it comes from rejecting or bracketing tradition and building knowledge on the basis of objective sense data, scientific experiment, or certain irrefutable *a priori* ideas. The foundationalists believe that true knowledge about the moral development of persons will be discovered scientifically, most likely from the various fields of psychology, whether psychoanalytic, humanistic, cognitive, or evolutionary psychological. Non-foundationalists believe that cultural and religious traditions are the carriers of reliable knowledge and that, at best, science or *a priori* intuitions add only certain minor clarifications to what our traditions already tell us (Bernstein 1983, 1–20). They believe that our religious and cultural traditions have already discovered both what moral persons are and how to form them. This chapter argues that the non-foundationalists are right, but only if they acknowledge the important role the sciences can play in the criticism, refinement, and appropriation of the moral wisdom of our traditions. This opens new directions for work in religious ethics.

Modern Psychology and Moral Development

Most of the modern psychologies of moral development have been foundationalist to the core. They have aspired to find an objective, value free, and tradition-free way of talking about moral development. Because of its scientific aspirations toward objectivity, much modern psychological research is now

[†] Deceased.

thought to have been incomplete. It did its research with inadequate prescientific models of what mature moral action and reflection are really like. For instance, Sigmund Freud believed that his psychoanalytic insights into moral development were scientific and value free. Morality is formed, he taught, by infants and children emotionally identifying with powerful parental figures in their lives, especially the father. In order to retain the father's love, children identify with the negative prohibitions of the father and internalize them into their inner psychological lives, what Freud called the superego (1957, 34–53). But this made moral development primarily an unconscious process of internalizing the values – and often the prejudices – of parents. It gave us no account of how mature persons learn to evaluate their parents' morality in light of classical moral insights found either in their cultural traditions or in recognized philosophical moral principles.

Humanistic psychology also wanted to find a ground for moral development that was scientific and liberated from religious and cultural traditions (Browning 1987; van der Ven 1998, 235). It is an approach to personality development and psychotherapy that held moral development of persons was a matter of learning how to listen to, reflect on, and evaluate one's own organismic experience and capacity for self-actualization (Rogers 1951; Maslow 1954; Perls, Hefferline, and Goodman 1951). Religious and cultural traditions – whether mediated by parents or local communities – were at best advisory to the final center of authority found in the biologically grounded self-actualization tendencies of the individual person. Only gradually did it become apparent that this view of morality was a form of “ethical egoism”; morality was what satisfied and fulfilled the individual (Browning 1987, 72). This implicit moral principle lacked the main feature of genuine morality: the capacity to mediate conflicts between the needs and desires of the individual and the needs and desires of others. In spite of this striking inadequacy, humanistic psychology has influenced the images of health and human fulfillment of much of modern psychotherapy and even the program in moral education called “values clarification” – an approach widely used in schools, prisons, and churches throughout the United States and in other countries as well (see, for example, Simon, Howe, and Kirchenbaum 1971).

The humanistic psychologies, with their biologicistic understanding of moral development, have affinities with the more recent claims of evolutionary psychology. This school of psychology believes that moral values are embedded in the biological processes of sexual selection (kin altruism, inclusive fitness, and natural selection). Kin altruism is the primate inclination to protect, care for, and even empathize with those beings (principally offspring and relatives) who carry and extend his or her genes (see Wright 1994, 158–161). The concept of inclusive fitness claims that creatures that procreate through sexual selection are concerned about the survival and well-being of not only their own genes but also the offspring and relatives that carry their genes. This is not just a selfish process. It can also be seen as the ground of sympathy and identification with others (see de Waal 1996, 78–83; cf. Dawkins 1976). The processes of natural selection, the theory goes, have tended to retain creatures with these sympathetic capacities because of their adaptive qualities for themselves and their genetic family line. James Q. Wilson in *The Moral Sense* (1993) has developed a link between evolutionary psychology and the moral sentiment theories of Scottish philosophers Francis Hutcheson, David Hume, and Adam Smith. Kin altruism and inclusive fitness give rise to moral sentiments that can become elaborated into an adult sense of sympathy, fairness, self-control, and even duty (1993, 29–120). These sentiments develop and mature within the context of the deep investments of family life, but can gradually be analogically extended and universalized to others outside the family (1993, 192–200).

Evolutionary psychology and humanistic psychology are doubtless correct in holding that our organismic experience or deep inclinations toward gene immortality, kin altruism, and inclusive fitness *under*

certain conditions contribute to morally relevant inclinations and sentiments. However, neither school of moral development understands the difference between such premoral inclinations and more properly moral inclinations, sentiments, and values. They do not understand the social, cultural, and hermeneutic conditions under which morally relevant (yet still premoral) biological inclinations are selected, nourished, and enhanced and inclinations and sentiments are channeled, sometimes suppressed, but finally redirected toward morally worthy ends.

The most powerful contemporary psychological perspective on moral development can be found in the cognitive theories of Lawrence Kohlberg. Along with the Swiss psychologist Jean Piaget, Kohlberg believed that moral development employed in the realm of moral conflict and deliberation used the same cognitive capacities as in science and mathematics (Piaget 1965; Kohlberg 1981). Kohlberg was stimulated to do his work because of accumulating evidence that moral training of the kinds associated with Boy Scout merit badges and Sunday School moral instruction did not help young people learn to cope with moral conflict and new moral dilemmas. He realized that social scientists cannot adequately do empirical work in moral development unless they make some important prescientific decisions about the nature of morality. Kohlberg decided that the moral theories of Immanuel Kant and the neo-Kantian perspective of John Rawls provide the most adequate philosophical framework for the scientific study of the moral development of persons (Rawls 1971; Kant 1959). Morality is primarily a matter of *moral thinking*; it is the capacity to guide one's actions by maxims that one can will to be universal law – a law for all humans to follow, both in your action toward them and their action toward you. To think morally means to be able to place oneself in the shoes of the other and think what one's actions might mean to them as well as oneself. It also means being blind to how one's action might benefit oneself in light of certain characteristics such as race, wealth, class, abilities, gender, education, or age.

Given these philosophical precommitments, what did Kohlberg actually learn from his scientific observations? Development of moral thinking, he showed, is measurable. One can find people thinking with some approximation to Kant and Rawls' view of morality, and that there is a developmental timetable for the emergence of one's capacity for such moral thinking. Moral thinking moves from the *pre-conventional* and egocentric stage of early childhood (the right thing to do is that which is satisfying and avoids pain and punishment), to the *conventional* thinking of late childhood and early teens (right action is what parents and the community say we should do), to *postcon-ventional* thinking of late teens and adulthood (right action is the greatest good for the largest number or, higher still, truly universal and reversible moral thinking of the kind Kant and Rawls describe) (Kohlberg 1981, 17–18). Of course, not everyone moves to the higher stages. Most do not get beyond conventionality and some are arrested at pre-conventional levels. Kohlberg believed his empirical studies demonstrated that moral development parallels, and is aided by, the natural sequence of human cognitive development. Finally, he claimed to learn some of the empirical conditions that facilitate the growth, elaboration, and complexification of higher levels of moral thinking. Moral development is provoked by diverse and conflicting social experiences that compel us to restructure our moral cognitive categories so that they become more attentive to and inclusive of the claims of other people, even those outside our traditional circles.

Today, it is widely believed that Kohlberg's view of moral development was far too narrow. He confined morality to moral thinking and paid no systematic attention to the premoral goods that moral thinking should order. Closely related to this point is the feminist critique. Carol Gilligan (1982) has argued that it is a model of moral thinking that fits men more than women. Hence, it was a gender-biased model. Kohlberg's view of moral thinking emphasizes justice and rights and neglects elements of care and

nurture, features that Gilligan believes, at least in Western societies, are more often found in the way women approach moral issues (1982, 62). Communitarian ethicists have advanced criticisms as well. They complain that Kohlberg neglects other aspects of morality, principally the role of virtue, narrative, tradition, and community (MacIntyre 1981). The field of psychology has been influenced by this line of thinking. Owen Flanagan (1991) argues for the importance in psychology and moral philosophy of the narrative formation of moral character and virtue.

Associated with the turn to virtue and narrative in modern theology, philosophy, and psychology is the emergence of character education in schools and communities in the US and other countries. In the early 1990s the general public in several countries became concerned about the increase in crime, cheating, out-of-wedlock pregnancies, sexually transmitted diseases, and alcohol and drug consumption among school-age populations. The leading approach centered around various programs in character education; these initiatives generally entailed school or community-wide discussions about the meaning of such virtues as truth, honesty, commitment, duty, etc. Although apparently powerful in producing a higher level of civility among students and community members, some critics believe that this approach to character education does little to illuminate either the goods at stake in moral issues or the principles of obligation that should guide deliberation and action in new situations. Furthermore, some sociologists believe that character education's concentration on lists of specific virtues may produce only superficial conformity rather than a vital and transformative moral life (Hunter 2000).

A Hermeneutic Understanding of Moral Development

Modern psychology has contributed bits and pieces of insight into the nature of the moral development of persons. It has not, however, delivered a dominant model that has been accepted widely or that has improved decisively our understanding of moral development beyond the wisdom of inherited religious and philosophical resources. Yet, the bits and pieces – the partial insights – can prove valuable if we resist the temptation to inflate a limited finding into representing the entire field of moral deliberation and action. The problem with social scientific research into moral development is this: it has been guided by inadequate prescientific models of morality.

Recently, new philosophical models of ethics and morality have emerged that should be examined for their usefulness for understanding the fullness of moral development. They also may have much to contribute to the social scientific study of moral development. I will illustrate these new prescientific models by outlining the hermeneutic view of ethics and morality found in the writings of Paul Ricoeur. Ricoeur's model can be found in what he calls his "little ethics" (1992, chs. 5–10). According to him, development toward mature moral reflection and action, when fully described, *both includes and yet is more than* the internalization of parental prohibitions (Freud), deepened trust in one's own valuing process (humanistic psychology), kin altruism analogically applied to non-kin (evolutionary psychology), universalizable moral thinking (Kohlberg), and the uncritical assimilation of virtues (character education). For Ricoeur, the development of persons toward moral maturity reflects the full structure of the self in its interpretive and dialogical action with the world. Ricoeur believes that the self in dialogue with its world has a three-step rhythm: the steps of *describing*, *narrating*, and *prescribing* (Ricoeur 1992, 20). When confronting a moral problem, we first describe it, then bring it into contact with our fund of narratives about the meaning of life and our place in it, and then prescribe some kind

of moral response. This happy formula about the moral self will help us understand the full complexity of moral maturity.

Mature moral thinking and action develops along the following lines. First, Ricoeur makes a distinction between ethics and morality. In fact, he asserts the logical and developmental priority of “ethics” over “morality.” “Ethics,” he claims, springs from our desiring selves and from our efforts to realize some good in our lives. Here is where Freud, the humanistic psychologies, and evolutionary psychology throw some light on moral development; all of them taught that ethics springs from our desires, needs, and strivings for self-actualization (Ricoeur 1970). Morality, on the other hand, has more to do with duties and obligations to others. According to Ricoeur, morality builds on, tries to fulfill, yet properly orders our ethical striving toward the good and does this in light of the needs and reality of other people.

How do we understand and learn about these aspirations toward the good? Do we learn about them by directly feeling and following our raw desires and actualization tendencies? Ricoeur says no. We should instead *describe* (the first of the three steps) our culture and tradition’s classic *practices* for pursuing these goods. Such practices crystallize our enduring goods and the appropriate means to acquire them. In this emphasis on practices as revealing the goods of our ethical strivings, Ricoeur affirms the importance to ethics of the teleological concerns of the modern psychologies (desire, organismic experience, self-actualization) but now places these strivings within a communitarian context. This view says, in effect, that the truly tested and lasting goods of life are discovered through the inherited practices of a community and its traditions (MacIntyre 1981, 177).

Teaching persons how to *describe* the inherited practices of a tradition is just the first step toward the moral development of persons. If we are socialized beings, the more excellent forms of our desires are projected into hierarchies of linguistic codes that give intelligibility to our practices: (1) codes of coordination (simple patterns of means to various ends); (2) codes of subordination (such as plowing in order to farm); (3) constitutive rules (moving the pawn to play the game of chess); (4) plans of life (far reaching goals and aspirations); (5) images of the “good life” (models as to what are truly valuable aspirations for life as a whole); and (6) larger narratives that give unity and meaning to our life in the midst of its disappointments and conflicts. All of these layers of language pattern our desires and practices at their very core, carry us toward more fully ethical action, and *lead us to the doorstep of morality*. Ethics understood as the pursuit of the goods of life requires a grand and complex process of education, socialization, and critical interpretation on the excellent practices of a tested and established tradition.

“Narratives” was the last of the long list of ways that our practices, which embody the goods we seek, are encoded by language and tradition. *Narration* was also the second step in Ricoeur’s threefold understanding of the interpretive and dialogical self. Some narrative – some story – always integrates the hierarchies of encoded “ethical” practices. Some narrative gives the final meaning to our means–end actions, our if–then actions, our plans of life, and our images of the good life. To develop as a moral person, one must assimilate the classic narratives of one’s tradition – those that over time have proved most capable of giving meaning to our ethical struggles and losses. In the words of Hans-Georg Gadamer (1989), from whom Ricoeur has learned so much, development toward morality requires learning to interpret the “classics” of a tradition.

In spite of this emphasis on the role in “ethics” of inherited communal practices and traditions, Ricoeur would have us go beyond the traditionalism of communitarianism. Action at this ethical stage only deals with communally patterned aspirations; we have not yet arrived in the arena of full “morality.” Why is it that our ethical aspirations toward the goods of life do not, in themselves, deal with the core of

genuine moral maturity for persons? The answer is that the goods of life conflict and thereby produce various forms of violence. The field of ethics, in contrast to the arena of morality, is born out of our purposive search for the good. “Morality” itself assumes and builds on our ethical and teleological aspirations, but it also goes beyond them. Morality in the proper sense of the word is born out of the tragic conflict between the goods of life. Morality mediates conflicts between goods and the different people and communities seeking these goods. Morality does this by employing tests about which of the maxims guiding our ethical striving are actually universalizable. Such tests can be found in Kant’s second formulation of the categorical imperative: “Act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only” (Kant 1959, 47). In the context of religions such as Judaism and Christianity, and other religions as well, one finds similar tests in the Golden Rule. In Christianity, we find the principle of neighbor love: “You shall love your neighbor as yourself” (Mt. 22:39). These principles show solicitude and respect for both other and self, tell us to treat all persons as ends and never as means alone, and require us to recognize that in their humanity alone *all* individuals are deserving of just access to the goods of life. Actions pursuing goods that pass this test of universalization are moral actions in contrast to simple ethical aspirations.

It is at the moment of this test that Kohlberg’s model of moral development and his emphasis on universalization as the highest level of moral thinking would find a limited place within Ricoeur’s fuller hermeneutic theory of morality. In discussing the test of universalization, however, one has already moved into Ricoeur’s third step: the moment of *prescription*. But prescription has several dimensions to it. First, as we have seen, an ethics of desire, habit, virtue, and community formation (Aristotle) is tested by the categorical imperative and similar principles of universalization (Kant). Second, the tests of our ethical strivings that come from using the universalization principle of the categorical imperative, the Golden Rule, or the love commandment must now be fine-tuned to assess the concrete goods at stake in specific situations. Ordering and ranking these conflicting goods requires wisdom, or practical reason. It requires taking seriously the situation in all of its complications and ambiguity.

The Aim of Moral Development

This critical hermeneutic perspective points to a fuller and more adequate model of development toward mature moral reflection and action. We should help children, young people, and adults understand that they are moral interpreters who inherit traditions of moral practice. Parents, schools, and religious institutions should help them understand that the first step of a moral decision is an act of interpretation; it involves asking, what is the meaning of the deeply coded practices that they have inherited? They should learn to inquire into the proper way to interpret these practices. They should learn to ask, “Do I understand these traditions of practices correctly? What are the images of the good life and the narratives that give them meaning?” They should be taught to be sensitive about whether their practices and the goods they embody conflict within themselves and conflict with, and perhaps destroy, the practices and goods of others. They should then learn to exercise some version of the principle of universalization. Finally, they should learn how to return to the original situation to determine how their narratives and the principle of universalization help reorder the conflicting goods that engendered the original violence. The aim of moral development should be wisdom.

Conclusion

Moral deliberation is inextricably related to understanding and interpretation. Something like this model of moral reflection and action should guide our social, cultural, and religious effort to develop moral persons. Something like this model should guide our human and social sciences in their research to grasp the more detailed conditions for moral development.

CHAPTER 16

Desire and Will

Kevin Jung

Is having the desire to do something the same as having the will to do something? At a cursory glance, it might seem that they are identical. People often use these terms interchangeably in reference to intentional action, as both desiring and willing are commonly attributed to an agent who engages in intentional action. But it is not clear whether they should be treated as the same. In the moral psychologist's chair, we may come to the self-awareness that we sometimes will to do what we desire to do but at other times will to do what we have no desire to do. We may will not to do what we strongly desire to do, or we may fail to do what we will to do. When it comes to normative reasons for action, some philosophers think that desires (more specifically, desire-based reasons) are the only grounds of normative reasons since they believe that no actions are causally efficacious without desires, while others believe that truth-valued judgments also can constitute normative reasons. This short entry cannot cover all of the many important philosophical and theological issues surrounding the topic of desire and will. In what follows, we will discuss only a few of the issues.

The Determining Ground of Free Choice

"Give me chastity and continence, but not yet," says Augustine in his autobiography *The Confessions* (1992, VIII). Even after his conversion to Christianity, Augustine continued to struggle with his sexual desire. But as an ordained priest and bishop, he also had a desire to remain chaste. Thus, within his mind, we see two competing desires, each seeking to overrule the other. But which of the two desires is his volition? Suppose he acts upon one of the desires. Is the action freely willed? What is the determining ground of free choice? Theologians and philosophers have been wrestling with such questions for centuries, as they often intersect with questions concerning other subjects such as divine foreknowledge, divine agency, and moral responsibility. I will briefly explore the nature of free will with a particular focus on the relations among will, desire, and the intellect among other things.

Ever since Augustine, who had a more expansive notion of will (*voluntas*) than any other ancient thinker, how the will is related to desire and to the intellect has been a subject of interest to many theologians and philosophers. In the Middle Ages, what later became known as intellectualism and voluntarism each presented opposing theories about the determining ground of free choice. Very briefly, intellectualism emphasized the primacy of the intellect over the will, while voluntarism argued to the

contrary, and, not surprisingly, their views on free will reflect their respective lines of emphasis. Thomas Aquinas, often viewed as a key intellectualist, considers the intellect to be a higher power than and to be prior to the will in the determination of an act. He holds that the intellect moves the will by presenting an appetible object to the will (*ST I–II* q. 82. a. 3; *I–II* q. 9. a. 1). Since the will, which is the intellectual appetite, is naturally ordered toward happiness, the last end of the human being, and since the object of the intellect is the idea of appetible good, the will is always inclined to some particular good apprehended as appropriate by the intellect. Thus, he explains, in the order of determining the act, “the intellect precedes the will, as the motive power precedes the thing movable, and as the active precedes the passive; for good which is understood moves the will” (*ST I–II* q. 82. a. 3).

Does this mean that we have *free choice*? Aquinas certainly thinks so because he regards our judgment to be from reason, not from a natural instinct in which case the judgment would be determined to one course of action. Insofar as inclinations are subject to the judgment of reason and insofar as the latter can follow opposite courses and can comparatively evaluate them, the will is to be considered free (*ST I–II* q. 83, a. 1).

A quite different view was developed by voluntarists. In particular, John Duns Scotus’s views are interesting, not least because of the resemblance between Scotus and Kant on their shared notion of the will as the self-determining faculty. Contra Aquinas, Scotus insists that the will does not necessarily want happiness as its end and claims that free will requires having opposites in the agent’s power (or what contemporary libertarians call the principle of alternate possibilities). Scotus rejects Aquinas’s view that the will is automatically inclined to happiness as its object of desire and that the will passively desires the good as presented to the will by the intellect. Distinguishing the will into a natural appetite and a free appetite, he contends that the will as the free appetite does not necessarily desire happiness, and it may or may not will, or even may suspend willing, with respect to the end of any natural inclination or a deliberation made by the intellect (Scotus 1997 *Ordinatio* IV, suppl., dist 49, qq. 9–10). The will is indetermined in the sense that it is not determined by anything external to itself. Scotus argues, furthermore, that the will is not free unless “it has the potentiality to determine itself to either alternative with the other alternative before it, and therefore it will act in this way” (Scotus 1997 *Questions on the Metaphysics* IX, q. 15). The point is that rational evaluation of possible courses of action prior to a decision is not sufficient for the freedom of the will.

A new creative proposal on the problem of free will was made by Harry Frankfurt some decades ago, who responds to the libertarian principle of alternate possibilities by reformulating classical compatibilism (Frankfurt 1969). His strategy was to conceive a freely willed action as that of a second-order volition, whether or not the action is causally determined. Frankfurt makes a distinction between first-order and second-order desires, according to which first-order desires are simply desires to do or not to do something, which can be expressed in the form of “A wants to do X,” and *second-order desires* are desires *about* first-order desires (Frankfurt 1971). The distinction is based on the idea that we are sometimes self-aware that there are some desires of ours that we sincerely do not want for ourselves. Imagine an unwilling alcohol addict who says and genuinely means “I want to stop drinking.” The addict has a second-order desire about his first-order desire to drink. A second-order desire then is a desire to have a certain desire, which involves the self-evaluation of one’s first-order desire(s). This implies that an agent’s second-order desires may not be identical with her first-order desires.

The fact that there could be a conflict between first-order and second-order desires may suggest that not all first-order desires are what the agent really wants for herself. In fact, for Frankfurt, an agent’s will is not necessarily identical to a first-order desire that inclines the agent to act. Rather, the will is

identifiable with what the agent wants *to be* her will, i.e. the second-order desire that a certain first-order desire be her “*effective* desire – one that moves (or will or would move) a person all the way to action” (Frankfurt 1971). He calls this second-order desire a second-order *volition*. Having a second-order volition is also important for the question of whether an agent enjoys freedom of the will. Frankfurt claims, “A person’s will is free only if he is free to have the will he wants,” implying that “having the freedom to do what one wants to do is not a sufficient condition of having a free will. It is not a necessary condition either” (Frankfurt 1971).

This claim shows a key difference between Frankfurt’s version of “semi-compatibilism” and classical compatibilism. In a rather simplistic definition, compatibilism is the view that free will and determinism are compatible with each other. David Hume, one of its defenders, famously argued that the liberty of spontaneity, not the liberty of indifference, is the only necessary condition of free will. The liberty of spontaneity here means the absence of external coercion, and the liberty of indifference means a negation of necessity or determinism. Roughly, the idea is that the agent’s will must be viewed as free as long as (1) she had the power or ability to do what she desired to do, and (2) there were no constraints or impediments that prevented her from doing what she desired to do. Classical compatibilists interpret (1) to imply that “one could have done otherwise, if he had chosen.”

“But what if the agent could not have chosen at all?”, ask libertarians. Frankfurt’s version of semi-compatibilism seeks to meet this libertarian challenge by making irrelevant a common libertarian requirement for free will, viz. the agent’s ability to do otherwise, known as the principle of alternate possibilities. On the libertarian assumption, the agent is not morally responsible for his action if he could not have done otherwise. But Frankfurt thinks that this assumption is false. He believes that the reason we often accept such a statement as a valid excuse for not incurring responsibility is not because the agent, literally, could not have done otherwise – as libertarians assume – but because that was *not* “what he really wanted to do.” Here we find again Frankfurt’s identification of second-order volition as the mark of ownership of action and as a necessary condition of free will.

Weakness of Will (*Akrasia*)

“I can will what is right, but I cannot do it. For I do not do the good I want, but the evil I do not want is what I do” (Romans 7:18–19), says the Apostle Paul. A number of philosophers and religious thinkers dating as far back as Plato have noted what appears to be a common experience in human psychology: we sometimes fail to do what we will to do or do something against our better judgment. Is weakness of will real? If so, why does this happen?

In Plato’s *Protagoras*, Socrates denies that weakness of will (*akrasia*) is possible. He says, “No one who has knowledge or thought of other actions as better than those he is doing, and as possible, will do as he proposes if he is free to do the better ones; and this yielding to oneself is nothing but ignorance, and mastery of oneself is as certainly wisdom” (Plato 1992 358b7–c3). The idea is that if one genuinely knows or believes a proposition *p*, then she does not act against *p*. (It is worth noting that Socrates is by no means the only thinker who denies the possibility of *akrasia*. The contemporary philosopher R. M. Hare, for instance, also denies the possibility, arguing that *sincere* assent to evaluative judgments which are action-guiding must be necessarily motivating.) There is considerable dispute about how to interpret the Socratic/Platonic response to *akrasia*. One possible interpretation is that having knowledge is different from having mere true belief in

that having knowledge necessarily includes being capable of self-control, as Plato seems to suggest in *Protagoras* (Plato 1992 352b–c). But the problem is that he also clearly writes, as quoted above, that it is not just those who know that *p*, but also those who have better judgment that *p* never act against *p*.

One person who found the Socratic/Platonic position to be at odds with observed facts was Aristotle. He sees weakness of will (*akrasia*) and self-control (*enkrateia*) as contrary features of human action. There are two types of lack of self-control that he identifies, namely impetuosity and weakness (Aristotle 1999 1150b19–26). For some akratic people, they cannot stand by the results of their rational deliberations because of their feelings, while other akratic people are led on by what they are feeling because they have not deliberated. The former, due to their impetuous lack of self-control, hastily act without following their own rational deliberations, and the latter, because of the intensity of their passions, do not wait for reason and simply follow appearances. Though Aristotle appears to dismiss the Socratic view that we act against our better judgment only through ignorance (Aristotle 1999 1145b24–9), but it is worth noting that Aristotle himself holds that no prudent person is capable of acting willingly against one's practical wisdom (Aristotle 1999 1146a5–9).

As it turns out, how to understand *akrasia* can hinge a lot on how we interpret the meaning of knowledge and better judgment. Does knowledge entail self-control? Does it entail not only action but also strength in action? Or, as Donald Davidson puts it, is better judgment all-things-considered “conditional” or “prima facie” (i.e. relative to the total set of considerations available to me) judgment, or “unconditional” (relative to some subset of the considerations available to me) all-out judgment? (Davidson 1969) For instance, I may judge that drinking a lot of alcohol is not a good idea, all things considered, but I may judge that it is best to do now, given my feeling of sadness. According to Davidson, such is a case of *akrasia* when my unconditional judgment, rather than my all-things-considered conditional judgment, determines my action. On this view, *akrasia* reflects lack of rationality.

One implication of Davidson's position is that we can explain the possibility of acting against one's better judgment only if the better judgment is understood as a conditional (all-things-considered) judgment and only if we have some excuse for going against the conditional judgment. But is this true? It seems that people would sometimes act against their better judgment, knowing in advance there really is no good excuse for what they intend to do.

For some religious thinkers, weakness of will has less to do with the problem of rationality than with the condition of the will. Augustine, for instance, holds that all those who come after the Fall suffer from the debilitating condition of the distorted will that is a consequence of original sin. As a result, we are unable to form a good volition, much less to do what we will. Our will being turned away from God onto ourselves, we have neither the intention nor the power to desire our proper end, i.e. God, and to desire everything else in the right order of love. As Augustine says, “willing is one thing, and ability another; willing does not necessarily imply ability; nor ability willing” (Augustine 1955, ch. 53 [xxx]). He then insists that God's grace is always necessary to repair our distorted will. To borrow Frankfurt's distinction about the two kinds of desire, we may say that God's grace is necessary for repairing both first-order desires and second-order desires; it helps us to form a good volition in us without us, and it strengthens our volition to be able to love God (Augustine 2017, chs. 29–33, 41–43; Stump 2006).

In a related but distinct way, Maximus the Confessor discusses two types of will that exist in human beings, namely natural will and gnostic will. Natural willing refers to the movement of a being in acting in accordance with the being's essential nature (i.e. its logos) and thus the divine will (McFarland 2015). He

posits that each creature has a particular motion corresponding to the end proper to the kind of being it is, and it follows that human beings have a proper end intrinsic to the kind of rational creatures they are. But living under the conditions of time and history in this earthly life prior to glory, our willing is not perfect. As rational creatures who do not have the perfect vision of the good, we are forced to deliberate and choose among the objects of our perceived good. Gnostic willing refers to this self-chosen inclination of a creature whose deliberation and choice can lead to error and thus to sin. From this perspective, weakness of will may be understood as the symptomatic expression of our gnostic will. It is important to note, however, that for Maximus the solution to our imperfect willing is found neither in the denial of our natural desires *per se*, nor in more rational deliberation and self-determination. Rather, it lies in accepting them as ours and bringing them to perfection beyond their natural capacities, through ascetic practices and divine grace, to correspond to our true nature, even though our willing remains gnostic in this life (McFarland 2015).

Normative Reasons for Action

In the Sermon on the Mount, Jesus says, “For if you love those who love you, what reward do you have? Do not even the tax collectors do the same? And if you greet only your brothers and sisters, what more are you doing than others? Do not even the Gentiles do the same? Be perfect, therefore, as your heavenly Father is perfect” (Matthew 5:46–48). Two agents who respectively performed identical actions may receive very different moral appraisals for the reasons on account of which each agent endeavored to bring about action. Reasons to do something are called normative reasons for action, and moral reasons for action are considered species of normative reasons for action. Now, are some reasons good or bad reasons for doing something, and if so, how should we think about these matters?

A desire is often understood as providing the agent with a goal to pursue and with a motivation to perform action. On this classical view, (a) having a desire entails having a desire for an object or a certain state of affairs, and (b) having a desire implies having a disposition to act. But on closer examination, neither having a desire for X nor having a disposition to act for X entails that X is a proper object of desire or that it is morally good to act for X. Some ethical naturalists infer from (a) the belief that the meaning of good is synonymous with what we desire (i.e. natural properties) such as pleasure. But as Moore pointed out, it raises an “open question” whether such a property is indeed good (Moore 1993). If the *meaning* of good is identical to what we desire, it would be a mere tautology to ask if what we desire is good (Hare 1952). Some contemporary ethical naturalists have taken a different approach, saying that what is desirable (i.e. moral properties) is synthetically reducible to what we desire (i.e. natural properties) without their analytic identity. Just as the morning star and the evening star can be known to be identical through observation despite their different meanings, they argue that a *posteriori* identification of moral and non-moral properties is possible.

With regard to (b), it is one thing to say that someone is attracted to the object of her desire, but quite another to say that it is okay for her to take her attraction or inclination *as a reason* for action. The former is a *descriptive* fact about the relation between desire and action, but the latter concerns *normative* reasons for action (hereafter normative reasons). Now suppose (b) is true. Still, (b) remains neutral on a number of related issues. Most thinkers agree that having a desire has a motivational effect on the will, but they disagree on whether this is a *sufficient* reason for performing an action. The question is not so much about whether having a desire can motivate the agent but whether all normative reasons, i.e.

reasons that count in support of action, are desire-based. Here subjectivists and objectivists *about reasons* usually find themselves at opposite ends of the spectrum (Parfit 2011, chs. 2–3). Very briefly, subjectivists about reasons (hereafter subjectivists) maintain that it is the facts about the subject's *attitudes* toward objects such as our desires that give us normative reasons, while objectivists about reasons (hereafter objectivists) focus on mind-independent facts that can render the objects of our desires and aims *objectively* good and thus give us normative reasons. Thus, subjectivists about reasons are (metaphysical) anti-realists about value, whereas objectivists about reasons are usually realists about value.

The biggest weapon in a subjectivist's arsenal often is moral motivation. If the end of morality is to teach us our duty and influence our conduct, are matters of fact capable of accomplishing this task? They argue, following Hume, that, in order for normative reasons to intrinsically motivate the agent, their source must be within the agent's subjective motivational set (Williams 1979). Otherwise, they worry that normative reasons for action would amount to nothing because they would be motivationally vacuous. The view sketched here is known as *reasons internalism*, which holds that all normative reasons are internal reasons, that is, reasons dependent upon the agent's psychological states such as want, desire, and emotion. Many – though not all – supporters of reasons internalism are Humeans who argue that only desires can motivate the agent. Humean internalism takes normative reasons to be always intrinsically motivating and thus states that normative reasons must be based on the agent's desires. If this Humean view is correct, we cannot be expected, much less commanded, to love someone unless the desire to love this person is already present within our psychological profile.

Objectivists, on the other hand, argue that there are object-given reasons for action. According to them, object-given reasons are made possible by the experience of certain objects which gives us the rational apprehension of their intrinsic values, regardless of our attitudes toward them. They also question the idea that all normative reasons must always be intrinsically motivating. It might be the case that some normative reasons have some degree of motivational force without always being intrinsically motivating. That is to say, some objective (i.e. attitude-independent) normative judgments may have some motivational force, but they alone may not be motivationally sufficient for moving the agent. Or, it could be the case that objective normative judgments as normative reasons require only *de dicto* (as opposed to *de re*) desires to motivate the agent. *De dicto* desires refer to standing desires toward some unspecified objects (e.g. she desires to marry *a* man as opposed to *that* man), whereas *de re* desires are specific to some particular objects. If so, having normative reasons does not entail the presence of *certain* desires, though the former may borrow some unspecified desires for motivation. For instance, an objectivist's normative reasons could go like this: when one performs an act of love towards a stranger, she is not motivated by some existing emotional attachment to the type of person this stranger is or certain instrumental value this stranger holds for her, but by intrinsic value the stranger possesses qua human and the additional motivational force that she borrows from her existing psychological resources through her moral imagination.

CHAPTER 17

Perception

Michael Sohn

Introduction

Perception has long been a subject of philosophical and religious reflection, initiated by the ancient Greeks and Romans, elaborated by medieval philosophers and theologians, and renewed by modern scientists and intellectuals. This is unsurprising, for perception is central to each of the major areas within Western thought: metaphysics, epistemology, and ethics. While the subject of perception can be approached from a number of different historical periods or from a number of possible constructive frameworks, this entry focuses on different modes of perception within modern and contemporary Continental thought: the empirical perception of the world, the phenomenological perception within consciousness, and the moral perception of the other. Examining these figures and frameworks accesses an important historical debate over the methodology of the sciences, delineates clear conceptual differences over the meaning of perception, and provides insight into how religion may shape our perceptions of the world and of others.

Empirical Perception: Perception of the World

Modern empiricism, which emerged in the seventeenth and eighteenth centuries and is associated with thinkers such as John Locke (1632–1704) and David Hume (1711–1776), posits that knowledge is primarily based on our sense experiences. Our sense perceptions are nothing other than the passive impression of external objects in the world on our consciousness. Objects are perceived objectively with distinct qualities, such as color, odor, taste, and sound, within time and space. The world, then, is reduced to the objective world, and truth becomes objective truth. The subject is reduced to a non-participating spectator of the world, observing cold, hard facts without any personal interest or involvement. It is implicated only insofar as it is merely the passive receptacle of the impressions from objects in the world.

The modern natural sciences use the perception of contingent, particular empirical facts in the world as its starting point and abstract from it necessary universal principles of nature. The works of Isaac Newton, one of the founding figures of the modern scientific revolution, can be seen as exemplary of such a worldview. The modern scientific method and its discovery of universal principles of nature has allowed for the prediction of natural and human phenomena, which has provided a level of certitude in knowledge about the world that was previously unimagined, leading to important discoveries and innovations in science, medicine, and technology.

The progress and achievements of modern science, however, did not come without its critics. Metaphysical critiques point out the contradiction that science begins with perception of the concrete and the particular, but concludes with abstract and universal truths. German philosopher, Edmund Husserl (1859–1938), for example, whose work will be examined in more detail below, points out that the immediate becomes only the apparent, and the “real” becomes beyond our immediate perceptions. He dedicated his work to critiquing the metaphysical and methodological presuppositions of the modern natural sciences and constructing an alternative method that would return to the immediate given within consciousness as the basis of a rigorous science. Epistemological critiques argue for alternative forms of knowledge and experience. The German historian and philosopher, Wilhelm Dilthey (1833–1911), for example, was concerned about the reduction of all reality and knowledge to the methodological presuppositions of the natural sciences. The dominance of empiricism, on his view, led to the loss of human spirit and life. To that end, Dilthey distinguished the natural sciences (*Naturwissenschaften*) from the human sciences (*Geisteswissenschaften*). Whereas the former are based on outer experiences (*Erfahrung*) of nature that lead to the explanation of facts, the latter is based on inner lived experiences (*Erlebnis*) of the spirit that lead to the interpretation of meaning. By carving out the distinctiveness of human lived experience, Dilthey sought to restore the validity of the human spirit, the self who experiences, acts, and suffers in history. Finally, moral critiques find issue with the reduction of all perceptions to brute hard facts. David Hume, for example, noted that our perceptions of facts convey truth and falsehood, discovering objects as they really stand in nature. Morals, however, do not have objective truth or falsity in this sense, but are rather “gilded” onto their objects in conveying value. The fact-value distinction, raised most famously by Hume, states that prescriptions about what ought to be cannot be based on descriptions about what is. In other words, there must be a moral perception of the other distinct from empirical perception of facts.

Phenomenological Perception: Perception Within Consciousness

Edmund Husserl (1859–1938) lived during this period of the dominance of empiricism and devoted his career to defending phenomenology as a rigorous science that would address the “crisis of the sciences.” For Husserl, phenomenology represented a new descriptive method beyond empiricism. It brackets our outer experiences (*Erfahrung*) of objective existences within the world and, instead, turns inward to life experience (*Erlebnis*). Whereas empiricism is based on the particular perception of contingent, actual existences, phenomenology describes the necessary essential structures of phenomena as they appear to consciousness. Husserl does not reject wholesale the being of the world in favor of the being of consciousness. Rather, consciousness is the necessary condition that renders possible any particular perception within the world. By bracketing our outer experiences, it is not so much that one loses the world but that one all the more regains it in an intimate, more primordial relationship qua consciousness. Perception, then, is not grounded in the passive sensation of impressions on the mind, as modern empiricists had argued, but rather it is an active, constituting act of consciousness. In every cognitive act, consciousness aims or directs itself toward one or another thing.

For Husserl, phenomenology was a rigorous science, the foundation of all other sciences. Whereas the natural sciences were *a posteriori*, dependent and based on our particular perceptions within the world and concluded with universal principles in nature, phenomenology was an *a priori* science, independent

from our contingent experiences of the world. While biology, for example, is based on the perception of objects in the biological world, physics is based on the perception of objects in the physical world, and so on, phenomenology is the study of the essential structure of perception within consciousness, which is the condition for each particular perception of objects in the world. In this respect, all sciences become simply branches of phenomenology.

The distinct contribution of phenomenology is that it shows what primordially exists is not a reality hidden behind the apparent phenomenon but the phenomenon itself as it appears in consciousness. Unlike the abstractions made with empiricism and the modern scientific method, which move from the concrete to general laws of the world, Husserl believed phenomenology offered a rigorous return to a scientific understanding of the concrete. By bracketing our outer experiences of the world and returning to our inner life experiences, phenomenology presents an alternative, more primordial account of human knowledge and experience. In summary, phenomenology can be seen as Husserl's constructive proposal to overcome the metaphysical and epistemological critiques of empiricism.

Phenomenology, however, had its own dissenters. According to its critics, phenomenology's focus on the constituting act of consciousness remains abstract and theoretical, neglecting the concrete, practical, and axiological dimensions of human existence. The second issue may be called the problem of solipsism. The reduction to consciousness without a world suggests that concrete beings exist only insofar as they exist for consciousness. In other words, phenomenology leads to a self-enclosed condition that fails to account for the moral perception of the other.

Moral Perception: Perception of the Other

In this section, we will examine two distinct paradigms of moral perception proposed by Emmanuel Levinas (1906–1995) and Paul Ricoeur (1913–2005), French contemporaries and colleagues who belonged to the same generation, lived through the same historical events, drew upon the same philosophical sources and tradition. They belonged to a generation, which witnessed that as technological progress in modern society brought people closer together, it left them more distant and remote from each other. And even as they decried the malaise of anonymity that afflicted isolated individuals in modern mass society, they also witnessed and experienced invidious forms of social discrimination and political persecution. The Dreyfus affair that scandalized French society at the turn of the century remained part of his generation's cultural collective memory and they were both confined in a prisoner of war camp in Nazi-occupied France.

The issue of moral perception emerged as a pressing issue out of these historical forces, and Levinas found resources for formulating a philosophical response by drawing from the work of Husserl. When he entered the University of Strasbourg as a student, it was a time of much intellectual ferment, for the regnant dominance of empiricism as a methodological approach for the sciences was being called into question. Maurice Pradines, one of his university professors, later reflected on this period as one that constituted a “number of revolutions” from various disciplines over the very meaning and approach to the sciences. Levinas studied under a number of scholars who were probing into new methods for scientific research, most notably Edmund Husserl. He attended Husserl's lectures in Germany in 1928–1929, and he was seminal in introducing his work to the French intellectual context by translating them. His first major scholarly contribution, *Theory of Intuition in Husserl's Phenomenology*, would become

among the first and most influential works dedicated to Husserl's thought. Levinas found Husserl's critique of empiricism to be so thorough and persuasive that he devoted sustained attention to it in this first work, but would dedicate the remainder of his life and career to understanding and critiquing Husserlian phenomenology.

From empiricism through phenomenology to Levinas's ethics, there is a progressive series of brackets that uncovers a deeper, more concrete, and more fundamental understanding of what it means to perceive. Phenomenology brackets empirical perception that simply observes cold hard facts in the world without any subjective interest or attachment. As we are more than simply spectators surveying or observing the world, phenomenology offers a return to an essential account of perception *within* consciousness. Levinas proceeds to go one step further by bracketing the phenomenological perception that describes phenomena as they appear within consciousness. As we are more than simply living within ourselves in solipsism as Husserl suggested, he describes an account of moral perception with the face of the other. Moral perception, in other words, is what it fundamentally means to perceive. To be human is not only to perceive empirical facts in the world; it is not only to perceive things as they appear to us; but it is most fundamentally to perceive the other with inestimable value. Levinas's ethics of alterity, on the one hand, recapitulates the fact-value distinction raised originally by Hume, yet he simultaneously breaks down that distinction by arguing that the immediate given is the other.

Levinas's account of moral perception is what he calls a "new sort of empiricism" that re-conceptualizes the meaning of sensation. It fulfills what the empiricists and phenomenologists had attempted, that is, to access the immediate and concrete. Sensation is neither the impression of objects on the minds of subjects as the empiricists had argued; nor is it implicated in the constitution of objects in the mind as Husserl suggested. Instead, sensation is radically passive, more passive than empirical sensation, as one is chosen and called to ethical responsibility by the other. At the same time, sensation is radically subjective, more subjective than phenomenology, because one is radically individuated and responsible to the other.

Through these successive brackets, there is a reduction that uncovers a fundamental account of moral perception. Beyond the empirical principles of nature that begin with our observations of facts within the world, beyond the phenomenological principle that begins with the constitution of objects within consciousness, there is an ethical principle that begins with the other. It is this radical encounter with the face of the other that indicates our deepest sense of self and our truest sense of what it means to perceive.

Moral Perception: Sympathy With the Other

Paul Ricoeur, Levinas's contemporary and colleague, provides an alternative account of moral perception, one that restores the self as the acting agent of moral perception. Like Levinas, Ricoeur played a critical role in introducing the work of Edmund Husserl to France by translating his works and by expositing his thought. Both Ricoeur and Levinas find that it is unclear how Husserl attaches value to the appearance of the other within consciousness. In other words, the other appears as a phenomenon within consciousness rather than as a person endowed with value, deserving respect.

Ricoeur turns to the work of German philosopher, Max Scheler (1874–1928), as a necessary corrective to Husserlian phenomenology. By drawing on Husserl, Scheler re-establishes the priority of the voluntary within concrete moral existence while, at the same time, acknowledging the involuntary constitutions of

human existence. For Scheler's ethics of sympathy is not grounded in the being or character of persons as such, but rather from the attitude of the spectator. While the other has a sphere of absolute difference which can never be given to us, we can have insight into others insofar as we treat their bodies as a field of expression for their experiences. Scheler develops a concept of sympathy (*Mitgefühl*) that draws from Husserl's doctrine of intentionality; sympathy always directs feeling toward the other's joy or suffering. By restoring the centrality of consciousness within his account of moral perception, Scheler is careful to distinguish the voluntariness of sympathy from mere involuntary "emotional infection," for example when a child's infectious laughter and personality affects others or when a cheerful atmosphere in a pub may "infect" the newcomers and "sweep them up" into a mood of gaiety. In these cases, there is neither an intentional direction of feeling towards the other's joy or suffering nor any participation in her experience. They just happen involuntarily and operate "unconsciously."

While Scheler retrieves Husserl's doctrine of intentionality for his account of sympathy, he also departs from him by distinguishing moral consciousness of others from consciousness of things. That is why sympathy (*Mitgefühl*) in experiences of pity (*Mitleid*) and joy (*Mitfreude*) are always additional to the grasping of the other as an object or thing. While Scheler uncovers a specifically moral dimension to the consciousness of the other that Husserl's phenomenology overlooks, Ricoeur observes that Scheler does not explore and explain why he privileges sympathy among intersubjective sentiments. Scheler, in other words, focuses on the concept of sympathy and neglects moments of negativity in intersubjective life.

Ricoeur argues that a coherent phenomenology of sympathy presupposes an ethics of respect. Retrieving Kantian ethics, he argues that the other like myself becomes an absolute value, which in turn justifies and funds Schelerian sympathy. Sympathy is privileged over other intersubjective affections because it is based on an ethic of respect. It is by respect that we sympathize with the joy and suffering of the other as hers and not as mine. Without respect, phenomenology passes through the problem of the constitution of *things*, not *persons*. For Ricoeur, it is not a choice between respect as a formal principle and the material ethics of sympathy, but rather respect is *a priori* apprehension of the value of another as such.

Levinas and Ricoeur, then, provide contrasting positions on moral perception even as they are both trying to account for the difference between the manner in which a person announces herself and the manner in which a thing shows itself. Levinas extends Husserl's program of phenomenology as a rigorous science, uncovering the most fundamental principle, which begins not with *facts* within the world, not with *objects* within intentional consciousness, but which begins with the *other*. Ricoeur, on the other hand, pursues Husserl's phenomenology in beginning with his doctrine of intentional consciousness, but exposit a specifically moral consciousness of the other through Scheler's account of sympathy and Kant's ethics of respect. Despite their considerable differences, they were both attempting to preserve an account of moral perception over against the forces of anonymity and misperception that overshadowed their period.

Religious Formation of Moral Perception

Many Continental thinkers maintained a strict separation between their philosophical and religious thought such that their claims with respect to their phenomenology and ethics upheld an integrity independent of religious belief, authority, and tradition. They also acknowledge the distinct resources that their respective religious traditions bring to bear on their philosophies. The work of Emmanuel

Levinas is case in point. Levinas's critique of empiricism and phenomenology and his constructive account of moral perception was within the strict limits of pure philosophy. Yet, he employs religious terms within his philosophical writings that suggest his account of moral perception is formed by religious sources. This is unsurprising, for even as Levinas was trained and taught at French universities, he also maintained an abiding commitment to Jewish studies. He began working at L'Alliance Israélite Universelle (AIU) in 1930, a Jewish organization that was committed to promoting the "rights of man." From 1947 until 1980, he served as acting director of l'École Normale Israélite Orientale (ENIO), an organization that recruited and trained teachers to cultivate Jewish identity through the study of Talmudic texts in Morocco, Tunisia, Algeria, Turkey, and Syria. Attention to his religious writings reveal the intersection and mutual relationship between philosophy and Judaism such that his account of moral perception is interpreted in specifically Jewish terms and that key doctrines within the Jewish tradition are interpreted in light of his philosophical account of moral perception.

Levinas's philosophical critique of the modern empirical sciences extends to his critique of the "science of Judaism" (*Wissenschaft des Judentums*). The science of Judaism transformed the study of Scripture in the nineteenth century through a rapprochement with modern methods of the sciences employed in sociology, history, and philology. Sacred texts became objects of historical, critical scholarship. By applying these methodological approaches to Jewish texts and history, the study of Judaism, so went the argument, would be properly elevated and esteemed to the status of a "modern science." The study of Judaism thereby shifted from Torah and Talmudic studies within the synagogue towards "academic Judaism" within a broader "scientific" study in the university.

According to Levinas, however, the study of Judaism, by employing modern scientific methods, abstracts from the true nature of living religion. While Lévinas does not discard wholesale the insights of *Wissenschaft des Judentums*, he believes that its approach is not sufficient for the cultivation of Jewish life. To study Jewish texts with critical distance as historical artifacts relegates them to a distant past that has no import for present Jewish life. And the distinctiveness of Judaism was lost when its texts became treated merely as one object among many to be classified, compared, and measured against other objects of investigation.

Although Lévinas rejected premodern and modern formulations of the science of Judaism, he drew from their insights to offer a more adequate articulation of the proper nature and task of a science of Judaism. He preserves a premodern form of Judaism that valorizes its classical textual sources and tradition, while, at the same time, maintaining a modern form of Judaism that enlarges its relevance beyond a historical community. This paradoxical position is perhaps best captured in Lévinas's expression, "Jewish humanism." He tries to reconcile these two poles by integrating Jewish particularism with the new insights of a general phenomenological method. At this intersection, Jewish doctrines of election, suffering, and prophetic exile, found in textual sources and interpreted throughout history, infuse his account of moral perception.

In Lévinas's new science of Judaism, the doctrine of election becomes thematized within his description of ethico-religious experience. Moral perception involves a religious dimension because the wholly Other or God elects or chooses us in a call to responsibility. Lévinas draws from the textual sources and traditions of Judaism not only to re-interpret the Jewish doctrine of election within the horizon of phenomenology, but also to re-interpret the moral perception of the other in specifically Jewish terms. The figure of the ethico-religious Jew gains privileged access to and is elected by the Other by undergoing suffering and persecution. The suffering of Israel throughout its history thereby becomes interpreted as a moral and religious category within Lévinas's phenomenological analysis of human experience. On the

one hand, the radical distance of the wholly Other becomes more proximate through moments of suffering and persecution, and it is the religious Jew who Lévinas suggests has such privileged access. At the same time, the feeling of being chosen or elected within the phenomenological analysis of moral encounter and responsibility implies a radical passivity, to the point of persecution and suffering. The primordially of sensation and passivity within Lévinas's philosophy then becomes re-interpreted against the backdrop of Jewish persecution and suffering, and conversely, Jewish persecution throughout history shapes his phenomenological description of moral perception. If the themes of election and suffering re-describe Jewish texts and history within a phenomenological experience, this comes to a head in configuring Jewish identity in terms of prophecy. Lévinas uncovered an ethical dimension of human life that bracketed the "world." His Jewish writings, in a parallel fashion, reduce the essence of Judaism to an ethico-religious encounter with the other such that the Jew lives outside of the world. The primordial dimension of ethical responsibility that brackets the world becomes reinterpreted within Jewish prophecy, and likewise, Jewish prophetic tradition is renewed by integrating its themes within phenomenological analysis.

While retrieving Jewish textual sources and historical experience, he reconfigured deeply ingrained categories and concepts, such as election, persecution, and prophecy, within a re-description and analysis of moral perception. Lévinas's new science of Judaism uncovered a concrete, ethical dimension that cultivated the perception of God and the other. The new science of Judaism sought to revive and renew Jewish life and identity in the postwar period by integrating the insights and overcoming the oversights of both premodern and modern forms. He retrieved classical textual sources that modern Judaism neglected while at the same time broadening its relevance beyond a historical community by employing a general phenomenology. While drawing from Jewish textual sources and tradition, he reconfigured specifically Jewish categories and concepts within an account of moral perception. Conversely, what appears as Lévinas's pure phenomenology within his philosophical writings is reinterpreted into Jewish categories and concepts within his Jewish writings. Philosophical concepts and themes, such as the passivity of sensation, individuation in the call to responsibility, and the primordially of ethics that brackets politics and history are interpreted anew within Jewish notions of suffering and persecution, election and prophecy. In short, Levinas broadens the science of Judaism by moving beyond the boundedness of a historical community, uncovering an ethical and religious dimension that is accessible universally, even as the figure of the Jew holds privileged access to this phenomenon.

Levinas is an excellent example of a contemporary Continental thinker who brought religious sources and beliefs to bear on their philosophy. Ricoeur, to take another example, drew on Protestant theologians, such as Karl Barth, Rulldolf Bultmann, and Gerhard Ebeling to develop a Christian hermeneutics in parallel to his philosophical hermeneutics. Jean Luc-Marion and Michel Henry develop philosophical concepts, such as givenness and the body, in parallel to Catholic reflections on revelation and incarnation. All these thinkers endeavored to develop a pure, rigorous philosophy and yet, in their own ways, indicated how empirical religious sources and traditions can shape our perceptions of the world, of ourselves and of others.

Conclusion

By examining different understandings of perception – the empirical perception of the world, the phenomenological perception within consciousness, and the moral perception of the other – it also disclosed different understandings of the self. The deepest and truest sense of our self is not when we are

spectators, observing facts in the world, nor when we are participants, perceiving within our consciousness, but when we are ethically responsible, perceiving the face of the other. While Levinas describes this experience within his pure philosophy, there are resources within religion that shape and provide distinct access to it. In the aftermath of World War II, Levinas argued that Judaism brought distinct resources to bear for a shattered world. It would inject received history and culture with new possibility and thereby serve as a model for a world that had lost its moral compass and needed resources around which it could orient itself once again.

CHAPTER 18

Love and Compassion

Lisa Sowle Cahill

Most religious traditions value the dispositions of love and compassion and encourage members to embody them practically, even when competing teachings, narratives, or historical practices in the same tradition permit or approve violence. Perspectives on formation for love and compassion vary by culture and religion; the base point of this entry is Christianity, but illustrative connections will be made to other traditions. All four New Testament gospels portray Jesus as teaching love of God and neighbor, compassion for the poor and marginalized, and even love and self-sacrifice for enemies. Judaism teaches that one must not only obey the law but also imitate God's compassion toward other human beings. Hinduism considers compassion (*Karuna*), incarnated in Lord Shiva, as a cardinal virtue. In Buddhism, *Karuna* refers to the strong desire to end the suffering of other sentient beings. The holy book of Islam, the Qur'an, names Allah as the one who is compassionate and merciful (Balslev and Evers 2010; McFarlane 1996). While valuing love and compassion, religious traditions prioritize them differently in relation to other character traits, and most limit their scope or application by differentiating between worthy and unworthy recipients.

Means of formation are both personal and social. They include appeals to individual conversion and desire, as well as engagement in community narratives and practices embodying love and compassion (e.g. religious rituals, communal patterns of moral behavior, and the emulation of role models). Some areas of critical debate regarding moral formation for love and compassion include: defining love and compassion; the interdependence of the emotions and moral reason in constituting moral character; the role of communities in teaching love and compassion; and the conditioning of moral agency by historical, genetic, or other biological factors.

What Are Love and Compassion?

While love is ordinarily understood as an intense feeling of deep personal affection and attachment, compassion is the ability to enter affectively into the experience of another, accompanied by the desire to relieve their suffering. More basic than either of these is empathy, the vicarious experience of the feelings or thoughts of another. The formation of loving and compassionate moral character is dependent on the capacity for empathy. Different from but related to all these is altruism, acting for the good of the other with no expectation of reciprocity or benefit. Many religious traditions idealize altruistic compassion, and praise those who sacrifice their own welfare for the good of others. Jesus Christ, whom the gospels

portray as sacrificing his life for the salvation of humanity, is a model for Christians. In Judaism, the Talmud and the rabbis commend a duty of self-sacrifice to meet the needs of the neighbor, though this duty does not override that of self-preservation. In the Buddhist *Jataka*, tales of a monkey and a hare who sacrifice their own lives to serve or rescue others idealize compassion as involving extreme altruism.

Christianity, originally a first-century Jewish reform movement, arose within the wider cultures of ancient Greece and Rome. Their influence is partly responsible for an ongoing Christian debate about whether acting with love and compassion fulfills and brings genuine human happiness, or requires extreme altruistic self-sacrifice. The classic philosophers (Plato, Aristotle, Cicero) saw moral virtue as requiring control of the passions by reason, sought moderation in judgment and action, and believed that human happiness (*eudaimonia*) resides ultimately in true virtue. In the fourth century, Augustine of Hippo offered a Christian version of this eudaimonistic framework, proposing that a rightly ordered, virtuous and happy life is one in which all other goods are loved in relation to love of God (Augustine 1948). In the thirteenth century, Thomas Aquinas (informed by the thought of Aristotle) agreed that the virtuous life is the happy life, adding that love of God as the supreme good requires the theological virtues (faith, hope, and charity) that unite the believer to God in personal friendship (Aquinas 1948, II-II.Q 62). Thus both Augustine and Aquinas envision that true Christian virtue – love of God and neighbor – leads to happiness (*eudaimonia*).

Yet from the earliest years of Christianity, Jesus Christ's voluntary and sacrificial death on a cross has contested the idea that to be virtuous is to be happy. Instead, some theologians argue, Christian virtue deeply contradicts earthly human happiness. Christian love entails the suffering and even death of the self in obedience to God's commands and in emulation of Christ. The New Testament Greek word for Christian love is *agape* – a term virtually synonymous with self-sacrificial love, extreme self-denial, and other-centered altruism. In the sixteenth century, the Protestant Reformer John Calvin wrote that “the sum of the Christian life” is “the denial of ourselves” (Calvin, 1960, Book III.7). The early twentieth century Swedish theologian, Anders Nygren, wrote an influential book, *Eros and Agape*, contrasting the Greek idea of desire-fulfilling love (*eros*) with Christian *agape* (Nygren 1982).

One way to resolve the debate between Christian *eudaimonism* and “divine command” or duty-based ethics is suggested by Jesus's paradoxical saying, “Whoever would save his life will lose it, but whoever loses his life for my sake will find it” (Matthew 16:25). A traditional interpretation is that disciples who renounce happiness or even life itself will be rewarded with eternal life. Another interpretation brings *eudaimonism* and self-sacrifice closer together in temporal experience. Those who focus their moral choices on their own happiness will not ultimately find it; but those who live by Jesus's command to love God and neighbor will discover that the meaning of life (and happiness) lies in compassion, love, and striving to alleviate human suffering. Moreover, adherence to Jesus's example brings union with God that is joyous and rewarding.

The debate about whether the religious virtue of love fulfills human nature or requires a sacrifice of the agent's own happiness, is highly significant for the question of moral formation. If religiously inspired love fundamentally contradicts (selfish and sinful) human nature, and does not bring temporal happiness, then moral formation must teach asceticism, self-denial, and submission of one's own will to that of God. The death of Jesus on the cross is the central formative image for Christians, supported by biblical depictions of everlasting reward for other-directed service and punishment for pride and selfishness (the parable of judgment in Matthew 25, for example). Traditions of religious asceticism illustrate formative practices. More important than compassion are humility, self-discipline, courage, and fortitude.

If, on the other hand, Christian virtue is the path to profound and genuine happiness, then moral formation teaches believers to recognize true happiness and embrace empathy and compassion. Serving those in need brings psychological, spiritual, and relational rewards, despite sacrifices. Here an empathetic disposition to respond compassionately to the needs of others is more important than self-denial. Formative narratives would include the complementary parables of the Good Samaritan (Luke 10: 27–37) and the Prodigal Son (Luke 15:11–32). In the former, a traveler rescues an injured robbery victim, providing care at his own expense. In the latter, a father joyfully welcomes his wayward son and celebrates with resources added to those the son has already squandered. Formative practices include religiously-inspired service, or outreach activities that build on human dignity and fellow-humanity, and increase relationship and understanding.

Reason, Emotions, and Moral Formation

Like the classical philosophers, Christian theologians have tended to see the passions and emotions as negative influences in the moral life, especially since the Enlightenment with its priority on reason. Since the Enlightenment, Christian theologians and ethicists have especially prioritized reason's ability to know, analyze, negotiate, and control moral situations. Moreover, empathy and compassion alone cannot choose between conflicting duties or needs of persons. Therefore, moral formation must emphasize ethical understanding, analysis, and reason-giving in favor of moral attitudes and actions.

Yet knowledge of right and wrong does not always produce the right actions or patterns of social behavior. In fact, as the term “rationalization” indicates, the desire for an outcome often conscripts reason in its service, rather than the other way around. Therefore moral formation must involve more than education in moral theory or analysis, and more than knowledge of moral rules. Formation must teach believers to desire the good wholeheartedly. Moral formation of the passions, emotions, desires, or “affections” has a history in Christianity tracing back to the Bible. Jesus's characteristic mode of teaching is parables: short narratives or scenarios with a surprising twist, reversing hearers' expectations, and imagining new possibilities of love and compassion. For example, the Good Samaritan belongs to a religious group on bad terms with Jews. Yet he stops to save a Jew left for dead by robbers, although two Jewish officials (a priest and Levite) have already passed him by (Luke 10:27–37). Gospel narratives about Jesus's forgiveness of sins, healing of the afflicted, acceptance of the outcast, and passion and death likewise awaken commitment and motivation to “go and do likewise” (Luke 10:37).

Virtually every major religious tradition embodies moral ideals in narratives, often centered on morally exemplary individuals, that are intended to shape the worldviews of adherents and produce commitment to analogous action. Buddhism honors Prince Siddhartha (to become the Buddha), who as a young man was moved by the sight of human suffering to adopt an ascetic path to enlightenment, and to teach compassion. Muslims recount that Muhammed illustrated compassion with a story in which a man with empathy for a desperately thirsty dog went down into a well to fetch water for him in one of his leather socks, and carried it up in his teeth. African traditional religions and moral cultures use maxims to elicit affective identification with the needs of others. The Akan of Ghana say “The right arm washes the left arm and the left arm washes the right arm,” “Life is mutual aid,” and “Your neighbor's situation is [potentially] your situation” (Gyekye, 2011). Imaginative illustrations of compassion, not abstract principles, have carried this ideal across multiple religious traditions over generations and inspired the moral passion behind it (Gill 2017, 187).

Among Christian theologians, Jonathan Edwards gives moral emotions or affections an unusually central place. Attraction to biblical love and compassion because of the beauty of the good is the key to virtue for Edwards, and virtue in turn beautifies the agent (Wilson and Porter 2003). In Christian tradition, the theologian *par excellence* of an ethics of reason is Thomas Aquinas, who grounds responsible moral action in “right practical reason,” formed by the virtue of prudence (Aquinas 1948, II–II. Q 47). Right reason chooses the highest good in the hierarchy of goods at stake in any situation of choice. Diana Fritz Cates argues that despite privileging reason, Aquinas has an important place for the passions or emotions, as interdependent with moral reason (Cates 2009). Emotional attraction (or aversion) affects the way we reason, and whether we put what we know to be right into practice. In fact, we should cultivate our own emotions, so we are more likely to feel empathy and compassion, or a passion for justice.

A closely related topic is the value of an aesthetic approach to moral formation. The role of aesthetics in religious formation is to communicate the beauty and attractiveness of a relationship to God that includes compassion and love for fellow humanity. The inherent attractiveness and compelling nature of altruistic compassion is one of the main lessons of the narratives and maxims above. Religions have distinctive traditions in the visual arts, music, poetry, ritual, dance, and architecture that convey the beauty of a loving relationship to God and others, engaging emotional and imaginative capacities in commitment to a renewed way of life.

In 1965, the Second Vatican Council of the Roman Catholic Church proclaimed that cultivation of the arts “can elevate the human family to a more sublime understanding of truth, goodness and beauty, and in the formation of judgments which embody universal values” (Second Vatican Council 1965, no. 57). The African-American theologian James Cone finds beauty in Christ’s cross insofar as it stands for justice against manifest injustice, such as black people who suffered on “the lynching tree.” Cone lifts up slave spirituals and the blues as musical embodiments of the connection of aesthetics to justice, and as invitations to empathy and to compassionate resistance (Cone 2011). John Paul Lederach shows how artistic expression and communication have inspired and empowered peacebuilders in violent conflict zones around the world (Lederach 2005).

Communities of Moral Formation

Moral formation is centered on individual character and virtue, but individual formation requires and assumes communal histories, traditions, narratives and practices (even though these are not stable but contested and renegotiated over time). Even when a religious tradition’s formative practices are centered on instruction by a spiritual master, that individual transmits to the devotee a religious heritage that is crystalized in teachings and devotional practices. Members of religious communities are formed in worldviews that, for example, either depict outsiders as enemies, or foster the practice of hospitality. Many religious traditions have encouraged militaristic and xenophobic attitudes that validate cultural-political programs of conquest. Many, if not most, religious traditions incorporate status hierarchies that inhibit or limit love and compassion for all. Yet most religious traditions also honor and teach compassion-inspiring practices of generosity and service that inculcate dispositions like empathy and love.

One example is the Christian tradition of spiritual and corporal “works of mercy.” The spiritual works are to instruct the ignorant, counsel the doubtful, comfort the afflicted, admonish the sinner, forgive offenses, bear wrongs patiently, and pray for the living and the dead. While several of these can be seen

as expressions of love and compassion, the corporal works of mercy are more clearly ethical, justice-related practices. They are to feed the hungry, give drink to the thirsty, shelter the homeless, clothe the naked, visit the sick, visit the imprisoned, and bury the dead. These can be translated into contemporary works like reducing global poverty and hunger, alleviating homelessness, accommodating immigrants and refugees, campaigning for prison reform, and remedying the global “diseases of the poor” (malaria, tuberculosis, and HIV/AIDS). The works of mercy are encouraged by the liturgy of the Eucharist and its repeated reminders that all are in need of divine mercy and called to show mercy to others (Keenan 2008). Christian communal formation for love and compassion need not always be asymmetrically other-directed. Oppressed and disenfranchised communities will rightly build up mutual solidarity, love, and compassion, while not excluding care for those who suffer beyond community boundaries.

Determinants of and Constraints on Moral Agency

The foregoing discussion of communities and moral formation shows why moral agency and freedom are always conditioned by social norms and expectations. This does not mean moral freedom is nonexistent, or people are unable to critique their cultures. This is why slaves were able to see through “biblical” justifications of their condition and embrace a different version of Christianity in which Christ on the Cross was suffering with them. It is why many white people were persuaded by the prophetic example of the Rev. Dr. Martin Luther King. Yet it is more difficult to resist injustice if it is part of one’s cultural worldview, practices, and institutions; and easier to do so if one is embedded in narratives and ways of life that continually remind one of the priority of love, compassion, equality, and altruism.

A newer line of inquiry concerns biogenetic determinants of moral agency. A first (and not so new) issue is the connection of moral agency to gender. Patriarchal gender hierarchies are almost a cross-cultural universal, and many cultural and religious traditions validate gender differences by saying they are “natural” or “God-given,” and by forming boys and girls, men and women, to conform to norms of “masculine” and “feminine” behavior. Women are seen as “naturally” destined for motherhood and domesticity, and as less logical and rational than men; girls are formed to embrace a nurturing, sacrificial, and submissive role in family and society. Love and compassion are key feminine virtues in this view. Men, on the other hand, are presumed to be generally aggressive and adventurous, as well as rational and objective. Boys are formed to take leadership positions, to provide material resources for their families, to be interested in sexual conquest over parental nurturing, and to exercise authority over women and children. Boys and men are also expected to bond together and fight off outsiders and competitors. Love and compassion are at least atypical for men in this view, and at worst “feminizing” and unmanly.

It is difficult for empirical studies to either confirm or disconfirm whether there are any natural or biological bases of such expectations, since research subjects will already have been products of some socialization. That being said, most research to date does not confirm highly differentiated, binary, or rigid gender characteristics or moral predispositions that are the natural correlates of biological sex. Further complicating any defense of gender dualism is the reality that some intersex and transgender persons are not clearly either male or female; and many experience as “natural” some gender characteristics that do not correspond to the norms associated with their assigned biological sex.

However, there is some evidence (not definitive) that in general males tend to be more aggressive and competitive, to have a stronger sex drive than women, and to have greater visual-spatial skills; while

women have greater verbal ability and emotional intelligence than men, and more interest in ongoing relational ties. (Neither sex takes the lead in intelligence or innate mathematical ability.) Sociobiology and evolutionary psychology suggest that such traits may have arisen through “natural selection” due to their evolutionary value to the survival of the human species and its near relatives. However, such traits undoubtedly are reinforced socially, so that the relative influence of “nature” and “nurture” is unclear; moreover, individuals vary greatly in whether they possess these traits or to what degree. To the extent that they exist, sex-based gender traits do not mean that human beings are morally captive to their sex drives, aggressive impulses, emotions, or “maternal instincts.” Rather, moral formation for love and compassion must take into consideration factors such as aggression and competitiveness, proneness to sexual infidelity, skill at emotional manipulation, or the tendency to conscript resources for one’s own young exclusively, whether they occur in a man or a woman in any particular instance.

A related line of inquiry concerns morally significant behavioral tendencies that can be correlated with individual neurological or genetic traits. For example, some researchers have hypothesized that males who have an extra Y chromosome (XYY), or abnormal versions of the MAOA gene located on the X chromosome, are more prone to aggressive and criminal behavior. A greater proportion of affected individuals exists in populations of men convicted of violent crimes than in the general population. Yet it is highly unlikely that genes by themselves can code for violence or crime (or, conversely, dispose to compassion and love). Rather, they are risk factors when combined with other causes of stress, such as abusive family situations, low peer acceptance, or academic failure. Key to moral formation are early intervention, and positive incorporation into relationships and communities embodying self-control, empathy, compassion and love, expressed at the practical moral level as service and other pro-social activities.

Beyond gene-specific conditions, neurological and genetic factors may be involved in diagnosable mental disorders such as depression, schizophrenia, bi-polar disease, autism-spectrum disorders, anxiety, and paranoia that can interfere with moral self-determination and relational ability, especially with empathy, love, and compassion. Even within “normal” psychological parameters, individuals have differing inclinations to poor impulse control, outbursts of anger, spontaneous anti-social ideation (e.g. regarding sex or violence), anxiety, or lack of confidence in one’s own agency. Formation for love and compassion must be sensitive to the differing capacities and obstacles of individual agents. Mentors, educators, and formative communities should respond with understanding, encouragement, and nuanced approaches. Moral freedom and the ability of individuals to be accountable, to assume moral responsibility, and to live up to the ideals of love, compassion, and justice – with the aid of a supportive narrative and community – are, and must remain, the *sine qua non* of moral formation.

CHAPTER 19

Practical Reasoning and Moral Casuistry

Albert R. Jonsen[†]

Practical reasoning is a phrase used in Western moral philosophy to designate the intellectual process whereby an agent deliberates and decides about a particular course of action. Since moral decision and action is formulated in the light of some sort of general principles, applicable to all similarly situated agents, particular agents must determine how those general principles apply to the specific situation in which they will act. The logic of practical reasoning has been a topic of interest since Aristotle delineated his views in the *Nicomachean Ethics*, pointing out how deliberation and decision about practice differs from speculative or scientific reasoning (1994, III, iii). Modern philosophers have studied how reasons serve to explain, evaluate, and justify intentional decisions and have analyzed the forms of inference involved in statements containing such words as “ought,” “should,” etc. (Audi 1989; Gauthier 1963; Raz 1978). Since real moral agents decide and act in relation to specific, attainable ends and in the context of concrete circumstances, practical reasoning can be said to be about “cases,” that is, “instances” (in Latin, *casus*), in which the particular agent’s specific purposes and motives, as well as the extant circumstances of time, place, probability, and possibility, etc., can be described. Thus, the term “casuistry,” although it has a more particular meaning to be noted below, may be used as somewhat synonymous with practical reasoning, and will so be used in this chapter about practical reasoning in religious ethics.

While diverse manners of practical reasoning appear in different traditions and cultures, this entry will attend particularly to the forms of casuistic reasoning that have a prominent place in the ethical traditions of three historic religions: Judaism, Christianity, and Islam. This review of the casuistic traditions aims at a general account of casuistic reasoning, with recognition of some problems inherent in this form of practical reasoning.

Textual Sources for Casuistry

Judaism finds the source of divine revelation in the five books of the Law given by Yahweh to Moses: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy, called collectively the Torah. Christianity accepts the same five books, together with another 34 books of the Hebrew scriptures, called collectively the Old Testament, and the four gospels and 23 other writings, called the New Testament. Muḥammed designated Jews and Christians as “People of the Book,” meaning that they had received a divine revelation contained in the written words of an inspired text, the Bible. Islam also has its Book, the

[†]Deceased.

Qur'an, in which Allāh conveys to humankind a vision of the meaning of life and commands about how to live it.

Thus, in each of these historic faiths, a written text incorporates the fundamentals of belief, not in abstract terms, but in the specific communications of the Lord, Creator, and Redeemer. The form of that communication, in each of the holy books, is varied: stories about divine creation and providence, poetry about divine mercy and justice, and extensive rules about worship and about the behavior of believers in every aspect of their lives.

The faithful, who are guided by the sacred texts, also live in times and societies not exactly like those in which the divine words were spoken to the inspired scribes. Thus, while the commands are clearly in universal form and are intended to bind the faithful through all time, the differences in cultural, social, and linguistic settings of the faithful through history, require additional interpretation, beyond the casuistry found within the text itself. Further, there is the theological question about inspired scripture itself: Does it represent the literal words of the divine source or does the human intermediary necessarily introduce the human elements of fallibility or cultural relativity and, if so, to what extent? Faced with these questions, each of the three faiths, through their long history, developed institutions for interpretation and commentary on the originating texts. Over many centuries, theological, moral, and legal commentary accumulated into elaborate systems of scholarly theory and method and of rules and opinions taught to the faithful.

Jewish Casuistry

Judaism reveres Torah as the primary source of revelation. These books contain not only the Decalogue but also, according to Jewish tradition, another 613 commandments applicable to Jewish life. A scholarly class, the rabbis, reflected on every word of those books to reveal their deepest meaning and their relevance for observant Jews. Schools of interpretation, with differing emphases but a common purpose of elucidating the sacred text, grew up in Palestine, Babylon, and the Diaspora; the vast literary collection of their reflections constitute Talmud. The Talmudic literature, incorporating the commentary of a multitude of rabbis over many centuries, becomes the major secondary source of Jewish Law. Codes, composed for the most part during the Middle Ages, systematize the multifarious reflections of the rabbis. In general, the sum of Torah, Talmud, and Mishnaic commentaries and Codes make up Halakhah, the law of Jewish life, in its ritual and moral dimensions. However, all these sources are themselves written works, in need of continual interpretation for current times and problems. Rabbinic activity includes a dynamic process: responses to particular questions posed by the observant Jew facing a situation in which some aspect of the tradition seems challenged by previously unfamiliar circumstances. These responses, called Teshuva, (often given the Latin name *Responsa*), are directed to the immediate question but reflect the entire tradition and become part of the tradition (Freehof 1955).

The responding rabbi (or rabbinical council) first examines the texts of Torah and of Talmudic and Mishnaic commentary and the Codes for the most relevant guidance, notes any contradictions or obscurity in these sources, then attempts to reconcile these difficulties in order to find a way toward a resolution appropriate to the immediate case. In the most orthodox view, rabbinic resolution is more than advice; it binds the conscience of the questioner. These responses, which are given in the course of daily life, are often private but are sometimes recorded and collected, particularly if they issue from a rabbi of renowned piety and scholarship. The responses then enter the stream of interpretation of the Law and are used by subsequent rabbis as sources of wisdom. Among the vast number of known Teshuva

(estimated at around 250,000 dating from several centuries before the Common Era), a recent collection is most poignant and revealing of rabbinic method and wisdom: responses issued during the Holocaust to Jewish questioners under the most extreme circumstances. One eloquent and heartrending response, issued by the Chief Rabbi in the Warsaw ghetto, considers whether an infant's crying might be stifled as Nazi stormtroopers hunted for hidden Jews, even if the stifling might smother the child. The rabbi answers in a long, scholarly review of the tradition about endangering life, which is almost uncompromising about protecting life, yet he comes to the conclusion that, although the child might not be killed, its life might be endangered to save the hidden Jews, for its own life would certainly be extinguished if the parents were discovered. This casuistry manifests how a tradition with the highest respect for the preservation of life might find grounds for an exception (Kirschner 1985).

Christian Casuistry

Christianity accepts the same first five books of the Hebrew Bible. At the same time, the moral imperatives of Jesus announced in the gospels and the teachings of the first disciples reported in the rest of the New Testament, provide extensive teachings about the moral life, many of which, in Christian eyes, surpassed the Jewish Law in rigor and in sublimity. Early Christians endeavored to put into practice some of the "hard teachings" of Jesus, such as the imperative to leave father and mother to follow him, to turn the other cheek and put up the sword when attacked, and to refrain from marriage, and were forced to interpret these commands within the demands of daily life. In the early church, distinctions between counsels of perfection, as enunciated in the words of Jesus, and moral imperatives, stated in the Decalogue, marked the beginnings of casuistry. Clement, Bishop of Alexandria, for example, wrote extensive treatises to advise his Christian flock about how to live in the pagan surroundings of that great metropolis. When the church was officially recognized within the empire, the strict pacifism that appeared to be the teaching of Jesus had to accommodate the needs of civil defense. Christians served as soldiers and could not be simply told to put up the sword. St. Augustine, formulating the theology of church and state, initiated a casuistry of "just war," an idea already adumbrated in Roman authors, such as Cicero, in which the conditions of legitimate self-defense of person and nation allowed Christians to shed blood. A large casuistry developed around these questions (Kelsay and Johnson 1991).

A practice of confession of sins by a believer to a priest appeared in the late middle ages. Practiced in different ways in different churches, the church in the British Isles, particularly in Ireland, imposed on the faithful a particularly demanding regimen. Moral offenses were catalogued in detail and penances for each specified in books entitled Penitentials. Despite the detail, priests had to consider the grounds for excuse or mitigation and so a rudimentary casuistry developed that was carried by monks from Ireland onto the Continent. Toward the end of the eleventh century, there appeared a movement to organize church law and practice, which had developed largely out of the decrees of local bishops and regional counsels. Collections of these "canons," or rules, were made, inspired by the desire to order and reconcile them. As canonists, the lawyers of the church, performed these tasks; they encountered the many cases that had given rise, over time, to the decrees they were reconciling and, in so doing, formulated certain rules for the interpretation of cases. In 1215 a major church council, Lateran IV, promoted the practice of personal, private confession to a central place in Christian life, requiring all Christians to confess to a priest at least once a year. In the wake of this decree, the need arose to educate clergy

throughout Europe about how to judge the seriousness of the sins confessed to them and to make discretionary decisions about penance and absolution. Much more sophisticated Penitentials were produced, often by the theological scholars of the new universities, in which the nature of virtues and vices was analyzed and the circumstances that rendered them more or less serious, that is, as mortal or venial sins, were explained, usually under the general heading of the Ten Commandments. These explanations were illustrated by “for examples,” that is, “cases.” These cases were sometimes reports of actual ones familiar to confessors or were fictitious ones used for didactic purposes.

The work of canonists and theologians drew on several sources. They not only referenced the precepts of the Bible, the comments of the Fathers, and the decrees of councils. They also utilized the rational techniques of scholastic thought, inspired by the Aristotelian renaissance in the thirteenth century. Also, a theory of natural law, inspired by Roman law and Ciceronian and Stoic philosophy, provided a conceptual framework for ethics which was not dependant on revelation. Christian casuistry, unlike Talmudic or Islamic, could proceed with wide ranging exploration of rational ethics and only peripheral references to revealed sources.

In the sixteenth century, casuistry emerged as a special branch of moral theology and a multitude of books, analyzing every conceivable moral act, appeared. The authors of these books were frequently members of the newly founded Jesuit order, whose interest in the education of young Catholics and in the ministry of the confessional made them the casuists *par excellence*. In 1656 the mathematical genius Blaise Pascal published *The Provincial Letters*, a scathing criticism of Jesuit casuistry in which he claimed that the techniques of rational analysis had been carried to extremes, justifying by clever reasoning the most outrageous violations of Christian morals and submerging the gospel message under sophistry. His criticism gave casuistry a bad reputation for centuries, and ascribed to the word “casuistry” an almost entirely pejorative meaning – a cynical, sophistic, deceptive distortion of moral rules in order to avoid obeying them through specious rationalization (Pascal 1967; Jonsen 1993). Despite Pascal’s criticism and the temptation to abuse, a sound, serious practice of casuistry continued within the Catholic and Anglican, and to some extent, Lutheran and Calvinist, churches (Jonsen and Toulmin 1988; Mahoney 1987; Keenan and Shannon 1995).

During and after the Reformation, casuistry also came in for severe criticism from the Protestant reformers. As Protestantism developed, the formal techniques of casuistry withered, although all moral judgment required some sort of practical reasoning. In Anglicanism alone, a vigorous scholarly casuistry prevailed, closely resembling Roman Catholic casuistry, although notably more liberated from hierarchical doctrine (Kirk 1999).

Islamic Casuistry

Islam holds the Qur’an to have been dictated to Mohammed by Allāh and to contain the substance of divine prescriptions for life. In addition, the Ḥadīth, or traditions ascribing certain words and practices to the Prophet, and to his first companions, was also held in high esteem as a guide to the moral life. Islam, within the first century of its existence, became sovereign over a wide region of the Near East and North Africa. Its military and political dominance prevailed over Persian, Syrian, Byzantine, and Hellenistic states where substantial systems of law and moral custom already existed. Islamic rulers desired to bring those legal and customary systems into some conformity with the divine law expressed

in Qur'ān. Early in Islamic history, then, judges (*qadis*) were appointed not simply to decide cases but to reinterpret them in light of Qur'an and Ḥadīth, and out of these judicial activities arose Shari'a, the law of Islam which contained both legal norms for social life and ethical norms for personal behavior, which were not sharply distinguished: all life for the believer, as well as all rules for the state, were included in Shari'a. The task of interpreting Shari'a, the jurisprudence and ethics of Islam, is called *Fiq* (Schacht 1964; Hourani 1971).

The daily life of the faithful encounters difficulties with the familiar norms of Shari'a and those who wish to fulfill the law are encouraged to seek the opinion of scholars of *Fiq*. These scholars, *mufti*, devote themselves to the study of Qur'an, Ḥadīth, and the traditions of interpretation. Organized in many schools of thought over centuries, these divided into traditionalists and rationalists: the former adhere closely to text and traditions, the latter allow the use of logic and rational methods, derived, as in medieval Christianity, from Aristotelian thought, to guide interpretation. Unlike Christian thinkers, Islamic scholars, even the rationalists, did not develop a formal theory of natural law ethics, although they left a large place for customary moral practices in their interpretation of Shari'a. The *mufti*, either as individual scholars or in schools, consider cases submitted to them, formulate their opinion, *Ra'y*, and issue advice, called *Fatwā*, about behavior that would most closely conform to Shari'a. The format of a *Fatwā* resembles the format of the Jewish Teshuva: reference to relevant scriptural texts, examination of scholarly opinion, rational efforts to interpret and reconcile opinions, allusion to analogies and formulation of advice. *Fatwā* can address political or personal problems. The consensus or agreement of the scholars, in a particular place or of a particular school or in all of the lands of Islam, provides an important criterion for the reliability of opinion. In the latter centuries of the Ottoman empire a bureaucracy was established, headed by a Grand Mufti of Istanbul, devoted entirely to the preparation of *Fatwā* for the guidance of government and of individual behavior.

Among the earliest and most fundamental moves of Islamic casuistry is the distinction of all moral law into five categories: obligatory, recommended, permitted, disapproved, and forbidden (there is debate about whether any acts are neutral). Working within these categories, *mufti* can draw careful distinctions about how stringently laws bind the believer. Thus, the ominous words of Qur'an, "Fight in the cause of Allāh those who fight you ... and slay them wherever you catch them" (S. 2, 190) can be interpreted as permissive, not obligatory, and it can be recommended that women, children, old men, and other non-combatants can be left unmolested. The words "those who fight you" can be interpreted to exclude these parties but if they, although non-combatants, give aid to the enemies of Allāh, it is permitted, perhaps obligatory, to execute them. It is disapproved to slay any conquered person who may be of use to Islam and it is forbidden to slay those who convert to Islam. Principles of mercy and moderation temper literal fulfillment of the law in the light of circumstances (Khadduri 1955).

Casuistic Method

The casuistries of these three faiths, while different in content and inspiration, are remarkably similar in their fundamental methodology. Crucial to each form of casuistry is the move between revealed text or universal ethical principle and the particular decision. The revealed text itself is rarely specific enough to meet the perplexity of the presented case and the texts themselves often seem to the uninitiated rather peripheral to the problem. For example, a text of the Book of Leviticus (19:16), "thou shalt not stand by

the blood of your neighbor,” serves as the starting point for a rich Talmudic casuistry about the duty to heal the sick. These words are certainly not an explicit command to heal, but one of the greatest Talmudists, Moses Maimonides (also a physician), reads them to say that anyone capable of rescuing another from drowning, from marauders, or from attacking beasts, who fails to do so, transgresses this command (Maimonides, *Hilkhot* 1.14). Maimonides clearly goes beyond the words of the text to what he considers its meaning. Modern Jewish bioethicists still reflect on cases of withholding technological life-support in the light of this text and its interpretations over time. Drawing any text close to an actual case demands both reverence for the text as well as intellectual ingenuity. It is this intellectual ingenuity that forms the heart of any casuistry.

However, intellectual ingenuity may also challenge reverence for the text or the principle. The human intellect is capable not only of reasoning but also of rationalization: thus, scholars may utilize the techniques of reasoning, such as definition of terms, distinction and division of concepts and the subtle, often fallacious, steps of logic to reach any conclusion dictated by their preferences. Religious casuistry attempts to reign in the unfettered use of rational techniques by embedding the reasoning within the tradition of scholarship. Many casuists have considered similar cases and frequently come up with similar conclusions, sometimes even by different routes of reasoning. Their opinions are to be respected and the divergent opinions that may also appear are to be carefully analyzed, in order to discern the grounds for the differences and to reconcile them, insofar as possible. If reconciliation is not possible and a genuine difference of defensible opinion remains, the questioner is free to act in accord with various opinions. Here the reputation of the competing casuists and the reasonableness of the various opinions must be weighed. In each casuistic tradition, rules for this weighing of opinion are devised.

Reference to the tradition of scholarly casuists involves reference to the cases that those scholarly predecessors and contemporaries have decided. The cases are, as noted above, “similar” to the instant case and their conclusions are “similar.” Again, the casuistries of the three faiths utilize reasoning by analogy as an indispensable technique. Reasoning by analogy involves identification of a case that seems similar to the present case and then carefully distinguishing the precise ways in which the present case resembles the former one, in expectation of finding some feature that allows the casuist to claim that this previously decided case is similar enough to the present case that the prior decision, or consensus of decisions, should be taken as the key to the resolution of the present case. It is, however, only the key, for the circumstances of the present case are likely to differ from the former one, or the circumstances of the former one might be too sketchily described to allow direct comparison. Thus, the importance of the circumstances must be carefully specified and their bearing on diverse resolutions evaluated.

These are central activities of casuistry: use of analogical reasoning and evaluation of circumstances. They too are open to abuse, since the choice of appropriate analogies and the description of circumstances may be very subjective. Here, the recourse to tradition is of less value, since at this point in the analysis, the casuist is on his own. He has been able to check his subjectivity by placing himself within the long conversation of his casuistic colleagues, but only up to the point where he must choose the appropriate analogy and weigh the current circumstances. Here the “prudence” or “practical wisdom” of the casuist, his ability to consider fairly and comprehensively the circumstances of this case, in light of relevant principles, becomes central. It is a virtue or talent of the experienced casuist. Casuistry, then, is both conservative and creative: it places cases within a tradition and then moves the tradition ahead by the decision in the present case. The primary check on unfettered ingenuity now becomes the response of the contemporary casuistic community, and the broader community of believers, to the new resolution of the new case.

Religious casuistry, then, is the practical reasoning of communities of faith. In the background always stand the scripture and traditional beliefs of the community. In the foreground stand the scholarly communities who interpret that scriptural and traditional background and teach it to the faithful. They use common rational methods of interpretation and, in addition, refer that interpretation to the preceding tradition of scholarship. They not only theorize but also respond to actual cases in which the faithful may face perplexity in acting according to their faith in current circumstances. They utilize to a high degree analogical reasoning, working from case to case, in order to reach a resolution that is both traditional and novel.

CHAPTER 20

Virtue and Virtue Ethics

Cheryl Cottine

Today the term virtue might conjure up images of figures like Mother Teresa, Gandhi, or Martin Luther King Jr. These figures, known for their benevolence toward humanity in many ways represent much about what is good in the world. Beyond turning to these larger-than-life-super-humans, many of us can identify models of virtue in our own lives. These individuals display courage in the face of adversity, are known for honesty, or seek out justice, perhaps at the expense of their own safety. Virtues come in many forms and are often defined by a particular social and/or cultural context. While what counts as a virtue may certainly vary between places and across time, there are some discernible characteristics that mark something as a likely virtue, and there are identifiable frameworks that are traditionally in place when we consider how a virtuous disposition is developed. Virtue and virtue ethics are distinct categories, yet, unsurprisingly, how one understands the former deeply influences the shape of the latter.

In what follows, a sketch of some key elements of virtue is provided. The aim is not to be comprehensive, but rather to focus on elements of virtue that are sometimes implicit in contemporary articulations of virtue ethics, as well as features that represent important points of debate. We then turn to consider how virtue influenced ethical theory and to the contours of contemporary discussions of debate in the field of virtue ethics. Finally, we consider how virtue ethics applies to practical ethics by focusing on the example of environmental virtue ethics.

Core Concepts

Virtue in Outline

Virtue has meant many things to different people, and there is certainly no agreed upon list of the virtues. To get a handle on what virtue entails, we briefly consider three thinkers who have articulated robust accounts of virtue from different traditions: Aristotle (384–322 BCE), Mengzi (ca. 391–308 BCE), and Aquinas (1225–1274). Aristotle's conception of virtue is the most referenced and retrieved conception of virtue by contemporary virtue ethicists. In the *Nicomachean Ethics*, Aristotle famously defines virtue as, “a state that decides, consisting in a mean, the mean relative to us, which is defined by reference to reason, that is to say, to the reason by reference to which the prudent person would define it. It is a mean between two vices, one of excess and one of deficiency” (Irwin 1991, 25). Additionally, virtue is about feelings and actions, and more specifically it is about choosing those actions that best express both

reason and emotions while aiming at what is fine or praiseworthy. Virtue is a state of character, and becomes such through deliberate habituation. Aristotle's account of the virtues is teleologically (end) oriented toward *eudaimonia* (flourishing). *Eudaimonia*, as the complete and self-sufficient goal for humans, is best realized through becoming virtuous. Virtue, requires *phronesis* (practical wisdom), and is something sought after for its own sake.

The early Confucians (thinkers living prior to 221 BCE) are equally renowned for their attention to virtue. Virtue (*de*) has a number of different characteristics. Where virtue often referred more generally to an object's distinctive characteristic that enabled it to act and respond to the world in a certain way (e.g. the virtue of a horse is to run fast), with the Confucians it more generally refers to a human character trait that allows one to act and respond well to others. In other words, the early Confucians moralize the concept of virtue. Virtue has a magnetic quality to it; a virtuous person is charismatic. In Confucius's language, the virtue of a ruler is like a pole star around which all others orbit (Slingerland 2003, 8). Mengzi expanded the scope of virtue, claiming that becoming virtuous was within everyone's power. Virtue is a character trait based in basic and universal human emotions that must be nurtured. Benevolence (*ren*), righteousness (*yi*), ritual propriety (*li*), and wisdom (*zhi*) are the four cardinal virtues, and the sprouts of these virtues are the feelings of compassion, disdain, deference, and of approval and disapproval respectively (Van Norden 2008, 45–47, 149). Despite having origins in natural human emotions or inclinations, Mengzi by no means thought that virtue came naturally or easily to humans. One must actively choose to cultivate virtue, a task requiring persistent attention and refinement.

The final definition of virtue we want to consider comes from Aquinas. As with the other thinkers considered, Aquinas's conception of virtue is too complex to do it justice here. For Aquinas, virtue helps orient us toward a particular end. Unlike his intellectual predecessor Augustine (354–430), who rejected the Aristotelian virtues on the grounds that they badly oriented individuals and bolstered personal egos rather than correctly orienting one toward God, Aquinas made room for both natural virtue (temperance, courage, justice, and prudence) and infused virtue (faith, hope, and charity). Aquinas recognized potential in the natural virtues to orient people toward the laudable end of the common good (sometimes called civic virtues), but also toward individual perfection. However, a human's true orientation is toward God, and infused virtues are necessary for this end. Infused virtues are not enhancements of natural virtues, nor are they merit based. Infused virtues are a gift of grace.

Virtue Requires a Robust Account of Moral Anthropology As Well As An Account of Moral Cultivation

Fully grasping the work that virtue does in a human's quest for moral betterment presupposes a robust account of the human condition. Are humans born morally blind and thus in need of direction to become virtuous? Were humans once perfectly good and now corrupt due to a fatal preoccupation with themselves? Or are humans naturally inclined toward goodness, but in need of direction to fully realize this potential? Where one begins determines the work that virtue does to enable one to reach the desired end, in many cases the most fully realized (read virtuous) version of oneself. Philip Ivanhoe identifies several models of moral cultivation. The four models this entry will focus on are the discovery, reformation, developmental, and recovery models (Ivanhoe, 2000; Van Norden, 2007). The discovery model presumes that humans already possess all of the requisite capacities to become fully moral; they simply need to dust off the mirror (to use a Buddhist or neo-Confucian image) to fully access these cognitive and

affective capacities and put them to use. On the reformation model, humans have the innate stuff to become moral, but this stuff requires a new mold in order to enable moral actualization. Xunzi (late fourth century BCE), another early Confucian, nicely exemplifies this model. According to Xunzi, humans are born morally blind but with strong inclinations, emotions, and cognitive capacity. If left untutored or in their raw state, then these inborn inclinations have the tendency to lead us toward selfishness and other unsavory tendencies. However, with applied effort, the help of teachers, and considerable manipulation (Xunzi famously uses the image of straightening warped wood to illustrate this point), these inborn tendencies can be beautifully reformed and directed into virtues. In contrast to reformation models, developmental models assume a more optimistic starting point for the human condition. Mengzi, for example, posits that our natural emotions and inclinations (the sprouts of virtue) incline humans toward goodness. Required is attention, care, and a will to help the sprouts develop into complete virtues. The recovery model is best exemplified by many Christian thinkers. On this account, humans (either collectively or individually, depending on the thinker) began life correctly oriented toward their end (God in this case), but fell from grace through a perverted act of the will. What is required for moral realization, then, is to recover some lost state.

Conceptions of moral development are not mutually exclusive, and often elements of several are contained within a particular account of moral development. Regardless of the account of human nature one begins with, and regardless of the target for fully realized humanity, an intelligible account of virtue will begin with an account of the human condition and articulate a method for obtaining or perfecting specified virtues.

Virtue is Responsive

To say that virtue is responsive means that it engages both the will and the emotions (or the passions, if we are talking about Hume). Responding well to a situation requires both rational and emotional training and maturity. The role that responsiveness plays in conceptions of virtue varies. Aristotle's and neo-Aristotelian portrayals of virtue situate responsiveness within a *eudaimonistic* framework. Responding in the right way is, in Aristotle's words, having feelings, "at the right times, about the right things, toward the right people, for the right end, and in the right way" (Irwin 1999, 2.6.11). Appropriately reading the situation and determining the best response requires training, an acute attentiveness, and the desire to act for virtue's sake. Responsiveness within this sort of *eudaimonistic* framework is a responsiveness to the demands of virtue.

Responsiveness can take other forms as well. Christine Swanton describes the response dependent virtue ethic of Hume and Nietzsche as "emotional response dependence." For Hume this manifests itself as a "pleasurable love of virtue constituting the approval of the moral sense"; whereas for Nietzsche, "the nature of the ethics-constituting response is inherently creative" (Swanton 2015, 28). Other thinkers, such as Iris Murdoch, describe responsiveness in terms of attention. Careful observation of the other and concerted reflection on one's reaction to others can result in a gradual revolution of how one sees and internally responds to the other (Murdoch 1997 and 2002). And within the Mengzian worldview, responsiveness manifests itself both in outward actions toward another, but also in careful attention to one's emotional responses to a given situation. Recognizing an action as a benevolent response, for example, is to simultaneously acknowledge the sprout of benevolence operating, in turn strengthening that inclination, making it more likely to fire in other analogous situations (e.g. Van Norden 2008, 7–15).

While responsiveness and virtue takes a variety of forms, it generally involves both an internal and an external component. The latter provides the framework for a response, while the former engages faculties such as emotional response, reflection, creativity, and the will.

Virtue is Normative

For those who understand morality in terms of virtue, virtue is a normative concept. To say something is normative means that it is action guiding, that it provides direction in determining right from wrong, good from bad. The way in which virtue guides one toward good responses is certainly different from the way focusing on duties or consequences do. Rather than asking about the appropriate maxim to apply to an act (deontology) and rather than calculating the good and bad consequences of an action (consequentialism), virtue provides normative guidance in its conceptualization of what it means to act from a specific virtue. In other words, the normative force of virtue comes from the overall picture of what it means to possess a specific virtue. Additionally, we can understand a virtue's normativity in terms of side constraints. Recall Aristotle's definition of virtue discussed earlier, where he places virtuous activity between two vices – between two sets of responses that are emotionally and cognitively inappropriate responses to a situation.

A side-constraint approach to thinking about virtue's normative aspects is more akin to doing normative ethics negatively. A virtuous action is not a vicious action. However, there are other normative guidelines available. In positive terms, one can determine the virtuous response by contemplating what the virtuous person would do. To be more precise, one would contemplate what the just, kind, courageous, benevolent, etc., person would do. These V-rules, as Hursthouse calls them (1999), are perfectly capable of providing concrete action guidance. Additionally, encouraging reflection on how a virtuous person might respond makes moral exemplars an integral part of virtue.

Virtue Attends to Moral Exemplars and the Community

One of the more compelling features of virtue is that it permits notions of the self and community into the sphere of moral concern and relevance. Communities are the backdrop that define and give meaning to virtue concepts; they produce the exemplars of virtue that are championed and admired, and, in Lawrence Blum's words, communities "can powerfully shape members' sense of undue burden, and hence of what they regard as "reasonable to expect" (Blum 1996, 245). Blum laments the lack of attention that contemporary virtue theorists give to community. Choosing to focus on what virtue is and means for an individual is to overlook the significant fact that notions of virtue and virtue cultivation are often community building and defining.

Communities often provide a sense of belonging; they are a larger entity to which one can relate and contribute to its growth and flourishing. Communities large and small establish codes of conduct, often champion exemplary figures who embody all that is good about the community, and they provide systems of support and correction. Communities work on multiple levels – they can provide an individual a broader sense of belonging, or offer a narrative into which an individual fits and understands his or her life (Haurawass 1981). Virtue, understood in the context of communities, is a praiseworthy character trait that enables the individual to contribute to communal flourishing at best, and functioning at minimum. It is from particular communities that exemplars emerge. Exemplars of virtue are individuals who embody

certain character traits which are deemed a worthy standard to strive toward in one's own quest for moral betterment. Mengzi, for example, championed ancient sages (exemplary figures of ancient times) not only because they embodied the virtues of a Confucian worldview, but because they were keenly aware that role models were integral to encouraging virtue cultivation by individuals in the community.

Virtue, with its attention to exemplars and community, more readily captures the complexity of the human psyche. Humans are social creatures who have a desire to belong to community and who are deeply influenced and compelled to action by others. Attending to the conditions defining and enabling virtues and to the power of moral exemplars necessarily expands the scope of the moral universe. Conceptualizing virtue as situated both within a specific communal context and in relation to moral exemplars provides a powerful explanatory mechanism for thinking about what motivates both moral cultivation as well as specific acts.

Virtue is Both Self and Other Regarding

Intimated above is the idea that virtue allows for and often requires attention to the self. In other words, a virtue focused ethic allows for what Michael Slote calls self-other symmetry (Slote 1992). One critique of consequentialist theories in particular is that they fail to adequately take into consideration the interests of the acting agent, prioritizing instead the interests and needs of others. Champions of virtue, however, more readily acknowledge that favoring the interests, needs, desires, and motivations of others over those of oneself, is problematic and lends morality an air of disinterestedness.

Many proponents of virtue recognize the improbability and danger of ignoring or downplaying personal interests, motivations, and what we might broadly label self-care. Aristotle perceptively speaks of friendship in terms of self-love not because he thinks that everything reduces to self-interest, but rather because he believes that we naturally and genuinely desire to realize the true and appropriate end for humans, and that this serves as a model for relating to, caring for, and aiding others – in this case friends (Irwin 1999, 119–136). The early Confucian texts emphasize in their own ways the importance of self-reflection. To fail to attend to the self and to strive toward virtue could be disastrous both at the individual and communal level. At the individual level because it would result in a failure to realize the full human potential, and at the communal level because it would contribute to moral decline and furthermore set an inadequate or bad example. Finally, we can observe attention to the self, acknowledged in specific Christian frameworks. Søren Kierkegaard (1813–1855), for instance, recognized that at the heart of Christian doctrine was a requirement for correct self-love (love thy neighbor as thyself). Failing to correctly orient oneself toward God would prevent one from being able to appropriately love others. These are very different examples, and yet they all attest to the importance of attending to self-orientation and cultivation. Notice, however, that attention to self-cultivation is not at the expense of other-regarding dispositions, but rather a prerequisite to being able to appropriately and adequately attend to the needs and interests of others.

From Virtue to Virtue Ethics

Ever since G. E. M. Anscombe's 1958 essay, "Modern Moral Philosophy," virtue ethics has enjoyed a revival and undergone significant development from its more traditional roots in Plato and Aristotle. While ancient Greek philosophy was certainly not the only ancient form of philosophy to champion

virtue – the early Confucians also had a robust account of virtue and moral cultivation – it certainly held a prominent place in the imagination of those desiring to address the shortcomings of the two dominant ethical theories broadly categorized as deontological and consequentialist ethics. The dissatisfaction with the contemporary state of moral philosophy was as varied as the thinkers addressing the problem: Iris Murdoch bemoaned moral philosophy's obsession with rationality and the will (Murdoch 1997); Bernard Williams was concerned that these forms of morality had become all-encompassing leaving no aspect of life untouched (Williams 1985); and Alasdair MacIntyre (MacIntyre 1981) with what he perceived to be a morally bankrupt America where communities as the source of and structure for meaning and morality were replaced with radical individualism and moral whim. These and other responses to bereft ways of conceptualizing the moral life spurred interest in rethinking what it means to be moral and to act morally, and renewed interest in more ancient ways of doing philosophy, ways which focused on character, defining the good life for humans, and moral development.

Virtue focuses on character, motivations, and cultivation, in addition to having something intelligent to say about the will, emotions, and human ends. With focus directed toward attributes of a person as well as motivation and away from a narrower focus on acts and consequences, virtue ethics naturally engages a wider set of questions about the moral life. How should one live? What is the good life for humans? What are the virtues? And what is human nature like? Many contemporary virtue ethicists traditionally answered these questions in neo-Aristotelian terms, embracing concepts such as *arête* (excellence), *phronesis* (practical wisdom), and *eudaimonia* (flourishing). Yet how these concepts relate and which is most integral to defining virtue for contemporary times, remains controversial.

While Aristotle's conception of virtue dominated early articulations of contemporary virtue ethics, it also spurred scholars to revisit virtue concepts in other classic thinkers in whose work virtue had not been the primary concept. For example, scholars began asking questions such as: was Kant completely uninterested in moral character? Or was this more a characteristic of Kantian ethics as engaged in by modern philosophy? Was it really the case that virtue concepts were lost? If so, how do we account for figures like Aquinas, Hume, Hutcheson, and Nietzsche, figures recently identified as carrying the torch of virtue despite the emerging trend and rhetoric moving toward championing reason?

The rising interest in virtue ethics also spurred comparative work, most notably comparison with early Confucianism. Lee Yearley's pioneering work compared Aquinas's and Mengzi's theories of virtues; Aaron Stalnaker's work engaged questions of moral cultivation in Xunzi and Augustine. Other scholars of early Confucianism focused more exclusively on identifying and analyzing the distinctive features of virtue within the early Confucian texts. Scholars of other traditions also explored the different notions of virtue and ethical formation contained within their respective traditions texts.

Virtue Ethics and Practical Ethics

Fields of practical ethics have also benefited from the sorts of questions and concepts championed by virtue ethics. In bioethics, for example, there is a distinct set of voices that challenge the more dominant deontological and consequentialists trends when thinking about issues such as resource distribution, patient-physician relationships, genetic engineering, or any other specific quandary. The field of environmental ethics, even more so than the field of bioethics, is increasingly interested in questions of virtue. Environmental virtue ethics (EVE) questions the efficacy of approaching questions surrounding

the human responsibility toward the environment in terms of duty and obligations. While important, proponents of EVE argue that what is required to address environmental issues is a question of character. How do we get humans to consider the environment as something worthy of *moral* respect? What are the environmental virtues? And what would both human *and* environmental flourishing entail?

Beyond questions of character and specific virtues, vice is often a topic of interest. While vice features in a more limited way in the broader virtue ethics literature, EVE devotes considerable attention to these questions in order to diagnose the root of the problem. Vices such as gluttony, greed, and apathy are considered particularly dangerous in relation to the environment because they represent a disposition prone to overconsumption and domination. The list of environmental virtues is open for interpretation. Some prefer to retrieve virtues from ancient sources and reorient them toward environmental ends. Other scholars suggest that developing new virtues are in order. Wonder, for example, could be a virtue that, if cultivated, would encourage a keen interest in environmental processes as well as a disposition to constantly look at and learn from one's surroundings.

Bioethics and environmental ethics are just two examples of how virtue ethics has started to inform and expand into fields of practical ethics. We see questions of character and virtue in other areas such as the ethics of interrogation, virtue and technology, and virtue and the professions more generally.

An attempt has been made to show the rich array of positions on virtue, as well as expose points of debate about the nature of virtue both within and across traditions. Just as definitions, sources, and key aspects of virtue vary, so too do contemporary articulations of virtue and virtue ethics. Ethicists wanting to return to virtue have sparked intriguing discussions and debates within the broader field of ethical theory, which has done much to expand the scope of ethical inquiry generally. What questions of virtue contribute to ethical reflection generally is a keen awareness that the moral life is complex and that focusing on acts of will, rationality, and consequences only account for a small fraction of moral activity.

CHAPTER 21

Consequentialism

Werner Wolbert

The terms consequentialism, proportionalism, teleology, utilitarianism, agapism, and agathology denote a type of ethical theory which regards the consequences of an action as its only right or wrong making property; it is opposed to a deontological theory which knows additional wrong making properties. The first term seems to be used primarily by its opponents (first by Anscombe 1981) who hold the opposite view of a strong deontology.

Terminology

The terms “teleological” and “deontological” were introduced by C. D. Broad. Deontological theories hold (Broad 1979, 206) “that there are ethical propositions of the form: ‘Such and such a kind of action would always be right (or wrong) in such and such circumstances, no matter what the consequences might be.’” Teleological theories hold “that the rightness or wrongness of an action is always determined by its tendency to produce certain consequences which are intrinsically good or bad.” (Broad 1979, 206–207). According to this definition, every normative theory falls under one of these two types. In addition, two types of deontological theories can be distinguished:

- a) The view that certain kinds of actions are always wrong because of a certain property of the action (e.g. its unnaturalness).
- b) The view that some actions have certain properties relevant, but not decisive, for their ethical assessment; this assessment is not based on harmful or beneficial consequences. Those actions (violation of a promise, not paying debts) are only presumed to be wrong (*prima facie* wrong) (Ross 1930, 19–20). The respective prohibition can be overridden by teleological considerations.

Critics of consequentialism often do not pay attention to this milder form of deontology (which they may also classify under consequentialism, as Anscombe [1981] would do), because it leaves open the possibility of overriding absolutely understood deontological norms by consequentialist considerations. A deontological theory, when defined as the contradictory opposite of (a), holds that the rightness or wrongness of actions is *not solely* a matter of the overall goodness or badness of their consequences. If only (a) is defined as deontological, there would be a large field of mixed theories. If “deontological” comprises types (a) and (b), every non-teleological theory is to be classified as deontological by definition.

Schüller who introduced Broad's distinction into Catholic moral theology (Schüller 1987, 282–298) chose this complete distinction because, first, the Catholic debate was centered on deontological norms in the absolute sense of (a). Second, it seemed to fit better into the framework of a Christian ethic. Unlike deontological theories, teleological ones hold “that there is only one *ultimate* obligation, and that this involves an essential reference to *value*. According to them the one ultimate obligation is to secure the increase and to prevent the decrease of the present amount of good, and to secure the diminution and check the increase of the present amount of evil” (Broad 1971, 126). This would correspond to Romans 13:8–10 according to which all commandments are summed up in (or derived from) the commandment of neighborly love. This position could also be called agapism. The opposite position is most extremely formulated by Prichard (1971, 4–5) when he doubts “whether our sense that we ought to pay our debts or to tell the truth arises from our recognition that in doing so we should be originating something good.” Whereas the deontological theory of obligation is pluralistic (because different duties cannot be summed up under one principle), the teleological one knows only the one obligation of love as benevolence and beneficence. “All other obligations, such as the duty to keep one's promises or to obey the laws of one's country, are derivative from this one” (Broad 1971, 126).

What regards the axiology, teleological theories may hold a pluralistic theory of value. The term “utilitarianism” mostly denotes a monistic theory which assumes that the one and only good-making characteristic of experiences is their hedonistic quality (Rashdall 1907, I 184). There is, however, also a pluralistic version “ideal utilitarianism” according to which “actions are right or wrong according as they tend to produce for all mankind an ideal end or good, which includes, but is not limited to, pleasure” (Rashdall 1907, I 184). Only this version can be classified as agapism in a Christian sense for which the “ideal” end is morality, love, and obedience to God itself.

Exceptions

A consecutive property of deontological norms in the strong sense seems to be that they exclude exceptions. For Anscombe it is a “noteworthy feature” of the Hebrew-Christian ethic, “that there are certain things forbidden whatever *consequences* threaten” (Anscombe 1981, 34). Consequentialism (like mild deontology), on the other hand, seems to be a theory that justifies exceptions from duties deontologically understood (e.g. prohibition of killing the innocent, vicarious punishment). This assumption is, at least partly, misleading because the necessity or possibility of exceptions may depend on the complete or incomplete formulation of a norm. The traditional prohibition of directly killing an innocent could also be formulated: killing a human being is forbidden, except killing the guilty and indirectly killing an innocent. Deontological norms can also leave room for exceptions by a restrictive interpretation of a norm (e.g. of “murder” or “lie”). By using evaluative terms, even a teleological norm may apply without exception because the prohibition is already included in the respective term. “Adultery” means an immoral sexual intercourse outside marriage; “treachery” denotes some form of disloyalty. Exceptions from the prohibitions of “treachery ...; idolatry, sodomy, adultery” (Anscombe 1981, 34) are excluded, because the prohibition is already included in the evaluative term. Those terms leave open the reasons for the moral disapproval of the actions denoted; the prohibitions are, therefore, only ostensibly deontological. The only point of debate between teleologists and deontologists is in which case and for which reasons an act is to be judged as adulterous, treacherous, etc. A moral norm may also appear as “absolutist,” because it provides for possible

exceptions already by a restrictive clause (“unless ...”). Granting exceptions is sometimes seen as a sign of moral laxity because of the wrong presupposition (e.g. in Kant’s writings) that exceptions are always made from a selfish intention. Refusing exceptions then seems to be a sign of moral seriousness or radicalness. Exceptions have, however, to be justified by the consequences for all beings concerned. Since caring for the well-being of all beings concerned by my action is a moral duty, the real question is not whether an exception is allowed, but *from which* of the conflicting duties an exception has to be made and for which reasons.

Consequences

There is no clear distinction between act (“itself”) and consequences. Depending on the language use, the consequences may already be included in the respective term or not. The term “poisoning” includes already the harmful or deadly consequence of e.g. “administering potassium cyanide.” The same could be said comparing “torture” and “coercion.” The consequences included in the description of an act have, therefore, to be distinguished from those not included. The first ones could be called *properties* of an act. (Bentham defines utility as “that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness ... or to prevent the happening of mischief, pain, evil, or unhappiness to the party whose interest is considered” (Bentham 1970, 12). Other teleologists speak of the “nature of the *whole action*” which has to be taken into regard (Stace 1975, 119; Janssens 1977, 231). Consequentialism could therefore be explained without distinguishing between action and consequence. The opposite theory, however, which holds that consequences may sometimes be not decisive, is dependent upon that distinction (Stace 1975, 119).

Speaking (with Bentham) of a *tendency* to produce indicates that the actual consequences of an act may be different from the foreseen or desired ones. Since the judgment on right or wrong normally has to be made in advance, the tendency has to be the decisive criterion, whereas in retrospect the actual consequences may count. Speaking of a tendency could also suggest that the judgment is not on a single action, but on a type of action. What kind of consequences do count, is a point of debate between act- and rule utilitarianism. Two concepts of rules have to be distinguished here. Regulative rules are rules of thumbs suggesting that in general an action *a* will have beneficial or harmful consequences. Institutional or constitutive rules create an institution or a practice, e.g. marriage, family, promise, penal law. There is a strong presumption for obeying those rules because the institutions are of fundamental importance for the coordination between humans as acting persons. This is a teleological criterion for obeying those rules, whereas deontologists like W. D. Ross used to regard their *prima-facie* validity as independent of any teleological reason (by paying one’s debt one does not do anything good). The question remains which criteria may apply for solving conflicts of those duties, when teleological considerations are excluded or not decisive.

A simple act-utilitarianism seems to overlook that an ethical evaluation has to imply the fundamental criterion of the Golden Rule or of universalizability, which means that any person in a relevantly similar situation should act in the proposed way, and, insofar, every moral judgment implies a rule. Therefore, the dispute between act- and rule-utilitarians is better understood by distinguishing different levels of moral thinking, the intuitive level at which we operate most of the time, when we follow rules or principles that are at least general enough to be learnable. For distinguishing good from poor principles, however, and for solving conflicts between the former ones, we need a higher level at which

“we select for use at the intuitive level those principles whose general acceptance or adoption is for the best, and in cases of conflict prefer those whose observance in the particular case will be for the best” (Hare 1986, 642). A deontologist like Butler would reserve those judgments (e.g. on preferential duties to our family or nation) to God’s providence who laid us under particular obligations “which we may discern and feel ourselves under, quite distinct from a perception that the observance or violation of them is for the happiness or misery of our fellow creatures” (Butler 1969b, 376 note). Since we have no direct and reliable access to the divine intelligence, we have to rely on our consciences in which those obligations are engraved. That means “that benevolence and the want of it, singly considered, are in no sort the whole of virtue and vice” (Butler 1969a, 383), and that, ultimately, those duties are justified because compliance with them will be beneficial for all creatures thanks to divine providence. Because of this reference to divine providence, Butler’s theory is basically teleological, insofar as the basic moral concept is the good; a teleological theory could, therefore, also be called agathological. In this sense, traditional Catholic moral theology is also basically teleological, even if it knows two types of deontological arguments. The first is humans’ lack of competence (*defectus iuris in agente*) in judgments which God has reserved for himself (questions of killing and dissolving marriages); the second is the unnaturalness (*contra naturam*) of certain sexual behavior and of false testimony. These arguments imply, however, that God as moral legislator will grant that complying with those norms and so relying on God’s superior wisdom will be to the universal benefit of his creatures. Insofar, traditional Catholic moral theology (like Butler’s theory) is basically teleological with some deontological twist caused by the failure to distinguish between the *manifest* and the *hidden* wisdom of God. When, for instance, killing the fetus is forbidden, even when the life of both the mother and the fetus is endangered and rescuing at least the mother seems to be the reasonable solution, one refers to the hidden wisdom of God. But this reference has its “*Sitz im Leben*” in the field of theodicy, not in that of normative ethics. Even Kant, who is often regarded as an archdeontologist shows a teleological conception in the second formula of his Categorical Imperative based on the unconditional value of morality and humans insofar as they are capable of it. For a deontologist like Prichard, however, the basic concept is obligation, or duty, or the right.

Numbers and Trumps

Butler’s arguments for particular duties could lead to the more general objection that a teleological theory leaves no room to particular obligations to people in close relation to us. Cicero comments: “For with them Nature herself engenders friendship” (*Laelius* 5, 19). Like Butler, Cicero seems to ground particular duties on the wisdom of nature in a deontological way. Unlike Butler, however, he identifies the rationale of that natural equipment: it leads to a more effective and coordinated use of our limited resources for doing good (*De officiis* I 16, 52); insofar, Cicero refers to the *manifest* wisdom of nature; his argument is, therefore, teleological. This is sometimes overlooked when a teleological theory is understood as taking the number of beneficiaries of an action as its only or predominant right making property, as Bentham’s formula of “the greatest happiness of the greatest number” (Bentham 1988, 3) might suggest.

According to one of the most common arguments against consequentialism, it sacrifices the individual in the interest of the greater number (using the individual as a mere means) when, for

instance, punishing (killing) one innocent for some overriding purpose, e.g. saving the lives of several persons (Anscombe 1981, 33–34). Deontologically understood prohibitions seem to offer some barrier against a maxim like that of Caiaphas (John 11:50; 18:14), according to which “one man should die for the people, and that the whole nation should not perish.” This maxim gets, however, a different sense in the context of the passion of Jesus when the suffering is voluntary. Self-sacrifice is normally something regarded as supererogatory and must be voluntary. The real issue, therefore, seems to be whether and how consequentialism can justify the difference of obligation and supererogation when the action with the best possible consequences is always obligatory. The teleologist could point to the necessary division of tasks and the difference of talents or gifts. Some actions or ways of life are desirable only when few persons practice it (e.g. celibacy), those who feel a vocation to it, or feel obliged to some ideal (e.g. serving the poor or the sick). Acting according to that ideal may be regarded as an obligation by the respective person. From the perspective of the third person, however, those obligations are categorized as supererogatory; nobody would be blamed for not aiming at a certain ideal way of life or a peculiar altruistic behavior.

Rights are also sometimes regarded as barriers, “side constraints” (Nozick 1974, 30) against (teleologically based) limitations of individual freedom of choice, as “trumps over some background justification for political decisions that state a goal for the community as a whole” (Dworkin 1984, 153). From a teleological point of view, one could argue that a goal for the community like happiness or well-being “is the justification, and ought to be the controller, of all ends, but is not itself a sole end” (Mill 1959, 621). Respecting rights could, therefore, be seen as a particular end serving the universal end of happiness of all beings.

Expressive Actions

Speaking of *producing* benefits as the only normative criterion may narrow the teleological perspective because it leaves out of sight expressive actions like boycotts or demonstrations, which do not necessarily produce or cause anything good, but are to be understood as a statement expressing an attitude against some evil or in favor of some value. Martyrdom, civil resistance, signs of solidarity, or affection may serve as striking examples. Protests, demonstrations, etc. may not change an evil situation (at least, not in the short run); they are to be regarded as an expressive statement on a certain evil witnessing against it. The story of the woman anointing Jesus (Mark 14:3–9) is a classic example of an action expressing love, sympathy, adoration, and remorse. Especially religious actions (e.g. prayer, services, pilgrimages) belong to this category. The story of the anointment may also illustrate the ethical problems given with those actions. On the one hand, they are meaningful in themselves as an outer expression of an inner attitude; on the other hand, they are often expensive or even wasteful and there may be doubts whether the resources could have been spent in a more useful way. Weighing up the expressive values (or disvalues) of an action with its actual beneficial or harmful consequences can be difficult when, for instance, public authorities consider succumbing to blackmail in order to save lives. The term “consequentialism” may obfuscate the need to take the expressive value of actions into regard because those values or evils will not spontaneously be associated with “consequences.” But without taking into regard the value of expressive actions, a teleological theory would seem one-sided and narrow-minded.

Moral and Non-moral Good (Evil)

Consequentialism is sometimes said to have increasing or maximizing of *non-moral* good and reducing or minimizing of non-moral evil as its goal. This sounds reasonable, because one cannot directly influence the morality of other persons; it overlooks, however, that the first rule of preference is the predominance of the moral good over non-moral values. Morality as an attitude or conviction is “under our control” (Epictetus 1966, 1); it is, insofar, the only possible object of a categorical demand, the only unconditional value. Non-moral goods like health, wealth, honor are useful, but can also be misused. In this sense, Kant distinguishes between price and dignity. Whatever has a price can be traded off against another good; the dignity of morality and the human person, insofar as it is capable of it, can never be traded off against anything. With reference to this dignity, all persons are equal. The moral good can be identified with the commandment of love of God and impartial love (benevolence) of one’s neighbor, respecting him or her as an end in itself. It corresponds also to the Golden Rule of applying the same moral standard to everybody. Augustine (1962, I 27) formulates that a just man has to form an “unprejudiced estimate of things,” “so that he neither loves what he ought not to love, nor fails to love what he ought to love, nor loves that more which ought to be loved less, nor loves that equally which ought to be loved either less or more, nor loves that less or more which ought to be loved equally.” Benevolence and justice (equality) are, therefore not distinct principles, but are based on the equal dignity of all persons. Since the moral good has always the precedence over non-moral goods, and moral evil (sin) may never be chosen to avoid some non-moral evil, which means e.g. obedience, fidelity to one’s conscience.

Good Ends and Evil Means

The term “proportionatism” is related to a special problem in Catholic Moral Theology, namely justifying evil means for a good end. The term is inspired by a passage in Aquinas’s treatise on self-defense (Aquinas 2019, II–II q 64 a 7) according to which a lawful act (with some evil effect) must be “proportionate to the end” (*proportionatus fini*). Traditionally, the principle of double effect, according to which the evil effect (e.g. the death of an assailant) may never be intended directly as a means, but may only be permitted indirectly, was applied only on few cases deontologically assessed. It was reinterpreted by P. Knauer as “the fundamental principle of all morality” (1969, 25), according to which indirect means “justified by a commensurate reason” (1969, 29). This interpretation changed the principle and the meaning of its terms. For the traditional reading, the respective action is forbidden as an evil means, not only in a non-moral sense, but in a moral sense as well because of the presupposed deontological prohibition. Insofar, one could better speak of an action with a double moral character (Schüller 1978, 175). Not the death caused is the evil effect, but the deontologically forbidden action causing the effect (killing), whereas for Knauer, indirectly intended is everything proportionate and not counterproductive to the intended end. That would mean that e.g. punishments “proportionate” to the end of deterrence and reintegration would have to be classified as indirectly intended. And immoral behavior may appear as simply foolish, because the agent would thwart his or her own ends. Knauer’s proportionatism seems to amount to a teleological position, but in a narrower sense because he denies a general obligation of increasing goods and diminishing evils.

Indirect causation has to be distinguished from indirect intention, even though opponents of proportionalism often take it for granted that, what is indirectly caused, is indirectly intended as well. That may mean, in practice, that the decisive normative aspect for a therapeutic abortion is the place where the doctor attaches the knife. To avoid those conclusions contrary to common sense, some authors classify as indirectly willed everything which is not a necessary part of the project (killing the fetus is not a necessary part of the project of rescuing the mother). In other contexts (e.g. indirect killing of civilians in war), the results of double effect thinking may be more plausible than supposed teleological conclusions. In most cases, however, the judgment may be the same, but for different reasons. Double effect thinking may sometimes indicate problems not yet satisfactorily solved from a teleological point of view. The same may hold for questions on doing and refraining when the consequences seem to be identical, e.g. killing and letting die.

CHAPTER 22

Deontology

Bharat Ranganathan

Introduction

In contemporary normative ethics, deontology (*deon* = duty, *logos* = science, study of) is a theory according to which agents deliberate about how they ought to act and evaluate whether their actions are right or wrong. On a rough characterization, deontology prioritizes the right over the good. Therefore, deontological normative theories require, forbid, or permit actions as a matter of principle, conforming to particular moral norms, largely regardless of the outcomes produced by those actions. In prioritizing the right over the good, deontological normative theories incorporate *agent-centered restrictions* and *respect for individual persons*. Because “standard deontological views maintain that it is sometimes wrong to do what will produce the best available outcome overall,” Samuel Scheffler writes, such views incorporate agent-centered restrictions. These restrictions on action:

have the effect of denying that there is any non-agent-relative principle for ranking overall states of affairs from best to worst such that it [is] always permissible to produce the overall best available state of affairs so characterized. (1994, 2–3)

Because of these agent-centered (or agent-relative) restrictions, the individual moral agent may be forbidden from performing some action that would promote the agent-neutral state-of-affairs. In other words, deontological agent-centered restrictions aim to capture the intuition about why the individual moral agent should not perform some action regardless of the good (i.e. agent-neutral state-of-affairs) that may come about from performing it.

Further underwriting the prioritization of the right over the good is respect for individual persons. For example, in his *Theory of Justice* (1999), John Rawls writes:

[e]ach person possesses an inviolability founded on justice that even the welfare of a society as a whole cannot override. For this reason, justice denies that the loss of freedom for some is made right by a greater good shared by others. (1999, 3)

For deontologists, respect for individual persons trades on the fact that each and every person possesses a particular (and equal) moral status. That is to say, people are *inviolable*, with such inviolability obtaining

simply by virtue of their humanity. For many deontologists, an action cannot thus be required if that action puts a group of people's gains – however many people, however large the gain – over and against the losses incurred by a single individual. T. M. Scanlon brings this view into sharper focus with his famous Transmitter Room example:

Jones has suffered an accident in the transmitter room of a television station. Electrical equipment has fallen on his arm, and we cannot rescue him without turning off the transmitter for fifteen minutes. A World Cup match is in progress, watched by many people, and it will not be over for an hour. Jones's injury will not get any worse if we wait, but his hand has been mashed and he is receiving extremely painful electrical shocks. Should we rescue him now or wait until the match is over? Does the right thing to do depend on how many people are watching? (1998, 235, cf. Rawls 1996, 365)

Commenting on Transmitter Room, Scanlon writes: “if one can save a person from serious pain and injury at the cost of inconveniencing others or interfering with their amusement, then one must do so no matter how numerous these others may be” (Scanlon 1998, 235). On this example, the individual moral agent has an agent-centered restriction not to maximize a state-of-affairs (i.e. allowing some large number of people to continue watching the World Cup) and an agent-centered requirement to show respect for an individual person (i.e. to rescue Jones).

The roots of contemporary deontology can be traced to (among others) Immanuel Kant. In his *Groundwork of the Metaphysics of Morals*, for example, Kant's second formulation of the Categorical Imperative (i.e. unconditional commands) contains the Formula of Humanity: “[s]o act that you use your humanity, whether in your own person or in the person of any other, always at the same time as an end, never merely as a means” (1999, 80, cf. Nozick 1974, 30ff.). For Kant, people's humanity makes them inviolable or, in Kantian terms, ends-in-themselves. Recognizing and respecting the humanity of another is normative (i.e. requires, forbids, or permits) upon certain actions. Other classical thinkers, for example, Thomas Hobbes (1996), John Locke (1988), and Jean-Jacques Rousseau (1997), developed deontological commitments in terms of contractualism, with contractualism concerning (1) the relationship among authority, individuals, and social groups, and (2) the public justification of deontological norms for political and social policy.

In contemporary normative ethics, deontology's foil is *consequentialism*. One particular species of consequentialism – utilitarianism, which is concerned with the maximization of “utility,” “well-being,” and so on – has long been the dominant normative theory in moral and political philosophy (for some classic treatments, see Bentham 1907; Mill 2002; and Sidgwick 1981; for some contemporary treatments, see Smart 1973; Kagan 1991; and Singer 1993). On a rough characterization, consequentialism prescribes and evaluates the rightness or wrongness, goodness or badness of action solely according to the consequences brought about by that action. In contrast to deontology, then, consequentialism prioritizes the good over the right, where the *good* refers to the maximization of consequences. Owing to the arguments developed Rawls and others, for example, F. M. Kamm (1993, 2007), Thomas Nagel (1991), Robert Nozick (1974), T. M. Scanlon (1998), Samuel Scheffler (1994), and Judith Jarvis Thomson (1990), deontology has emerged in recent decades as a plausible alternative to consequentialism. Despite these developments, however, Bernard Williams's hope – “[t]he day cannot be too far off in which we hear no more of it” (1973, 150) – has not yet been fulfilled.

Before proceeding, some further distinctions are necessary. Given that both are concerned with the prescription of action, deontology and consequentialism are *deontic* (i.e. what we are obligated to do) theories. Moreover, both are *evaluative* (i.e. what is right or good to do). In contrast to these two theories, virtue ethics is an *aretaic* (i.e. excellence of kind) theory: it is concerned with what sort of person one is or ought to be. Furthermore, in contrast to deontology, both consequentialism and virtue ethics are *teleological* theories, that is, they are concerned with outcomes, whether of an action or of a person's life. But the distinction between teleological and non-teleological theories may only work within the ambit of non-religious ethics. Given that all religions tend to be concerned with the final ends of humanity and, indeed, all life, it is difficult to say that there exists a religious ethics that is not teleological in character. In Christian theological ethics, for example, God is conceived as both the good (*Summum Bonum*) and the source of the right, collapsing any easy distinction between the right and the good. Thus, in religious ethics, the formulations “the right *over* the good” or “the good *over* the right” might be better understood as “the right *in* the good” or “the good *in* the right.”

This entry identifies some characteristics of deontological moral reasoning. To help appreciate these characteristics, the entry first works through some thought experiments. In working through these examples, the aim is to map roughly the distinctions between deontological and consequentialist reasoning. Second, turning to medical ethics, this entry examines how deontological commitments may be understood in contractualist terms, focusing on the example of doctor-patient interaction. However, there are two further qualifying notes. First, given the sheer number and diversity of religious cosmologies, as well as the potential commensurabilities between these cosmologies, the entry will be limited to sources drawn from Christian ethics and moral and political philosophy. Second, some readers may be hesitant about (if not resistant toward) the use of moral and political philosophical concepts to think about religious ethics. The entry will refrain from commenting on whether such hesitance is warranted.

Distinctions between Deontology and Consequentialism

To begin distinguishing between deontology and consequentialism, consider the following case:

Torture. Frank is holding five innocent people, who he intends to kill if his demands aren't met, hostage. Fortunately, counterterrorism agent John has captured him before he has the chance to do so. If John tortures Frank, he will be able to discern the location of the hostages. Moreover, if John tortures *and* then kills Frank, he will not only be able to discern the location of the hostages but also prevent Frank from ever again taking hostages. The counterterrorism agency's analysts have been unable to discern where Frank has kept the hostages. Therefore, the director of the counterterrorism agency has licensed John to use his best judgment. What ought John to do? (Ranganathan 2014, 13)

What features from torture are worth noting? There is an initial *state-of-affairs* (Frank holding hostages), an *agent* (John) who *aims* through some *means* (torture, kill) to bring about some *end* (saving five people). Conflicts between deontologists and consequentialists emerge when reflecting on whether (and, if so, how) John might bring about this desired end.

If John employs consequentialist reasoning, on the one hand, he will have one of two options. On the first option, if he *merely* tortures Frank, he will be able to discern the location of and rescue the hostages. The promotional function of this action, then, would result in saving five lives. On the second option, if he tortures *and* then kills Frank, he will not only be able to discern the location of and rescue the hostages but also prevent Frank from ever again taking hostages. The promotional function of this action would result not only in saving five lives but also ensuring that Frank will never again be able to commit some wrong action that detracts from the overall state-of-affairs. On either option, John overrides Frank's particular (and equal) status.

If John employs deontological reasoning, on the other hand, he will not have recourse to either of the options available to the consequentialist. This is because deontological theories take seriously the separateness of persons (Rawls 1999, 26). For deontologists, the separateness of persons is predicated on the idea that individual people have a particular (and equal) status. This status places normative constraints on the actions one may take in the pursuit of one's goals. On normative constraints, consider Robert Nozick's definition:

[i]n contrast to incorporating rights into the end state to be achieved, one might place them as side constraints upon the actions to be done: don't violate constraints *C*. The rights of others determine the constraints upon your actions. . . The side-constraint view forbids you to violate these moral constraints in the pursuit of your goals. (1974, 29)

In torture, both deontologists and consequentialists can agree that John's aim of saving five people is laudable. But from a deontological point-of-view, given that Frank possesses a particular (and equal) status, John is normatively restricted from taking either option available to the consequentialist in order to save the hostages. The rightness of certain actions (e.g. respecting Frank's status) is antecedent to and therefore restricts the ways (e.g. torture, kill) in which one may pursue some end (e.g. saving five people). Given this restriction, John has a *prerogative*, that is, a morally permissible option, not to maximize the state-of-affairs.

Keeping in mind Torture, another distinction between consequentialism and deontology is that the former is agent-*neutral* whereas the latter is agent-*relative*. Scheffler (1994) distinguishes agent-neutrality from agent-relativity as follows. For consequentialists, there are agent-neutral reasons to bring about some state-of-affairs: since a state-of-affairs in which five people are saved is *better than* a state-of-affairs in which they are not, John has reasons to aim for that state-of-affairs, using whatever means are necessary to bring it about. But deontological theories have constraints on the means by which some end may be brought about, constraints that are relative to the agent who must undertake an action. "Side constraints," Nozick writes, "express the inviolability of other persons" (1974, 32). In a particularly famous passage, he comments further on respect for the inviolability – or separateness – of persons:

[i]ndividually, we each sometimes choose to undergo some pain or sacrifice for a greater benefit or to avoid a greater harm: we go to the dentist to avoid worse suffering later; we do some unpleasant work for its results; some persons diet to improve their health or looks; some save money to support themselves when they are older. In each case, some cost is borne for the sake of the greater overall good. Why not, *similarly*, hold that some persons have to bear some costs that benefit other persons more, for the sake of the overall social good? But there is no *social entity* with a good that undergoes some sacrifice for its own good. There are only individual people, different

individual people, with their own individual lives. Using one of these people for the benefit of others, uses him and benefits the others. Nothing more. What happens is that something is done to him for the sake of the others. Talk of an overall social good covers this up. (Intentionally?) To use a person in this way does not sufficiently respect and take account of the fact that he is a separate person, that his is the only life he has. (1974, 32–33)

These constraints prohibit John from *treating* Frank in a certain way (torture, kill) in order to bring about the state-of-affairs in which five people are saved. John has agent-relative reasons not to torture and/or kill Frank. So, while both consequentialists and deontologists may agree that a state-of-affairs in which five live is better than one in which five do not, they disagree over the means that agents may employ in order to reach such a state.

Reflecting a common pre-philosophical commitment, the distinction between *doing* and *allowing*, *commission* and *omission*, also separates consequentialists and deontologists. Roughly speaking, one has duties and obligations to another depending on whether one *does* something or merely *allows* something to happen to another. For example, Andrew and Bartholomew are interacting with one another. Since they are interacting, they have particular duties and obligations toward one another, for example, Andrew owes it to Bartholomew to treat Bartholomew according to some acceptable terms. If Andrew and Bartholomew are trading baseball cards and Andrew damages one of Bartholomew's cards, then, by virtue of their interaction, Andrew has particular obligations to Bartholomew, for example, to replace Bartholomew's baseball card. If some third party, Christopher, damages one of Bartholomew's baseball cards while Andrew is present, Andrew might not have these obligations because he merely allowed something to happen. He may have a prerogative to do so – namely, to respect Bartholomew's humanity – but failing to do so does not mean he acted wrongly.

While many deontologists accept the distinction between doing and allowing, consequentialists reject it. For example, in his classic article, "Active and Passive Euthanasia" (1975), James Rachels introduces two cases – call these Bathtub – with the aim of collapsing the distinction between doing and allowing. In the first case:

Smith stands to gain a large inheritance if anything should happen to his six-year-old cousin. One evening while the child is taking his bath, Smith sneaks into the bathroom and drowns the child, and then arranges things so that it will look like an accident. (1975, 79L)

And in the second:

Jones also stands to gain if anything should happen to his six-year-old cousin. Like Smith, Jones sneaks in planning to drown the child in his bath. However, just as he enters the bathroom Jones sees the child slip and hit his head, and fall face down in the water. Jones is delighted; he stands by, ready to push the child's head back under if it is necessary, but it is not necessary. With only a little thrashing about, the child drowns all by himself, 'accidentally,' as Jones watches and does nothing. (1975, 79R)

Smith acted by commission: he actively drowned his cousin. Jones acted by omission: he allowed his cousin to drown. For both Smith and Jones, their desired end – a large inheritance – and the circumstances according to which that end might be reached – the death of each person's cousin – are the same.

Commenting on this pair of cases, Rachels claims: “[i]f the difference between killing and letting die were in itself a morally important matter, one should say that Jones’s behavior was less reprehensible than Smith’s. But does one really want to say that? I think not.” And if Jones defends himself by claiming that he merely let his cousin die, Rachels says, “[s]uch a ‘defense’ can only be regarded as a grotesque perversion of moral reasoning. Morally speaking, it is no defense at all” (79R). For Rachels, there is no morally relevant distinction between doing and allowing. From the point-of-view of consequences, both Smith and Jones acted wrongly.

For deontologists, the distinction between doing and allowing is morally significant. So, how might a deontologist respond to Rachels’ charges regarding a case like Bathtub? The deontologist can agree with the consequentialist that both Smith and Jones acted wrongly. But evaluating the wrongness of their actions is not done by an appeal to the consequences brought about by his (in)action. Instead, the deontologist can point out that neither treated his respective cousin as bearers of a particular (and equal) status. That is to say, each treated his respective cousin, through his (in)action, merely as a means toward some desired end rather than as an end-in-himself. Compared to John in Torture and Smith in Bathtub, each of which highlighted restrictions about whether one may pursue some desired end, Jones gives rise to obligations about how one ought to act. So, deontologists acknowledge that respect for others may, depending on the case, restrict or oblige. And the justification and motivation for restrictions and obligations derives not from an appeal to consequences but rather from a respect for persons.

For deontologists, then, treating others as bearers of a particular (and equal) status can also give rise to positive obligations. On such obligations, consider the following case

Dinner. Phil has at long last secured a dinner reservation at Exclusive Restaurant. On his walk to dinner, he witnesses a woman being involved in a hit-and-run. The woman is badly injured. No one else is around who can help. Phil could call an ambulance, apply pressure to her wounds, and wait with her until help arrives. If he were to do so, however, he would miss his reservation. What should Phil do? (Ranganathan 2014, 15–16)

Commonsensically, Phil ought to stay with the woman and provide whatever care he can until the ambulance arrives. This obligation obtains despite the fact that he will miss his reservation; it also obtains despite the fact that Phil himself did not hit the woman. That is, he did not directly *override* the woman’s particular (and equal) status. Respecting her status, however, requires some positive obligations. Thus, to respect the woman, Phil ought to stay with her and provide whatever help he can (cf. Scanlon 1998, 103–107, 152ff.).

Contractualism in the Context of Medicine

Rawls and Scanlon further explicate deontological commitments in contractualist terms. Contractualism is concerned with determining and establishing the authority, content, and legitimacy of moral norms, norms that prescribe and evaluate the conduct of individuals and/or political and social institutions. In the domain of politics, for example, the authority and legitimacy of political institutions hinges on those

institutions being designed and consented to by the people whom those institutions govern (cf. Rawls 1996). And in the domain of morality, the authority and legitimacy of actions and principles turns on mutual agreement among those affected by those norms. For example, Scanlon writes:

[w]hen we think of those to whom justification is owed, we naturally think first of the specific individuals who are affected by specific actions. . . . [W]e must [also] take into account not only the consequences of particular actions, but also the consequences of general performance or nonperformance of such actions and of the other implications (for both agents and others) of having agents be licensed and directed to think in a way that that principle requires. (1998, 203)

Without such considerations, actions or principles are neither authoritative nor legitimate. Like its non-contractualist varieties, contractualist deontology aims to respect individual persons. Following Scanlon's description, respect for individual persons requires justification to those affected by particular actions. Moreover, discerning the content and authority of moral principles in general likewise requires agreement among those aiming to discern the content and authority of those principles.

To think about the relationship between contractualism and religious ethics, briefly consider a case from medical ethics: doctor-patient interaction. When doctors and patients interact with one another, the doctor diagnoses the patient's ailment and presents the possible course(s) of treatment to the patient. The patient first needs to consider whether to pursue treatment or, if presented with several courses of treatment, which course of treatment among them to pursue, and second, provide informed consent to the doctor. Providing such consent demonstrates that medical practice is a "mutual process between physician and patient of informing and discussion (whenever the patient is capable of discussion), thereby leading to a mutually acceptable treatment." Informed consent is important because it "provide[s] the opportunity for the patient to become more actively involved in the ongoing decision-making process than has often been the case in medicine" (Brock 1993, 22).

Underwriting the relationship between the doctor and patient, Paul Ramsey observes, is a more basic relationship, that is, a relationship between members of the covenanted community. "In order to create and maintain a community of persons," Ramsey writes, "much more (and more intentionally) than in economic exchange is necessary that each seek not his own good, but the good of his neighbor" (1993, 235). Moreover, "[o]nly an element of concern for the other person for his sake creates a community among men" (1993, 238). Concern for the other person for that person's own sake follows from recognizing that the other person has a particular (and equal) status. Moreover, in the context of doctor-patient interaction, concern for the other person both requires and prohibits certain actions, the content of which is discerned through informed consent.

How does informed consent reflect concern for the person? Informed consent prohibits the doctor from overstepping his or her bounds while treating the patient, reflecting the deontological commitment to observing normative constraints. Moreover, privileging the person delimits what may and may not be done, prioritizing the right over the good. Between the doctor and patient, there must be "a determination of the rightness and wrongness of the action and not only the good to be obtained in medical care or from medical investigation" (Ramsey 2002, 2). To determine what is right or wrong, the doctor is required to get consent from the patient, with consent reflecting the "canon of loyalty" between them. Instead, the patient is "a *personal* subject," with the antecedent person-to-person relationship between the doctor and

patient informing and delimiting what may be done. For Ramsey, “[c]onsent expresses or establishes this relationship, and the requirement of consent sustains it” (2002, 5).

Depending on the length of treatment, consent must be “continuing and repeatable” (Ramsey 2002, 6). What is more, the patient must also be able to “reasonably free and adequately informed consent.” Thus, informed consent in medical ethics takes seriously the claims that people make on one another. Moreover, given their commitment to act together, the doctor and patient recognize and are motivated by one another’s status. That they even engage in the give-and-take of reasons in the first place indicates that the doctor and patient recognize one another’s particular (and equal) status, reflecting the deontological commitment to respect for persons. Recognizing one another’s status also highlights that there are constraints on what may be pursued in the context of their interaction with one another, tracking the idea about the agent-relative normative constraints. And the give-and-take of reasons helps determine the content and limits of what they together do, highlighting in particular the contractualist contributions to deontological reasoning.

CHAPTER 23

Responsibility

Jesse Couenhoven

“Responsibility” is a term that has taken on a number of technical meanings in scholarly usage. Even in everyday speech, talk about responsibility can mean significantly different things, depending on context. One might, for instance, talk about hurricanes being responsible for the devastation they cause. That notion of simple causal responsibility is quite different from the meaning parents have in mind when they tell their children to behave more responsibly, or when people of all ages try to do the responsible thing. Such talk of meeting one’s responsibilities invokes the idea of moral obligation, and is often characterized as looking forward to what one ought to do of course one can look back in time to obligations met or unmet as well. More closely connected to the idea of causal responsibility are the things adults sometimes tell one another about holding one another responsible, or being the responsible party. Such ways of talking about what is often called moral responsibility invoke the ideas of being accountable or of something’s being attributable to one, and typically look backward, assessing persons for their having met or failed to meet some obligation.

The Responsible Self

It is helpful to distinguish these uses of the term “responsibility” to avoid confusion. Having a responsibility (obligation) is not the same as being morally responsible (attributability). However, some theologically influenced treatments of the idea of responsibility have sought to reflect on ways in which forward and backward-looking uses of the term are connected. The connection between speaking about human beings as under obligation and as accountable has especially been made via H. Richard Niebuhr’s notion of the “responsible self,” where “responsible” evokes the idea of being able to respond, and thus a responsive self (Niebuhr 1963). In his and associated approaches, human beings are conceived from a theological vantage point as engaged in dialogue with other human individuals, with society, with the natural world, and with God. These realities address us, and we are called to answer them, but in order to do so we must engage in interpretive struggles to determine what is being communicated to us and how we might best answer. The responsible self, when it is indeed responsible, is thus an agential self that is both passive and active. Human persons are passive inasmuch as we are deeply receptive, a product of God’s creative power and the creative this-worldly forces that give us essential aspects of our selves. At the same time, however, we are not merely acted upon; we are also active agents who are able to respond in creative ways that are not simply determined by the past.

Crucial to Niebuhr's development of the first of these themes was a particular take on the idea of human beings as being under the call of morality. As "answerers," the moral task is not simply to follow rules or to achieve particular goals by whatever means necessary (and thus, not to be merely indebted to deontic or utilitarian ways of thought, as he understood them). Rather, we are called to be perceptive and attentive interpreters who ask "what is going on?" This emphasis on the importance of interpretation in the moral life helped to inspire and shape the early interest in virtue ethics in such thinkers as James Gustafson (Gustafson 1983) and Stanley Hauerwas (Hauerwas 1974). Early theologically inspired virtue theorists were interested in the importance of moral vision and social, religious, and other perspectives in shaping accounts of virtue and vice, right and wrong.

A second theme that emerged from Niebuhr's discussion of human beings as responsible selves is accountability. Having engaged the powers that engage us, and sought to understand them, we are called to act in a manner befitting the situation. As we do so we have responsibilities to the realities with which we are engaged, and whose responses to our responses to them call us to account. This combination of the themes of interpretation and obligation is central to "hermeneutical" approaches to religious ethics (cf. Schweiker 1995). The aspects of this theme of responsive action that are associated with the ideas of human social solidarity and communal and cultural "situatedness" have also received a fair amount of development in the field of religious ethics (e.g. Curran 1999), which has in recent years typically been more sensitive to ideas about human community and inter-relatedness than the field of philosophical ethics. However, theological and religious ethicists have paid much less attention to another central question related to the idea of accountability, the problem of who is accountable and under what circumstances, and how accountability relates to freedom.

Influential as Niebuhr and others' treatments of the "responsible self" were, the term "responsibility" today more strongly evokes the questions about free agency and accountability just mentioned than the themes of vision and interpretation mentioned above. Virtue theory has flourished in religious and philosophical ethics, but increasingly without making central the idea of human selves as answerers. This is not to say that Niebuhr's insights, or those of his followers, have been lost, but rather that his terminology is no longer prevalent in the realm of ethical theory or meta-ethics. By contrast, terms such as "responsibility," "answerability," and "accountability" are regularly used in discussions of freedom and responsible moral agency, especially in the subfield of philosophical action theory.

The Concept of Moral Responsibility

Moral responsibility is, broadly speaking, the kind of responsibility persons have for their actions or states of character when they can be held accountable for them, and called to answer for them. It is widely accepted that when a person is morally responsible for something she or he is open to being morally blamed or praised and even (when further conditions are met) punished or rewarded. Conversely, it is widely thought that agents who are not morally responsible should not be blamed or praised for their actions or attitudes. Appropriately, then, moral responsibility is often contrasted with mere causal responsibility. A hurricane might be causally responsible for destruction to your home, but we do not blame it for that (certainly not morally, and probably not otherwise), or hold it against the hurricane. The hurricane has a certain kind of power and influence but it is not, after all, a responsible agent. Were a friend to be causally responsible for destruction to your home, however, more difficult questions would

arise. Did that person know what she was doing? Did she do it intentionally? If so, it would be natural to consider her morally responsible and, at the least, blame her for it. If causing harm to your house was simply an accident, however, or if your friend was doing what she did only because she had been forced into it, it might make sense to excuse your friend from responsibility, or at least from blame.

Talk of *moral* responsibility focuses attention on personal accountability for morally significant behaviors. But it is also possible to be responsible, in the rich and important sense that talk about moral responsibility attempts to pick out, for non-moral states of affairs. For example, a person might practice drawing or painting, and create a work of art that seems meaningful and significant. One would generally be considered responsible for doing so, but it might be confusing to speak here of moral responsibility. A better approach might be to appropriate Susan Wolf's idea of "deep" responsibility (Wolf 1990). An artist can be deeply responsible for her or his work, and worthy of significant praise for it, without that work having to be morally significant. Deep responsibility is therefore a broad concept, one that includes the idea of moral responsibility but is not limited to it.

Saying more about what it means for a person to be deeply responsible for something turns out to be a complex and controversial task. The most intuitive approach may refer to attributability, as well as praise and blame. On this approach, a personal agent is responsible for something if it is attributable to that person, in such a way that it is appropriate to hold that person accountable. Attributability, then, is what makes blame and praise appropriate (Strawson 1982). Blame and praise are typically understood as umbrella terms meant to encompass a wide range of positive and negative reactive attitudes that respond to actions (or states of character) for which agents are responsible. One can blame or praise oneself as well as other agents. When we do blame, we hold the person we blame responsible in the sense that we attribute something to that person, see it as bad or wrong in some way, and consider it proper to call them to account. Notably, however, it is possible to be responsible for actions for which one should be neither blamed nor praised, such as in cases where a person is responsible for doing something morally indifferent. Understanding responsibility in terms of attributability can be helpful, therefore, in cases where thinking about reactive attitudes are not.

The metaphor of a "ledger" is sometimes used to develop these ideas (Zimmerman 1988). The ledger metaphor offers an image that makes particular sense from a religious perspective. It is an ancient tradition within monotheism to think of God as a judge who keeps accounts concerning what a person has or has not done or stood for. In this picture, the ledger is the divine account book, a register of the actions and states of character that are attributable to each person. Much like financial accounts, this register contains not merely a list of things done but negative and positive entries for good or bad behavior that can add up in various ways. Of course, one need not believe that any such books are actually kept by anyone for the ledger metaphor to be helpful. That said, it is notable that even apart from religious traditions about God as judge, we often speak of ourselves as keeping accounts on others.

To have a ledger at all is to have a special kind of status; not every being is capable of performing actions that ought to be charged to their own personal account. Even those who have a ledger will find that not everything about them is listed on the ledger. Their physical attributes, for instance, are an important part of who they are, but they are not accountable in any deep way for such attributes (plastic surgery aside). What is entered on the ledger is relationally significant, provoking praise or blame, because the actions, attitudes, and so on that are recorded are attributable to the person whose story as a personal agent is being told in the lines of the book. The ledger metaphor thus suggests that accountability is social but does so without implying that being deeply responsible is merely a social construct.

The account books are supposed to contain objective judgments that make praise and blame fair and appropriate. Taken as a whole, persons' ledgers tell a story about who they are, in light of which those persons can be called to account, and potentially asked to answer for what they have done and even who they are.

In keeping with what was said above, it is notable that although a ledger entry makes it possible for a person to receive praise or blame, it need not imply that either praise or blame is required. It is possible for something to be attributed to a person in such a way that that person is accountable for it without deserving blame or praise. The example given to make this point above was indifferent actions, which might be acceptable but not deserve particular praise. It may also be possible to be responsible for bad acts without being blamed for them, for instance, if a person acts badly but only under compulsion. Being coerced does not justify doing just anything, but it does seem to mitigate or in some cases even nullify blame or praise.

It is also widely agreed that blame and praise do not necessarily lead to punishments or rewards. Since external expressions of blame and praise can function as punishments or rewards, it can be helpful to distinguish between attitudes of blame and praise, and public censure or endorsement. Words can provide powerful incentives and reinforcement. What we typically think of when we think of punishment or rewards, of course, goes beyond words to the assignment of penalties or giving good things. Here it is helpful to keep in mind that although anyone may be in a position to properly have an attitude of blame or praise, it is more rare to have the standing required to properly assign a person a penalty or reward. In addition, it is notable that the logic of assignments of deep responsibility, blame, and punishment seem to differ in certain respects. Being responsible or even blameworthy is not a sufficient reason for being punished (much here depends on one's theory of what punishment means, and what it is for).

This overview is meant to illuminate the idea of deep responsibility and to offer a picture of the relationships between some of the key terms often used to talk about responsibility. It does not, however, address the problems of how freedom relates to responsibility, or of what conditions must be fulfilled in order for a person to be responsible for anything.

Responsibility and Freedom

That there is a connection between freedom and deep (moral) responsibility might seem obvious. It is widely taken for granted that responsible agents are free, and vice versa. However, the term "freedom" can mean a great many different things. As a result, it can be confusing or even misleading to associate the two ideas. The question of how political freedom (the freedom to follow your conscience as an actor in the realm of politics, however "politics" might be defined) relates to deep responsibility differs in important ways from the question of how personal freedom (on many accounts, the idea that something is "up to me," perhaps in the sense that I have intentional control over whether it comes to pass or not) relates to deep responsibility. One might, for instance, want to claim that even non-responsible actors (such as infants or incapacitated adults) are entitled to a variety of political freedoms. By contrast, it is widely thought that personal freedom is required for and implied by deep responsibility.

Here again, complications arise. It was historically common to speak of personal freedom in normative terms, associating true freedom with the power to be good and to know what is true. Today, we tend to focus on more structural kinds of personal freedom, such as freedom of the will, of choice, or of action.

All of these kinds of personal freedom are related to responsibility, but not necessarily in the same ways. It seems clear, for instance, that a person could be responsible for her or his actions without having the normative freedom described above.

Libertarians, who consider determination incompatible with deep responsibility, tend to think of freedom of the will as a condition for responsibility. By contrast, at least a fair number of compatibilists, who consider determination of at least some sorts compatible with responsibility, have been open to the possibility that the conditions for freedom differ from those of responsibility. On such views, one might be responsible without being free (e.g. Fischer and Ravizza 1998). This position gains credence from the fact that although it may make sense to think that agents can be responsible for coerced actions, it can seem odd to say that a person who has been coerced is free. (Even if I have been threatened one could argue that I remain responsible for the way I responded to the threats, or which threats I responded to.)

However, the question of how freedom and responsibility are related is one that this article will largely put aside. Perhaps the best argument for doing so, aside from the limitations of space, is the pragmatic point that given the vast number of things people mean when they appeal to freedom, it is hard to clarify the idea of or conditions for deep responsibility by reference to it. Freedom is no less confusing than responsibility, so rather than claim that responsibility depends on freedom, it is helpful to simply elaborate on the specific conditions for responsibility one has in mind.

Theories of Responsibility

As just noted, philosophers typically divide theories about the conditions of responsibility into two broad categories, the compatibilist and the libertarian (a species of incompatibilism). Compatibilists hold that deep responsibility is compatible with determination of at least some sort, whereas incompatibilists hold that it is not. Libertarians are incompatibilists who believe that human beings are free and responsible (for an incompatibilist who is not a libertarian, see Pereboom 2017).

Typically, libertarians maintain that persons are accountable only for what they could have avoided. The avoidability requirement, however, is not meant to capture the essence of deep responsibility but rather functions as a way to ensure that agents meet a more fundamental condition of responsibility. That more basic condition is that agents be in some way or other the ultimate source of the actions or attitudes that are attributed to them. This “sourcehood” requirement is not meant to deny Niebuhr’s insight that human agents are fundamentally responsive as beings who are always part of interconnected webs of relationships. Libertarians do not see responsible agents as merely autonomous. They do tie deep responsibility to a kind of autonomy, however, inasmuch as they claim that it is only fair to hold a person accountable for what is fundamentally attributable to that person, and that what is attributable to that person is only what that person had some sort of final say concerning. Thus, if I am inclined to love the things my family has loved, but could do otherwise, then I make my own non-determined choice about who I am and how I act, and it seems fair to hold me accountable for that. If, by contrast, I am not able to avoid doing something or being a certain way, then I do not appear to own it in the same deep way. In short, as Robert Kane has argued, to be morally responsible for something “we must be responsible to some degree by virtue of our own voluntary actions for anything that is a sufficient ground (arche) or reason (condition, cause, or motive) for our acting as we do” (Kane 2000, 66).

This claim applies especially to our wills: if we do what we want, but do not control what we want, we are under the control of some cause external to us. The libertarian ideal is thus that “Man himself must make or have made himself into whatever, in a moral sense, whether good or evil, he is to become” (Kant 1960, 40).

One might wonder how it is possible for a human being to be an ultimate source of her or his own behavior. In some ways, libertarians are still refining and developing one or both of two suggestions made centuries ago by Anselm of Canterbury (Timpe 2013). Anselm thought that humans define themselves by their choices, and most fundamentally by their non-determined decisions about whether to prioritize self-love or love for justice. Such choices can incorporate antecedent influences from one’s past yet go beyond them, making it possible for human beings to have a kind of power of self-creation. Anselm also saw God and other personal agents as “agent-causes,” whose actions cannot finally be explained by reference to any antecedent causes (or mere chance) but rather by reference to a person’s having willed them (Anselm 1998).

Although it has ancient roots, libertarianism is particularly popular today. Historically, however, compatibilist views were at least as influential and widespread. Compatibilists often begin making their case by offering a distinction between kinds of determination (ancient examples include Augustine 1999; Calvin 1996). Causal or theological determinism are thought not to undermine responsibility, but being forced or coerced does. Correlatively, many compatibilists argue that it is possible to have whatever kind of control of one’s will and actions is required in order to be morally responsible, even if one cannot do or be otherwise, so long as one is able to act for one’s own reasons. They argue, therefore, that in itself necessity is no barrier to responsibility. After all, if I intentionally act in a particular way because I think it best, why should that not be attributed to me, and why should I not be held accountable for it, even if I am expressing who I necessarily am?

Perhaps the most famous and influential recent compatibilist account has been Harry Frankfurt’s. Frankfurt suggested that although we may not be responsible for the first-order desires we simply find ourselves with, we are responsible for the desires we identify ourselves with (our second-order desires) (Frankfurt 1988). Making a choice remains important on his view, but Frankfurt was aware that if determinism of some sort is true, the choices we make are unavoidable. Frankfurt argued, however, that what matters is not whether our choices could have been otherwise but whether they flow out of what we, upon reflection, endorse.

A more recent addition to the conversation have been what some call “quality of will” compatibilist accounts. On such views persons are responsible for their attitudes, when their attitudes are properly sensitive to reasons, and for the behavior that flows from their attitudes (e.g. Scanlon 2008, Chapter 4). This makes it possible for persons to be accountable for the character they have even in cases where they did not choose to have the emotional or belief-states that make their character what it is. Decentering the importance of choice in attributions of responsibility seems to suggest that responsibility is not mainly about control but about personal ownership (Couenhoven 2013).

One increasingly influential response among philosophers to these disagreements has been to distinguish ever more carefully between varieties of deep responsibility (Shoemaker 2015). It may be that a number of important qualities of character can be attributed to us even if we have not chosen them, or if we have no option but to choose them. Certain responses of, say, repugnance or delight might be

appropriate in response to such aretaic qualities. Such reactions might be rather different, however, from more demanding ideas of accountability, which might be associated with having higher degrees of control over oneself. Although extremely fine distinctions between terms that seem to have overlapping meanings in common speech can be unhelpful, the intuitions to which these ideas refer force us to ask whether moral responsibility is one integrated concept or a compilation of many. A way to mediate between these options might be the suggestion that responsibility has a unified meaning but also comes in degrees, the degrees of which have been at least partially captured by many existing theories of responsibility.

CHAPTER 24

Value Theory

William Schweiker

Definition and Task

Value theory is a rational account of the meaning, definition, source, and justification of claims about “value” in human life and conduct. It is related to, but distinct from the narrower task of “axiology” as classifying what things are “good.” By “value” one means, most simply, what people care about and deem important, whatever the reason or source of their care. Not only things and people can have value or worth, but so too ideas, beliefs, ideals, experiences, events, and so on. There is seemingly no end to what people can and have valued. The attribution of value may be, as will be explored below, due to the intrinsic nature of something or someone; it might rest on the usefulness of an entity or idea; beauty and other aesthetic qualities are also valued. One can thereby differentiate aesthetic, religious, economic, political, and many other kinds of value, including, for this entry, moral value. In terms of moral value, a distinction is often drawn between moral and non-moral or even pre-moral values as well as intrinsic and instrumental values. In religious ethics, these ideas are often important for relating religious and non-religious values or goods.

One task of value theory in general, then, is to define and clarify the types and relations among human values (see R. B. Perry, *General Theory of Value* 1926). This is important in ethics since human individual and social life are surrounded by and saturated with values. However, value theory within ethics, as normative reflection on the orientation of human life, must provide the means to determine which values can and ought to guide human conduct and how to adjudicate between values when they conflict. With respect to moral values, we are especially interested in reasons for actions, or, stated otherwise, answers to the question: why do you do that? Ethics must also assess and judge the justification of those reasons for action. In that respect value theory cuts across the traditional categorization of moral theory into normative and meta-ethical inquiry. This entry will focus on value theory within ethics, addressing other forms of value tangentially.

There is a related and yet distinct task of value theory for ethics that reaches back through the history of Western thought. In his famous dialogue, *Euthyphro*, often associated with the question of the source of the good (is it from the gods or is it self-subsistent?), Plato’s Socrates asks the young Euthyphro,

But what sort of thing would make us enemies, angry at each other, if we disagree about it and are unable to arrive at a decision? Perhaps you cannot say offhand, but I suggest you consider whether it would

not be the just and unjust, beautiful and ugly, good and evil. Are not these the things, when we disagree about them and cannot reach a satisfactory decision, concerning which we on occasion become enemies – you, and I, and all other men?

(Plato 1984: 7c–d, 47)

Human conflict seems to be waged over competing beliefs about values, moral and non-moral, say, democracy or human rights or the value of prenatal life. While disputes over matters of fact can be resolved empirically and disagreements on rational matters can be settled by means of deliberation and validation (however defined), the most difficult disputes to resolve are those about values. What people care about and why can and does pit son against father (as in the *Euthyphro* itself), family against the state (see *Antigone*), nation against nation (the history of wars from the *Iliad* onward), or civilization against civilization (see Huntington, *The Clash of Civilizations*, 1996) with each side claiming the rightness of its conduct.

Beyond clarifying the types, sources, and meaning of value within value theory, ethics itself as a discourse about moral value must seek to provide non-violent means for the resolution of conflicting values. In fact, this search for peace may be, humanly speaking, the *raison d'être* of ethics. It is why one undertakes the labor of critical and normative moral reflection. In this respect, value theory is crucial for the analytical and conceptual work of ethics but also in terms of the practical purpose of orienting human conduct. The following pages explore these basic tasks of value theory mindful of the challenge that conflicts of values put to the work of ethics. Yet, it cannot, by the nature of the case, discuss in detail every topic in value theory, say, value pluralism or value monism. The constructive claim of the entry is that value theory is important in ethics because of the issue of human conflict and the search for a moral and peaceful resolution to it.

Types of Value

In spite of the importance of value in human life, there is little agreement about its “meaning,” and how, if at all one can communicate about individual values. Granting that value is “what is important” to an individual or group of people, what they care about or have an interest in, it is still not clear that such import can be adequately articulated within any culture’s linguistic and cultural forms. Must value ultimately escape rational definition, communication, and adjudication? Are values solely the product of a society’s beliefs and discourses? In light of these and other questions, thinkers have isolated different types and terms for value.

Value as Price and Utility

The simplest, and in our global age most ubiquitous, means for communicating about “value” is to denominate its meaning in economic terms, say, price. This definition shares with the common sense meaning of value as what is important or cared about, but it complicates matters in terms of what *creates* value. Some, like Adam Smith no less than Karl Marx, argued that labor creates value in the so-called labor theory of value. Others have argued that value or price is determined by the market with respect to supply and demand in relations of exchange. Likewise, neoclassical economists speak of “utility,” meaning by this the value that someone (e.g. a consumer) expects to derive from something at a certain price. Debates about the meaning and source of value within business and economics are ongoing, but

their moral relevance is the extent to which utility and price define every form of value, that is, allow all values to be commensurate. There are then two questions. First, can one kind of value be applied across diverse categories of objects? For example, can we put a price on a “valuable” idea or work of art or a person? Second, are there some things, say, persons, whose value cannot be reduced to any price, say, because they have independent worth in themselves?

The moral theory most interested in commensurating values is classical utilitarianism. Utilitarians aimed to show that every form of pleasure or interest could be treated alike and one way to do so was to assign a price and thus utility to them. This argument gave way to John Stuart Mill’s more nuanced account of forms of pleasure and thus an expanded sense of utility. Yet even in Mill’s case, the concept of “justice,” which hardly seems commensurate with other values or pleasures, could be related to utility. We leave the discussion of economic value to other entries in *The Encyclopedia of Religious Ethics*.

Intrinsic and Instrumental Values

Within forms of ethics that resist a utilitarian calculus a distinction must be drawn between intrinsic and instrumental value, although there are other types as well. Instrumental value is a means to a separate, further end. I might, for instance, value my car as a means to get to work. Insofar as the car fulfills that function, then it has instrumental value to me and can be easily replaced by another car that performs the same task more efficiently and cheaply. There is nothing inherent in, or essential to, the car that is of value; it simply does the job it is meant to do. It is instrumental to other ends or purpose that I might have.

Intrinsic or inherent value, conversely, indicates that something cared about in and of itself. This is the framework for Immanuel Kant’s famous distinction between worth (intrinsic value) and price (instrumental value) (Kant 2012). I do not value my son, hopefully, because he is instrumental to caring for me in my retirement, for example. I do not love a friend because that person is a means to advancing my reputation or increasing my income. In fact, the ideas “love” and “son” designate non-instrumental or intrinsic values. These individuals are not means to further ends, but, as Kant put it, ends-in-themselves. The paradigm case of an intrinsic value is oneself. That is, I do not, unless deluded or wrongly self-sacrificial, love myself as a means to some other end, say, the glory of the nation or the pride of my race.

Of course, these categories can shift, as pragmatists have shown (see below). I might instrumentally value my car as a means to get to the intrinsic value of having a job. But, on reflection, having a job might be instrumental to loving my son. These are, then, distinctions dependent on context and matters in view. But they do designate two distinct, if related, perspectives on value: objective and subjective. Objective, or intrinsic, value exists independent of how people perceive, speak, or act on it. Subjective value depends on the emotions, experiences, desires, interests, or perceptions of valuing individuals. These two types of value have often been taken as exhaustive of the types of moral value.

Hypothetical and Categorical Values

In Kant’s moral philosophy, the distinction between intrinsic and instrumental value generates two distinct correlated types of duties. A hypothetical duty is an obligation on me insofar as it pertains to a means to some desired end. The object of the duty is a means to some further end, that is, its value is instrumental. If I want to learn to play violin, then I have a hypothetical duty to practice daily; if not, then no such duty obliges me.

Categorical obligations are binding in every case and for everyone. They concern ends-in-themselves (say, persons) and are not subjective in the above sense. I have a duty to respect a person whether or not I like him or her. In fact, respect just *is* the marker of that obligation; it testifies to a categorical, that is, intrinsic value. To act justly or to tell the truth are also, for Kant, categorical imperatives that signal the intrinsic worth of a peaceful community and language as a means for human communication and understanding. These ideas have been important in the development of modern human rights discourse as well as our treatment of animals, the natural environment, and the ethics of Artificial Intelligence.

Kant also articulated at once a modern and yet also ancient conception of the Highest Good, morally speaking. That is, while religious sages have long identified the Highest Good with God, the sacred, or the holy (see *Euthyphro*), other thinkers have defined the highest moral good as some relation between virtue and human flourishing, namely happiness (*eudaimonia*). Kant held that the highest good is not virtue itself (as the Stoics argued), happiness as pleasure (hedonists old and new), virtue and the good fortune to be happy (Aristotle), but rather a synthesis of happiness commensurate with virtue, that is, justice. The possibility of this synthesis, and thus a reason to act on the highest good so conceived, warranted, for Kant, the postulate (not proof) of the idea of a God to reward virtue and immortality in order to work out one's worthiness to be happy.

Contributory Value

Pragmatic theories of value, like John Dewey's (1929), argue that human beings always act with ends-in-view or certain ideals. However, insofar as humans are always acting and adapting to changing circumstances, there is no such thing as an "intrinsic" value, but, rather, that which serves in the ongoing search for some consummate fit between an agent and its environment. In this respect, every value contributes to the resolution of the search for a creative fit realizing that, in the ongoing labor of life, new "fits," and so new contributor values, will be needed. This has led one contemporary pragmatist to argue that values are about self-formation and self-transcendence in that we are dependent on going beyond ourselves toward ideal ends (Joas 2000). Pragmatism also elides the philosophical distinction of objective versus subjective values.

Beginning somewhat like Charles Darwin with an organism's need to adapt to its environment, Dewey argued that values are what contribute to, and so shape the ongoing interaction between the two (Dewey 1958). Human beings, as thinking and acting creatures, can revise their values in order to achieve a consummate fit with their social and natural environment, a final ideal. There are no intrinsic values or fixed ideals that are not open to revision and could thereby thwart and distort action. This means that what was once a final ideal can become, in the flow of time, an instrumental value as agents reflect on and adjust their action. In a word, value construction is an ongoing creative process of reflexive action seeking to further the labor of life. Value is that which contributes to this creative process.

Theories of Value

The concept of value is essential to understanding distinctively human action. It is not surprising, then, that within the history of Western philosophical and religious ethics there have been various "theories" of value (axiologies). These theories seek to clarify the meaning of moral value, the relation between

moral values (if there be more than one), and to justify the meaning and ranking of values. Given the immense scope of the topic, we can organize the myriad theories into four basic types, with claims about a transcendent Good, on one extreme, and the idea that values are mere human social constructions, on the other. Between these are theories that conceptualize value in terms of the proper function of a being or the object of a special human intuition or moral sense.

The Transcendent Good

Perhaps the oldest philosophically sophisticated axiology is found in the work of Plato, as intimated in the citation above from the *Euthyphro*. Plato's contention was that in a proper sense, "good" cannot be defined. It resists articulation because it is the form in light of which we apprehend other things. Comparing the "Good" to the sun, in his *Republic*, Plato argued for the Form of the Good as a transcendent source of every specific good. The philosophical task, on this account, is a journey or ascent of the mind to a "vision" of the Good in order to gain a proper knowledge of contingent reality. This meant, importantly, that philosophy is, conceptually speaking, learning to die to the realm of appearances in order to apprehend the reality of the Good. For Plato, what is "good" is intrinsically so, because what is meant by the good is something that inheres in its "object" regardless of knowledge of it or a community's discourse about values.

Plato's thought has, of course, been a dominant voice in the history of Western ethics, philosophical and religious, with expressions in Jewish, Islamic, and Christian thought. In the ancient world, religious thinkers like St. Augustine and Philo, among others, or medieval theologians such as St. Bonaventure, in *The Mind's Road to God* (Bonaventure 1953), continued the argument in theistic terms. For classical theists, God is the supreme reality and proper object of human desire, and God is a being in whom is found the pattern or archetype of reality. This makes contemplation of God and/or the love of God and others the highest human good.

Surprisingly, Platonic insights also appeared within twentieth-century ethics. G. E. Moore, in *Principia Ethica* (1993), argued that in the analysis of moral concepts, "good" is indefinable since one can always ask of any ostensive candidate for "goodness," "is it really good?" As an indefinable predicate of anything, Moore argued within a generally consequentialist outlook that value is the object of an intuition akin to the experience of "yellow." One must experience it to know it and yellow is not the object of description. This means, in his terms, that good is a non-natural property and thereby escapes the so-called naturalistic fallacy, namely that moral terms can be "reduced" to natural characteristic of a thing, person, or action (see below). Rather, the good or value is intuited as it supervenes on non-moral realities.

Another "Platonic" voice in twentieth-century ethics was the philosopher and novelist Iris Murdoch who famously argued that the "Good" is sovereign over other concepts and that, in fact, the idea of Good can replace previously metaphysical conceptions of God as a real, existent, supreme reality. In this sense, as she put it in her Gifford Lectures, metaphysics should guide morals (1992). Yet like Moore, who shifted the argument to the nature of moral properties, Murdoch likewise redirected the Platonic argument, in two ways. The Good is known, first, by loving attention to concrete other people rather than as the form of all forms (see Murdoch 1970 and Antonaccio 2000). Second, she argued that we perceive the world with respect to gradations of value and the task of the moral life is to escape self-consoling fantasies in order to see the world and others in truth.

The Argument from Function

The oldest line of criticism of the Platonic Good is found in the thought of Aristotle. He denied Good is a unity and looked instead to the proper and maximal function of a thing or creature. A good “shield” is one that fulfills its function. Human beings too have a proper function. While we share bodily and social natures with other animals, humans alone can rationally guide their conduct. Insofar as the “Good” is, formally speaking, what everything aims at, as noted in the *Nicomachean Ethics* (1999), the human aim is happiness (*eudaimonia*) achieved through rational and virtuous action. In terms of axiology, then, Aristotle’s argument is that “good” is the flourishing and perfect functioning of a specific thing or being such that it will be predicated of a warrior differently than, say, a “knife.” This is, in terms of moral theory, a form of ethical naturalism.

Aristotle’s thought has also had a profound influence on Western Jewish, Christian, Islamic, and philosophical ethics. Widely used by medieval Jewish thinkers like Maimonides to give an account of the moral (as distinct from the intellectual) virtues. Muslim scholars Avicenna, Averroes, and Al-Farabi as well as Christian theologians like Thomas Aquinas each drew on Aristotle’s virtue ethics, often linking it to biblical law (Maimonides, Aquinas), the example and teaching of Muhammad and the Qur’an, as well as, in Aquinas, ideas about natural law. In each case, what is of value is the perfection and flourishing of the being in question, specifically, the human (Rubenstein 2004).

Aristotelian naturalism fell out of favor with the criticism of medieval scholasticism by nominalist thinkers and then with the rise of modern, experimental science, especially Darwinian thought, that challenged the idea of a natural teleology to any living thing. Yet, surprisingly, here too there have been several twentieth-century revivals of ancient Aristotelian axiology. One contemporary form of Aristotelian virtue ethics was advanced by the Catholic philosopher Alasdair MacIntyre in his landmark work *After Virtue* (1981), where he argued that modern moral thought is pieced together from fragments of different ethical systems and thereby feeds endless moral disagreement. The answer to this condition is to reclaim a teleological vision of the human good in terms of the virtues and practices to which they are germane. In later works, like *Dependent, Rational Animals* (2001), MacIntyre embraced a morally robust ethical naturalism in terms of his conception of human value.

Amartya Sen, an economist, and Martha Nussbaum, a philosopher, have developed what they call the “capabilities” theory which draws heavily on Aristotle and others. Their argument is that human beings have rights to the development of their natural capabilities important for their flourishing. Relatedly, the philosopher Philippa Foot developed an axiology in her book *Natural Goodness* (2001) that, like Aristotle, depended on a concept of the flourishing of an individual as a member of a species. Granting developments in biology and philosophy of science, Foot nevertheless championed a form of ethical naturalism wherein “value” is defined with respect to the flourishing of a being given its distinctive natural features.

Intuitionism and Moral Sense

Another strand in theories about value is moral sense theory or, more broadly, ethical intuitionism. The claims of these positions, generally stated, is that human beings can know the distinction between moral/immoral and good/bad and so moral facts non-inferentially either through a specific cognitive capacity (conscience or moral sense) or emotional experience with respect to various sentiments, say, benevolence or self-love. In modern British moral philosophy, thinkers like David Hume, Adam Smith, Lord Shaftsbury, and Francis Hutcheson argued, in different ways, for a moral sense in the case of Hume and

Smith, within a hedonic idea of value linked to pleasure and pain. Yet this hedonism was properly moral insofar as the moral sense, say, benevolence, motivated action for the good of general utility.

Other British thinkers, like Thomas Reid, the founder of Scottish common sense philosophy, Bishop Joseph Butler, and theologians like John Wesley and, in the American colonies, Jonathan Edwards, also argued for a distinct moral sense on analogy to other senses. Edwards, in his *The Nature of True Virtue* (2003), claimed that religion is a matter of holy affections and that virtue is consent to the system of Being and an apprehension of moral beauty. Butler argued that “conscience” dictates our duties consistent with or contrary to other principles of action (self-love and benevolence) (Butler 1983). In a word, the field of human values, for example, aesthetic, religious, moral, were understood to be apprehended by a distinct sense, say, the sense of beauty, or through a distinct rational faculty, say, conscience. For these thinkers, moral properties are not inferred from natural ones, thus they rejected naturalism as well as rationalism.

There are also contemporary forms of moral sense theory and intuitionism. Deeply influenced by the thought of Jonathan Edwards and also Pragmatism, H. Richard Niebuhr and, with a more naturalist bent, James M. Gustafson argue for relational theories of value. The first axiological question for these theologians is “good for whom?” “Value” is what advances a form of life within complex sets of relations, social and natural, that sustain and limit that being. The perception of that value, and hence what is a responsible relation to it, is a sense of what is “fitting” to the situation (Niebuhr) or an informed intuition backed by a process of discernment (Gustafson 1992). In each case, value is increased through the right relations within a social or natural situation.

Ethical intuitionism, has found advocates in W. D. Ross (1877–1971) and more recently Robert Audi (1941–). Building on Ross, Audi argues for a form of deontological, pluralistic intuitionism. That is, there is a plurality of real intrinsic values open to human intuition that can be understood in relation to a Kantian-like deontology: the Good is in the Right, as he puts it (Audi 2004). The advantage of this form of intuitionism is that it avoids the problems found in G. E. Moore’s consequentialism because it insists on the intrinsic moral status of every individual (see Jung 2015). First noted by Henry Sedgwick, in his *Method of Ethics*, the most basic form of intuitionism is the non-inferential grasp of moral duties outside of complex reasoning about cases. Kant’s arguments about the Categorical Imperative or Butler’s dictates of conscience would seem to be cases in point. Rather than depending on elaborate systems of ethics, the human can grasp under its own lights principles of right and wrong (Kaspar 2012).

The Construction of Value

We have seen that value theory touches on issues in moral epistemology, namely, how values are known, say with respect to a “moral sense” or by analysis of the specific function of an animal, including humans, or a thing. Value theory also poses metaphysical and meta-ethical questions: are values real, and if so in what way, and do they have truth status or are they the objects of sentiments and experiences, and hence non-cognitive? Values are also basic to a conception of moral agency in terms of motivation, say, the quest for happiness or moral excellence, interests, and utility, and thus are reasons for actions. Theories of value in ethics answer these questions in different ways, as has been indicated.

One other type of value theory remains to be addressed, namely, the category of theories that claim that values are individual or social constructions. The value theories explored above claimed that value is somehow a metaphysical feature of reality, however they are known (Platonic-like theories); defined with respect to the proper functioning and flourishing of a thing or creature; or the perception or command of a

special moral sense. In this respect, each of them is a version of *moral realism*, meaning by this that moral statements have truth-value; they can be true or false. But there are other theories of moral value that claim that value is an expression of subjective preference or the (arbitrary) creation of human communities.

In many respects, constructivist theories are the most dominant ones in later modern, globalized societies. The reason for this fact seems simple. Given the profound moral diversity of such societies as well as the loss of any shared religious or metaphysical conception of value, it seems that different persons and communities simply “value” different things and have diverse ways of ranking values. This has the added attraction of seemingly avoiding the conflict of values, first seen in the *Euthyphro*, since there is no “objective” standard for adjudicating between theories of value. Certainly, the global reach of value as price and economic utility is an expression of constructivism in axiology. Price is set by the market and not written into the nature of things.

Perhaps the most dramatic and controversial constructivist theory of value was advanced by Friedrich Nietzsche in the nineteenth century. Nietzsche, in texts like *On the Genealogy of Morals* and *Beyond Good and Evil* (1967), argued that everything is driven by a will-to-power (*Wille zu Macht*): an urge which every being has to increase its power and its capacity to dominate others, but also simply to affirm its life. Against this background, societies develop “tables of values,” that is, conceptions of what is valued and then a ranking of what is deemed valuable. He argued that two fundamental value systems dominate the West. One found originally in ancient heroic Greek culture, especially Sparta, which prized strength and the affirmation of life marked by the axiological distinction of good/bad. The good is simply what the strong endorses, especially themselves, while the bad are the weak. With a supposed “slave revolt” among Jews and Christians this heroic table of values was overturned and with it there was instituted the distinction good/evil where the good is what is humble and weak whereas the evil is anything that harms the weak. In this way, the West came to despise the will-to-power and also finite life itself even while being driven by it. The West became, in a word, nihilistic. The task now, Nietzsche, insisted was the “self-overcoming” of “Man” through a new transvaluation of values. He was insistent that any value system that denies the vitality of living things must, ultimately, be overcome.

The legacies of Nietzsche’s work have been many, some horrific (National Socialism) and some not. Communitarian ethics, for example, holds that values are constructed and understood in terms of the discourse and practices of some community and its tradition, for example, the Christian Church (Hauerwas 1981) or some oppressed racial group (Cannon 1995). In each case, values serve the affirmation of the life of the relevant community and one must be or become a member to grasp its values as reasons for action. Pragmatic theories of value creation are also constructivist, as noted above in Dewey’s ethics. Then too, there are radical relativists who believe that values are the creation of and thus relative to individuals. Like the ancient world, claims about value dominate much contemporary social thought and moral theory.

Value Theory and Ethics

The domain of value theory is vast and it is obviously contested territory among moral thinkers, religious or not. If Socrates is right, as noted above in the *Euthyphro*, then ethics is, in itself, a moral advance for human beings. That is, if reasoned debate about conflicting values can in some small measure triumph over hostile conflict, then the good of peace is shown to be humanly possible and not merely a wishful dream. In this respect, one can say, again, that value theory is, *in nuce*, the grounds and purpose of moral reflection itself.

CHAPTER 25

Alterity

Paul Mendes-Flohr

The concept of *alterity*, denoting the non-self, marks a radical shift from the question of “How do I know other minds?” to “How am I to relate to the other?” whose inner-reality is acknowledged to be beyond the epistemic reach of cognition. This entry traces two overarching approaches to alterity, transcendental phenomenology and the philosophy of dialogue. The former, principally associated with Edmund Husserl, formulated this issue as one of “inter-subjectivity” or the intentional act of becoming aware of others; the latter, represented Emanuel Levinas and Martin Buber, as one of interpersonal relations, which for both has the quality of a religious act. The entry concludes with a brief account of the appropriation of the concept of alterity by various humanistic disciples.

A term derived from the Latin *alter* designating the other (of two), alterity denotes a philosophical problem reaching back to René Descartes (1598–1650) who pondered the epistemological dilemma whether knowledge of other minds is possible. The Cartesian “I think. Therefore, I am,” poses the question of the relation of the self – the cognitive I – to the non-self. How, indeed, can I know the other and his or her inner reality, or Otherness? Is the other a mere object of the knowing subject? In that case, the other would be but an epistemic iteration of one’s self, the “same,” implicitly denying its otherness. And should the other be held to be intrinsically beyond the reach of rational cognition, one is faced with an untenable solipsism and epistemological relativism. In twentieth-century thought this seemingly intractable epistemological conundrum was re-framed to consider the ontological status of the other. To mark this shift in focus from the epistemic other to the ontological other, the term “alterity” is increasingly employed. Posited as an autonomous subject and agent, the ontological alterity of the other is not regarded as an object of knowledge but rather is enjoined to honor the non-self in his or her irrefragable and distinctive otherness. The overarching question facing otherness or alterity so conceived is thus not how one knows the other, but how one is to relate to the other. How is one to respond to the other who confronts one in concrete, specific situations?

Initial adumbrations of this shift to ontological otherness may be found in Wilhelm Dilthey (1833–1911), who famously argued that the human sciences (*Geisteswissenschaften*) are not to be studied according to the analytical presuppositions and methods appropriate to the natural sciences (*Naturwissenschaften*). Whereas the latter seeks causal explanation (*Erklärung*), the human sciences require understanding (*Verstehen*). This methodological distinction accordingly entails a transition from epistemology to hermeneutics. In seeking to gain an understanding of others and their life-experience, Dilthey insisted, one cannot assume others are mere extensions of oneself. Through such essays as

“Understanding other Persons and their Life-Expressions” (Dilthey 1910), he set the ground for the emergence of a phenomenology of the other.

To understand why a child cries, one does not seek to explain the cause of a child’s sobbing by analyzing the chemical composition of her tears or the physiological process of ocular tearing; rather one seeks to understand the inner lived-experience (*Erlebnis*) that is prompting the emotional state of crying. Understanding (*Verstehen*) the lived-experiences of others thus requires an imaginative entry into the other’s experience (*Nacherleben*), which is not, however, merely an act of empathy. One gains access to the inner experience of others through its expression in language, gestures, or artistic production. One understands the inner-experience of others through these culturally objectified structures of expression that give voice to that experience. The interpretive decoding of another’s experience, then – such as the crying of one who is hurt, physically or psychologically – as articulated in a specific culture’s discursive structures is thus said to have the dialectical effect of acknowledging the subjective uniqueness of the experience of that person, while also allowing it to be recognized as an experience that the interpreter can recognize as one they have had or can imagine having (Dilthey 1910).

In broad strokes, there are two distinctive approaches to the phenomenology of the other, transcendental phenomenology and the philosophy of dialogue, as delineated and systematically analyzed by Michael Theunissen (Theunissen 1984). To explain our experience of a non-self, transcendental phenomenology deploys the concept of inter-subjectivity, a technical term first formulated by Edmund Husserl (1859–1938). The inter-subjective experience of others, Husserl argued, is borne by empathy, the conscious attribution of intentional acts to other subjects by which we put ourselves, as it were, in the other’s shoes. The vicarious experience of the innermost motives or emotions of others, however, are felt as real or imagined; but empathy as an inter-subjective experience is *not* the experience, feelings, and motives of the other. Hence, it is argued that the transcendental theory of intersubjectivity – even as elaborated and refined by the likes of Heidegger and Sartre – is unable to relate to the other *qua* other, for it merely provides an empathetic sense of the other’s inner world. Husserl’s inter-subjectivity, in the end, remains within the realm of the intra-subjective, and thus perforce reduces alterity and ontological difference to the “same.” By deducing the other by way of analogy, Husserl, in effect, derives the other on the basis of the Same and hence ceases to be to “other as such” (Levinas 1984). It would seem that Dilthey’s cultural hermeneutics, in which one sees one’s self in the other, also fails to confirm that other of its alterity.

Dialogical philosophy avoids the subjectivism of transcendental phenomenology by assuming what Martin Buber (1878–1965) calls a “primal distance” (*Urdistanz*) from the Other, which allows one to honor the ontological integrity of difference (Buber 1965a). I-Thou encounter is not an intentional act, for one ultimately meets the other in dialogue, which, as Buber’s colleague, Franz Rosenzweig (1886–1929) put it, in dialogue one addresses “someone [who] is always some one who is always quite a definite some one, and he has not only ears, ‘like all the world,’ but also a mouth” to which one may – if one is up to it – respond (Rosenzweig 1925, 200). The dialogical response to the other is thus both active and passive. It is a “pure” act that is, “at the same time a doing” and “not doing” (Buber 1923, 42, 77). This paradoxical formulation was inspired by the Chinese Daoist sage Zhuang Zhou’s concept of *woe-wie* – no-action, a non-intentional, non-calculating, non-deliberate manner of being the world. In adhering to the “path” of *wo-wie* one is wholly open to the moment, the here and now (Buber 1910). The Daoist doctrine of *wo-wei* would inform Buber’s concept of the I-Thou encounter. Cf. “The You encounters me by grace – it cannot be found by seeking. But that I speak the basic word [of I-Thou] to it is a deed of my whole being, it is an essential deed. ... Thus, the relationship is election and electing, passive and active

at once. An action of the whole being must approach passivity, for it does away with all partial actions and thus with any sense of [intentional] action ..." (Buber 1970, 57).

The Other addresses one with the expectation of a response, which may or may not be forthcoming. In responding to the address, one meets the other not as an It, not as the object of an intentional act. Rather one meets the Other as a Thou – as an independent subject; as such dialogue is akin to love, a bond between two individuals that is born of the free response of one to the other. It is neither coerced (by heteronomous precepts) nor generated by the intentional activity of one of the members of the dialogical relationship. It is thus said to be reciprocal. The reciprocity of the I-Thou dialogue is preeminently existential; in its full expression dialogue is instantiated by the mutual confirmation of the other's existential "presence." In this respect, the I-Thou dialogue is meta-ethical.

To further clarify dialogue as a meta-ethical, non-intentional act, Buber sought to differentiate it from empathy (*Einfüllung*) from what he called *Umfassung*, embrace or include. In contrast to empathy – by virtue of which one identifies with the experience of the other as similar to one's own – in *Umfassung* one is attentive to the experience of the other as expressed in distinctive voice, which one seeks to hear without subsuming it under a universal category or with one which one is familiar. When one embraces the pain of another; it is heard not as pain is in general, but as specific pain of a specific person. Nor does one empathetically identify with the pain of the other, for it is to remain the other's specific pain (Buber 1965b, 97f.).

Emmanuel Levinas (1906–1995) thus somewhat derisively characterized Buber's conception of dialogue as "spiritual friendship" (Levinas 1967, 148). Levinas surmises that the encounter with the other issues in an ethical response (Levinas, 1969, *passim*). That response may be in the small acts of everyday life by which one acknowledges the needs of the other, such as the gesture of holding the door of an elevator for one not swift afoot, or more urgently in heeding the biblical injunction to feed the hungry and to clothe the naked (Levinas 1969, 77). Buber's response to Levinas's critique highlights the fundamental difference in their respective conceptions of dialogue: One "may clothe the naked and feed the hungry all day and it will remain difficult for him to say a true Thou. If all were well clothed and well nourished, then, the real ethical problem would become wholly visible for the first time" (Buber 1967, 723).

The difference between Buber and Levinas boils down to how they each understand the address of the other (Atlerton 2004). For Levinas it is a call for help, a call for an ethical response, to take on the responsibility of satisfying the perceived need of the other, of relieving the other of his or her anguish. The call need not be uttered in words; the summons may be etched in the face of the other. The visceral response precedes the decision how to realize the responsibility one has taken upon oneself. The conative impulse precedes the cognitive translation of the call. The response is pre-intellectual (or as Husserl would say pre-intentional). The call issued by the face of the other is neither that of God nor any ethical authority. The Face that addresses one has no normative voice behind it. It is the "gaze" of the other in-of-itself that "speaks," that commands. What primes the gaze is beyond our cognitive, or for that matter our auditory reach. It is simply the utter otherness of the gaze of the other that enjoins one's ethical response. The radical otherness of the other is, as it were, outside the person one encounters; it is infinitely beyond him or her. It is the infinite otherness of the other that constitutes its alterity. In the immediacy of the encounter, the other is not experienced as an other subject like oneself, but as a radically Other, who calls one to respond even before determining how to do so: "Obedience precedes any hearing of the command" (Levinas 1978, 148). Radical Otherness begets a radical passivity in which one humbly accepts the command before hearing the concrete command of the other: "The possibility of finding, anachronously,

the order in the obedience itself, and of receiving the order out of oneself, this reverting of heteronomy into autonomy, is the very way the Infinite passes itself” (Levinas 1978, 14). The assumption of ethical responsibility for the other is, then, the affective, immediate experience of alterity as the bearer of “transcendence.” The ethical life, as Levinas understands it, thus takes on a religious hue.

Levinas does not identify transcendence with God, however. It is in response to the address of the Other and its infinite Otherness that testifies to a religious sensibility (and not necessarily belief). Called upon by the Other, one testifies to his or her readiness to respond as Abraham had when addressed by God, *Hineni*, here I am (Genesis 22:1). Levinas explains Abraham’s replies as follows: “‘Here I am in the name of God,’ without referring myself directly to his presence; ‘here I am,’ just that! The word God is still absent from the phrase in which God is for the first time involved in words. It does not at all state ‘I believe in God.’ [...] The witness is humility and admission; it is made before all theology, it is kerygma and prayer, glorification and recognition” (Levinas 1978, 149). The adjective “religious” serves as phenomenological description of the “moral responsiveness to the concrete reality of the other as exemplified in the vulnerability and height [that is, infinite otherness] of the face. The dimension of height is associated not with heaven but with invisibility [of alterity’s transcendence]” (Levinas 1969, 35). In confining himself to a phenomenology of the lived-experience of the response – the *Hineni* – to the call of the Face of the other, Levinas withholds any theological or metaphysical delineation of the experience (Levinas 1987, 84). Hence, all he can say is that the primordial response of *Hineni* does not place one in a reciprocal relation with the other. The *Hineni* opens an “intersubjective space [that] is not symmetrical,” that is experienced as reciprocal, nor is it necessarily anticipated as reciprocal. Such anticipation would be to suggest that one anticipates a reciprocal response would, of course, inflect the response with a theological orientation, which would breach the bounds of a purely phenomenological portrayal of the primordial, kerygmatic moment of a “moral responsiveness” to the call of the other. Accordingly, it has been observed, “Levinas does not offer a religious or theological ethics but a philosophical exploration of the conditions of the ethical that potentially addresses all as an each, including the non-believer and non-monotheist. Ethics is not so much a belonging to any order or institution of being, including the religious, as it is the transcendence and utopianism of ‘small goodness’ to use [the Russian novelist Vasily] Grossman’s expression” (Nelson 2008, 102, cf.). “Levinas does not want to propose laws or moral rules ... it is a matter of [writing] an ethics of ethics” (Derrida 1967, 111).

Levinas, nonetheless insisted that religion cannot separate itself from ethics. “Going towards God” is meaningless unless seen in terms of my primary going towards the other person. I can only go towards God by being ethically concerned by and for the other person (Levinas 1986, 23). But Levinas’s conception of God is ambiguous. To be sure, he draws on biblical tropes, such as, humility, grace, judgment (“the Other who judges me”). Yet he consistently refrains even in his Talmudic Readings (Levinas 1990) from speaking of a personal God, who is, indeed, a God who enters a reciprocal relation with humans. What intrigued Levinas about the Talmud is not its theology but rather the attention the rabbis give to concrete human concerns. The Talmud thus demonstrates that concern for the other is not, indeed, cannot be mere theoretical or rhetorical exercise. Levinas reads the Talmud to challenge the Western philosophical tradition reaching back to the pre-Socratics of attributing ontological primacy to the self. Reading the Talmud philosophically, he sought “to express in Greek what Greece herself cannot express” (Wygoda 2000, 145).

The concrete, even quotidian concerns of the Talmudic rabbis, as Levinas reads them, foreshadowed an understanding that ethics is the ground of being, that a solicitous concern for one’s fellow being is the

“first philosophy.” The rabbis realized that one meets God in the existential realities of the everyday of one’s neighbor. And the neighbor is always a specific other (Levinas 1974, 159). For Levinas, implicitly parting from the rabbis, the radical otherness – the alterity – of the neighbor is beyond sociological ascriptions; one heeds the call of the neighbor as one is utterly “different,” an “alien” unknown voice. The neighbor is thus beyond definition, political cultural, ethnic, or otherwise. Herein lies the universality of Levinas’s ethics of alterity.

Inspired by the increasing philosophical attention to alterity, the radical other, the ethical presuppositions of various humanistic disciplines have been revisited and, accordingly revised (Mendes-Flohr 2015). Anthropologists have thus shifted their focus from cultural differences, constituted by distinctive epistemologies and worldviews, to “being.” Consonant with this “ontological turn,” anthropology views worldviews not simply as different representations of the same world. Rather, cultures are now said to have different ontological perspectives on the meaning of existence and thus see the world in different ways, although the world remains one. Therefore, the ontological turn refers to a change in perspective that suggests that cultural differences can be understood, not in terms of a difference in worldviews, but differences in the world ontologies and, therefore, that all of these worlds are deemed to be of equal validity (Holbraad 2017).

Poststructuralist theories have conscripted the concept of the radical other to dismantle the hitherto regnant notions of the subject as sustaining a stable and “centered” discourse. Deconstruction, a method of textual analysis most prominently associated with Jacques Derrida (1930–2004), seeks to uncover and expose the imperious discursive logic of Western literature, and open it up to *other voices* that its “logocentrism” perforce suppresses (Derrida 1978). In a similar vein, feminist theory discerns the root of gender inequality in the male dominated culture to represent women superciliously as *the other*, which has been characterized as the Manichaeism of sexism of patriarchal cultures, the origins of which Simone de Beauvoir (1908–1986) locates in the biblical book of Genesis: “[Therein] humanity is male and man defines woman not in herself but as relative to him ... He is the Subject, he is the Absolute – she is the Other” (De Beauvoir 1978, xxii).

Postcolonial theories have likewise challenged what is held to be invidious logic Manichaeism dualism. As the Palestinian literary critic Edward W. Saïd (1935–2003) noted, such dichotomous conceptual constructs imply that cultural differences are epistemological and axiological; “our” civilization is self-evidentially privileged and superior, theirs is, indeed, different and strange. In truth, however, this binary separating us from them is inherently confrontational and, indeed, belligerent (Saïd 1978). From the perspective of the experience of contemporary China, Xianomei Chen (b. 1954) questions the anti-Western polemic attendant to the postcolonial theory. Coining a concept of Occidentalism – in contradistinction to Saïd’s Orientalism – that by reversing the dualistic divide of West versus East, postcolonial theory fails to appreciate the political significance of cross-cultural appropriation. “It seems imperative that we at least attempt to find a reasonable balance between Self and Other, between East and West, so that no culture is fundamentally privileged over its Others. Perhaps the realities of history cannot allow such a balance to be fully realized. Indeed, it is even necessary to affirm that these master tropes are necessarily veiled by the fictional. What must be stressed here is that even imagining such a balance – surely one of the first requirements of a new order of things – can never be possible without each Self being confronted by an Other, or by the Other being approached from the point of view the Self in its own specific historical and cultural conditions” (Chen 2002, 89). Judith P. Butler (b. 1956) shares Chen’s caveat about the “exclusionary logic” of an oppositional binary of Self or Other, particularly when

evoked as ideological trope as an ideological construct. It is not only utterly unnecessary for gay and lesbian identity, she argues, “to constitute themselves through the production and repudiation of a heterosexual Other,” but such adversarial constructs are likely to invite a “reversal” of the antagonism (Butler 1993, 112). The ideological appropriation of the philosophical concept of alterity often confounds honoring the ontological integrity of the Other with othering.

CHAPTER 26

Discourse

Brett T. Wilmot

Communication is a method of social coordination, where a speaker or writer conveys information to a recipient that elicits a response based on an understanding of what has been communicated (which includes potential misunderstanding of the content or intention of the speaker/writer). Even distorted communication (e.g. deception, threats, etc.) are parasitic on this basic form (e.g. in the way that the possibility of a lie depends on the presumption of truthful communication). Discourse is a second-order form of communication that takes up the content of first-order communication and subjects it to critical analysis. This can happen on an ad hoc basis when the validity of a claim has been contested in the context of a particular communicative exchange or as part of a formal inquiry, where various types of claims are systematically evaluated following the norms of a particular discursive practice. Discourse is typically intersubjective, involving two or more parties in an exchange of arguments, evidence, and reasons, and its norms closely reflect a given community's epistemological assumptions (e.g. its views on what count as authoritative sources, conditions for justified belief, valid forms of argument, etc.). Discourse is also constitutive of subjectivity independent of engagement with interlocutors insofar as the self engages in critical reflection on her own beliefs, and this interior dialogue mirrors and anticipates intersubjective exchanges. While "discourse" suggests verbal exchanges, texts (or other methods of preserving communicative content) provide a mechanism for the critical analysis of validity claims extended over time and space. As with any form of communication, matters of understanding and interpretation are critically important, including challenges related to translation. The possibility of discourse, and communication in general, rests on overcoming a number of hermeneutic hurdles, particularly when considering exchanges across the boundary of traditions and even within traditions over time. Religious ethics as a discipline can be understood, in part, as a form of discourse (second-order critical reflection) focused on assessing the legitimacy of normative claims made in the context of particular religious traditions, between traditions, and as part of public discourse in liberal democratic societies that affirm the legitimacy of an indeterminate plurality of religions.

Language is a mechanism for coordinating social activities of various kinds based on what has been understood (e.g. directing an employee to complete a task, expressing one's sympathies at another's loss as a way satisfying social norms, etc.). When there are reasons to suspect the legitimacy of the content of what has been communicated or the act of communication itself (e.g. how, when, and where particular claims have been made), discourse is the social practice of assessment (which can be more or less formal) by which that legitimacy is tested. If first-order communication seeks understanding and assent with the

aim of social coordination, discourse involves the evaluation of the validity of these first-order claims, which temporarily suspends the first-order attempt at social coordination. It is always possible, in theory, to suspend first-order social coordination to engage in informal and/or formal methods of discourse with respect to the nature and content of communicate acts; however, most matters of understanding and assent are resolved informally in light of appeals to widely held community norms and expectations. Communicative acts involve at least three possible dimensions for consideration on the part of an interlocutor: the truth of a claim (whether the propositional content expresses a factual claim about the world that can be supported by reason and evidence), the truthfulness of the speaker (whether the expressed content truthfully conveys the internal states of a speaker, e.g. intentions or emotions), and normative legitimacy (whether a command or evaluative claim – including ethical judgments – are appropriate). Formal methods of discourse have emerged that focus on the critical assessment of the truth (e.g. natural sciences), truthfulness (e.g. psychology), and normative validity (e.g. ethics) of communicative acts. While these practices can be employed in cases where specific claims have lost their *prima facie* legitimacy and are in need of justification if they are to serve as mechanisms of social coordination for the parties involved, they have also developed as free-standing practices of inquiry that operate independent of the need to justify particular claims in an actual discourse. When engaging in discourse where particular claims are in need of justification as part of an effort at social coordination, the normal process of coordination is temporarily suspended so that this second-order social practice can resolve questions and disputes related to the validity of communicated content and/or its form of expression.

Every community will have some more or less formal framework for engaging in discourse when validity claims are contested, including religious communities and the traditions they embody. Pre-critical discursive forms typically rely on the consultation of recognized sources of authority for a community or tradition. When discursive practices emerge for contesting the validity of such authorities within a tradition and become formalized, then the tradition has entered into a critical stage with regard to its modes of discourse. While this distinction has been contested, it is often used to differentiate culturally between pre-modern and modern periods, with modern modes of discourse defended as systematic methods of inquiry and critical analysis whose sole authority rests on human reason and experience. Postmodernity reflects, in part, suspicion of modernity's claim to have achieved (or approximated) its foundational ambitions to escape the limits of inherited tradition/authority through the formalization of its methods of critical discourse. One of the tensions that persists in the modern world for religious communities is the suspicion that the very nature of religious beliefs and the forms of social coordination they make possible are irreconcilable with modern forms of rational discourse. This has to do with the role of authority in religious traditions, which often circumscribes its dogmatic beliefs and revealed truths in ways that preclude assessment through modes of discourse more familiar to modern science and philosophical inquiry.

It is helpful to distinguish between inter- and intra-traditional discourse, both synchronously (among contemporaries) and asynchronously (extended through time and often dependent on the availability of texts of various sorts). Discourse occurs within a tradition, among its various members, as a way of evaluating a range of claims that are central to the self-understanding of that community. Religious communities rely on oral traditions and/or sacred texts that require authoritative interpretation, and this gives rise to more or less formal modes of discourse for resolving disputes for their application to the social coordination of these communities. Distinctive modes of discourse also emerge in the context of inter-religious dialog, which raises novel hermeneutical challenges related to translation. Discourse is also a

practice extended in time that is enhanced by the possibility of preserving communicative acts in more or less permanent forms as texts. Here, too, we can speak of discourse that operates over time within a tradition that retains significant continuity with itself and discourse that involves encountering different traditions through preserved artifacts.

There are two further points that are noteworthy regarding the nature of communicative action and the special case of discourse. First, it can be argued that both communication and discourse (as a special form of communication) involve a number of pragmatic assumptions regarding the parties involved. At the very least, attempts at social coordination through communication assume that one's interlocutors are capable of understanding and assenting to what has been communicated, which emphasizes their equal status as rational beings. In the modern era in particular, rational beings are accorded a special moral worth, so communicative action implicitly assumes the equal moral worth of conversation partners, even when such equality is explicitly rejected by one of the parties (one example of distorted communication). Additionally, since social coordination relies on assent to the validity of what has been communicated, there is always the presumption that such assent can be withheld (at least in principle), which then raises the question of how to proceed when validity claims are contested by other rational beings. This presumption anticipates and invites the social practice of discourse (again, more or less formal in nature) as a mechanism for resolving disagreements or misunderstandings, not merely as a practical tool but also as a moral imperative based on the recognition that for assent to be legitimate, dissent must be possible, including some process for expressing and resolving dissent. Thus, every communicative exchange between interlocutors presumes that both are capable of understanding and assenting/dissenting to what is understood and, further, are capable of suspending social cooperation temporarily in order to engage in discourse in cases of misunderstanding or dissent. Norms of communication and discourse, then, are always implicit presuppositions of every community that is coordinated by communicative acts (every human community), whether or not these norms have been made explicit and affirmed by those communities, and this would be true of religious communities/traditions as well.

Second, for language users, our subjectivity is constituted, in part, by our interior discourse, where we find ourselves engaged with ourselves over time regarding the validity of our beliefs, including beliefs about the nature of reality and ethical norms. It can be helpful to think of our beliefs as enjoying the kind of *prima facie* legitimacy noted previously in everyday communicative activity with others. We typically operate uncritically in terms of our beliefs until something calls them into question, which include assent to propositional characterizations of our world, understandings of our own interior states, and the appropriateness or legitimacy of our value and normative commitments. It is also possible to be habituated to forms of critical thinking that make such evaluations a more regular occurrence in the life of a given individual, even when nothing but that habit of thought has called a belief into question for the subject. Any of these beliefs are potentially subject to critical scrutiny on our part, just as they can be called into question intersubjectively. If communicative interactions give rise to normative insights regarding one's moral relationship to others as conversation partners (as suggested previously), so, too, it might be said that the self stands in relation to itself as a conversation partner extended in time, which can give rise to normative insights regarding this self-relation and the identification of critical reasoning as a virtue independent of its role in navigating intersubjective disputes. In either case, standards of rational justification and conditions of epistemic warrant apply (in whatever way these are understood by the parties in question), and in this way, there is continuity between standards of epistemic warrant

for individual subjects critically reflecting on their beliefs over time and the conditions of intersubjective rational justification when engaged in critical discourse with others as a social practice.

In this context, religious ethics can be understood as the formal discursive practice for validating the normative claims made within and among religious communities and traditions. Religious communities engage in communicative acts with the aim of social coordination. This coordination includes properly orienting members of the community toward one another and toward the sacred. These standards are communicated in various ways, both orally and through sacred scriptures. As in the case of communication generally, these claims are typically afforded *prima facie* legitimacy by members of the community. There are times, however, when understandings may be contested or their legitimacy doubted. Here, as in all communities, more or less formal discursive practices will emerge for sorting through such claims. Some traditions will be more hierarchical and fix limits on who is qualified to engage in such practices, particularly when the outcome involves fundamental matters of community identity. Others will take a more inclusive approach, allowing and even encouraging a greater role of non-specialists to engage in this activity. With the major Abrahamic traditions, each has developed fairly complex traditions of critical discourse around matters of dogma, practice, and ethics, where participation increasingly depends on technical expertise with regard to theology and philosophy. Insofar as these (and other) traditions seek to contribute to public discourse in modern liberal democracies that affirm the legitimacy of a plurality of religions, there is also the need for some degree of expertise in standards for secular moral discourse and strategies for navigating exchanges between religious and secular moral sources.

It is helpful to identify three areas of work that are foundational to religious ethics as a particular practice of critical inquiry. First, traditions that have formalized this type of communication will have a framework for engaging with the traditions, texts, and practices that are constitutive of the community and for clarifying and defending the moral values and commitments of that community for members. This is a form of intra-tradition discourse that arises from the need to address misunderstandings and disagreements among members of the community, both among contemporaries and for preserving continuity in that community over time. Second, religious pluralism has given rise to the need for interreligious dialogue, and those traditions that have been engaged with other religious communities in practical and speculative communication. It has been necessary to develop strategies for translation (to foster understanding across the boundary of different traditions) and for engaging in critical discourse when such cross-traditional communication has given rise to contested validity claims. Finally, particularly in what is often referred to as the modern period, there has been increasing attention to the distinction drawn between sacred and secular spheres, particularly where this involves a political response to religious pluralism and the organization of public life and the pursuit of the common good. Thus, religious ethics has developed strategies for systematically examining the normative claims of a particular religious community, for engaging in critical discourse across the boundaries of different religious traditions, and for participating in public discourse in the context of modern pluralistic, secular societies. Each of these areas deserves separate consideration.

Examples of discourse within a religious tradition related to its ethical claims would be something like the development of natural law in Catholic moral thought and the formalization and application of the principles of Catholic social teaching. The scriptural sources of the tradition express a great deal of ethical content and sometimes appear to be in tension with themselves and in need of authoritative interpretation. Some of this content is presented as directly revealed by God; in other

cases, we find the recordings of community norms for governing disputes, distributing resources, inheritance, criminal punishment, etc. Much of the moral teaching arises in very concrete social contexts, and the challenge becomes whether (and how) to generalize from those contexts to address new developments in the life of the Christian community. The tradition of natural law, carried over from Greek and Roman thinkers, provided a framework for interpreting the moral content of scripture, at least with regard to ideals of human relationships and behavior that did not rely on special revelation for their justification. The latter, however, also needed to be integrated into a complete vision of the human person, her nature and supernatural destiny, in light of both natural reason and revelation. The further development of principles of Catholic social thought provide additional examples of how the community has formalized its critical analysis of the normative content derived from scripture and natural law to provide a framework for responding to disputes about the meaning and validity of that content with respect to a range of ethical topics, including the environment, economic matters, criminal justice, the common good, family life, human sexuality, etc. Different stories could be told of the rise of formal discursive methods in the Protestant, Jewish, and Islamic traditions, among others.

In addition to the development of intra-traditional methods of discourse for critically analyzing the ethical content of individual traditions, religious ethics has developed to facilitate discourse across the boundaries of different traditions. One contemporary example of this is the practice of scriptural reasoning that has emerged among members of the Christian, Jewish, and Muslim faiths. This practice invites participants to read one another's scriptures together and to engage in a discourse that seeks to overcome hermeneutic barriers and to facilitate critical analysis of the different validity claims made by these faith traditions with the aim of achieving a better understanding of the individual traditions, their similarities and differences from one another. This relatively new practice is continuing to work out its norms, but it points to the ways in which forms of discourse (as second-order critical reflection) emerge in contexts of sustained communication as necessary for responding to challenges of interpretation and for addressing contested validity claims, whether within or between traditions. There are other examples to be found in the history of the engagement of Christian missionaries and theologians as they encountered, for example, Hindu and Buddhist communities and texts. Beyond the challenges of overcoming differences in language and culture, the political and economic effects of colonialism, racism, and imperialism have distorted communication and skewed efforts at discourse in harmful ways. Here, appeals to the pragmatic presuppositions of communicative action with regard to the moral status of one's interlocutors becomes a helpful corrective (at least in theory). Postcolonial and postmodern criticisms of modernity have been helpful for resetting this process of engaging with other communities across the boundaries of various religious traditions (and for addressing communicative distortions within communities and traditions), but it is still an ongoing effort to establish the recognition of the moral equality of all and to foster modes of communication and discourse consistent with this insight.

Finally, in modern Western democracies that have embraced the legitimacy of religious pluralism, there is the challenge of how to understand the role of those religious traditions and their beliefs and values in the context of public and political discourse. Because of its long history of dominance in the Western democracies, Christianity probably has developed the most extensive and complex responses to this topic. The idea of religious freedom and the rhetoric of the separation of church and state have generated tensions of various sorts and a variety of responses, ranging from the insistence that public

discourse be secularized, on the one hand, to explicit appeals to religious sources as a legitimate foundation for law and public policy, on the other. Efforts have been made to articulate standards of public discourse that are more or less inclusive of religious perspectives from the point of view of secular philosophers and political theorists, and representatives of different faith traditions have advanced counterproposals for preserving the legitimate role of religious insights regarding public life and policy matters. Here, too, we see how efforts to achieve social coordination through communicative acts in a context in which traditions and community norms are not shared has given rise to various modes of discourse for reflecting critically on the validity claims being made by the various interlocutors. Participants in this conversation increasingly require significant expertise in legal, political, theological, philosophical, and ethical modes of reasoning and debate in order to understand the complexities involved and to communicate effectively among the various participants.

Discourse as a second-order practice of critical reflection on claims made in various modes of communication emerges naturally and by necessity to address misunderstandings and disagreements about the validity of those claims. Religious ethics is an example of this second-order social practice that emerges first as an intra-traditional practice (more or less formal) and, when conditions allow, develops into a strategy for interreligious dialogue concerning human values as found in those traditions when their members seek to communicate with one another. In the modern age, with the rise of pluralistic democracies that affirm the legitimacy of religious diversity, religious ethics has further expanded to promote critical reasoning with regard to navigating the line between the sacred and secular when it comes to the political life of religiously pluralistic communities.

CHAPTER 27

Text and Canon

Michael Fishbane

Introductory Considerations

A characteristic feature of the great historical religions is the formulation of their teachings, laws, and norms into collections of authoritative teachings. The status of these diverse instructions varies, depending upon the status of the teacher (e.g. prophet, priest, or wise man) and their putative source (in divine revelation, guild esoterica, or experience and tradition). Moreover, these “text ensembles” (be they oral or written) are variously deemed to be sealed and sacred by their societal stewards, such that their classical content is closed and their transcription or recitation are part of the ritual order. Hence, distinctions are regularly made between the primary or foundational sources of authority and subsequent secondary traditions that deal with their meaning and ongoing significance. The closure of the initial teachings gives them all a fixed, canonical status, and whatever the form of their initial presentation (oral or written), the end result is the emergence of a written scripture which has the status of a holy object, to which nothing may in principle be added or removed. On the other hand, the secondary traditions remain theoretically open and subject to ongoing modifications or revisions through interpretation; though, in time, these oral instructions are also written down and develop their own canonical status, thus requiring explications of both their own meanings as well as how they are assumed to explicate the scriptures. Such is the recurrent dialectic, and it produces a type of sensibility that we may well call “canon consciousness.” Its effect upon religion, and upon the ethical life practiced within its contours, is considerable and merits reflection and analysis.

Among the Western religions, the Hebrew Bible is a paradigm example of the processes just noted. It is a massive anthology of foundational instructions, memories, and traditions from ancient Israel, recording in written form a variety of divine and human teachings, as well as a large assortment of practices both official and popular (and rooted in physical or verbal performance) that in one way or another were preserved and deemed worthy of transmission. In the process of tradition-building that developed, diverse narratives, laws, and practices were variously integrated, wherever possible, or were collected in self-contained units. The editorial result preserves a great mass of materials, even on the same subject, covering a time expanse of a millennium and more, and collated from various cultic, legal, and royal centers, as well as from a variety of scribal schools and wisdom traditions. Certainly, hierarchies of authority and instruction may readily be observed (in both the category of divine revelation and in the category of human wisdom): the teachings vouchsafed to Moses and the prophets were topmost; and below them

come any number of legists and priests who claimed to teach the older laws, as well as individuals whose proverbs and reflections were grounded in reason or experience. The upshot is a welter of instructions, quite often tangled and contradictory. This is particularly evident from the internal evidence of scripture itself, where authoritative teachings were interpolated with secondary instructions – for further clarification, qualification, or harmonization of the historically diverse materials; or for purposes of revisions and correction on the basis of new or competing values (see Fishbane 1985).

We might therefore note the existence of modes of canon consciousness within the canon-in-formation. Much was at stake. Insofar as the separate teachings all provided warrants (of different types and authority) for action, or their enforcement, the precise meaning of these teachings would have to be clear, as well as their interrelationships (insofar as they were complementary, supplementary, or contradictory). Interpretation is therefore an inherent component of the emergent biblical “text culture,” though matters are much more simple when the traditions were still open to change and circulated in separate units. With the closure of the canon, the multiplicity of teachings on any subject increased, raising the thorny issue of just what the warrant of scripture was on any given point. Conversely, the delimitation of a canon fixed the formulations themselves, but these then required interpretation to make them livable – either because the received formulation was too loose and ambiguous, or because its values appeared to be problematic to later eyes and sensibilities. The sources were thus understood to project certain legal or ethical standards and values that could be variously accepted, rejected, or transformed on the basis of the norms, standards, or values of later readers. These intersecting “value vectors” are of immense hermeneutical and cultural importance. Paradoxically, the linguistic conditions for one set of ethical values and action (the canon) may also provide the site for their exegetical revision – in whole or in part. In this way, the authority of the ancient canon is both sustained and honored in the breach. One might even contend that the strength of a traditional culture (or one rooted in the language of precedents) depends upon its capacities to utilize the inherited formulations of a canon, without sacrificing its ongoing ethical will or judgment.

In the ensuing discussion, Jewish law and ethics will provide the paradigmatic cases to illustrate modalities of how certain Western religions have negotiated their values in and around an authoritative scripture. They will hopefully also provide a paradigm for a certain mentality and sensibility in which ethical action is part and parcel of a larger realm of religious duties – be these authorized by divine revelation or human reason, or both. In the present discussion, texts will be chosen largely from the classical collections of ancient rabbinic Bible interpretation, called *Midrash*, during the second to fourth centuries CE. Their explicit hermeneutical character will best allow us to see how scriptural exegesis negotiated the vectors of values just noted – deftly authorizing the new as a species of the old, and the old as encoding ensuing meaning. The following examples are meant to serve as models only, and not by any means to characterize the full range of types of ancient Jewish religious ethics and values. Rooted in the canon of Hebrew scripture, we find here a privileged witness to a mode of moral reasoning or justification through textual exegesis.

Models and Cases

Reactions and Revisions

Among the “hard cases” bequeathed to later tradition is the rule found in Deuteronomy 21: 18–21 concerning a “wayward and rebellious son who does not listen to the voice of his father and the voice of his mother.” It goes on to state that “they reprove him,” but he heeds them not; and then “they seize him

and take him out” to the local elders at the gate. They say to these persons that their son is rebellious, does not heed them, and indulges in gluttony. The sentence for this crime is that all the men of the city shall stone the guilty son to death, so that this evil will be eradicated and “all Israel will heed and fear.” Clearly, a certain measure of procedure is presented in the conditions that are to ensue before and during the trial. Presumably, the issue of rebellion is deemed a repeated offense of insubordination that also includes reproof or warning before the son is taken to the judges; and it is notable that the offense is unspecified and that it is against both the father and the mother (probably intended to mean either one of the family order, and not just the father). However, at the trial itself, the matter of reproof is not specified, leaving the impression that this is not a separate condition, but a feature of the repeated attempts of the parents to make the son obey; and further, the vague category of rebellion is supplemented by references to gluttony, suggesting that this represents the need to specify the type of rebellion, and probably not to delimit it entirely. Withal, we see that the son has no judicial say or defense in his trial – possibly because he is a minor or because the parents have complete hegemony. Either way, the parents have total discretion about whether the offense is actionable, and can press charges without prior restraint or subsequent court investigation. Moreover, it is notable that the penalty of death is executed by all “the men of the city” and does not specify the parents at all (and it certainly does not include the mother); and that this harsh verdict is intended to serve as a public deterrent to such misdemeanors.

The rule as formulated is thus puzzling and problematic in many places, even on its own terms. Later commentators accentuated these matters in their discussions of the canonical rule, and their different attempts to justify or delimit it reveal aspects of their moral concerns and sensibilities (Halbertal 1997). The rule in this religious source thus sets the template for certain features of ethics bearing on family law, whereas the cases of exegetical reasoning revise the absolute warrant of the text and refocus the ethical issues involved. A spectrum of issues emerges.

The first matter to be noted in the earliest stratum is moral outrage at the gap between crime and punishment: “And because [the son] ate and drank [a specified overdose of] meat and wine he is to be stoned [to death]?” (Finkelstein 1966, 253 [pisqa 220]). Such a query sharply exposes an unethical dimension of the law, and thus requires a response. One tack is to protect the law and its overall moral purpose, and this is done by transforming the initial exclamation into a rhetorical question. Since for this position the unethical character of the law is unthinkable, the solution is to see the law not as dealing simply with a rude and uncontrollable son, but with an offender whose sociopathic character has hereby been revealed, such that the law must impose a harsh penalty at the outset (when the person is relatively innocent) in order to prevent a more dangerous crime in the future (Hoffmann 1908–1919, 131). The tactics of proof offered vary: in some cases they are simply asserted or presented (Hoffmann 1908–1919, 131), in other instances the procedure is exegetical and uses traditional forms of hermeneutical logic (Finkelstein 1966, 251 [pisqa 218]). In both cases the underlying ethical concern of the ruling is clear and firm, its intention being to protect the social fabric as a whole through a precautionary action: just as one may kill a real attacker in self-defense, so must the law protect the people from the real or imminent danger of a rebellious son. The culprit is thus moved out of the category of a family nuisance into one that justifies the use of preemptive legal force to protect society. Through this reasoning, the punishment of death is made to fit the crime. But in the effort to provide an ethical justification for the authoritative divine law, the new rule becomes readily subject to abuse by less than omniscient human legislators. The paradox is here pressing, and may serve to highlight a danger for religious ethics when it settles on strategies of exegetical justification – rather than taking on the language of difficult laws and defanging their force.

More decisive in this regard are those interpreters who turn the formulations of the old rule into pawns of their new moral purpose. Several strategies occur. One of these is to take on the term “son” and so delimit its age range (between youngster and pubescent young adult) as to make it of fleeting applicability (M. Sanhedrin 8.1). A second strategy is to pick up on the apparently redundant phrase “the voice of his father and the voice of his mother” and turn this into a razor’s edge to reduce the applicability of the law. Thus the clever interpreters said that this clause means that the son has to be warned by the voice of both parents – which has to be identical; and just as their voice must be identical, so also must their size and appearance be the same (M. Sanhedrin 8.4; B.T. Sanhedrin 71a). Clearly, this is an absurdity, and only marks the need to take an offensive but ineradicable law and make it practically inapplicable and void. A similar tack is taken by others who so define the nature of this gluttony (in terms of consuming vast quantities of meat and wine simultaneously) as to make the conditions for its performance humanly impossible to execute. Indeed, in all this, the moral will of the later tradition subverts the rule entirely. Perhaps for this reason, if not just for reasons of absolute outrage, the opinion is even given that the law of the rebellious son was never meant to be applied, but was only given as an exercise for exegesis – and that just this is the sole merit of the rule and the sole basis for a divine reward for its fulfillment (B. T. Sanhedrin 71a). Hence, if at one end of the foregoing spectrum of interpretations we saw an attempt to discern the deeper divine purpose in a rule whose punishment does not seem to fit the crime, at the other is an attempt to see a divine pedagogy that confirms the moral will of the interpreters themselves. Indeed, herewith the canon has itself provided the culture with a case that can be used to teach exegetes how to subvert its own applications when these are deemed ethically improper. Thus, while the canon of divine scripture is formally honored, the canon of traditional interpretations shows repeated attempts to displace its effectiveness through a casuistry that honors the moral will of the sages even more. In the process, the canon can even become the site of ethical reflection and reform.

Delimitation or Expansion of Operative Conditions

The ensuing cases continue some aspects of the preceding model, but show in a unique manner how the formal features of a law can be applied in ways that promote certain moral values or alleviate certain immoral situations. In these instances, the moral will of the interpreter provides new warrants and conditions that allow the law to rise to its highest value potential. I choose two polar instances from the rules of witness: the case of the abandoned wife (*agunah*) and the cases of capital crimes. The legislators revise the same rules of testimony in two opposite directions in order to safeguard and even serve moral values of the legal culture as a whole. Indeed, they show the potential flexibility of a canonical culture where the moral will is determined to be flexible for the sake of the dignity of its citizens and the value of life as a whole.

Biblical legislation is absolutely clear on the requirement of two witnesses to produce valid testimony; and a great amount of rabbinic discussion attempts to determine just how the witnesses are deemed to complement one another. With respect to married women, rabbinic law is also precise and clear on the point that a woman is permitted to remarry only if she has received a valid writ of divorce, or if there is valid testimony that her first husband is dead. An *agunah* is a married woman in a limbo and potentially irremediable situation, insofar as she may have been abandoned by her husband, or otherwise put in an intolerable predicament by virtue of the fact that she has no divorce document (either because the man cannot be found or refuses to do so); or because there is no valid testimony from two witnesses that her

husband is dead (as, for example, in cases of soldiers missing in action, or as was recently the case with unconfirmed deaths at the World Trade Center). This rule notwithstanding, rabbinic law went to exceptional lengths to protect a woman from a life of solitude due to the circumstances just noted. With respect to a missing husband, the normally rigorous application of the rules of testimony by courts that had no means of proving the death of the husband were relaxed and made more lenient. For example, Rabban Gamliel the Elder (first century CE) resolved the problem by adjusting the rules of evidence themselves, and he gave a rule (now codified in the Mishnah) that in cases of no legally certain evidence of death, the testimony of one witness was sufficient, even if that testimony was hearsay only, or even if the testimony was brought by persons normally deemed invalid to give legal evidence (like a bondswoman or a slave) (M. Yebamot 16.7). Thus, hereby, a difficult rule was suspended owing to circumstances, and canonical law (of written scripture and rabbinic tradition) was revised owing to a certain moral temperament. And once that happened, a permanent loophole was left open so that judges could remedy other difficult cases of a similar kind. An example from a millennium later proves the point, for we have at hand a *responsum* of Maimonides (thirteenth century CE) concerning a case where there was only the testimony of a non-Jewish woman that a certain man had been killed, and this testimony was brought to the court as hearsay evidence. Maimonides decided that this testimony was sufficient and that the Jewish woman was free to remarry. In support of his ruling, he articulated a fundamental principle that came to serve as a canon for moral rectitude in such cases thereafter. He noted: “We do not enter into lengthy and detailed examinations of the testimony offered on behalf of an *agunah*. Moreover, whoever adopts a stringent position in such cases, and subjects the evidence offered to a detailed investigation and examination, *does not behave properly*. [Indeed,] our sages are displeased with this conduct, since it was their specific rule that we are to take the most lenient position with respect to an *agunah*” (Maimonides 1934, 157 [no. 159]).

Clearly, the application of the canon is left to judicial discretion, and Maimonides not only made his own moral position clear, but also gave it further warrant by attributing this sensibility to the early sages, whose revision of the rule was taken as a sign of moral probity as well as the warrant for further remedies in the same spirit. The complex dialectics of text, canon, and morality are fully played out in this case.

But the wheel of testimony can turn in the opposite direction as well, when the values of life impose themselves on the will of a custodian of the canon. For example, as against the maximalist relaxation of rules of testimony just noted, cases involving capital punishment could produce highly stringent applications of the rule in order to minimize, if not eradicate, the possibilities of issuing a verdict of death. Indeed, in some circles, antipathy to the death penalty was so severe that the details required for valid testimony were taken to extreme lengths. Normally, the need for two eyewitnesses to produce absolutely congruent testimony established a very high judicial standard, and it was very rigorously enforced. But while this procedure ensured the probity of the court, in certain hands the rules were also used to subvert the process itself. Such is the case when Rabbi Yoḥanan ben Zakkai (first century CE) was faced with a murder case, and he required the witnesses to provide detailed descriptions of the stalks of the figs on the tree near which the murder was alleged to have taken place (M. Sanhedrin 5.2). This made the application of the testimony virtually impossible, for the judicial conditions he imposed were in fact a razor’s edge for the sage to cut off the necessary testimony at its root.

What can be learned from these contrary cases, which bear on cultures that are locked into canonical formulations of rules that one would not want to tamper with, but are faced with potential and actual instances where these rules might produce or aggravate some unwanted situation? These formulations not being readily amenable to exegetical revision, they were variously suspended or reformulated in

order to remedy difficult instances, or they were so applied as to produce the desired result. The point to stress is that the requirement to save and conserve the authority of the canonical law need not prevent or frustrate the cultivation or application of moral values and value judgments that might contradict the normal or formal enforcement of a rule. These values may come from within the canonical system itself or from the outside, but their bold applications show that a cultural system remains alive by virtue of the vigor and manner with which it addresses difficult issues and allows the same text to provide the warrant for alternate actions. It is in the arena of this debate that religious laws and ethics are tested and proved. One might even say that the received formulations of a canon provide a framework for an ongoing cultural pedagogy, whereby the conservation or cultivation of the laws may be ethically enacted and evaluated.

Tensions between Ethics and Norms

Another significant dimension of the relationship between text, canon, and ethics is where there are tensions between the strict formulation of a rule and the guiding ethical dimension that may be overridden by comporting with such a formalism. Indeed, it brings to the fore the fact that ethical principles must guide the application of the law in order to safeguard the overarching norms of justice and equity. We may take an example from the law of sales, where the basic rule is that one does not acquire proper title to moveable property, even if money has been exchanged, until the purchaser of the goods performs an act of drawing the object (actually or symbolically) into his possession. Such an action derives from an older customary stratum of sales, but it was retained as a component of gaining title. However, in the process, a gap could arise of a moral nature, as when two persons enter into a verbal agreement and even exchange money, but the buyer has not performed the requisite ritual of “drawing” the goods into his domain. Now in the rule as canonized in the Mishnah, the vendor formally has the right to withdraw from the purchase agreement with no penalty (M. Baba Metzi’a 4.2). But the Mishnah goes on to say that it is improper for anyone to take advantage of this loophole simply on formal grounds; one may have a legal right, but this is not the morally right thing to do. To stress the point, the text states that God will curse such a person “who does not stand by his word” (M. Baba Metzi’a 4.2). The higher principle is therefore stressed, in order to strike down a narrow application of the law. Maimonides summarizes the case a thousand years later, and gives a further moral dimension in his codification of it. He says that a person “who changes his mind” after an agreement has been struck, be he the vendor or the buyer, “has not acted in a manner befitting a Jew” (M. Torah, Hilkhoh Mekhirah 7.1).

This becomes the standard, and introduces a principle of ethical rectitude that overrides the strict letter of the law. A more specific articulation of what that principle might be is stated in a commentary on Deuteronomy 6:18. The words “you shall do what is right and good (*ha-yashar v’ha-tov*) in God’s eyes” seem initially puzzling, since they appear both too vague, on the one hand, and apparently irrelevant on the other (since the biblical canon is full of very specific rules of behavior). But this is exactly the point, says Nahmanides (thirteenth century CE). On the one hand, scripture (the textual canon) could not state every single possible rule of behavior that might arise; hence, the phrase is not empty, but a statement of the overarching principle for all unspecified actions. Moreover, this same phrase is actually a specific formulation of the principle with which one should enact every rule and law; namely, with a spirit of equity and compromise and decency. Absent such a standard, and one can justify improper actions by appealing to the law itself. Elsewhere, in a trenchant rebuke, Nahmanides acidly states that a

person who exploits gaps in the law without any principle of restraint is simply “a crass vulgarian with the permission of the Torah” (Leviticus 19:2). Clearly, in the tension between formalism and virtue, religious ethics must condition and set the standard of action. In the Mishnah itself, and subsequent Talmudic discourse, this guiding principle is referred to variously as “the ways of peace” or “the ways of pleasantness.” (The Hebrew idioms are *darkhei shalom* and *darkhei no’am*, respectively. For examples, see M. Gittin 5.8–9 and BT. Sukkah 32b and BT. Yebamot 15a.) Hence, the canon may teach the law and even ethics, but it is also clear that the overall moral tone that a religious ethics propagates may have much to say to some specific laws, and to the spirit or manner by which they should be applied. These are seen as the higher warrants of behavior, and become the measures of justice itself.

Some Conclusions and Considerations

Religious ethics finds its duties and their warrants in authoritative texts, of divine and human authorship; it also finds ongoing duties and their warrants in ongoing reflection on the meaning and implications of these texts, thus producing new texts and traditions of various degrees of authority. This process is at the core of traditional societies, grounded in scriptural canons; and the measures of cultural strength are directly related to the comprehensive authority of the primary canon, on the one hand, and the correlative boldness and assertiveness of its cultural inheritors on the other. The tension is necessary for the ethical matters to retain a transcendent and *a priori* claim upon those who accept the canon as one stamped with a divine and traditional imprimatur, even as this latter is subject to creative transformations based on ethical imperatives which impose themselves upon the cultural conscience. Hence, the heteronomous character of canons does not subvert the play and power of autonomous reason, but rather subordinates its activities to itself through acts of legitimate exegesis, which uphold the canonical sources while revising their contents in often bold and radical ways. Canonical cultures thus have various voices of authority. The ongoing ethical voice of the interpreters speaks through the shape of the authoritative words of scripture, so that by donning the mask of exegesis the authoritative texts speak anew, as the old and ever-new world of moral and religious authority. Split the sacred bond between a scripture and its interpreters, and the scripture becomes a historical relic and its interpreters mere rhetoricians. Joined together, the imperatives of the canon may be renewed in unexpected ways.

The canonical texts and their ethical teachings and values provide the framework and terms of an ongoing moral pedagogy that variously imposes itself upon and challenges the conscience of the interpreters. The mark of a culture is the nature and substance of its ongoing responses to its authoritative teachings, and how these are carried over or changed for new generations. Indeed, readers provide the canon with new moral valences and warrants for action. “Normativity” thus emerges as a negotiated and constructed entity. For whatever be the content of the original norms imposed by the canonical sources, their normative force cannot be separated from the power and character of their reinterpretation. Ethical freedom is thus conditioned by the content of canonical texts and constrained by the modes of exegesis available. But it is repeatedly clear that where there is a will there is a moral way. Canonical cultures meet the challenge and raise their traditions to the standard of their new ethical insights through the instruments of exegesis and unwavering integrity. Mere (legal) formalism is repeatedly resisted.

We thus acknowledge a paradox: the coexistence of “hegemonic texts” and “hegemonic interpreters.” Strong texts can withstand strong readers; and strong readers can withstand strong texts. Authority and integrity are at both poles of the dialectic, as also are ethical imperatives and their cultural challenges. But in the end, ethical readers are the true “spirit” of the law, animating it and giving it vitality for new generations. In this way, the present recreates its past for the sake of its future.

CHAPTER 28

Hermeneutics

William Schweiker

Definition, Task, and Purpose

“Hermeneutics” designates the theory, method, and art of interpretation, paradigmatically of written texts but likewise of any experience, event, or sign that bears meaning. Taken from the Greek god *Hermes*, a wing-footed messenger between the gods and humans but also a trickster, hermeneutics has developed throughout the centuries and in different cultural forms to deal with the ambiguity and confusion inherent in the attempt to understand what claims to be meaningful. The purpose of interpretation thereby is to achieve *understanding* of the *meaning* of whatever individuals or communities care about in their acts of communication. In this light, the paradigmatic form of interpretation, as explored below, is the act of dialogue or conversation seeking understanding. There are many forms of interpretation among the religions, for example, divinization, exegesis, reading of animal entrails or bones, mystical reading of texts, that, nonetheless, aim at attaining an understanding of the meaning of what is of religious importance.

The centrality of hermeneutical theory for ethics, religious or not, can hardly be doubted. Insofar as every moral situation, action, or relation takes place at some time and in some place and claims to be both important and significant, it bears hermeneutical scrutiny. Any act of violence, for instance, might, under careful consideration, be interpreted as an act of murder or an act of self-defense. This is why virtually every religion and culture has developed some form of an ethics of war in order to interpret human conflict. Likewise, highly literary and textual traditions, say, Buddhism and Judaism (among others), have generated millennial-long conflicts among traditions of interpretation, say, about the Buddha’s teaching on mindfulness or Rabbinic debates about *Torah* teaching (Wright, 2009; Fishbane, 2003). Hermeneutical reflection bound to religious sources and cultural forms is inescapable in the conduct of life.

In defining hermeneutics as a discipline, its central task must be differentiated from but also related to other branches of philosophy in terms of its focus and distinctive claims. In terms of focus, hermeneutical reflection must be differentiated from empirical reflection that is, the fact of *perception* or sensible experience, and also *conception* as the attaining of an idea (general or not) that can organize thought. Throughout history, many epistemologies, that is, theories of knowing, have been proposed about the relation between precepts and concepts in human cognition. Examples include beliefs about the “Agent Intellect,” among Jewish, Christian, and Islamic medieval thinkers to explain the relation of the divine to human minds, Immanuel Kant’s clarification of the unity of consciousness in the transcendental unity of apperception and in the twentieth century, the so-called linguistic turn in Anglophone and

Continental thought. The question of the relations among precepts and concepts have given rise to different traditions in philosophy, specifically empiricism focused on experience and sensible facts and rationalism as the attempt to provide some rational system of knowledge.

Hermeneutics rests on the insight that in addition to perception, conception, and their relations in knowing, human beings seek understanding through the interpretation of signs, symbols, narratives, experiences, rituals, and events. In its contemporary form, it is related, but not delimited, to the linguistic turn in thought. Yet hermeneutics arises from attention not just to language systems, but also to human beings as communicators across boundaries of space, time, language, and even forms of being, divine or otherwise. In this respect, it is a distinctive way for philosophy to resist being reduced to mere empiricism, even if it is concerned with empirical, interpretable objects (e.g. texts, rituals), rationalism, (although here too there are connections insofar as the concern is with coherence of meaning), or linguistic systems. In other words, human beings are hermeneutical creatures who, like fleet footed Hermes, carry meanings across boundaries because human meaning is unexplainable solely within empirical or conceptual frameworks of thought.

This claim about distinctly human understanding distinguishes – but can also relate – hermeneutics and other branches of philosophy: *ethics*, as noted, focuses on the conduct of personal and social life, *epistemology*, as a theory of knowledge, *linguistics* which explores how languages create and convey sense and reference, *phenomenology* as the study of consciousness and the description of objects of direct experience, *ontology*, the study of “being,” and, finally, *metaphysics* as the examination of the most general features of reality and also first principles of thinking. Of course, each of these branches of philosophy can be and often are related. However, insofar as hermeneutics is related to, for example, “ontology,” the concern will be with the *meaning* of being explored through the interpretation of cultural forms, that is, human artifacts. To use another example, hermeneutic phenomenology is the description and interpretation of the meaning of phenomena by engaging consciousness of objects of interpretation. Structuralism and Post-Structural philosophy (deconstruction) explore the way languages and cultural forms depend on some deeper structure, or, conversely, continually undoes itself as a system thereby producing meaning. The important insight for hermeneutical thinkers, as Edward Said noted, is that human beings reach understanding through the interpretation of what they have made (Said 2004). Or, more basically, as medieval theologians noted, things are known according to the mode of the knower. Insofar as human beings are language and symbol using creatures, our mode of knowing others, our world, and ourselves is inescapably interpretive in character.

This entry cannot explore every possible connection among the branches of philosophy listed above, although the connection between hermeneutics and ethics will be addressed in the following pages. For more on this point see Volume II of the *Encyclopedia of Religious Ethics* which contains articles on the modes of interpretation found in the ethics of particular religions of the world.

Major Concepts

The following pages focus on hermeneutics in connection to ethics insofar as the religions are especially concerned with meaning, understanding, and interpretation for the sake of orienting human conduct. Next, we examine major concepts in hermeneutical inquiry.

Meaning and Text

Some of the major concepts of hermeneutical inquiry have already been mentioned in passing, but they require further examination. “Meaning,” in this context, indicates that some thing (say, a text, symbol, ritual act, experience) has both *import* – it is has importance and is cared about or valued by some group of people – and also *significance*, that is, it fits within and deploys the lexicon of signs of a culture, namely, its language and symbolic codes. Only the conjunction of import and significance denotes “meaning,” hermeneutically speaking. In the terms of linguistics, meaning is the conjunction of “sense,” the intelligibility of some text, experience, or action within a cultural code (language) with reference, that is, what the sense is about, its intended content or import. Even more generally, we can use the term “text,” which unites import and significance, as a term for any object of interpretation. Action, ritual, and experience can each be seen as a “text,” from this perspective (see, P. Ricoeur).

Furthermore, human cultural forms (“texts”), as domains of sense or significance, make understandable the objects, experiences, or events that claim import. However, things often have *significance* even while their *import* is disputed, vague, ambiguous, or confused. Think, for instance, of imaginary animals or playful, fantastic tales (e.g. *Alice in Wonderland*). Similarly, something – a text or experience – may have *import*, and so value and refer content for people in terms of what they care about, and yet fail to have the adequate *significance* needed to articulate the sense of that *import* thereby leaving an individual or community mute about its importance for their lives. The reality of “death” is one paradigmatic example where import exceeds significance. Importantly, religions have complex myths and beliefs about death, the after-life, spiritual enlightenment and salvation. In this respect, one purpose of hermeneutical inquiry is to articulate *import* that is as of yet mute, implicit, obscure, and valued within some culture’s language and symbolic system (see Taylor 2016).

Hermeneutics, then, is a response to the ambiguity of claims to “meaning” with the aim of attaining human understanding. Little wonder that the religions concerned with complex matters of ultimate *import* (life, death, worth, love, joy, suffering, gods or God, heaven or enlightenment, etc.), and *significance* (myths, symbols, rituals, etc.) have always, in different ways, been engaged in the work of hermeneutics, whether called that or not. While Greek in origin, the work of hermeneutics is not limited to one linguistic horizon, but is a necessary feature of existence for human beings insofar as they are creatures who communicate *import* through *significance*, that is, beings who are meaning seeking and creating creatures.

World and Horizon

One should note that inherent in the term hermeneutics is the idea of moving between “worlds,” as Hermes did in Greek myth. These different worlds might be separated by time, for example, the teaching of the Buddha and contemporary life; or space, like the realm of the gods and human existence; languages, namely how to move from ancient Hebrew to modern English in the translation of *Torah*; experiences, say, life in a global media age and rituals developed for an agrarian society; and, of course, socioeconomic boundaries of class, gender, sexuality, and race. Hermeneutics, then, entails the possibility and necessity of *translation* that of course is itself wily, sometimes deceptive, readily open to misunderstanding, and thus marked by Hermes as a trickster. Yet despite the trickiness of translation,

human beings for hermeneutical thinkers are not trapped within the confines of their cultural, historical, and linguistic worlds. To be human is to have the capacity to translate and move between worlds (see Schweiker 2004, 2019). We return to this crucial point at the conclusion of this entry.

What then is meant by a “world?” Like “text” the idea of a world is used analogically in hermeneutics. It is meant to denote how human beings are always thrown, found, created, or dependently generated, within some determinate domain of meaning. To be human is to be in some world and in fact many worlds (Gabriel 2017). Certainly, the idea of a “world” does not mean the empirical reality of planet earth since that is a perceptible fact. And while the concept “world” does help us to think about our place in time and space as a unified reality, it also designates a spatial-temporal horizon of meaning and a domain of understanding. A “horizon” is both the limit to understanding, that which, might or might not be transcended, and thus that upon which human meanings are projected. Although some horizons can never be reached since they recede before us, a “world” denotes, for hermeneutical thinkers, a boundary of import and significance that can be crossed, even if that crossing is exceedingly arduous (Heidegger 1962). As will be explored below, for some hermeneutical thinkers the “meaning” of a text is “in front of it” in terms of the possibilities it opens up for the interpreter. So, the twenty-first-century interpreter can, for example, enter into the “world” of the biblical “text” even if it remains, in some important degree, a foreign land. In order to grasp debates about this boundary crossing work of hermeneutical inquiry, we have to examine other concepts basic to hermeneutics, specifically, interpretation and explanation.

Explanation and Interpretation

Interpretation is the labor of boundary or world crossing, and must therefore be distinguished, from empirical explanation of the kind found paradigmatically in the natural sciences as well as “historicism.” Explanation, in the strict sense, seeks to identify the cause of some effect in order to justify and clarify that effect. In the natural sciences, explanation is sought by identifying causal relationships through experimentation with the aim of validating a specific hypothesis or theory. In ethics as well, people ask for the reasons, decisions, or impulses that “caused” an agent’s action and how that may, or may not, justify the action. Important in legal cases, this logic of explanation is also crucial for the moral evaluation of the consequences, or intended consequences, of an action. Granting the difference between the causality of nature and the causal force of intentions, in moral thought, explanation has been crucial in utilitarianism and other forms of consequentialism as well as virtue theory. Explanation thereby assumes that one can reason from effect to cause and vice-versa. However, it is not clear that such reasoning is really possible in the domain of understanding and meaning, which is the focus of hermeneutics. Why might that be the case? Unless history is ruled by an iron law of cause and effect – that is, determined in some complete way by a god or nature or human genes – the hunt for *determinative causes* is impossible.

Hans-Georg Gadamer notes, some texts, what he calls “classics,” have the power to speak across time, space, and language to be fused with our own horizon of understanding (Gadamer 2004). This possibility has led to fundamentally different conceptions of the work of interpretation within the human sciences, namely, historicism and interpretation theory or hermeneutics. Historicism is the view that the “meaning” of a cultural artifact is completely inscribed in its historical situation. In other words, it claims that once we determine, as some forms of biblical and textual criticism do, the author’s supposed intention or the work’s historical *Sitz im Leben* (situation in life), then we have explained, as much as possible, the work’s meaning. It might be the case with the religions that a community’s tradition bears the text

through time via ongoing interpretation, but that fact means that the “text” is unendingly read and reread often with different meanings.

Interpretation, rather than explanation, might include a moment of explanation and even a critique of ideology but its aim is to discover the meaning of a cultural form not just in itself and in its *Sitz im Leben*, but for the interpreter(s)’ understanding (Habermas 1998; Ricoeur 1976; Ricoeur 1981). The various theories or types of interpretation are ways to understand the meaning of objects that make a claim to exceed or transcend their context and even the author’s intention, assuming the author is identifiable.

Types of Hermeneutics

Having clarified the definition of hermeneutics and some of its basic concepts, we can now examine the central types of hermeneutical theory by attending to the relation between understanding and interpretation. As already noted, the distinctive object of human understanding, as opposed to perception and conception, is meaning as the unity of import and significance achieved through interpretation. Generally speaking, interpretation theory has been divided between (1) general hermeneutics and (2) special hermeneutics, the more ancient of the two, at least in Western thought (see Klemm 1986). After exploring this distinction, the entry will end with prospects for future work in religious ethics.

Special Hermeneutics

Special hermeneutics is a product of highly textual religious traditions rather than those without canons of sacred texts or authoritative collections of stories and myths such as those focused on ritual, shamanism, or inspiration. This does not mean, as noted above, that non-textual traditions are somehow non-interpretative. There are complex patterns of interpretation and practice in every religious ritual, and the original meanings of those practices, like the Christian “Eucharist” (the Lord’s Supper) or Zen practices, are endlessly disputed. Nevertheless, special hermeneutics arose out of the demand to interpret and understand confusing, obscure, ambiguous, or even morally questionable passages within a community’s sacred writings. In each case, the aim is to clarify the meaning of a text for the sake of orienting the life of a community and its members. Using Christian examples, although parallels are found among Jews and Muslims, we can briefly note four types of special hermeneutics, what we will call the allegorical, the exegetical, the theological, and the sociological theories.

One the most ancient of hermeneutical theories is the so-called allegorical method. Arising in the Greek world from the interpretation of Homer’s works, this theory of interpretation assumes that there are different levels of meaning in a text in addition to the literal or plain sense. The task of interpretation is, first, to grasp the plain sense or meaning of the text. When difficulties arise with the plain sense, for example, ambiguity or seeming contradictions, then the interpreter explores one or more “spiritual senses”: the tropological or moral meaning, the allegorical or symbolic meaning in the narrow sense, and/or the anagogical or mystical/spiritual meaning, say in Jewish *Kabbalistic* or Muslim *Sufi* poetry. The allegorical method thus provides the interpreter or interpretive community considerable latitude in determining the meaning(s) of a sacred writing, a fact that has led to the misuse and abuse of the method. The allegorical method as a whole implies both a cosmology and also an anthropology. Reality itself has literal, moral, and spiritual meaning because allegory is written into the nature of things as itself a system

of signs, and the same is true of human beings. Humans have a hidden meaning, say, created as images of God, but also a literal bodily being with moral and spiritual dimensions. In this way, the allegorical method is actually a way to educate the human mind and soul to its truest spiritual meaning. Interpretation is a pedagogy of the soul; understanding is moral and mystical union with the text's meaning.

Given the possible excesses of allegorical interpretation, the rise in the West of Renaissance humanism and Protestant thought put renewed effort into distinguishing the original text from the additions that had been made to them over time. This new focus on accurately translating the Bible into the vernacular (Martin Luther and others), as well as correcting the original Latin text (Erasmus), cast a critical light on the allegorical method. Among Protestants there was a concern with the "Plain sense" and also the "canon within the canon." That is, in order to discern the coherence of the Bible, itself a collection of diverse texts, theologians, like Luther, argued that wherever does not bear Christ and so the promise of salvation is not properly Christian teaching. Other theologians argued for different canons within the canon to bring coherence to the Bible's meaning.

Protestant and humanist thinkers thereby focused not on levels of meaning, but, rather, the import, the *Sache*, of the text. This new focus ushered in further developments in the theory of interpretation. First, it advanced the work of interpretation by distinguishing *exegesis* (the critical explanation and reading out of the meaning of a text) from *eisegesis* (the imposition of the reader's meaning on a text). The concern to avoid imposing meanings on a text, the constraint danger of the allegorical method, led to the use of different forms of criticism (source, historical, textual) that sought to grasp the "original" meaning of the text in its *Sitz im Leben*. Here the danger is wooden forms of historicism that lock the meaning and text into its time and place. However, the focus on the subject matter, actually opened up, in the eighteenth and nineteenth centuries, a shift from hermeneutics in its allegorical or exegetical forms, to what is now called general hermeneutics with its theological and sociological emphases.

General Hermeneutics

The transition from special to general hermeneutics finds expression in several seminal thinkers. Given the vast reach of scholarship on hermeneutics, these figures will provide orientation to the topic.¹

The so-called Father of modern hermeneutics is Friedrich Schleiermacher (1786–1834), the nineteenth-century German theologian, philosopher, and translator of Plato. In his "Lectures on Hermeneutics" he isolated a number of dialectical relations, most notably between "grammatical" and "technical" interpretation. According to Schleiermacher, the work of interpretation requires that the reader know the author better than the author knows themselves, through the mastery of the language and historical context of the text. However, the work of interpretation must go beyond exegesis. Schleiermacher, and other Romantic thinkers, argued that the interpreter, through the power of empathy, must "divine" the import of the text and thereby grasp the mind and intention of the author. Hermeneutics, then, is a general account of the human ability to understand another. With this move, Schleiermacher, in his 1809/1810

1 Importantly, the four figures noted do not include the work of Jacques Derrida (1930–2004) the originator of so-called Deconstruction. The reason to focus on thinkers centrally involved in the development of general hermeneutics is due to the simple fact of the antagonism between Deconstruction and Derrida himself with the project of hermeneutics, an antagonism beyond the scope of this entry (see Michelfelder and Palmer 1989).

lectures on “General Hermeneutics,” initiated the focus of hermeneutics on human understanding as such and thereby changed the landscape of philosophy (Schleiermacher 1977).

The shift from special to general hermeneutics was decisively made by Martin Heidegger (1884–1976) in his landmark *Sein und Zeit* (1928). Heidegger undertook to analyze and interpret the meaning of being through what he called *Dasein*, human being in the world. Working from phenomenology into hermeneutics, Heidegger introduced crucial concepts into interpretation theory, including “world” and “horizon,” as well as indicating that the meaning of Being is, from this perspective, time. That is, human beings project the meaning of Being onto the horizon of time as the inner possibility of their existence in being towards death. Heidegger only produced the first half of the projected work and subsequently turned his focus from an existential analytic of *Dasein* to how, in his thought, Being presences itself through history, technology, art, and poetry.

It was with Heidegger’s renowned student Hans-Georg Gadamer (1900–2002) and his seminal work *Wahrheit und Methode* (1960) that hermeneutics was fully established as a branch of philosophy focused on human understanding. Unlike Schleiermacher, Gadamer utterly denied the possibility of empathetically identifying with the mind and intention of the author or artist. Rather, the work and interpreter each have their own horizon (or world) of understanding. Interpretation’s object is correspondingly a disclosure of meaning as “truth” rather than any “method” of explanation. The paradigmatic act of interpretation is a dialogue between interpreter and the work in which the aim is to return the work to the lived reality of speech. This is possible because the focus of interpretation is the *Sache*, the import or subject matter, which is the object of inquiry rather than the work’s author or its *Sitz im Leben*.

Gadamer’s understanding of the text or work of art does not mean, as it did for historicists, a sharp break between the past and the present work of interpretation. History, of which a text or work of art is part, has in fact, especially in the case of “classic” works, effects on human consciousness, effective-historical consciousness (*wirkungsgeschichtliches Bewusstsein*), as he called it. Instead, the work of interpretation, seeks a “fusion” of horizons between the world of the text/work of art and the world of the interpreter. The fusion won through careful historically informed interpretation is “understanding” whose object, as noted, is truth as the disclosure of meaning. Thus, understanding through interpretation is not empathetic unity, as for Schleiermacher, nor a means to explore the meaning of “being,” as Heidegger argued, but, rather, how truth appears as meaningful and understandable for us (Schweiker 1985, 1990). In this way, Gadamer sought to reclaim truth for the human sciences in the form of meaning freed from the dominance of scientific method as the paradigm of truth where truth is a claim about a factual state of affairs open to explanation.

A final figure important for the development of modern hermeneutics was the French philosopher Paul Ricoeur (1913–2005). Ricoeur sought to mediate the debates between historicists and hermeneutists by articulating a productive relation between explanation and interpretation. One of his central insights is that human understanding involves a three-step process beginning with a first naïveté where the meaning of a text, event, or myth is taken at face value, what was called the plain sense in special hermeneutics (Ricoeur 1984). However, there is the need, after the rise of various forms of critical analysis, to submit the work to critical explanation or exegesis. This moment of explanation creates a distance between the work and its origin, whether in an author or community, as well as between the interpreter and the work. Critical distanciation, as Ricoeur called it, can be achieved by several critical methods ranging from historical analysis to Freudian explanation as well as structuralism and post-structural methods of explanation. Yet Ricoeur insisted, in the way historicists and others do not, that after the work of criticism, the interpreter seeks a “second naïveté,” a critical grasp of the work’s meaning, opening possibilities now.

The possibility of a second naïveté won through the dialectic of explanation and interpretation must be situated within the context of Ricoeur's thought about the import and referent of a work or text. He argued that a work opens up a world *in front of itself* rather than disclosing the mind of the author (Schleiermacher) or offering a fusion between the world of the text and our own historical horizon (Gadamer). For Ricoeur, the text projects a world of imagined and real possibilities for the interpreter's existence. We fashion our narrative identities with respect to two horizons of time: death but also "eternity," by which he meant that the future has a priority in human life rather than just being a terminal horizon on life.

A final contribution that Ricoeur has made to general hermeneutics is found in his Gifford Lectures, *Oneself as Another*. In this work, Ricoeur demonstrated that human beings have basic capabilities related to a self in relation to others (Wall, Schweiker, and Hall 2002, 279–290). His vision of the "capable human" entails two important insights for ethics. First, the ground of human capabilities is a fundamental attestation that it is good to be alive. Being human is an affirmation of being and thus a testimony to the worth of life itself. Second, and relatedly, Ricoeur argues in his "Little Ethics" that the ethical aim of human existence is "seeking the good life with and for others in just institutions" (Ricoeur 1992). In this respect the ethical life not only affirms the goodness of existence within an open future, but also that the ethically good life must pass through the moral claim of others on us and the task to build just communities.

The shift from special to general hermeneutics has opened up new paths in philosophy in terms of history, ontology, and ethics. Taken together these developments clarify the centrality of meaning and understanding in human existence, but also that human beings as thinking, acting, and symbolizing creatures are themselves "hermeneutical" beings. Our capacity to cross boundaries opens up fundamental reflection in the various branches of thought. With that insight, we can turn to the importance of hermeneutics for religious and philosophical ethics.

Hermeneutics and Ethics

Having discussed the definition of, major concepts within, and basic types of hermeneutics, the entry will now conclude by briefly isolating five ways in which interpretation theory is important for the work of ethics and moral theory.

First, as shown, questions of meaning, understanding, and action always take place in some "world" (real or imagined) and with respect to the horizon of that world. It is crucial, then, to interpret those circumstances of action, often construed by the religions in terms of their cosmogonies, eschatologies, and metaphysical beliefs and theories. Even within "secular" moral philosophy, how the context and horizon of human existence is construed bears on the meaning of human actions and relations as the subject of ethics. This is especially true in an age of global interaction and climate crisis since how one interprets people's worlds relates to their obligations to respect and enhance domains of life.

Second, insofar as practical ethical reflection on human relations and actions must consider the meaning of human acts and relation in the "world" in which they take place, then one is always engaged in the work of interpretation. Since a basic question in ethics is "what is going on?" interpretation is inescapable (Niebuhr 1999). This is especially true because human purposes and relations depend on ques-

tions of the meaning and worth of those purposes and relations. Further, practical ethical reflection, especially within the religions, is embedded within traditions that have authorities, practices, community, rituals, texts, and myths, but also, as shown above, different patterns and types of interpretation theory. Not only is it important to grasp the significance of these theories, usually the task of the historian, but also, for ethical thinkers, it is necessary to adopt or develop a theory herself or himself in order to contribute to the ongoing life of the community and its tradition. This is the work, as we have seen, of special hermeneutics.

It also seems, third, that the hermeneutical turn in ethics bears on the account of the meaning and worth of human agents. As seen in the development of general hermeneutics, to be human is to carry meanings across boundaries and furthermore to act into a future, variously construed, with an affirmation of the capacity for agency. This suggests, meta-ethically, a basic affirmation of being and acting which undergirds ethical traditions that teach compassion for all who suffer (Buddhism) as well as traditions of justice (Islam) and love (Christianity), to name a few. This is not to deny the profound difference between, say, Buddhist and Christian cosmologies, but rather, to show how basic moral attitudes and commitments of the religions come to articulation within hermeneutical inquiry through the human capacity to seek, create, and understand meanings across boundaries.

Fourth, hermeneutical inquiry implies a broadly humanistic stance as a normative perspective within ethics, and in two ways. First, insofar as the objects of interpretation are human cultural products (texts, actions, rituals), then whatever other divine or sacred origins are imputed to them (say, divinely revealed or ultimate teachings) they still require interpretation. This fact opens for ethics the various types of special and general hermeneutics in the quest to understand the relevance of religious sources for the orientation and evaluation of human conduct. Second, a broadly humanistic stance in ethics does not in itself imply an invidious anthropocentrism. It does mean that ethical reflection as the work of human beings cannot and should not escape or critique the human search for meaning and understanding through the work of interpretation.

Finally, hermeneutical theory wrestles with the relation between meaning, as the object of the human sciences, and “truth,” the seeming domain of the natural sciences. This history of hermeneutics aims to complicate that division of labor between meaning and truth and with it meta-ethical questions about the validity of an ethical position. In this respect, a hermeneutical perspective in ethics seeks to validate or invalidate moral orientations for the guidance of human conduct within specific traditions of interpretation.

The importance of hermeneutics, of whatever sort and within any tradition, is that it provides the tools to articulate the ways in which human beings and communities understand meanings that sustain and orient their conduct. In this respect, interpretation is a basic element in ethical reflection.

CHAPTER 29

Contested Canons and Counter Traditions

Victor Anderson

Leaving Africa Behind

The West has largely ignored the rich textuality of moral practices and rituals, customs and manners, and wisdom traditions of sub-Saharan African peoples. Thinkers such as Hume, Kant, Jefferson, and Hegel find little value in turning to Africa for clues to the progress of Western historical consciousness. Hume surmises, “I am apt to suspect the Negroes to be naturally inferior to the whites. There scarcely ever was a civilized nation of that complexion, nor even any individual eminent either in action or speculation” (Hume 1985, 208). Kant compares differences between global populations, including Spaniards, French, English, Arabs, and Negroes. This leads him to observe, “Not a single one was ever found who presented anything great in art or science or any praise worthy quality” (Kant 1960, 110). Jefferson notes, “Their love is ardent, but it kindles the senses only, not the imagination. Religion could have produced a Phyllis Whately; but it could not produce a poet” (Jefferson 2001, 97). Hegel offers a culminating judgment, “Negroes are to be regarded as a race of children who remain immersed in the state of uninterested *naïveté*.” They are “the compact, *differenceless mass* [*my emphasis*] of the African continent” (Hegel 2000, 40). These thinkers shoulder the weight of Western sentiment, respecting the non-importance of Africa to Western civilizing forces in science, arts, industry, religion, and morality. They reveal an anti-black racism produced and preserved in Western philosophical, theological, humanistic, and scientific manuscript canons and traditions, culminating in the encyclopedia of human knowledge, which leaves Africa behind in the currents of forgetfulness.

Black Religion

But Africa is not forgotten. Its moral universes preserve its peoples and lands, customs and manners, and moral cultures and wisdom traditions against decimating forces of the Transatlantic Slave Trade. Among the religious traditions to survive the mutating forces of the slave trade, Yoruba constitutes one of the largest religious groups in West Africa. Its influence is felt even today among Afro-religions in Cuba, Brazil, Jamaica, Haiti, and the US.

Peter Paris finds this influence widely spread beyond Yoruba religion throughout the spirituality of African peoples. “The moral understandings of African peoples cannot be understood apart from their common cosmological understandings,” which are integrated into the whole fabric of African realities

(Paris 1995, 25). Paris provides a cosmological scheme. The spirit world includes the Supreme Deity, lesser deities, and ancestor spirits. Through them, the cosmos is preserved. Communal life is balanced with the spiritual, and this harmony is the moral end of human life. Family life is the basis of personal identity, which is guided by the spiritual forces of the spirit world and the moral culture of the community. To live one's life in harmony with this moral universe is the striving of the individual's soul (Paris 1995, 25).

The African transatlantic slave trade decimated ancestral lines, religious practices, moral cultures, and kinship bonds by mixing and interbreeding peoples from indigenous regions, tribes, villages, and societies. However, Raboteau details how African slaves transported their deities, ancestor spirits, and aspects of their traditional religions and moral cultures to the Americas: "The gods of Africa were carried in the memories of enslaved Africans across the Atlantic. To be sure, they underwent a sea change" (Raboteau 1978, 16). African slaves preserved and modified aspects of their indigenous religious traditions within their New World situation. This transformation helps to understand and appreciate the moral cultures and universes they produced in the Caribbean Basin: Santería in Cuba, Shango in Trinidad, Voodoo in Haiti, Candomblé in Brazil, and Slave Religion and the Black Church in North America. These new religions throughout the Americas cluster under the umbrella phrase, Black religion.

Black religion is a cultural emergent from the cosmic violence inflicted on African peoples through contact and conquest, chattel slavery, anti-black racism, and white supremacy. Black people transformed the traditions they encountered, whether Islam, Catholicism, or Protestantism, "by 'bluing the note' and producing a sound that was recognizable but different" (Hart 2008, 193). Black religion transformed the existential situation of transplanted African peoples in diaspora into moral cultures of hope, resistance, and freedom that would send shock waves throughout all of Europe in the Haitian Revolution (1791–1804).

Although Black religion is not restricted to the standard narrative of slave religion and the Black Church tradition in the US, this narrative, beginning with the "invisible institution," is an expedient entry into the contested canons and traditions of Black religion in the US. It was invisible only due to its having been neglected by religious historians prior to the second half of the twentieth century as a legitimate province of study (Raboteau 1978, x). "By largely ignoring this tradition, much of which had been preserved, historians have rendered an articulate people historically inarticulate, and have allowed the record of their consciousness to go unexplored" (Levine 1997, 59). However, slave religion reveals close connections to African practices, modes of thinking, familiar customs, and the manner in which African slaves understood their situation and forged an economy of black existential hope.

Slave Religion

Appreciating the moral universe of slave religion requires turning to the concrete, situated moments of black suffering. Black existence is situated, determined, and already characterized as the Western "problem" as we saw with Hume, Kant, Jefferson, and Hegel. Where they engage in a politics of black forgetfulness (the eradication or subordination of black peoples by white hegemony), Black religion encodes situational moments of black lived experience into shapes of freedom, anguish, responsibility, embodied agency, sociality, and liberation (Gordon 1997, 3). Within this economy of black existential

hope, “Africana peoples’ being-in-the-world is the question of value raised by people who live the situation,” says Gordon (Gordon 1997, 3). This economy of hope, produced and experienced by slaves, guided their ethical perspectives on the world and presentations of their experiences in tales, prayers, letters, journals, sorrow songs, sermons, autobiographies, manifestoes, worship, political activism, and more.

Earl Jr. describes how slave religion came to express the slave community’s moral and religious significance through his analysis of slave songs, conversion narratives, autobiographies, journals, and folklore. “Each genre of the folk sources produces its own conceptual paradigm for looking at the fundamental ideas of self, God, and community” (Earl Jr. 1993, 8). These sources collectively and individually inform African Americans’ identities, help towards understanding how African slaves navigated their ethical duties, and exhibit complexity among slaves in their understanding of the self, God, and community.

Slave religion produced a remarkably resilient moral universe of deep spiritual and ethical significance, which sustained the slave community against the death-dealing effects of the transatlantic slave trade and the dehumanizing plantation system. Their economy of existential hope offered spirituality, conjuring practices, and folk wisdom, which are articulated and preserved in black folk-cultural productions. Through these sources of moral insight, slave religion did not only emphasize the slave community’s ambiguous and contradictory relation to white Christianity. They also centered the community’s confidence that justice and freedom would triumph over oppression. Webber concludes, “most of the values, attitudes, and understandings that whites taught their slaves were rejected by members of the slave quarter community” (Webber 1978, 246), and this contradicted whites’ view of slaves “as a people without a culture, without themes and educational instruments of their own” (Webber 1978, 249).

The Black Church Tradition

The economy of black existential hope, produced and preserved in the moral universe of slave religion, was a repository of human creativity and moral wisdom that exerted its moral influence within the Black Church tradition. Lincoln and Mamiya (1990) interpret the moral universe of the Black Church tradition symbolically as the black sacred cosmos. As a covering term, the Black Church represents “independent, historic, and totally black controlled denominations” represented by 80 percent of black church memberships (Lincoln and Mamiya 1990, 1). Although identified mostly by Protestant denominations, Lincoln and Mamiya see conceptual and moral connections between the Black Church and traditional African religions. The black sacred cosmos designates black people’s “unique and distinctive forms of culture and worldviews as parallels rather than replications of the culture in which they were involuntary guests” (Lincoln and Mamiya 1990, 2). “The core values of black culture like freedom, justice, equality, and African heritage, and racial parity at all levels of human intercourse, are raised to ultimate levels and legitimated by the black sacred cosmos” (Lincoln and Mamiya 1990, 7).

The black sacred cosmos is incarnational, stressing the immanence of God and Christ in the lived situation of black people; Jesus symbolizes black people’s triumph or transcendence over the death-dealing effects of anti-black racism and white supremacy. Universal egalitarianism and freedom are norms of all inter-human relations. Ecstatic worship signifies a realized eschatological hope and fulfillment of union with God, Christ, and ancestors through the Spirit. The black sacred cosmos “reflects

the deepest values of African Americans, giving primal consideration to the necessity of freedom as an expression of complete belonging and allegiance to God" (Lincoln and Mamiya 1990, 17).

Paris derives a substantive ethics from his account of the Black Church as a "surrogate world" that parallels the sacred and moral universe of white Christianity where the absolute moral norm of black moral agency is the biblical view, which regards all people as equal under God, and is "the final authority for all matters pertaining to faith, thought, and practice" (Paris 1985, 14). This first principle of practical reasoning in human relations, governed by this universal and egalitarian principle, "has tended always to be life-protecting, life-enabling, and life-respecting" (Paris 1985, 14). These norms substantively constitute the virtue tradition of black self-reliance, self-support, self-determination, and self-respect. "These virtues constitute racial and moral virtues, the validity of which has never been disputed by blacks" (Paris 1985, 15). The universal reach of Black religion's categorical imperatives, absolute equality before God and justice for all, would be most tested by black liberation ethics.

Black Liberation Ethics

James H. Cone is widely regarded as the unsurpassed representative of the black theology of liberation trajectory emerging from the late 1960s. Its moral fervor was fueled by the shifting grounds of black liberal politics and liberal ethics of universal egalitarianism to black radical politics and its black revolutionary consciousness in movements such as Black Power, the New Black Aesthetics, and the black student movements of the 1960s. Cone insisted that the theological problem of American culture was white racism, and that the task of black theology of liberation was to critique it through a new, black revolutionary collective consciousness. This new black consciousness was an emergent from the "the black community, the pain and joy it derives from reacting to whiteness and affirming blackness and the mythic power inherent in [its historic religious] symbols for the present revolution against white racism" (Cone 1991, 27).

Cone's is a classic statement on the meaning of black existence for black theologies of liberation. Black existential hope is turned on black survival and black revolutionary consciousness, which seeks "to interpret the theological significance of the being of a community whose existence is threatened by the power of non-being" (Cone 1991, 16). Understood as an economy of black existential hope, blackness expresses self-determination, self-reliance, and self-assertion in shapes of self-love. Black pride, respect, and loving blackness means rejecting inhuman living conditions and a social order that debilitate black youths' life expectations through mass incarceration, crippling education, and murderous policing. The "Black Soul" centers the economy of black existential hope, which "comes from the totality of black experience, the experience of carving out an existence in a society that says you do not belong," says Cone (Cone 1991, 70). The moral supports, which fund this economy of hope, are black experience, black expressive culture, black history, the Black God, and the Black Christ. "The test of truth in black theology," says Dorrien, "was whether a statement or action served the end of black liberation (Dorrien 2009, 402).

This moral imperative led many black theologians (many former students of Cone) to return to slave religion as a source for black theology. They were in search of the radical impulses of self-determination and self-empowerment in these sources, which they held had become quieted in the Black Church's liberal politics and ethics. The economy of black existential hope, which Earl Jr. discovers in the moral

universe of slave religion and culture, was given theological interpretation through the moral demands of black theology. From this spiritual and moral economy, slave narrative theologians (Hopkins and Cummings 2003) construct a theological and moral economy of black existential hope from which today's generations of black people may find enough faith and hope for liberation praxes against white oppression. Where slave religion transformed the situated moments of the slave community's live experience into shapes of freedom, resistance and even revolts, a return to this moral universe, these theologians had hoped would empower contemporary black lived experience in forms of resistance and liberation praxes.

Black liberation ethics stresses the prophetic character of Black religion. Its essential message is derived from the biblical Exodus story and the proclamation of Jesus (Luke 4:18ff.) to set at liberty the oppressed. It insists that the work of liberation is the radical transformation of individual and systemic power structures in harmony with God's preferential option for the poor and resisting forces of white supremacy. It joins global liberation movements, which also seek to free the oppressed from the demonic forces of global capitalism and all forms of authoritarianism. Black liberation ethics, thus, rejects abstract, universal egalitarianism, while insisting that the liberation of the poor and oppressed, wherever, always remains the unfinished work of the spirit of freedom (Hopkins 2006, 6–7).

Womanist Ethics

The later decade of the 1990s saw black liberation ethics advancing in keeping with debilitating social forces beyond anti-black racism and widening its scope towards the intersections of classism, sexism, and heterosexism. Womanist ethics contextualizes this spirit of freedom in situated moments of black women's experience. Katie Geneva Cannon's *Black Womanist Ethics* (1989) "signaled new beginnings in several ways," says Mitchem (Mitchem 2006, 69). Womanist ethics foregrounds black women's realities in distinction from white feminists, where black women's lived experience had long been overlooked as a space for the study of ethics. Cannon also called into question the ways that white, male, Christian ethics construed individuals, power structures, and moral agency (Mitchem 2006, 69). From sources of black women's literature, spirituality, and experience, womanist ethics constructs an economy of black existential hope that sustains black women and the whole community from systemic intersecting assaults from racism, classism, sexism, and heterosexism. The black women's literary tradition provides a deep repository for preserving black women within the economy of black existential hope created by and nourished in Black religion and a moral universe that, says Cannon, "allow them to prevail against the odds, with moral integrity" (Cannon 1988, 75).

Williams (1993) articulates this economy of black women's existential hope as one of struggle, survival, resistance, and quality of life demands. She morally reflects on the biblical story of Hagar and her wilderness trials, as well as the ministerial vision of Jesus. Williams finds them existentially anticipating situated moments of black women's wilderness experience, which leads her theologically to conclude that God cares, meets black women through their life of prayer and struggles, and provides resources and support for ongoing resistance against black women's oppression. However, God does not liberate. Liberation, says Williams, must be the work of black women themselves for themselves (Williams 1993, 238–239).

Mitchem succinctly details the womanist economy of black existential hope. It attends to the ordinary theologies of black women's lives, Christian and non-Christian; stresses the communal aspects of black

women's experiences, including social activism and their creation of safe spaces; insists on being interdisciplinary, while keeping all aspects of black women's lives central; is the starting point for womanist theology and critical social analysis; and dialogue and openness are essential virtues for keeping womanist ethics open to situated lived experience of others, sometimes even serving as a corrective to theologies that undermine black women emancipatory potentials. The moral universe of womanist ethics gathers up the histories, social constructions, activism, and faith of black women within shapes of freedom that preserves and transforms the ever-expanding economy of black existential hope in Black religion.

In conclusion, the traditions, which constitute Black religion in the US – from slave religion to black liberation ethics – remain vital yet expanding, deepening, and constantly being reconstituted among newly emerging and challenging contexts and trends in twenty-first century scholarship. Economies of black existential hope expand with each emergent generation, creatively and boldly urging each generation to resist social forces of anti-black racism and white supremacy, while articulating the generative relevance of black religion albeit beyond the standard narrative.

The 1990s and the beginning of the twenty-first century have been shaping African-American religious ethics in widely, sweeping directions. Once almost singularly cultivated under the rubrics of theological education and American social ethics (Wilmore 1989; Dorrien 2009), the passing of the twentieth century has witnessed African-American students of religion and theology being introduced to and working from within “A New Cultural Politics of Difference” (West 1990). This cultural move unsettles any grand metanarrative or essentialist interpretations of nature, the human, or the self, including our structural understandings of race, class, and sexual-gender politics in black lived experience, in favor of “multiplicity,” “plurality,” and “difference.” bell hooks describes this as a turn to “post-modern blackness,” where scholars “dialogue about everything, make spaces where we can engage in critical dissent without violating one another” (hooks 1990, 19).

Presently, in our postmodern moment, African-American religious ethics has unhinged itself as being a strictly Christian or theological discipline. Students are being educated in theories and methods derived from anthropology, the social sciences, postmodern philosophy, physics and natural sciences, cultural studies, and more. Books are being published that pushed beyond racial and religious essentialism toward the priority of difference (Anderson, 1995, 2008; Hart 2008, 2011); race and science (Holmes 2002); sociology and economics (Floyd-Thomas, 2006; Day 2012); and sexual-gender politics (Pinn and Hopkins 2004; Griffin 2006). Doing justice to this emergent bibliography in African-American religious ethics awaits further watching and research into this encouraging multiplicity beyond the standard narrative of Black religion in the US.

CHAPTER 30

Revelation

Mark Douglas

Definitions

The complexities of revelation in religious ethics begin with definitions. When revelation has been defined as the process of divine wisdom being conveyed to human beings, it has tended to imply theism, a human capacity for receptivity, and an active relationship between the divine and human beings. Theism situates the divine as distinct from the world while also having attributes associated with agency: divinity is neither diffused nor inert but instead finds itself concentrated in an intelligent being with both a will and the capacity to act. As such, revelation will play a more significant role in the Abrahamic traditions, for instance, than in Eastern religions. Human receptivity is a precondition for the meaningful translation of divine wisdom into moral direction: revelation assumes not only that human beings (or at least some human beings) have the receptors through which they can be attuned to divine wisdom but that they can translate their experiences of divine wisdom into directions for action in the world. As such, revelation will play a more significant role in religious anthropologies that highlight complex capacities for spiritual discernment and moral reasoning than in those that treat human beings as determined by their material existence or blind to the forces that motivate their actions. An ongoing relationship between the divine and human beings establishes the coherence and trustworthiness of divine wisdom for human action: revelation is a two-party event that reaffirms, reinforces, and reshapes divine-human relationships. As such, revelation will play a more significant role in religions that highlight the continuing quality of divine actions and the imperfections of the world than those in which the divine has withdrawn or that assume either the insignificance or completeness of the world as it is.

Where revelation has been defined as the shock of discovery at understanding the world in a new way or seeing something that had previously been shrouded, it has played a more prominent role in Eastern, naturalistic, humanistic, and Deistic religions as well as those in which divine presence is either obvious or diffused. Within such a definition, revelations in religious ethics manifest as epiphanies about better ways to live in the world or clearer reasons to behave in some ways rather than others. This broader definition of revelation not only allows the term to function in a wider range of religious traditions, it also shapes possibilities for interreligious engagements – including around shared moral concerns – and projects in comparative theology that are either precluded or foreshortened within the more restrictive definition above. Yet such a broad definition invites questions as to the very utility of the term. If revelation can be so expansively understood, what – beyond an epiphenomenal and morally insignificant moment

of pleasure about a new insight – distinguishes such revelations from the insights that come through careful *a priori* reasoning or *a posteriori* reflections on experience?

Toward a fuller description of the roles that revelation has played in the moral claims of particular religious traditions, this entry leans toward the first definition of revelation because of the work that revelation does in the religions where that definition is meaningful. It does so, though, weakly, recognizing that the very project of referring the many to the one is always fraught and never an innocent or apolitical project. If, at its end, this entry has prioritized the role of revelation in some religious traditions and perspectives more than others, it hopefully has done so in a way that is consistent with the way that and energy with which those particular religious traditions and perspectives understand revelation.

If defining “revelation” is a first problem, defining “religion” is a closely related second one, made more complicated by recent scholarship on the modern origins of the concept. First, there are any number of life-ordering traditions that carry metaphysical weight and may or may not count as a religion, depending on who is doing the defining: does Confucianism count as a religion? Not only are definitions disputed, those disputes align with debates about the definition of revelation revealing biases toward Western religions and modern constructs throughout. Second, the organic quality of religions makes distinguishing religions from each other complicated. Is the Church of Latter-day Saints a kind of Christianity or a unique religious tradition? Do Lingayats in southern India practice a version of Hinduism or is theirs a religion distinct from Hinduism? How many Traditional African Religions are there and what makes them distinct from or connected to each other? Paradoxically, this organicity also reveals the mobility of ideas about revelation and moral authority: religious construals growing out of revelatory insights not only birth new religions with distinct moral systems (as was the case for Christianity’s growth from Judaism) but connect religious traditions to each other conceptually (Hinduism to Buddhism), historically (e.g. Candomblé’s joining of West African religions and Roman Catholicism), and morally (so, e.g. the moral foci of Bahá’í and Unitarian Universalism share substantial overlap although the traditions arise from very different sources). And, third, there is great variety within recognized single religious traditions. So, for instance, the three major streams of Christianity (Roman Catholic, Orthodox, and Protestant) break down into innumerable smaller and distinct branches and those three major streams still exclude recognizably Christian communities like the Nestorians or Jehovah’s Witnesses. Moreover, distinctions within a single religious tradition seldom align with distinctions in the way those streams understand the moral implications of revelation: many streams may share significant overlap about understandings of revelation and morality (as is the case for Islam) or overlapping understandings of the moral authority of revelatory events may link otherwise disparate streams of a single faith (e.g. the apocalypticisms of the Fifth Monarchists and the Millerites).

With those definitional complexities in mind, this entry first turns to an overview of the role revelation plays in some of the world’s major religions before exploring the moral purposes of revelation in religious ethics and naming some abiding questions about revelation in religious ethics.

Revelation in the World’s Religions

Judaism

Neither the Hebrew Scriptures nor the Talmud speak abstractly about revelation or offer abstract reflections on revelation. Nor do the Hebrew Scriptures analyze the type of communication that revelation is. They begin, instead, in stories about particular revelations – either as “unveilings” (*glh*) or “communications”

(*nggd*) – from the God of Israel to particular persons or groups of people, whether those revelations occur orally (Genesis 12), in dreams (Genesis 37), via theophanies (Exodus 3), or even, paradoxically, in the absence of such things (1 Kings 19). The two inherently linked fundamental revelations (*yd'* or “proclamations”) within Judaism – the ones around which all other revelations revolve – are the liberation of the Hebrew people from Egypt and the giving of the law on Sinai (Exodus 5ff.). In this story, revelation functions not so much to give evidence about the reality of God or the superiority of the God of Israel in comparison to other gods but as a display of God’s particular concern for a chosen people and the covenant’s insistence that the revelations that bind the people and their God to each other are fundamentally moral. The moral form of these revelations, expressed as law, shows only limited concern about distinguishing between laws ordering divine-human relations (“You shall have no other gods before me”) and those ordering inter-human ones (“You shall not kill”); between laws that apply only to the Hebrew people (“the pig ... is unclean for you”) and those that apply to all people living in the land (“you shall not oppress a resident alien”); between laws that pertain to ceremonial rituals and those that pertain to public life. The revelation of the law by God on Sinai is a single revelation of the many laws that constitute a covenantal relationship between God and Israel. The enduring significance and sufficiency of this revelation has manifested itself in suspicions within Rabbinic and Orthodox Judaism about the need for any other revelations from God (see, e.g. the Babylonian Talmud *Yebamot* 49b). New revelations, when they happen, are subsidiary revelations that help interpret the Torah; indeed, the sufficiency of the Torah as revelation is so great that even if God chose to reveal Godself and offer new wisdom, that revelation could be rejected as immaterial. As rabbis participated in divine revelation by reflecting on the Torah, these new revelations were captured first in the Mishnah and then in the Talmud. Following Aristotle, Maimonides understood the revelations of the oral law in the Talmud to be natural phenomenon; as such, the meaning of “revelation” within Jewish thought contains though distinguishes between the two definitions of the term offered above.

Christianity

Christianity finds its center in the revelation of Jesus, the Christ, and his incarnation, teachings, works, death, and resurrection. Jesus is the embodied revelation of God; to understand God, God’s sovereign reign, and humanity’s place within that reign, one looks to Jesus as he is described in the Bible and his will and purposes are discerned through the movement of the Holy Spirit. Locating its central revelation within a person (rather than, e.g. a set of laws or a particular event) complicates and diversifies how Christians have understood the moral import of that revelation. Scripture – and particularly but not exclusively the New Testament – gains its own revelatory status such that many Christians not only treat the Bible as a revelation but believe that reading it can stimulate new revelations. Given the variety of moral codes, ideals, visions, analogies, narratives, and implications contained within the text, Christian disagreement not only about which parts of this revelatory text are morally authoritative, but to whom these texts are authoritative, and how these revelations apply in new contexts were inevitable. Moreover, appeals to the Holy Spirit as a means of ordering these disagreements have only multiplied the ways Christians understand the revelation of Jesus and the moral life that follows from belief in him as Lord. Believing that the Holy Spirit still moves in the world and that the revelation of Jesus as the Christ only finds its completion upon his return, Christians find themselves perpetually open to new revelations about how to live. In their most vigorous forms, including the one described by theologian Karl Barth, these new revelations manifest as divine commands and Christian ethics become a project of discernment and obedience. Other expressions of Christian

ethics, such as the one described by Thomas Aquinas, distinguish natural revelation (what can be discerned of God and God's will and work in the world by all persons) and special revelation (insights into that will and work that are given only to some through the work of the Holy Spirit). For the most part, discernment of revelations is a project of the church, though individual revelatory experiences can function to shape personal moralities and initiate new moral projects.

Islam

Muslims believe that God had given revelations (*Wahy*) to prophets since Adam, including those to Abraham, Moses, and Jesus, but that God's final revelation came verbally through the angel Gabriel to the Prophet Muhammad. This revelation is expressed in the *Qur'an*, which is the literal and perfect revelation of Allah to all humanity, given word-for-word by Allah, and which will endure until the end of time. The content of this revelation in the *Qur'an*, combined with the sayings of the Prophet (the *Hadith*) and descriptions of his daily practices (the *Sunna*), constitute the law (*Shari'ah*) that orders Muslim life. The *Qur'an* consists of rules and wisdom for living along with warnings and a description of final judgment. These rules are most clearly expressed in Arabic but can be translated to other languages because Allah is not only the God of Muslims but of all people. Revelations, given only to the prophets, complement reason and sense experiences and make human life coherent. Other people cannot receive revelations, no revelations have occurred since Muhammad, and none of God's revelations can be altered. The righteous – regardless of religious faith – can, however, receive inspirations (*Ilham*) to aid them in their moral journeys. The perfect and encompassing qualities of Allah's revelations to the prophets and, especially, in the *Qur'an* mean that all other authorities used when making normative claims (e.g. appeals to natural capacities for human reasoning or personal experience) are subsidiary and only legitimate to the extent that they conform to revelation. Following this revelation, Muslim life is ordered by the Five Pillars (profession of faith, prayer, almsgiving, fasting, and pilgrimage to Mecca). Collectively, these pillars shape daily moral life and display the Islamic resistance to distinguishing between faith and actions: what one believes and how one acts are of a piece and all actions carry moral weight.

Hinduism

Revelation in Hinduism begins with the Vedas, a collection of writings which human beings heard (*śruti*) from the gods. They are *apaurusheya* (supernatural) and have always existed, having been passed along by seers from the beginning of time. The Vedas shape the processes of *bhakti* (devotion) through which human beings come to discover knowledge of the *brahman* (the supreme or ultimate reality) and *ātman* (the self that continues through the processes of reincarnation) and they order the *dharma* (rules for right conduct) for all things. Those who seek after such knowledge will discover the permanence and ultimacy of *brahman* and the fleeting/illusory/transient qualities of everything else. Most theistic forms of Hinduism favor the idea that God (Ishvara/Brahma/Shiva/Vishnu) promulgated the Vedas but that each promulgation is only a manifestation of the Vedas' already existing quality. In these Vedantic forms, God uses karma to rule over the world: beings collect merits and demerits according to how they fulfill or fail to fulfill their *dharma* and their karma determines their next incarnation. In non-theistic forms of Hinduism, however, the effects of karma are, themselves, sufficient as natural processes that determine the next incarnation.

Buddhism

The clearest expression of revelation in Buddhism is in the Four Noble Truths revealed to Siddhartha Gautama through his reflections on the Four Passing Sights which he saw as a young man (an old man, a sick man, a corpse, and an ascetic) that led him to reflect on human existence and its meaning. These truths – that life is suffering, that suffering comes from desire, that suffering ends when desire ends, and that to end desire, one should follow the Eightfold Path – are revelations according to the second definition offered above. Following the Eightfold Path, which lays out moral practices designed to reduce suffering in the self and others, will eventually lead one to Nirvana and the *anatman* – the non-self – in which persons escape the cycles of desire and suffering by seeing through them to reality, itself. Various components of the Eightfold Path carry varying degrees of revelation with them so, for example, right understanding is a fleeting recognition of the impermanence of things (and so contains a revelatory quality), whereas right thinking or right speaking are disciplines that make right understanding more likely.

Chinese Moral Traditions

While they are associated with ancestor worship and a pantheon of gods who can influence everyday events in human life, Chinese moral traditions (especially Daoism and Confucianism) might more properly be understood as sets of moral practices through which one becomes wise as one lives in harmonious relationships with all around them by attending to the interconnectedness of all things. Whether these harmonious relations are expressed through balance (the yin and yang of Daoism) or moderation (the Doctrine of the Mean in Confucianism), the moral commitments of Chinese moral traditions are grounded in practices associated with virtues like kindness and duty to family. Ancestors and gods do not impart wisdom for the pursuit of moral ends so much as exist as participants within interconnected reality; as such, revelation functions in ordinary rather than ecstatic ways in these traditions. That said, there are components of some Chinese moral traditions that include ecstatic encounters (the *Yuanyou* of Daoism) or control over supernatural forces (the *I Ching* of Confucianism) that might be identified with the first definition of revelation.

African Traditional Religions

Standing in for a variety of indigenous spiritualities that preexist both “Western” or “Eastern” religious traditions in Africa, the phrase “African Traditional Religions” has been used to describe a wide variety of beliefs, rituals, and practices associated with ethnic groups throughout the continent (e.g. Akan, Bantu, Yoruba, etc.). Though they vary widely, ATRs might be understood as a way of life in which there is no separation between the spiritual and the physical. Deities and spirits are a part of the world and no special revelation is required to discern their existence; participation in rituals and ceremonies recognize and reinforce their places in the universe. A few persons, though, can divine the purposes of the deities and spirits and convince them to take on certain tasks that help those who properly request their aid. Whether such divination and supplication can be understood as either expressions or products of revelation is more likely to reveal the limited usefulness of the term “revelation” than point to any role that revelation plays in ATRs.

Humanist/Modernist Traditions

Not all interactions between religion, revelation, and morality have led to or deepened faith. Claims about revelatory events or visions have also undermined religious convictions. Perceived contrasts between reason and revelation shaped Western Enlightenment and Modern traditions that rejected any insights that could not be arrived at through empirical or logical means. Natural disasters like the Lisbon Earthquake of 1755 led thinkers like Voltaire to reject any religion which linked divine purpose to human suffering. Great moral evils like the *Shoah* led religious thinkers like Emil Fackenheim to hold God responsible for human suffering when no revelation of divine self, power, or instruction was forthcoming.

While this tour of the world's religions and the role revelation plays in them is cursory and leaves many unnamed, it offers some sense of the breadth and range of the ways that revelation and morality can relate. Just as importantly, it joins the conceptual connections between revelation and morality to the histories and practices of actual religions.

Morality and Revelation: Relations and Questions

Revelation, then, can be related to morality in a variety of ways. As is the case for Christianity, revelation can found a religion by providing a previously undisclosed vision of the cosmos which either includes or mandates a particular set of moral reflections and practices: revelation grounds morality. As is the case for Judaism, revelation can give reasons for a particular set of reflections and practices that might otherwise seem arbitrary or incoherent: revelation clarifies morality. As is the case for some versions of the Abrahamic faiths, revelation can mandate an action or set of practices that might otherwise be rejected: revelation determines morality. As is the case for other versions of the Abrahamic faiths, revelation can open receivers up to a wider vision of the cosmos, inducing the human senses of *mysterium tremendum* and *mysterium fascinans*: revelation relativizes morality. As is the case for Hinduism, revelation can promote an openness to thinking in new ways about living a moral life: revelation expands morality. As is the case for Buddhism and some forms of Chinese moral traditions, revelations can provide additional support for particular practices: revelation supplements morality. As is the case for African Traditional Religions, revelation can make some practices or actions easier or more fruitful: revelation aids morality. And as is the case for modern humanist traditions, revelation provides dubious moral authority (at best): revelation undermines morality.

To the extent that a religious ethic can be understood to include a degree of second-order reflection on moral claims, each of these relations between revelation and morality shapes a range of questions that warrant further reflection. Though the types, structures, emphases, goals, and lexicons of these questions will be distinct for each religious tradition – and may differ within various forms of these religious traditions – there are points of connection and overlap between them. Among overlapping sets of questions about the relation between revelation and religious ethics, one might include at least the following:

- What is the weight of the authority of revelation in shaping morality and how does it compare to other authorities/guides (e.g. scripture, reason, tradition) that shape morality?
- How much freedom does one receiving a revelation have in interpreting that revelation and/or accepting the moral injunctions that may come through that revelation?

- What is the relation between revelation and reason? Does revelation supplement, confirm, or challenge reason? Does it come before reason, after reason, or exist as an authority parallel to but disconnected from reason?
- Who has the ability or permission to interpret a revelation and how is such ability or permission gained? And how ought we to account for increasingly acute criticisms of traditional forms of religious ethics as voiced by feminists and other oppressed persons, especially when appeals to revelatory experiences have funded such persons' claims to their own unique moral authority?
- How do new revelations – especially about moral life – replace, supplement, or confirm old ones? For that matter, can there be new revelations?
- What are the differences between revelations that are, in principle, available to all persons and those that are given only to and for particular individuals or groups? What are the implications of those differences for the way persons and/or groups order their moral lives and relate to others?
- How authoritative can or should moral claims discerned via revelation be in the lives of those who did not, themselves, experience that revelation?
- How are revelations experienced? Are they experienced through the senses, do they occur in dreams, or are they intuited? And how can the means through which they are experienced shape moral claims about, e.g. the value of the human body or the significance of the natural world?
- Does one prepare for a revelation through, e.g. participation in particular rituals or the use of psychotropic substances? If so, who is allowed to participate in such rituals or use such substances and how are either those rituals or substances regulated?
- What social forces or psychological conditions make revelations more or less likely or coherent? What might it mean, for instance, that conditions for revelation are both produced by and made less coherent in what philosopher Charles Taylor has called the “immanent frame” of Western modernity – especially when that frame reinforces the primacy of morality for conceptually ordering the social imaginary in which the citizens of Western modern systems live? (Taylor 2007, 542ff.).

This list of questions is neither comprehensive nor sufficiently complex. Taken in concert with the discussion of the way revelation relates to the religious ethics of the various religious traditions described above, though, it starts to get at the untamable qualities of revelations as they shape and are shaped by religious ethics.

CHAPTER 31

Law and Religion

Winnifred Fallers Sullivan

Law is an expansive concept with resonance across the many domains of human society and culture. Law is also an enormously diverse social fact, present in all human communities. This chapter briefly introduces “law” in relation to “religion” and to “morality.” A short chapter such as this cannot hope to do justice to the varieties of law and of its varied relationship to domains as large as religion and morality across space and time. The prejudice of this chapter will be that adequate consideration of these interrelationships could be generated only from a generously inclusive consideration of the discursive histories of these terms and their cognates in cultures across the globe. Instead this chapter will introduce several persistent themes in the study of law, religion and ethics today, and gesture to further lines of inquiry.

Law, religion, and ethics each, among other things, concerns itself with the problem of how one ought to live and how communities ought to be governed. They might be seen, in fact, as alternative but deeply inter-related systems, or structures, within which to reflect on the appropriate occupation of humankind. These alternatives are differentiated insofar as persons are to be understood to be defined primarily by their relationship to government, to their gods, or to each other. No person lives exclusively within one of these systems. An individual human being inhabits these various realities simultaneously and in community, fielding the competing demands of the systems in different ways. Individuals and communities both shape and are shaped by various and often multiple blendings of law, religion, and moral traditions. From an analytic point of view, however, and for the purposes of discursive clarity, the three may be held apart provisionally and be seen as having had varying relationships to one another and to have taken various forms at various times in history and in various places. Law, institutionally and culturally, may at times be seen as the carrier of moral principles, which in turn may or may not be expressed in a religious idiom. Or law may be seen as autonomous, independent of the other two. Religion and morality likewise. Religion in some contexts may be expressed through law or prescribe rules of morality. In others, religion seems to be both antinomian and amoral, leaving law and ethics to the secular domain. Morality may be embodied in formal law, or not. It may be explicitly religious, or not, in its foundation and expression.

Law, the rule of law, if you will, has a very high value in the contemporary international order. But “law” is a deceptively easy little word, one that is worth pausing to reflect on. What is law? Is law a list of rules made and enforced by an always essentially violent and ideologically oppressive sovereign power? Or is law more properly understood as the collective will of the people – always negotiated with realities on the ground. Is the sovereign itself subject to law, or not? If so, where is the law to be found that governs the sovereign? What about the sovereignty of God? Is coercion a necessary component of law? Is

law better understood as a particular kind of process – rather than as a list of rules – a culturally specific system for mediating the inevitable anomalies of life? Does law require courts, judges, and police? How is law affected by economic realities? What is the relationship of law to justice?

Law and Culture

The Massachusetts Bay Colony was founded in 1629 on what was to be the east coast of the United States. The English men and women who constituted the members of the colony struggled over the first few generations of their corporate existence to construct a society founded in a religious vision *and* governed by law. Determined to leave behind them a corrupt British establishment, they sought, using little more than the Bible and human reason, to create a Christian place governed by Christian laws and ethics. The initial shape of the colonial government was explicitly biblical. There were distinct religious and civil institutions, but men who claimed to know God's will ruled the community. The right to vote depended on proof of religious conversion. The Bible was the source of all law, religion, and ethics for these New England Puritans. But they had endless debates as to whether the Bible was self-interpreting or whether it could be interpreted by men, and, if it could be interpreted by men, who was the appropriate interpreter and what was the appropriate method of interpretation. Several different positions contended for supremacy, and these various positions are revealed in the legal controversies of the young colony. Whether debating the presence of the cross in the colony's flag or of Anne Hutchinson's legitimacy as a religious leader, the rulers of Massachusetts Bay simply could not agree. They also had debates about the jurisdictional reach of their governing institutions, church and state. The Ten Commandments, for example. Should both tablets be enforced by the civil authorities or only the second? The first four were commandments as to one's duty to God. The remaining six expressed one's duties to other people. There were also different opinions as to the advisability of referring to English common law for guidance.

Legal historians have been fascinated with the history of this small band of idealists and of their efforts to invent a new legal system – to discern law for themselves – and how their experience affected later iterations of American law. They now trace what seems to have been a gradual abandonment of the rule of God in the face of, not only differences about biblical interpretation, but also of growing diversity of other kinds within the population and the press of social and economic change. Within the first twenty years of the colony's history the biblical ideal was discarded in favor of came to be called a government of laws, not of men of God. The long story that is told is that law was secularized while religion and morality were gradually privatized – although there are those who would nuance this version.

What is obvious from this historical example is that how one understands “law” affects how one understands its relation to religion and ethics. For some, law is to be understood as a humanistic discipline, a set of practices and a language of persuasion and argumentation that is continuous with other linguistic institutions such as theological and moral reflection and debate. If law is seen as rhetorical in this sense, as James Boyd White and others would argue, then it necessarily engages religion and ethics as other such cultural discourses, an engagement that can range across time and place but is always embedded in local culture. The words law uses always implicate ethical positions and depends on religious anthropologies and cosmologies. For others, law is to be understood as autonomous and self-contained, either as universally ordained by God (in which case the role of the human is to implement God's purpose), or as a tool of social engineering, one that should be governed by “scientific” principles.

If law is about social control then religion and ethics tend to be excluded from discussions of law or to be simply employed in service of what are understood to be essentially utilitarian ends. Law in this latter sense has no culture and no history except as a laboratory for what does and does not work. A study of law in Massachusetts Bay can teach us how better to understand American Puritans, or the early history of American government, or it can help us to understand when law is or is not successful or it can be fruitfully studied as revealing the complex ways in which the three are connected.

Through most of human history and in most places, law, religion, and ethics have shared a largely common culture, whether religious or secular. So, roughly speaking, law in Morocco speaks a language that assumes Moroccan Muslim ethical principles, Moroccan Muslim understandings of the motivations and capacities of the human person, and a Moroccan Muslim picture of the universe and of causation. Law in Thailand speaks a language that assumes Theravāda Buddhist ethical teachings, notions of what it is to be human, and understandings of the nature of the universe and of causation. Within a particular society, of course, different segments, distinguished by gender, class, occupation, etc., may be understood to inhabit different legio-religio-ethical subcultures depending on their social and geographic location. So, for example, a poor woman in nineteenth-century New York City may have lived a life structured by very different notions of the nature of the human person and of causation than her well-to-do counterpart, but the identity and choices of each were largely circumscribed by an integrated legal, religious, and ethical system particular to her social location.

But these integrated systems always interacted and affected each other. Legal, ethical, and religious pluralism is the norm rather than the exception. Particularly in imperial formations there have been interestingly mixed legal, moral and religious complexes. (See, for example the work of legal historian Nandini Chatterjee on the legal pluralism of the Mogul Empire.) An interesting example for students of law and religious ethics is the history and experience of the Jewish Diaspora. Since the first century of the common era, Jews lived in most countries as self-governing enclaves, tolerated more or less by various state authorities, from the Roman to the Ottoman empire and then to early modern Europe. But, as Natalie Dohrmann and others have pointed out, Jews did not simply live in a world defined by Jewish law and ethics alone. The early rabbis, beginning in the Roman empire, largely without political or police power with which to effect enforcement of their rulings, elaborated a legal and religious system for their community but with one ear out for both neighboring communities and the law of the ruling regime, modifying their rulings to enable their people to live both apart from and within the cultures in which they lived. Eighteen centuries later, one sees the same dynamic at work in Isaac Bashevis Singer's description of his father's law court in early twentieth-century Warsaw. His father's jurisdiction is greatly circumscribed. His cases concern the regulation of ritual activity and marriage, for the most part. A delicate balance is achieved in the family and in the community between assimilation and conformity to Russian law, on the one hand, and, on the other, fidelity to an everadapting Jewish law.

In the modern period, however, by and large, law, religion, and ethics have in most places been progressively differentiated in conception and institutionalization, being understood, both socially and rhetorically, to inhabit different domains, while debates about their interrelationship have provided the framework for an ongoing conversation about how society ought to be governed. Law has been a prime mover in the production of a modern secular consciousness, whether of the repressive or of the liberating sort.

In the economy of the modern academy, law, religion, and morality may, roughly speaking, be considered from a philosophical or an historical/social-scientific perspective, depending on whether one wishes

to argue abstractly about law as a part of the nature of things or whether one wishes to understand and describe law as embedded in human society and culture, now and in the past, in all its messiness. In either case, at the beginning of the twenty-first century, law, religion, and morality, and reflection upon them are, by and large, seen by most scholars to have plural forms. It is not enough to understand the relationship of a single system of law, a single religion, and a single moral tradition in one place and time. One must seek to understand how they relate in a state of radical pluralism and rapid change. And one must ask whether pluralism and radical change are modern phenomena or whether they characterize all of human history, so that cultural essentialism is inappropriate in understanding the past as well.

The Study and Practice of Law Today

The academic study of law today is in the midst of change. Understandings of law in the modern academy, arguably achieving their high water mark in the work of H. L. A. Hart and others, were, beginning in early modernity, increasingly positivist. That is, law was understood to be a deliberate human construction. Legal authority was understood to reside solely with the sovereign. Law was what the sovereign said it was. Law had no debt to religion and had no morality of its own. Law was understood to be autonomous. Law functioned as a closed system and was studied as a closed system. It had its own modes of thinking and a specialized profession of those experts in such thinking. Its goal was largely utilitarian, efficient social control producing the greatest good for the greatest number. Law that did not fulfill these criteria – what was denominated religious law, for example – was simply not regarded as law.

Over the last half century there have been a number of different critiques of legal positivism. Beginning with legal realists who imported social scientific thinking into the study of law, but more rapidly thereafter with rights theory and critical legal studies, among others, the modernist pretensions of the law have been devastatingly deconstructed. Law, and the study of law, is in considerable disarray. Law is studied using the tools of all of the disciplines of the modern academy. It becomes difficult, then, when relating law to another academic discipline such as religious ethics, to know of which “law” to speak. When the internal critique of law is combined with the enormous expansion of “law” through a globalizing of legal practice and scholarship, it is a daunting task indeed. It is one that also faces an academy that largely assumes an irreversible secularization of law.

The necessary and progressive secularization of law has been taken for granted as a mark of progress and of modernity until very recently. Beginning in the medieval period, law, like politics, business, and education, was, in many places, gradually divided from the workings of the church. There were different theories as to how the relationship should be understood, and the extent to which law depended on religion for its moral foundation and anthropology, but law gradually developed a life of its own. Such a separation continues to unfold around the world, for the most part, particularly with respect to international and commercial law. (Family and criminal law remain in most places still heavily indebted to local religious and cultural understandings of the human.)

A notable and sustained critique of this growing separation has come from several quarters in the last 25 years. Religious thinkers and actors across religious traditions seek to reverse the trend and to link explicitly religious values to state law. They seek to reintegrate what they see as a dangerously atomized and degenerate society around shared creeds and structures. Some Muslim thinkers build such a theory on the idea of *Shari‘a*. *Shari‘a*, for them, serves as a complete legal system, religiously sanctioned and

more than sufficient, appropriate for the governing of a modern society in all its aspects, private and public. Some Jewish, Christian, Hindu, and indigenous thinkers make similar arguments, to take just a few examples. On the other hand, some religious thinkers have seen the employment of law as the antithesis of true religious conduct. Law, for these people, constitutes a threat to moral values and to the duty one voluntarily owes to God. Discipline should be internal.

Other challenges to modernist notions of law as universal, transcending social and cultural boundaries, come from critical theorists who see law as always implicated in exercises of power and/or as always local, embedded in and particular to the realities, religious and otherwise, of a single community. International human rights conventions and other transnational agreements struggle to express universal human values while protecting self-determination, religious and cultural. Martha Nussbaum and others have attempted to justify universal human rights philosophically, while critics argue that universality is impossible, that most international law simply encodes concealed Western assumptions, religious and secular, about anthropology and cosmology. These critics would have modern Western law acknowledge its religious and cultural bias, coming to the international negotiating table as a local, rather than as a universal, system.

Complicating the multiple legal, religious, and ethical layers of contemporary life is rapid technological and scientific development. Increasingly, a serious and thoughtful theory concerning the relationship between religion, law, and morality depends on a defensible scientific theory of human behavior. Why and how do people do what they do? How does law work? Why do people obey laws? Do they, in fact, “obey” them? Is nature and/or culture and/or religion a more significant element in determining human behavior? And are law, religion, and ethics to be thought of as nature or culture? Is religion to be understood as a universal aspect of human culture structuring the human imagination or as a narrative in service of ideology?

A rapidly evolving science of human behavior suggests a continuum of possibilities. Evolutionary psychologists may argue that human behavior is largely programmed by longstanding species adaptations to survival. On this reading, law, religion, and morality are simply epiphenomenal, ways of explaining or describing what would be done in any event. Those on the nurture end of the spectrum would argue for a heavy environmental component as a conditioner of human behavior. People are not simply born hard-wired for life; rather, their behavior is molded and shaped by their experience, both external and internal, intentional and not. Law, religion, and ethics would for the environmentalists assume a more important role in actually structuring and changing human activity. Law’s own self-understanding, for the most part, falls into the environmental end of the spectrum. It assumes that law is an important conditioner of human behavior, that it does affect what people do and can be used as a tool of societal reform, because people obey the law out of fear of sanctions. Religion works with a range of explanations for human behavior. Religion may or may not assume free will. It may have access to force as a means of ensuring compliance with its norms, or it may rely on promises or threats to be enacted in future lives. Systems of morality depend on the reality of human intentionality and, when they cannot rely on law and religion, must depend on exhortation and persuasion.

In the United States today, and many other places, one issue that falls at the intersection of the three systems under discussion is the regulation, or not, of sexual behavior and of reproduction. The laws of the various states until recently prohibited sexual relations between members of the same sex and have limited marriage to one man and one woman. Until the Court’s decision in *Roe v Wade*, abortion was prohibited in most states. Can these laws be defended in purely secular terms? Are they rather grounded

in a particular Christian anthropology which understands homosexual activity to be sinful, marriage as ordained by God, and a fertilized egg as having a human soul? (See Janet Jakobsen and Ann Pellegrini, *Love the Sin*.) If the latter is the case, does the Constitution prohibit such arguments for laws? Must laws be publicly justified, whatever the motivation of the legislators, on purely secular grounds?

In *Bowers vs. Hardwick* (1986) the Supreme Court of the United States held that there was no Constitutional right to privacy protecting homosexual behavior. In response to the argument by the challengers of the statute that it had no rational basis, Justice White, for the majority, said: “The law ... is constantly based on notions of morality, and if all laws representing essentially moral choices are to be invalidated under the Due Process Clause, the courts will be very busy indeed.” Concurring, Justice Burger added: “Condemnation of those practices is firmly rooted in Judeo-Christian moral and ethical standards ... To hold that the act of homosexual sodomy is somehow protected as a fundamental right would be to cast aside millennia of moral teaching.” In dissent, Justice Blackmun, citing the ecclesiastical origins of anti-sodomy laws, argued: “The legitimacy of secular legislation depends ... on whether the State can advance some justification for its law beyond its conformity to religious doctrine ... A State can no more punish private behavior because of religious intolerance than it can punish such behavior because of racial animus.”

In part the debate in the court, and in American public discourse generally, reveals a community split about basic issues. Is homosexual identity biologically based? Can homosexual identity be modified through law, religion, or ethical exhortation? Should modern secular state law in a pluralistic nation be justified in “scientific” or in religious or ethical terms? Is it possible to somehow craft a law which simply “keeps the peace” and leaves religious and ethical choices to the individual and her chosen community? This is a loud and contentious debate, one that is magnified at a global level. While the 2015 decision in *Obergefell v Hodges* found a constitutional right to same-sex marriage, public acceptance of that decision, as of the decision in *Roe*, remains tenuous.

While the regulation of the family and of sexuality dominates the headlines in these areas, the proper relationship between law, religion, and ethics is a matter of debate across contemporary institutions. Today’s many migrants face the competing demands of multiple legal, religious, and ethical cultures and multiple layers of authority – local, national, and international. A Laotian man is imprisoned in the United States for abduction when he attempts to enact his tradition’s way of marriage through engaging in bride capture. Muslim schoolgirls in France were dismissed from school for covering their heads. In Israel religious orthodoxy controls the marriage laws and mixed marriage is prohibited. Christian conversion may curtail the civil rights of Indian dalits. But all of these essentially cultural ways of understanding human identity, however different, contend with materialist explanations as a basis for law.

CHAPTER 32

Schools and Monasteries

Christine Luckritz Marquis

For much of history, the idea of “schools” was less likely to conjure our modern notion of a building in which instruction occurred. Rather, schools consisted of a master and his disciples. In the Greco-Roman world, the schools where moral inquiry took place were the philosophical ones, such as the Platonists, Aristotelians, Stoics, and Epicureans. We might also include Cynics in this collection, though they did not tend to function as much like schools as the other philosophies. (For a good summary, see Bénatouïl 2009.) Regardless of which philosophy one adhered to, transmission of moral knowledge often occurred via a mixture of spoken discourse (including lectures) and didactic writing exercises. Moral inquiry focused on what constituted the “good” life and how best to achieve it. While an interest in constructing a civil society might be a value of a given philosophical school, discourse emphasized moral behavior in the individual. Situated around a dynamic instructor, such schools continued and expanded through students teaching (and often adapting) the lessons of their master. Thus, we can image moral knowledge spreading through generations of teachers like the limbs of a tree spreading from the trunk.

Early Christian

Christianity, emerging in this Greco-Roman context, likewise developed around the model of a foundational, charismatic teacher (Jesus) and his students (his disciples). After Jesus’s death, transmission of the Christian message continued partially through the teacher-student relationship. Moreover, some early Christian groups quickly clustered around the memory of one or another of Jesus’s first disciples. That Christian communities might look like philosophical schools, with a leader who sought to convey moral knowledge, highlights the hazy delineations between “schools” and what we moderns tend to retrospectively call “religions.” The places where these porous boundaries are most visible are the major cities, especially Alexandria. Across the second and third centuries CE, alongside the emergence of house churches, interpretations of Christianity would pop up around charismatic teachers (e.g. Marcion, Valentinus, Irenaeus). Often the individual was a prominent presbyter or bishop, but sometimes – as with Origen of Alexandria – the teacher was just an educated church member. All interpreters sought to understand the growing body of Christian texts with the goal of explaining existing practices and justifying new ones.

These competing interpretations are often referred to in scholarship as “schools,” as they paralleled (and likely developed in conversation with) other Greco-Roman philosophical schools in the region. So, for example, the Alexandrian Christian “school” became known for its allegorical interpretation of Scripture in contradistinction to more literal readings of sacred texts (Watts 2008). How one read Scripture had important implications for how questions and answers regarding morality were framed. Swirling around these early schools were questions of authority (could an unordained but educated Christian interpret with validity for others?) and questions about legitimacy (which understanding of Christ’s message and which practices were correct?). At stake in many of the debates was not merely access to power but also concern about living “correctly” – morally – in order to achieve salvation.

Late Ancient Christian Monasteries

From the fourth century on, Christian education increasingly was situated in monasteries. Churches continued to develop catechetical training of some sort for the entire community, but higher preparation became increasingly the purview of the ordained and/or the holy man. That is, in-depth moral training occurred in a manner and locale set off from the daily lives of most Christians. While the most famous late ancient monk may have been the Egyptian hermit Antony, many who chose the monastic life opted to live communally under a shared rule. Several such monasteries developed in and around Gaza across the fifth and sixth centuries, preserving the traditions of past Egyptian ascetics (Bitton-Ashkelony and Kofsky 2006). The prominent place that the gathering, copying, and study of texts among these monks held indicates how highly valued education and its transmission were. It was quite plausibly these Gazan monks who gathered the various wisdom of past monks in the famous *Sayings of the Desert Fathers*. While the sayings may have originated as oral knowledge passed on from master to disciples, under the rigorous Gazan school the sayings became a text-based guide to ethical behavior. The monasteries expected some degree of literacy from its members and used the sayings as school exercises to instill the skills of reading and writing. In particular, extant variations among copies of a particular saying indicate that such short apothegms were malleable enough to be useful as rhetorical exercises (Larsen 2006). But their content makes equally clear the importance of the sayings in the moral formation of the monks. Multiple sayings attest to the aspirations of the monks to live properly in relationship with their neighboring brethren. They likewise attest to monks’ continued struggles against the vices of anger, jealousy, greed, apathy, and the like. The copying of such aphorisms functioned to internalize the expectations of the monastic community. Given that most communal monasteries placed a premium on silence, it is perhaps unsurprising that texts took on a more prominent role in moral formation. Through reading and copying the wisdom of long dead monks, the new generations of Gaza were able to maintain a link to a nostalgic past.

Rabbinical Schools

Comparable traditions, in particular the rabbinical schools and later Islamic schools, emerged in the ensuing centuries. In the third to sixth centuries, alongside monasteries like those at Gaza, Jewish teachers developed amoraim, the earliest rabbinical schools. As later pedagogical models have largely obscured their first pedagogical examples, how precisely such schools functioned is difficult to unearth. What is clear is that near the end of this era, a document similar to the *Sayings of the Desert Fathers*

developed: the Babylonian Talmud. Although oriented more toward religious laws than the *Sayings*, the Talmud shares not only a general ethical concern for the properly comported life, but also particular themes (e.g. prayer, anger, forgiveness, and particular interpretations of biblical figures) (Bar-Asher Siegal 2013). Thus, both the *Sayings* and the Talmud should be understood as arising out of educational contexts concerned with codifying in text the wisdom of past teachers and with instilling in students the textual, interpretive, and ethical practices needed to impart that wisdom.

The schools that succeeded the rabbinical schools of the Talmudic era, the geonim, arose under Islamic rule in the seventh to eleventh centuries and inherited a fixed Talmudic text. They remembered their predecessor schools as strictly distinguishing between what was written and what was taught orally and attempted to continue that traditional framework. Scripture and private notes could be written, but all interpretations were to be taught orally. Listening to their teachers' lessons, the students, in turn, would memorize them, and then orally repeat and question each interpretation. Such a process meant that face-to-face interactions between teachers and students were the means through which decisions, including moral ones, were learned. In this mode, the Talmud alone was not considered an adequate source for moral formation. Rather, the ethics of life focused on engaging and, where appropriate, adhering to past teachers' rulings and interpretations. As the Jewish diaspora spread over a larger geographic area, the people had a harder time accessing the later geonim, and the Talmud increasingly became a written source from which one might learn. Although teachers still played a role in later rabbinical schools, the transmission of oral wisdom that created a chain of teachers through the generations gradually lost importance. In its place, the Talmud as a written artifact became a solidified, authoritative body of knowledge to which not only students, but also anyone who read, could appeal (Fishman 2011).

The geonim had flourished early under Muslim rule. For the first two centuries of Islam, both Christian monasteries and rabbinical schools found themselves as continued loci for conveying several types of knowledge. Christians and Jews taught fields such as mathematics, astronomy, astrology, science, and (in particular) medicine to their new Muslim neighbors. Study of these topics was eagerly sought by many of the Abbasid court, but was delineated as "foreign" knowledge, distinct from specifically Islamic wisdom. For study of the Qur'an and hadith, early Muslims attended teaching circles held in the first mosques. That is, Islam from its foundation was concerned with educating all its practitioners in its own sciences. Throughout Islamic history, mosques have remained important sites of knowledge transmission. In this way, the boundaries between a locus for worship and a space for schooling blur. But in the ninth century, as Arabic became the common language of the empire and the Abbasid rulers cultivated a textual culture at and around Baghdad, Islamic schools displaced their Jewish and Christian counterparts as the main centers of knowledge production. Many texts that had originally been in Greek, Syriac, or Persian came to be translated into Arabic. (See the works by Hill, King, Pingree, and Isaacs in Young, Latham, and Serjeant 1990.) Christian monasteries and Jewish geonim continued to function, but without caliphal support they were greatly diminished in both size and influence on the larger culture, serving only their own minority communities.

Islamic Schools

With Abbasid support, the establishment of Islamic schools, or *madrasas*, developed in and around the capital city of Baghdad. The phenomenon quickly spread to surrounding regions under their rule. Often translated as "colleges," these schools were where individuals trained in one or more of the four Sunni legal schools (Hanafi, Shafi'i, Maliki, and Hanbali) as well as in exegesis of the Qur'an and the hadith.

These legal schools played a vital role in Islamic daily life, their teachings informing the broader Sunni Muslim population's notions of what constituted the moral life and how it ought to be enacted. Although the proliferation of *madrasas* emerged slightly later in Cairo, its schools highlight both the continuity with and innovation of past pedagogical models that occurred (Berkey 1992).

Under the Mamluk regime (1250–1517 CE), Cairo grew to become the premier intellectual center of Islamic learning by the thirteenth century. A plethora of schools full of teachers and students bloomed in and around Cairo, and intellectuals fleeing Mongol-ravished Baghdad soon joined them. As was the case for most of the previous examples, students sought out highly reputed teachers rather than particular schools. Like their geonic counterparts, it was the teacher (*shaykh*), not books, who was truly understood to be the source of knowledge. A renowned teacher could point to a lineage of past teachers through whom information had been transmitted on how to live the proper Muslim life. Both the names of particular teachers in such a chain and the relative length of that chain bolstered the authority of a given teacher's claims to legitimacy. Because students attached themselves to a teacher rather than a school, not only the instructor's lessons, but also his comportment inculcated his followers. For the larger institutions this was especially true, as teachers and students often lived alongside one another within the school's walls.

Endowing a school in Mamluk Cairo carried a significant amount of cultural cachet, and thus schools became a way for local elites to showcase their wealth and their piety. Depending on a given funder's wealth, schools might be quite elaborate with extensive library resources or more humble with limited manuscripts with which to engage. That each school was individually funded meant that while certain constants were held across schools, there was room for innovation as well. So, all schools tended to also function as worship sites, but whether or not such worship included Sufi rites depended on who established the school. Teachers, especially famous and sought after ones, also might play a prominent role alongside the endower in determining what was and was not taught. The preferences of the endower of the school also surfaced in the curriculum and sometimes the architectural design of the building, the larger legal school tradition to which a patron subscribed being given a more dominant place. In this way, school structures physically marked portions of the landscape as loci of more intense ethical formation. As with many of the past exempla, schools still relied on the reputation of a given teacher or several teachers, but what is noteworthy here is that buildings also were now designated a role, however minimal, in the education process. That funding could come from either men or women also allowed more access, though still decidedly limited, for women alongside their male peers. The entire system was a dynamic one, students being taught ethics by teachers both in lessons and the lived moments in between, within and through the architecture of a given school. Throughout the Mamluk era, such diversity among schools was allowed, if not actively encouraged.

Medieval Christian Monasteries

Such a rich and diverse educational culture stands in stark contrast to Christian models that emerged in the West. As elsewhere in the Christian world, monasteries were the primary centers for education and moral formation. After the fall of Rome, many noblemen, especially the younger ones, joined monastic communities. In fact, across the western half of the Christian world, monasteries soon served as major education centers for most young men of means, replacing the older rhetorical and philosophical schools that had existed in the Greco-Roman world since before the emergence of Christianity. What made

monasteries distinct, both in the western ones and their eastern counterparts, was that the emphasis on literacy and education more generally meant that knowledge and focus on the ethical life were not solely the purview of the wealthy elite. If a poorer individual should commit himself to a monastic community, then he too might receive an education, one he otherwise would never have had access to.

As noted earlier, Christian monasteries established and enforced common guidelines for their occupants. While these rules were meant to negotiate daily life, they also served to instill particular ethical values. Such rules dictated appropriate thought and prayer processes as well as proper bodily comportment. The dynamic interplay between physical and mental control was meant to mutually support each goal. At first, rules varied from region to region, and sometimes even from monastery to monastery. *The Rule of Benedict* is noteworthy among these variants because of its author's overt intention to be not only a guide for monastic life, but also a "school for the Lord's service" (White 2008, 9). That is, the *Rule* makes explicit that monasteries and schools were often perceived as interchangeable categories in the medieval West. While the *Rule* developed in the sixth century, its popularity reached new heights under Carolingian rule. Under Charlemagne and then his son, Louis the Pious, Benedict's *Rule* became the rule by which all monasteries were to be managed as an attempt to centralize authority and limit diversity. It also served to produce a flourishing manuscript culture in Latin. Whereas translation into Arabic under the Abbasids had established and promoted a range of Islamic schools, such a translation movement in Latin was made possible by limiting monastic innovation.

In the ensuing centuries of the medieval era, Benedict's *Rule* maintained the importance if not absolute prominence Charlemagne had envisioned. Although Benedict's *Rule* had been designed for male communities, it also came to be instituted in the parallel structures that emerged for women. Given the emphasis of the *Rule* on study, its use in convents meant that women also might have access to an education. Despite the opportunity, medieval nuns were rarely taken seriously as authors or teachers in their own right. Hildegard of Bingen, first a nun and later Benedictine abbess, stands as the notable exception, having capitalized on her educational privilege to become a theological force in her own day (Newman 1998). While she is perhaps more famous for her written visions, the *Scivias*, Hildegard was also an author of homiletical, natural historical, and medical texts as well as poems in Latin. Beyond her writings, she was an equally skilled artist and musician. In fact, she wed her literary and musical skills in a moral play, *The Play of Virtues* (Kienzle 2000). Hers is the only known moral play written and performed by a woman in her day. While it clearly celebrates chastity as a higher good than marriage, the play more generally encourages all its hearers/viewers to abandon whatever sin might plague them and deepen their virtues. The nuns of the convent performed the play at least once a year themselves. Thus, each nun was assigned to embody a virtue in relation to her fellow sisters/virtues. The play in particular highlights how Hildegard transformed her own skill and access to knowledge into an educational tool meant to transmit moral wisdom to the nuns under her guidance.

The Rise of Universities

While Hildegard represents a pinnacle of women's educational achievements, the twelfth century quickly brought such opportunities for women to a close. In the last decades of Hildegard's life, a new type of school rapidly began to emerge: the university. Universities were outgrowths of cathedral schools, parallel educational institutions that had existed alongside monasteries, serving to educate clergy and

some portion of the nobility. The cathedral schools and monasteries had complemented each other rather than competed in the educational sphere. Monasteries were the primary sites of moral formation, with the cathedral schools directing their students both in theological and daily practicalities. With the development of universities in Paris, Oxford, Bologna, and other major cities, monastic education was somewhat diminished. While individuals still might receive their initial education in the monastic context, the university came to be seen as the place where one went if they desired more rigorous training. That theology was one of the three major areas of inquiry one could pursue, indicates the central role that Christian ethical formation played among the educated elite. What was novel in the new university system was the increased importance placed on the institution rather than the teachers. While certain “schools” of thought continued to compete within these structures, being tied to a particular school name itself came to carry value. This attention to where rather than who one studies with has been bequeathed to our modern educational system.

The exclusion of women at universities meant that convents maintained their roles as loci of education, albeit much dampened in rigor or extent. The famous example of the abbess known as Julian of Norwich highlights how such education continued primarily in vernacular languages rather than the more highly valued Latin. Moreover, her role as a visionary speaks to the increasing emphasis placed on mystical visions as an alternate way to experience the divine and perform one’s morality. While Sufi visionaries were cultivated alongside other educational models, Christian visionaries often emerged among women excluded from the university system, nun and secular alike. In particular, Julian served as a spiritual guide not only to the nuns under her, but also to spiritual women like Margery Kempe. The relationship between Margery, a secular woman who both begat children and had her own divine visions, and Julian, a reclusive abbess, speaks to the ways in which the new educational model of the university fostered and enhanced educational alliances among women of different stations.

This historical tour de force of schools and monasteries across fifteen hundred years indicates both institutional commonalities and innovations in how moral knowledge was conveyed in multiple religious traditions. Training in schools and monasteries shared the fundamental goal of conveying moral knowledge. Underlying the various models described above was a desire to socialize individuals in a particular approach by gathering them for intense exploration. In many of the examples discussed above, students were expected to devote their lives to not only a particular philosophy but also the very locus where training occurred. That is, such formation was not restricted to particular hours of the day, but rather was understood as necessarily one that required full immersion into a communal, pedagogical ethos. Such still is the case for Christian monasteries, where adherents are expected to live within the confines of the community for the remainder of their days.

Another common thread that weaves through most of the schools and monasteries described above is that they originally placed emphasis on teachers as lines of transmission rather than on individual study of texts. In each school or monastery, the teacher had a great deal of latitude in how they conveyed the tradition handed down to them. As noted above, some schools were more willing than others to allow an equal amount of freedom in interpreting past wisdom. The centrality of the teacher’s role meant mimesis not only of the teacher’s lessons but also of his or her daily life practices. The ability of a teacher to model proper morality and correct errors in understanding resulted in bounded knowledge. The combination of orally conveyed and embodied knowledge helped maintain the boundaries of what was considered ethical ways of being within a given tradition. Such approaches tended to be more conservative than

interpretations yielded by individualized study of texts in later periods, which allowed students to produce a wider array of readings.

In most of the examples above, there was a slow but perceptible shift in how moral knowledge was conveyed. For each tradition, the codification of oral knowledge only gradually leads to the creation of texts. Such textualization might limit the manner in which a teacher conveyed information, but it also opened up access to knowledge to a greater swath of individuals. Moreover, translation movements invited more individualized study of texts. The proliferation of texts possible after the development of the printing press only served to accelerate the ways in which texts themselves came to serve as teachers, introducing readers to this or that particular school of thought. In this way, the embodied knowledge that was conveyed through teachers and students living in community has increasingly been decoupled from the conveyance of ethical wisdom only over the last several hundred years. With the Internet, the role of self-teachers has accelerated exponentially. Once more, we find ourselves in an era of “schools” of thought as much as actual schools serving as loci of knowledge. The difference from the past is whether individuals also have a teacher helping them distinguish facts from fiction.

CHAPTER 33

Communications and Media

Günter Thomas

Introduction

No human being or any human society is conceivable without communication and media. The *animal symbolicum* (Cassirer) is also a *homo medialis*, a creator of media, by which social life is not only enabled in its diachronic and synchronic dimensions, but continuously reshaped. Communication media are the object of moral evaluations as well as the means for the transmission and dissemination of moral orientations for people. From the early development of societies onward, religions have dealt with the problem of communication with transcendent realities. For that reason, they are laboratories for the development of media and for means of their control. Given these conditions, any concept of the human being, society, and spiritual life entails an implicit vision of the place and function of communication and media.

Philosophical and religious traditions are sources for media and communication ethics. In light of the crucial importance of communication and the use of media it is not surprising that their regulation is not left to moral practices, but is often embedded in legal formations. Due to the materiality of communication, significant resources are needed for the creation of media. Hence communications and media become a matter of economic calculation and control. Since modern democracies depend on free communication processes and access to media, both “old” and “new” media are socially embattled. When technological advances allow a wide-ranging observation of communication and the processing of the generated data, the moral implications of such an “all-knowing” entity become an intensely debated issue. Against the background of each of these richly textured and powerful social practices, media ethics has a strong descriptive as well as a normative branch. And yet, faced with the pace of techno-cultural innovation, any ethical reflection on communications and media tends to come “too late.” The complexity of the level of communication and media practice leads then to two consequences. First, any ethical reflection is embedded in a more encompassing social theory. Second, there exists no comprehensive media ethics for all communication processes in which media play a role. Instead, the field of media ethics is highly differentiated and compartmentalized.

Communication and the Multiplicity of Media

Four types of media need to be distinguished:

- 1) *Media of communication* (M1) are the basis of social life: language, sound-clusters, gestures, smell, smoke, but also more sophisticated ones like narratives, architectural symbols, rituals, and clothing patterns. Often analyzed as signs or symbols, media of communication are bound to interaction in distinct spaces at distinct times. Plato's arguments about orality versus literacy as well as Aristotle's discourse about the impact of fictional communication in the theater provide examples of these early ethical controversies about the media of communication.
- 2) *Technological media of transmission* (M2) allow communication to transcend space and time. Writing in general and particular forms like letters, books, the telegraph, the radio, the telephone, newspaper, television, the cinema and eventually computers, the Internet, and the cellphone fall into this category. Rituals as replicable performances had been powerful media of transmission in early empires. All media of transmission rely on the existence of media of communication (M1) and at the same time selectively transform them. Movies, sitcoms, or series consist of complex multimedia packages of media of communication which can be stored, streamed, and traded.
- 3) *Generalized media of exchange* (M3) are developed in modern functionally differentiated societies (Luhmann 2012; Habermas 1987, steering media) and in most of society's subsystems. If something is communicated through the specific medium of a given sphere – as inappropriate as it might be outside the respective sphere – it tends to be accepted in that subsystem. Power in the political sphere, money in the economic sphere, or love in the sphere of intimacy are prime examples.
- 4) *The media system* emerged in the twentieth century as one of society's subsystems (Luhmann 2012) or sphere of value (M. Weber) (M4) operating on its own code and rationality (besides law, politics, religion, sport, etc.) fulfilling a unique function for society. In this sense, the so-called media system is often considered to be a fourth estate or power side-by-side with the three powers of the state (executive, legislature, and judiciary). Any efficient media system utilizes a variety of media of communications (M1) and media of transmission (M2), which are then modulated in recursive processes. However, not every use of media of transmission – like the reading of the Bible in church, the use of films in school, or fax machines in university offices – can be considered part of the media system.

The so-called new social media which became prominent after the turn of the millennium embody hybrid forms. They make use of transmission technology for the sake of connectivity which is extending social interaction and is simulating physical presence. Because of this feature, new social media not only permeate everyday life but also profoundly shape it.

Ethical reflection aimed at moral analysis and orientation can focus on all four types of media. For instance, questions about the role of school uniforms or the place of dance in worship as well as about the threshold separating polemics from hate speech, each relates to the level of primary *communication media*. Debates about the role of reading for citizen education, about the amount of TV-viewing among and cellphone use by junior-high school students, as well as about the place of digital learning at universities, concern moral issues on the plane of *transmission media*. Discussions about the role of money and power in the life of education institutions or about appropriate bodily communication in situations of intimacy relate to a

social ethic of *generalized media of exchange*. When people debate the role of the media in politics in general and in elections in particular, when the role of broadcasting in the organization of the Olympic games is disputed, when teachers complain about students' lack of attention on Monday mornings, or citizens of other countries feel misrepresented in the national news, the *media in their systemic* setup are the focus of ethical reflection. In the social practices of a given society, the types of "media" are deeply intertwined.

Ethical Approaches Related to the Communication and Mediation Process

The various kinds of media ethics can be clustered according to an overly simplified model of communication processes: sender, mediated message, and receiver. First, there are agents as producers of communicative offers on the level of media of communication (M1), moral agents choosing specific media of transmission (M2), initiating agents using generalized media of exchange (M3) and eventually also agents and agencies forming and shaping the institutionalized system of the media through their actions (M4). Second, there is the utterance or statement in a specific communication medium (M1), the packaged product in a medium of communication (M2), the communication or action using a medium of exchange (M3), and also an overall impact a media system has on the subsystem of politics, religion, education, and so on (M4). Third, there is the recipient of an utterance (M1), the people buying and watching a packaged product in a transmission medium (M2), agents who accept a communicative offer in a medium of exchange (M3) or agents and agencies who accept the impact the media system has on their sphere of responsibility (M4).

On the side of what can be called, for the reasons of simplicity, the "sender," moral orientations are often embedded as tacit forms of knowledge in more fluid forms of social tact and the public recognition of situations (M1). What can be said in a courtroom or classroom differs from the dinner table, for example. Beyond that, among professional speakers, such as lawyers, journalists, psychiatrists, preachers, teachers, or politicians, professional ethics have developed. In professional ethics, the most influential ethical models are virtue or deontological ethics. When journalists start lying, a whole profession can be thrown into crisis. When politicians stop embodying virtues like courage or respectfulness, democratic processes can be jeopardized. Since representatives of a profession are endowed with a high degree of social trust, apparent violations of responsibility can radiate through large areas of social life. Sexual misconduct of priests, trainers, producers, and politicians are current and painful examples.

Compared to the ethical analysis concerning the sender, the discourse on the receiver is underdeveloped. On the reception side and in the case of communication media (M1) the moral issue is – among others – reflected within an ethic of self-respect and responsibility for one's own life. The communication media in which someone wants to be involved depends on her or his vision of flourishing (Booth). On the level of technological media of transmission (M2), consumer ethics is emerging that reflects the insight that through feedback loops, that is to say, recursive processes, the recipient can influence the behavior of the sender. Whoever listens stipulates what is and can be said. Consumer ethics is often embedded in cultural practices and varies significantly across social strata. The place where the implicit moral practices become an object of ethical discourses is education within the family. The transmission of conflicting moral orientations by the use of TV, the Internet, the cellphone, or social media opens up discursive spaces in which an ethics of goods and deontological ethics as well as utilitarian approaches to moral actions collide. Consumer ethics demonstrate how many moral orientations rely on the texture

of role models in the social environment, education, broader visions of life, and the formation of individual responsibility. On the recipient side of communication, moral orientations support responsible individual choices.

Ethical discourse on what, in the current simplified model, is called “message” is a highly contested area. Several overarching principles become visible but are difficult to harmonize. In fact, normative frameworks for the whole field of media communications come to the forefront. In Western societies indebted to Enlightenment traditions there are two fundamental rights highly valued. The freedom of speech is an individual and communal right (i.e. for newspapers or broadcasting stations) and the social precondition of constitutional democracies (Ward). In addition, audiovisual entertainment but also traditional forms like theater or musical performances claim freedom of artistic expression even though they might be critical of political or religious institutions and policies. In addition, in international affairs, the freedom of trade concerns packaged media products. These three forms of freedom, however, can be in conflict with other moral goods. To what extent the freedom of expression allows a critique of religion without violating the right of freely practicing religion is frequently discussed. In recent years, the claim that certain portrayals of religion hurt the feelings of religious followers has sparked intense debates about constitutional and civil rights. The widely accepted claim that media communication and especially packaged media communication should respect human rights has a strong positive and an yet also a questionable effect. On the positive side, moral orientations in the field of communications and media can be compared with other areas of social life. However, it remains difficult to specify which communications violate human rights and in particular the rights of particular peoples. The danger is that under the umbrella of a human rights any kind of strong critique of inherited social practices can be silenced. Most Western societies tend to value the freedom of speech so highly that they allow far-reaching (but not totally unrestricted) critiques of opposing views and worldviews.

Moral Challenges in the Field of Communications and Media

The breadth and depth of the ethical field of communication and media can be comprehended by considering crucial issues that are timely and timeless.

Blurring the Border Between Reality and Fiction

Since people tell stories to narrate their experience and to explore their lives, the distinction between truth as factual and truth as fictitious has been debated. In modern communication, this distinction is reflected in the difference between information and entertainment. Even a seemingly rigid separation of these has to acknowledge that a fictitious story can be true and any fact-oriented communication has to add elements, often fictitious, to catch the audience’s attention. Most contemporary debates hardly move beyond two ancient arguments. The Enlightenment criticism of communicating fictions goes back to Plato’s philosophical critique of the mythic imagination in his ideal state. He held, in the *Republic*, that fiction erodes the moral formation of the youth based on the assumption that the uneducated cannot properly distinguish between fact and fiction and hence they imitate immoral acts of the gods narrated in stories. Aristotle’s *Poetics* takes the reverse stand. The partial identification with a tragic hero through the poet’s making of a plot can provide a *catharsis* of pity and fear that benefits the moral life of citizens. However, there is a legitimate moral concern with the marginalization of fact-oriented communication

within entertainment culture. Equally important is the concern that invented information be labeled “true” can undermine democratic processes.

The Mediation of Distant Suffering Through Media of Transmission

Even though people in the past were not utterly tied to their locality, the Internet (including social media) has changed the social imaginary of localities and social presence. Communication technologies permit specific forms of technically mediated social co-presence across spatial distance. The space of social interaction is decoupled from the range of perceiving life. This decoupling has far-reaching consequences for a media related ethics of responsibility “regarding the pain of others” (Sontag 2003). Communication technologies (M2 and M4) make the spectator a witness to distant events, injustices, needs, and pains. Media can turn spectators into voyeurs who have to negotiate proximity and distance. Through media technology moderns become “travelers in the landscapes of pain” (Boltanski 2008). Even though these vistas can mobilize aid and political solidarity, the connection between others’ suffering and the possibility for spontaneous help is systematically decoupled. Seen alternatively, the enormous expansion of perception by means of audiovisual media technology is only possible on the basis of the decoupling of perception and social space, and, therein, taming the tide of the negative news. Given that any help remains disproportionate to the suffering and the horrors of injustice seen around the world, some moral observers think that this media constellation might cause an exhaustion of compassion. Undoubtedly, there is an unbridgeable gap between a vague feeling of responsibility based on media-facilitated perceptions and the disproportionately limited options for concrete action.

The Choice of a Medium as Moral Act

Every medium facilitates and at the same time restricts what can be communicated. Every medium creates both sight and blindness. This concerns media of communication (M1), transmission media (M2) as well as media of exchange (M3). The bouquet of flowers says both more and less than the spoken promise. For good reasons, the vow of marriage should not be made over the phone. Political advertising by means of TV-spots cannot say the same as a written political program. Every medium embodies a specific rationality to a certain extent. In a sense, “The medium is the message” (McLuhan), or at least a meta-message and an impacting entity. Without any doubt, the spread of the radio was a factor in the rise of fascism in Europe. The advent of audiovisual media like television sparked the discussion about the extent to which political discourses can be carried out in visual media. Is visualization a way to trivialize the complexity of political matters? Given that the chosen medium or even a set of media have a distinct effect on both the possible content and the receiver, the choice of the medium is inevitably an act of personal or institutional moral responsibility. This problem reflects ancient debates about the power of rhetoric and its choice of morally appropriate linguistic and performative tools.

Conflicts about Religious Media of Communication and Transmission

Religions have always been creative cultural laboratories (1) for the development of multimedia performances (rituals, worship) (M1), (2) for media through which the (absent/transcendent) divine can communicate (M1), and eventually (3) for bridging time and space among the community of believers and to

reach out for mission (M2) (Horsfield). In particular, what serves as media of divine communication belongs to the peculiar ontology of a faith community. Many interreligious as well as intrareligious conflicts can be understood as conflicts over media preferences. Since the media for divine communication are the most holy material objects in religions, not only is their spatial location heavily disputed, but they can become the target of interreligious hostilities and destruction as well. When mosques, relics, churches, bibles, crosses, or the Qur'an are destroyed, the aim is also the other material medium of religious communication. In a similar vein, intrareligious conflicts about the role of Mary, the ordination of women, the furnishing of religious buildings are media conflicts. The Pope in the Catholic imagination is not just the highest representative of the Catholic Church, but also a literally outstanding medium of divine communication. Not only the materiality of religion, but also most of the history of theological imagination is a media history with far-reaching moral choices. The secular cult around icons of sport or music is a faint resemblance of this aspect of religious communication.

Medialization of Life

The increase of media of transmission for transcending time and/or space has an ambiguous double effect: it increases the reach of interaction through mediated interaction. At the same time the mediation of interaction is a substitute for real interaction based on physical co-presence (Lundby). This process of accelerated substitution characterizes late modern society and provokes much media criticism with tragic undertones. While it may be preferred to visit one's mother on her birthday in person, media of real time transmission allow Filipino women employed in Saudi Arabia to stay in real time contact with their children at home. Through this shift in the media ecology, physical co-presence becomes an even more valued asset. The process of increasing mediation raises questions about how essential physical co-presence is in social subsystems: the courtroom in law, the stadium in sports, worship in religion (Horsfield), personal encounters in medicine, summits in politics, performances in the arts.

Mediatization Inflicting in other Rationalities

Mediatization in late modern societies is a process in which social systems other than the media system transform themselves according to the supposed expectations of the media system. This can happen either through strategic planning or it might be more or less preconscious or even unintended. Based on such expectations of media, politics or sports can change their operations in order to attract media's attention: changes in statements, the provision of attractive photos, the scheduling and structuring of events, the showcasing of media-savvy personnel, and so on. The transformation of politics by means of the media is well studied. Even sciences have to adopt some media logic in order to attract political attention and receive public funding. An issue debated worldwide is the presence of cameras in the courtroom. The fact that cameras have an impact on interaction in the courtroom is beyond question. The ethical question is whether this is or would be a change for the better or worse and what would be the criteria for judging such. The public streaming of educational events makes them subtly shift toward sensationalism. In a word, moral orientations concern not only individuals but the formation, the maintenance, and the development of societies' institutions. Media's observations are never innocent or objective. On the level of organizational life, they change the object under observation.

The Fight for Attention

The investment of attention is a prerequisite for any form of communication and media use. Modern societies produce an enormous overflow of communicative offers compared to the amount of attention which can be invested in communication. Due to this asymmetry, attention becomes an embattled and scarce resource (Thomas; Couldry/Linvingstone/Markham). This battle for attention moves several moral issues to the forefront: what means for attracting attention are morally appropriate and how much blood needs to be shown in reports from warzones? Moreover, democratic societies need public debates. The ancient trope bread and circuses draws attention to the fact that attention can be exploited, wasted, and distracted. In the economy of attention, attention can be absorbed in ways that weaken citizenship. Particularly in democracies, the steering of attention is a prime locus of power. Thus, several moral questions arise: Who is deserving of and who gets attention? Are corporate moral agents (NGOs, churches, etc.) mobilizing and steering attention or do they imitate the media system's attention? In paid advertising, consumers are selling their attention in order to subsidize what would be more expensive without advertising. What are the personal or social standards for trading attention as a commodity? Are there thresholds beyond which advertising ought to be considered a pollution of public space? Interestingly enough, many countries have institutionalized forms of moral oversight of advertising and regulate what can be advertised.

Disappearance and Retrieval of Solitude

The obvious fact that human beings are social beings can lead to the conclusion that being connected by communication is essentially good. To communicate seems to be morally more valuable than not to communicate. Accordingly, being connected and being accessible for communication with others is the marker of life dominated by social media. The dominance of this social imaginary raises questions about the place and creative function of de-coupling communication and solitude (Booth). Religious, but also artistic and educational traditions, offer ethical resources for a retrieval of solitude in the life of the mind.

Global Communication Creating Unity and Division

It is a widespread opinion that communication as such is something good; that it furthers understanding, agreement, and respect and, so, eventually leads to a more peaceful world. The social image for the expansion of broadcasting and audiovisual media in the 1960s was the "global village." This image suggested that media of transmission create proximity which then equals familiarity and understanding. The same optimism was found in the emergence of the Internet. These visions did not become true because they are based on a twofold misunderstanding of communication that point to moral conflicts.

First, communication can deepen conflicts. Often, understanding, not misunderstanding, feeds conflict. Any communication takes place against a much broader background of tacit as well as vague suppositions of agreement. Communication is always risky, because it transforms the vague and mostly implicit background to explicit knowledge. Whoever can understand another person or community not tacitly but through communication might have more reasons to disagree. Social life, not only in close relationships but also in institutions and even more on the level of international

politics, works on the basis of untested and hence presupposed agreements. Given that fact, communication is never without risk.

Second, the possibilities of global communication do not necessarily create global aspirations and cosmopolitan consciousness. As seen in the last couple of decades, the Internet and the new social media became the means to reinforce chauvinistic group identities. These media mobilize and spread reasons for deepening divisions and fueling conflicts. Enhanced means of networking through hybrid new media can be used to do both: to enlarge the group of like-minded people and to spread markers of difference to an even larger group of less like-minded people.

That said, the very same media of transmission can be used for building trust and familiarity. In a moral view of these processes, the media function like a magnifying glass for existing divisions and for weaving bonds of solidarity.

Big Data

At the turn of the millennium, new technological developments gave rise to a new moral challenge in the field of communication and ethics: the comprehensive technological observation of individuals and large-scale populations' communications (Couldry; Meijas). This concerns every level of communication media described above. Through the processing of data gained by means of technical forms of observation, two goals are achieved. First, there is a comprehensive and precise image of a person's communication practice. Second, there is the databased predictions of peoples' behavior in the future. This raises several moral questions. Some of the data are collected secretly. And yet, many people trade their data in exchange for digital services, namely free apps for cellphones. Do persons have the right of information self-determination? Is the individual person entitled to determine what is done with their data, because that person owns them in the first place and they are in some way part of their identity? The diversity of answers given to this question reveals how culturally-bound the conceptions of individual freedom and dignity are.

Metaphorically speaking, the graven image of God is now replaced by the digital image of human beings. The all-knowing God of classical metaphysics appears to be replaced by an all-knowing digital superstructure. Defenders of data-collection point to many moral goods resulting from this observation of communication: crime prevention, economic efficiency, preservation of environment, and peaceful social interaction. Critics point out that the misuse of economic interests and political control eventually mean a massive assault on human freedom. The ethical handling of these moral issues will determine the fate of liberal democracies.

Conclusion

Insofar as we now live in an age of global communication, it is essential that theologians and philosophers consider the moral demands and possibilities of communication and media. This entry has tried to enumerate these as well as signal points where theoretical and practical reflection is needed about this ever evolving field of human conduct. Of course, what the future holds for new kinds or types of media remains unknown. What is certain is that insofar as human beings are media creatures, ethical reflection will remain of importance and increase in urgency.

3 Practices

CHAPTER 34

Practices

Francis X. Clooney

Practices and Moral Change

Theory follows upon practice; theories are rethought in order to undergird practices to which a community remains committed, and ethical analysis is primarily about practices generative of theories, not theories eventuating in practices.

People normally do not determine first what they think and see as their values and then, on that basis, decide what to do. Most of the time, they instead articulate ideas and values in conformity with what they already do; they begin with and do not merely conclude to expectations about proper ways of acting religiously. They belong to traditions already in place; concepts, explanations, and modes of behavior have been settled in the past. The boldest thoughts and most consistent logical conclusions are constrained to conform to what people already do and want to keep doing. Radical change, as distinct from claims about the desirability of radical change, is unlikely, and conclusions about the rightness of particular actions become predictable once we attend to the requirements generated by practices already in place before the reflection begins.

These persistent patterns of action, understood and explained within communities, are what I mean by *practices* – not merely actions, but actions as invested with explanatory and supportive meaning through continuity of tradition (as prior to their current practitioners), habit (as regular, insinuated deeply enough so as to function smoothly without overt attention on the part of their agents), and interpretation (as plausibly explaining actions in discourses which are in some way public). As practices, such actions survive changes in justification by generating new explanations allowing for continuity even when other factors might commend other practices. While practices change over time, most often explanations change to support of persisting practices (MacIntyre 1981; Bourdieu 1977, 1990; Reynolds and Tracy 1992; Yearley 1990).

As traditional, habitual, and (even if open to new interpretations) already explained sufficiently well, practices require little by way of explicit comment. Evident to their practitioners, they remain unspoken in conversations about communal values and function perfectly well without overt attention. Perhaps inadvertently, their very centrality may be concealed from the view of newcomers, because other things with less foundation in tradition require more discussion. The persistence of practices may be all the more unnoticed in a comparative context where explanation and practice are both unfamiliar, and where it may be tempting to treat explanations – available in conversation, in books – as determinative of

behavior, causes rather than results. While causal inquiries are useful, realizing that conceptions and words normally follow upon practice illumines how people act, how they think in relation to what they do, and how we can best assess both practice and theory.

It is in times of controversy that the justifications attached to practices become explicit, vulnerable to review, and available for an analysis able to distinguish theories from underlying practices. Proposing new explanations calls practices into question by threatening the reasons traditionally supportive of them. Proponents of established practices may merely defend contested theories but, since the practices are more important than the theories, such proponents may also invent new explanations able to support old practices in a new situation. Innovators may lay claim to older and truer versions of the practices in dispute, and to more honest explanations, but in order to gain credence for their new ideas they may have to attenuate those ideas' effectiveness and diminish their potential actually to change practices. Accordingly, it is a key area of ethical reflection to notice how practices are debated and explained in times of stress when (at first) new practices seem likely but when (in the end, most of the time) established practices endure.

This chapter elucidates the preceding reflections on practice by pointing to three controversies highlighting how religious practices resist change and stimulate new supporting theories when the practices are under stress and seemingly about to change. First, I consider a familiar Reformation dispute: the argument over meritorious works, justification, and atonement as argued by Lutheran Philipp Melanchthon (1497–1560) and Roman Catholic Tommaso de Vio Cajetan (1469–1534). Second, I turn to the south Indian Hindu context and examine differing views on the religious significance of birth status and religious class – “caste” – according to Piḷḷai Lokācārya (1205–1311) and Vedānta Deśika (1270–1369). Third, in a sense combining the preceding cases, I consider how Roberto de Nobili (1577–1656), a Jesuit intellectual missionary in south India, chose to characterize caste as cultural but not religious practice in order to make it compatible with conversion understood as religious but not cultural practice. These instances of practice – religious works (such as the confession of sins, the Mass, the veneration of relics); caste behavior (such as restricted patterns of marriage and dining, and of the study of sacred scriptures) resignified in light of divine love; conversion (as abolishing caste practices and replacing them with alternative Christian patterns of behavior, or as complementary to caste) – are complex and require much more detailed analysis than is offered here. My aim is simply to exemplify how thinkers moderate new ideas to make them consonant with practices likely to endure whatever the supporting reasons.

Does the Death of Christ Make Good Works Unnecessary?

The early Catholic–Lutheran debate over faith, merit, and good works was a fierce contest with broad social, political, and religious roots. It was also a serious theological dispute about how traditionally esteemed good works might be relevant to the accomplishment of human salvation if, as Protestants and then Catholics came to admit, salvation is achieved through the death of Christ and not by human accomplishment. In the Catholic–Lutheran context the debate was also a delicate negotiation in which both sides had already decided not to drop the key practices in question, but sought ways to accommodate those practices to the logic of new supporting theories (for this section, see Melanchthon 2000; Cajetan 1978).

In “The Lutheran Apology of the Augsburg Confession” Melanchthon argued for a realignment of the language of salvation, so that primacy is accorded to justification by faith. God’s saving initiative is primary; humans must simply recognize this and take it to heart, rejecting notions of self-salvation and also the related merits of works and other forms of self-justification. He repeatedly emphasized God’s initiative in Christ and the role of faith as the proper human response to God, and he denounced Roman Catholic defenses of merit and satisfaction as perverse justifications of self-aggrandizing actions merely portrayed as pious. Despite the rancor, however, Melanchthon’s overall agenda was conservative. He respected tradition and ecclesial structures, and left no room for a life lived so purely by faith that there would no longer be any recognizable normative Christian practices. If reliance on faith is the foundation of the Christian life, it can also yield a proper sense of the worship, duties, and pieties that continue to be obligatory. Although Melanchthon called for a radical recalculation of values, he left no room for truly radical innovation in the living of the Christian life. Confession and absolution are to be retained even if they occur in the context of God’s activity and not as signs of the human achievement of sinlessness; baptism, the Mass, prayers, alms giving and other acts of charity, all were to be maintained in the new Lutheran dispensation. A new theology in fact confirms much of what was already in place.

In “Faith and Works” Cardinal Cajetan refuted Melanchthon’s “poisonous” charges about superfluous customs and superstitions in the Catholic community. To safeguard the faithful from doubts about or laxity in the performance of Catholic practices, Cajetan shifted the argument away from Melanchthon’s appeals to personal experience and conviction, emphasizing instead the faith of the church and its tradition. However satisfying personal convictions may be, the church is a more reliable guide to the Christian life. In an ecclesially regulated context one will be able to understand clearly the dynamic of salvation: God’s love works in particular persons who are transformed in ways that become evident as they perform good deeds approved by God and the church. Even a person mired in mortal sin, if he or she has some inkling of the better life arising in repentance, can profit from performing good deeds which make one more responsive to the divine initiative.

Although Cajetan could not bring himself to dismiss any of the disputed church practices, he actually aimed for a middle ground that accommodates Melanchthon’s concerns. He refused to base practices merely on authority or the sheer fact of tradition; instead, he revalued meritorious works, purifying them of the appearance of merit construction or the incremental achievement of salvation. Like Melanchthon, he forged a more spiritual and Christocentric foundation for his position, adducing scripture texts acknowledging divine grace while confirming traditional practice. It is true, he said, that scripture, tradition, and the revered practice of the church all testify that it is Christ who offers salvation by his singular and perfect self-giving action; good works are a response to Christ’s salvific act. Works are important, but they remain essentially secondary to the work of Christ. Catholic practices are reinterpreted in order to preserve them.

Differences aside, Melanchthon and Cajetan agreed that scripture and ecclesial authority had to be respected and important practices preserved. Both reject (real or hypothetical) antinomian alternatives leading to radically truly different ways of acting. Meritorious works are not conceded primary status, but the notion of merit is adjusted so that key practices are allowed to continue. This compromise worked in the Catholic–Lutheran context – old practices, new theories – because the theories about good works and merit were not the cause of the debated practices; rather, theory was for the most part conformed to already-existing practices which were to endure, even if purified in some way or another. For Lutherans and Catholics alike, just as practices provoke debates, they also marked off boundaries within which reflection should rightly begin and end. Changes in theology did not necessarily change practice in any

radical fashion, and more often preserved it. There were surely some Catholics who did simply repeat old explanations in favor of the debated practices; some Reformation theorists and practitioners did adopt more radical stances which led to the abolition of hitherto settled practices. But the classic argument between Melancthon and Cajetan more modestly and typically clarified debated issues and eliminated abuses in order to preserve practices central to both the Catholic and Lutheran traditions.

Does Love of God Make Caste Irrelevant?

Like other Hindu theorists writing in Sanskrit or in heavily Sanskritized vernaculars in medieval India, the thirteenth and fourteenth-century Śrīvaiṣṇava theologians of south India sought to combine new religious values – such as devotion to Lord Nārāyaṇa (Viṣṇu, Rāma, Kṛṣṇa) – with the traditional and pan-Indian elite practices connected with brahmanical orthodoxy, including the caste practices calculated according to birth status (*jāti*) and religious class (*varṇa*). Birth status, assumed to be innate, regulated “natural social” activities related to birth, dining, marriage, and education; the theory of religious class served as a theoretical explanation of these regulations. Birth status was understood to mirror the reality of the universe, and the categories of religious class articulated the meaning of the innate differences. The system of *varṇa-āśrama* (class, state of life) *dharma* framed in ideal terms the life of the male according to stages of life (*āśrama*) and class hierarchy (*varṇa*), reaching from (theoretically) religiously and intellectually privileged elite brahmans down to (theoretically) inferior and uneducated manual laborers, *śūdras* (for this section, see Lokācārya 1979: vv. 194–233; Ayyangar 1956; Mumme 1988).

Along with the observance of caste practices, however, new devotional movements brought to the fore a new theistic and interpersonal religious calculus, according to which relationship to God was the first and foremost measure of relevance. Pillai Lokacarya, a founding leader of the emerging Teṅkalai sect of Śrīvaiṣṇavism, was a foremost proponent of the new turn to a theistic perspective. In his *Śrīvacanabhūṣaṇam* he established the absolute priority of love of God and divine favor over against any other criteria for religious value, superseding previously settled orthodox standards for religious value, including caste. Were divine love really to become the sole measure of social practice, then caste would be stripped of its significance and its practices would lose support. Pillai Lokācārya did not go so far, since he also implanted religious values in a context of settled religious practices, and accordingly maintained a delicate balance between new religious insights, radical rhetoric, and traditional practices. On the one hand, he argued as vigorously as possible that radical dependence on God is indeed the core value by which actions are rendered religiously significant; religious identity and prestige within the community of believers can no longer depend on birth status and religious class. On the other, he in fact also remained committed to caste practices. While he valued exceptions to caste rules, he offered no comprehensive alternative; he seemed interested more simply in insisting that divine love is primary while status and class are secondary. Norms for purity, eating, ritual performances, etc., were not discarded, but only treated as secondary, and as liable to important and occasional exceptions. In his *Śrīvacanabhūṣaṇam* he moderated a potentially radical language of devotion which might have overturned caste entirely by replacing it with stress on the interior quality of individuals surrendered entirely to God; the overall impact of Pillai Lokācārya's argument was to suggest that devotees should learn to live in an ordered world where caste differences did not really matter but were still to be observed. Devotion triumphs, but caste practice endures.

Vedānta Dēśika, a theologian of the next generation and of the reputedly more conservative Vatakalai sect, placed stronger emphasis on the value of caste practices. He may have had Piḷḷai Lokācārya's arguments in mind when he strongly defended caste in several of his writings, particularly in Chapter 25 of his *Śrīmadrahasyatrayasāra*. As he saw the matter, even if overly excited devotees suggest that there is some conflict between devotion and caste, there is in fact no real problem, once devotion and caste are properly understood. Just as Cajetan accommodated Melanchthon, Dēśika conceded much of the ground contested by Piḷḷai Lokācārya, agreeing that devotion and relationship to the Lord are the primary religious criteria – but he then used the new values to support the old practices. Caste was not religiously odious, but existed according to the will of God. People who love God should have no problem in adhering to practices which continue to please God. Old practices were thus preserved, precisely by a cooptation of the originally troubling logic of devotion. For Lokācārya, the new devotional calculus did not actually change caste practices, but simply moved them to a secondary position; for Dēśika, those practices were maintained by investing them with new religious values. Both of them, even in the heat of debate, agreed to exclude the possibility that practices such as marrying, dining, or studying would really change, as if to occur entirely without consideration for caste.

Does Conversion to Christianity Make Caste Objectionable? A Debate Among Missionaries

The third example builds on the first two. Roberto de Nobili, an Italian Jesuit and missionary in Madurai, south India, brought the concerns and questions of Reformation Europe to brahmanical south India; traditional practices and their (new and old) religious justifications were already an issue in de Nobili's mind before he arrived in India. By 1610, a few short years after his arrival, he had decided that the major obstacle to the conversion of Hindus was the reluctance of brahmins to become interested in the gospel; in turn, the major reason for their disinclination was their reluctance to give up the practices marking brahman status (e.g. the wearing of the brahman thread, sectarian markings on the forehead, distinctive hats, certain ablutions, and even their certainty that the Sanskrit language was intellectually and spiritually superior) (for this section, see de Nobili 2000; for general background on de Nobili, see Saulière 1995; for the controversy over caste and conversions, see Zupanov 1999).

Most missionaries seem to have had no interest in caste values, and assumed that converts should abandon them. Indeed, among practices which might be considered prototypically radical, conversion practices – promoting it, undergoing it – would certainly be among the more prominent. Brahmins opposed the missionary agenda not primarily because of any particular Christian doctrines, but rather because conversion would entail a radical departure from caste values, the mingling of castes, and a pernicious disregard for obligatory practices. They were right; most missionaries were interested in conversion and not in caste, and perhaps assumed that converts would abandon the old brahmanical practices for the new Christian ones.

In the face of seemingly conflicting practices, de Nobili sought a middle ground. He did so because he prized the practice of conversion, and did not want to see it stymied by theories of culture that would unnecessarily (in his view) encumber it. Missionaries would make no progress in converting brahmins as long as conversion entailed the rejection of deeply embedded caste practices, so a new theory was required: it had to be the case that those practices were not actually contrary to Christian identity, and it

had to be the case that conversion could be lived in such a way as to not interfere with caste. To further his own religious project, conversion, he had to develop a consonant theory of caste which reinterpreted caste practices as cultural and not religious.

For this purpose he wrote his *Report Concerning Certain Customs of the Indian Nation* in order to defend the conclusion that key brahman practices were social and not essentially religious (de Nobili 2000). Insisting that such practices were not incompatible with Christian values, de Nobili hoped to persuade both missionaries and brahmans that cultural caste practices could be combined with the religious practices of the Christian community. Both conversion and caste practices could be reinterpreted, to preserve both.

Although currently available sources do not warrant conclusions about all sides of this debate – we have only missionary writings – we can recognize at least how the several agendas overlapped in this trilateral dispute involving de Nobili, other missionaries, and brahmans. For their own reasons, brahmans defended caste and missionaries defended conversion; for his own reasons, de Nobili defended both caste and conversion. He prized conversion to the extent of stripping it of its cultural force, reconceiving it as a religious discourse compatible with Indian caste practices. Neither caste nor conversion would any longer mean quite what it had meant previously, yet the practices involved would continue. Out of necessity de Nobili thus invented the “Christian Brahman,” preserving both Christian and brahman practices.

From Classic Controversy to Contemporary Ethics

In the preceding sections we have explored three moments of controversy where practices were attacked, rethought, and resignified, but still enacted: the death of Christ is recognized as central, but pious and meritorious actions are still performed; divine love is recognized as superior to practices related to birth and class, but those practices persist, for new reasons; conversion is recognized by missionaries as a foremost religious practice, but with the proviso that it not interfere with caste practices. Criticisms of works, caste, and conversion had endangered traditional practices, but at the moment of resolution potentially radical ideas and words were refashioned in order to resignify and thus preserve the practices undergoing critique. All our disputants portrayed themselves as rejecting more extreme lines of thought such as would have totally overthrown traditional values; likewise, they all rejected more stubborn defenses of tradition which would have bound practices exclusively to particular theories. Rather, particular theories are dispensable and can be adjusted or replaced so that practices could be maintained.

Practices are not eternal, however agile their defenders may be in improvising new theories to justify them. Even the most skillfully reinterpreted practices may eventually decline and fall out of favor. If supporting explanations fail, and fail to be replaced by more convincing ones, it may become impossible to continue acting in certain ways, however valuable the traditions involved. Powerfully intrusive new practices do sometimes overwhelm and eradicate older, settled ones. There are certainly instances, too, when cherished theories become in effect verbal practices to be preserved by the discovery of still further additional justifications. Nonetheless, I suggest, the fact that practices endure while justifications change is the ordinary state of affairs and rightly a primary object of ethical analysis. We need to keep asking which practices are at stake when theories are being explained, adjusted, or replaced in arguments about what is morally and religiously acceptable. Hear the words, but search out the practices.

The three examples adduced here are safely located in premodern and early modern times, and remind us of concerns to be kept in mind while studying controversies from the past. But they also illustrate patterns still operative in actual ethical decision making and central to the study of those decisions by ethicists. Today, it remains necessary to step back and identify the dominant practices likely to remain in force even after a debate about ideas and values, since what is debated is not identical with what is at stake. We must examine how theories, however radical, often simply revalue practices rather than change what people do. Debates over liturgical norms and jurisdictional control within a church, prohibitions of stem cell research and euthanasia, the relief of third world debt, and the abolition of the death penalty, etc. – all entail important theoretical issues, but we must remember to seek out the enduring practices at stake “beneath” the issues explicitly debated. We must notice how behavior does not change, while new reasons are enlisted to defend established practices. It is useful to attend to new theories which, if implemented, would change everything, but not primarily because in a few cases such theories might actually take effect. Rather, their novelty prods those with vested interests to stake out moderate positions couched in the language of the new concepts and values, to situate these positions as prudent alternatives to real or imagined extreme positions, and thus, in the long run, to maintain traditional practices by promoting new reasons for still doing them.

CHAPTER 35

Theories of Practice

Anne Mocko

At one time, Western ethical deliberation was dominated by Aristotelian virtue ethics, which emphasize habit and practice as strategies for developing ethical capacities. European religious life, too, was dominated by the Roman Catholic Church, which taught a rich repertoire of devotional practices to shape the lives of devotees. In more recent centuries, however, embodied religious and ritual practice has tended to be downplayed or underappreciated in Western culture and thought as a mode or site for ethical cultivation.

This general move away from appreciating practice began during the Protestant Reformation. As penance, fasting, and mortifications of the body gave way to reading and contemplating biblical text, embodied practice was increasingly seen as a superficial and optional form of religious life. This change in the religious cultures of Europe inspired and was complemented by the advent of the Enlightenment, during which time Western thinkers turned resolutely away from the body and toward the mind. Descartes posited a strong mind-body dualism, and located fundamental human-ness in the capacity for rational thought. Kant, too, emphasized the importance of the deliberative rational mind, and further argued that actions could only be considered moral if they represented deliberate acts of intellectualized will, overcoming embodied inclinations and habits. Based on these deeply influential academic and institutional movements, Western scholarship on ethics and religion for centuries has broadly tended to emphasize beliefs, attitudes, rational deliberation, and literary texts as the core sites of forming ethical humans.

Starting in the late nineteenth century, however, scholars interested in religion gradually began to regain appreciation of the ways that embodied practices – public and private, religious and non-religious – can be important modes of orienting humans to the worlds they live in. These modern theorists of practice have examined the political, social, and moral valences of practice, and they have variously demonstrated ways that habituated practice locates selves into sociocultural realities and institutional power structures. They have also attended to the ways that scholarship itself is a form of practice that is particular, contextual, and invested in non-neutral ideologies.

Colonial Ethnography, “Primitive” Practice

The institutionalization of the academic study of religion in the nineteenth century coincided with the tightening of structures of European colonialism, and substantial academic attention to practice was devoted to trying to understand the ostensibly bizarre cultural and religious practices of colonized non-European peoples. Nineteenth-century theorists were united in their conviction that human cultures followed evolutionary patterns, and that by studying the simplest, “least-evolved” forms of human practice, they would be able to “read” human history and universal truths about the human condition.

This task of unraveling the evolution of human culture was the foundational project for early anthropology, particularly early British anthropology. Early anthropologists wanted to understand how modern Europeans were developmentally related to “primitive” non-Europeans, and they simply presumed that modern Western Europeans compared favorably to evolutionary antecedents. Moreover, they commonly conflated as evolutionary antecedents both ancient people and contemporary non-Western people, and tended to assume that “primitive” people in the present were stuck in time, having simply failed to advance as far or as fast as Europeans.

Major projects in this vein include Tylor’s *Primitive Culture* (1871) and Levy-Bruhl’s *Primitive Mentality* (1923), and this evolutionary model is perhaps best exemplified in James Fraser’s *The Golden Bough* (1913–1915). An “armchair anthropologist,” Fraser was fascinated by religious practice, yet convinced of its basic illogic/inadequacy: for him, cultural difference inevitably provided an opportunity to observe the shortcomings of unevolved humans. By juxtaposing short accounts of bizarre practices from across the world and history, Fraser constructed a grand vision of human evolution, which he argued developed from magic to religion to science. This account was simultaneously temporal, geographical, and racial: science and reason were typical of contemporary Europe, religion was the province of contemporary Asians and historical Europeans, while magical practices characterized ancient people and supposedly unevolved peoples of Africa, aboriginal Australia, or the Pacific Islands.

Beginning in the twentieth century, however, ethnographers increasingly traveled beyond Europe, living for prolonged periods of time among the people they wrote about. As a consequence, though they still considered their objects of study broadly primitive, their theories of practice became substantively more sensitive. One anthropologist who exemplified this turn toward participant-observation was E. E. Evans-Pritchard, who lived and worked in colonial sub-Saharan Africa. His seminal work, *Witchcraft, Oracles, and Magic among the Azande* (1937), argues for the reasonableness and social efficacy of South-Sudanese divinatory practices. This book helped deconstruct the notion that African peoples were irretrievably unlike (much less evolutionarily “behind”) Europeans.

Bronislaw Malinowski similarly aimed to demonstrate sophistication and coherence in the practices of supposedly primitive people. Malinowski lived for several years in the Trobriand Islands, and in his *Argonauts of the Western Pacific* (1922), he theorized that the local practice of gift-exchange (*kula*) was a way to construct relationships of reciprocity. Malinowski’s account of *kula* would help underpin the theory of *functionalism*, which posits that every cultural practice fulfills a practical or psychological need of its performers. Though functionalism was later critiqued for being reductionist, it was important in presuming purpose, logic, and value for practices that Europeans initially found strange.

Durkheim and Social Cohesion

Like early British anthropology, early French sociology looked to the practices of “primitive” non-western peoples with the expectation that theorizing them would help identify fundamental patterns and dynamics of human society. Rather than seeking to understand cultural evolution per se, though, they examined non-Western societies to help understand how collective practice, particularly collective religious/ritual practice, created social cohesion among participants and fostered social harmony/cooperation.

The central figure of this school was Émile Durkheim. His masterwork, *The Elementary Forms of Religious Life* (1912), sought ostensibly to explain totemic practices of aboriginal Australian tribes, but did so in service of a grand theory of religion and social life. Durkheim focused his discussion on the ways that practice can create the distinction between “sacred” and “profane.” Durkheim argued that when cultural practices set aside or hedge in particular objects, spaces, or times, limiting how one may access or interact with them, it is those practices themselves that create a sense of sacredness. Because significances are produced through human behaviors, “sacredness” is not some higher-than-human reality or mystery, but rather the collective consciousness and the product of the sociality of the group. Religion, for Durkheim, represents a process of symbolically constructing, thinking about, and acting on one’s social group, and he argued that collective religious practices foster an “effervescent” experience of group-belonging.

Durkheim’s theoretical project, to understand social solidarity from primitive practice, was supported by his students, most significantly his nephew Marcel Mauss. Mauss’s essays on magic (1902) and with Henri Hubert on sacrifice (1898), sought to trace reasonable patterns and purposes behind some of the most “exotic” practices of other cultures, while his essay *The Gift* (1925) theorized the role of ritualized practice in the formation of social and economic relationships. Mauss’s 1934 essay on “techniques of the body” was responsible for reintroducing the Aristotelian term *habitus* into modern Francophone theory.

The Durkheimian school would provide the major foundation for the theory of *structural functionalism*. This approach, which in its fullest form is particularly identified with Talcott Parsons, hypothesizes that a society is a complex system of parts – institutions and established practices – all of which work to promote stability, solidarity, and cohesion among the members of the society. According to structural-functionalist perspectives, religion should always be analyzed for the ways that its institutions and practices promote social harmony.

This line of theory, emphasizing harmony and cohesion, has been critiqued for underestimating the significance of conflict and inequality in social systems. Competing modes of interpretation have included Marxism, social conflict theory (within sociology), and the Manchester School (within anthropology). The latter is particularly associated with the work of Max Gluckman, who directly studied rather than ignored the colonial contexts of the non-Western data that many early scholars relied upon, and who insisted that the “effervescence” and solidarity Durkheim saw in ritual practice was an ideological effort at papering over real and important social disunity.

Foucault

In the second half of the twentieth century, there emerged in French academic thought a sustained and important discussion about social practice that drew from both Durkheimian sociology and Marxist intellectual traditions, to develop powerful ideas about the ways that social practice teaches people ideologies

and draws them into institutional structures. The definitive scholar in this conversation was Michel Foucault, whose work has defined and inspired many subsequent discussions of practice.

Foucault fundamentally challenged the Enlightenment vision of an individual independently knowing his world and acting based upon rational principles. Instead, Foucault argues, people learn to be human in and through different regimes of power and discipline. Foucault's prolific work on power – particularly the complex confluences between power and knowledge – prompted a critical re-evaluation of traditional academic assumptions in many fields, and initiated new sets of questions and methods for interrogating a wide range of social practices and realities.

One of Foucault's most influential concepts is discourse, which in *The Archaeology of Knowledge* (1969) is taken to mean “language that creates the reality of which it speaks.” Discourse refers to modes of thinking and speaking about the world that shape what can be perceived, and that thereby drive the ways that individuals act and react. The category “autistic” for example (though not an idea Foucault himself analyzed), provides a frame through which specific behaviors can be grouped together as significant. Once an individual's past and present behaviors are read as “autistic,” then a variety of institutional mechanisms are set in motion, and that individual's future behaviors will all be scrutinized through the lens “autism” until that person is rendered a socially significant kind of being. In this way, the concept of autism enables not just the identification of but the production of autistic-ness.

The notion of discourse insists that practice and language (or more broadly, body and mind) are not separable from one another, but rather are mutually constitutive. Minds do not create themselves: they come to be in the contexts of bodies. Bodies, likewise, do not carry out practices devoid of mental content or meaning, but rather are shaped and molded by categories and ideas that are shared and enacted in social settings. Practice thus guides and is guided by the life of the mind, and vice versa.

Crucially, too, Foucault argues that neither body nor mind exist solely as individuals, but are rather inextricably embedded in social, historical, cultural contexts. In order to understand these contexts, Foucault theorized that specific institutions are organized to monitor and exert external force on people, and more provocatively, that they also persuade people to monitor and exert internalized pressure on themselves. This interest in the disciplinary capacities of institutions led to a broad variety of objects of study, particularly famously mental institutions (*Madness and Civilization* (1964)), medical institutions (*The Birth of the Clinic* (1963)), and prisons (*Discipline and Punish* (1975)).

In *Discipline and Punish*, Foucault demonstrates the logic and efficacy of institutional practice by tracing the historical shift in Europe and America from explicitly pain-full criminal punishment (such as drawing and quartering) to intentionally pain-less incarceration. The shift in institutions, he argues, both reflects and creates a shift in the idea of crime and what it demands, a shift in the ways that bodies are made criminal and acted upon. He finds particularly significant a never fully implemented prison design called the Panopticon, which featured a central guard-tower positioned to see into and through every cell of surrounding circular rows of cells. Because the guard in the tower *could* be looking into any particular cell at any given moment, prisoners would constantly comport themselves *as if* they were being watched, even if the guard was looking elsewhere – or crucially, even if there were no guard at all. In this way, the physical layout of the prison was designed to discipline the prisoners to *watch themselves*, to internalize the power exerted over them by those in control. Foucault finds this a fundamental example of how a regime of power can be individualized and made part of someone's consciousness.

This interest in the ways that institutionalized practice can convince people to monitor themselves would subsequently develop into an interest in Christian traditions of confession. This subject was

projected to be the central frame of the never-written second volume of *History of Sexuality*, and was only partially worked out in some late essays, but nevertheless stands as a useful challenge for theological ethicists.

Theological ethicists may also find of particular significance Foucault's posthumous volume, *Ethics: Subjectivity and Truth* (1997). In this text, he puts forward a four-part theory of ethical action (here taken from Saba Mahmood's distilling of Foucault's argument (1997, 30)):

- 1) the "substance of ethics" (the issues which societies wish to work on, or consider to be the most significant problem),
- 2) "modes of subjectivation" (the authority structures that call people to feel or recognize moral obligations),
- 3) "techniques of the self" (the practices that an individual undertakes to become a culturally molded ethical actor), and
- 4) *telos* (the socio-historically articulated ultimate goals of ethical action or being).

This model usefully relocates ethical deliberation away from the ratiocination of individuals, and places it instead in embodied practice and collective institutionalized modes of deliberation and authority. It hence illustrates more broadly Foucault's insistent attention on cultural practice (its contexts and purposes) as the most fundamental object of academic thought.

Bourdieu and Althusser

Also important to mid-century French theories of practice were Foucault's two near-contemporaries, Louis Althusser and Pierre Bourdieu. Althusser and Bourdieu extended and complemented Foucault's interests in practice as a crucial site for understanding social power, though both approached the question from more explicitly Marxist lenses.

Louis Althusser was the most explicitly Marxist of the three theorists, and the only one actively involved in communist politics. Like Foucault, Althusser was interested in the ways that individual people are drawn into power structures, and perhaps his most provocative contribution to theorizing practice was his notion of "interpellation." In his essay "Ideology and Ideological State Apparatuses" (1970), he posits that people are "always-already" social subjects, inscribed into identities before they are even born. Once born, people are interpellated into an assortment of relationships and identities: they are addressed and hailed in constant ways that position them relative to other people and the world, and in being constantly hailed, each person is called into their structural identity. Althusser's theory of practice thus emphasizes the ways that people act, not as autonomous individuals so much as fulfillments of social and ideological expectations.

While Althusser has remained a somewhat obscure figure, Pierre Bourdieu became widely known for his interventions into theorizations of practice, and he is often credited as the central or even founding figure of "practice theory." Bourdieu particularly became famous for his adaptation and expansion of the term "habitus."

Like Mauss, Bourdieu describes *habitus* as the deeply engrained knowledges of the body, developed over many repetitions of practice – the often subconscious understandings of how to act and hold oneself in the world, the "socialized subjectivity" or "structuring structure" that develops from one's total history of social

interactions. Bourdieu resists the idea that one's embodied cultural knowledge is either a passive repository of personal history or a prescriptive deterministic programming, however. Instead, he emphasizes the ways in which *habitus* starts from descriptive rules or patterns regarding what has in the past been appropriate or inappropriate in particular circumstances. These internalized experiences produce “generative models of practice”: repertoires of possible acceptable and unacceptable responses to novel moments, among which a social actor will creatively (and sometimes subversively) select how to actually act.

Thus for example, Bourdieu describes how people might develop a *habitus* regarding gift-giving. By observing and participating in dozens or hundreds of gift exchanges, individual people develop intuitive understandings of collective cultural norms – how gifts may be timed, how expensive they should be relative to various circumstances, what consequences might arise from not presenting a gift – but then that person does not give a new gift deterministically bound by old rules. Rather, people can strategically work within their embodied cultural knowledge to respond in a novel but culturally and historically inflected way in a new circumstance.

Bourdieu's analysis of *habitus* represents a major innovation in discussions of how individuals relate to norms and structures. It accounts for the source of norms and structures (they are the product of patterned group behavior through time), and it accounts for how individual people may be powerfully molded by, yet still act as independent agents within, those norms and structures.

Like Althusser, Bourdieu was writing in an explicitly Marxist framework, and one of his important contributions was the expansion of the idea of “capital” beyond simple economic terms. Instead, Bourdieu (1990) posited that there are three different forms of capital – economic, social, and cultural – and argued that these different forms of capital may be collected, exchanged, and transformed into each other. Social capital he identified as one's network of relationships, especially institutional relationships. Cultural capital includes the culturally significant objects that one possesses, the knowledge one holds in one's body (including how to present oneself according to group conventions), and the credentials or institutionalized forms of recognition one has received. By analyzing disparate forms of practice as “capital,” he significantly expanded the types and modes of practice that could be subjected to Marxist critiques of distributional inequality.

Theorizing Domination and Structural Identity

Beginning in the 1970s, there began to be systematic recognition of the ways that society generally, and academic work specifically, have prioritized and normativized default perspectives that were white, male, and Euro-American. As the academy began to be more diverse, practices of dominance long left invisible began to be systematically interrogated. This opened up the possibility both for more nuanced studies of religious and ethical practices, and for a broader sensitivity to the ways that scholarship itself is a particular kind of situated practice.

Critical Race Theory

Critical race theory is the systematic critique of race-based practices and systems of knowledge (as opposed to “race theory,” the pseudoscientific efforts to prove black or brown racial inferiority). This important field of inquiry regrettably remains largely siloed and ignored by mainstream white academia,

but it constitutes an important site for theorizing practice, particularly for theorizing the large-scale systemic practices of full societies. Moreover, critical race theory raises a particularly crucial cluster of questions for ethicists, namely: How is it that people become acclimatized to injustice? How are people who are subjected to injustice socialized to accept it, and punished for challenging it? How are people who benefit from unjust systems taught to accept and even fail to see those realities?

White readers entirely new to critical race theory are commended as primer texts Robin DiAngelo's *What Does It Mean to be White?* (2012), Nell Irvin Painter's *The History of White People* (2011), and Beverly Tatum's *Why Are All the Black Kids Sitting Together in the Cafeteria?* (1997). Readers interested in improving their understanding of American racial history are recommended to consult Michelle Alexander's *The New Jim Crow* (2010), Khalil Gibran Muhammad's *The Condemnation of Blackness* (2011), and Ibram Kendi's *Stamped from the Beginning* (2017).

One text that particularly clearly articulates a theory of practice is *Racecraft: The Soul of Inequality in American Life* (2014) by Karen Fields. Fields argues that although most people assume it is the fact of physical differences that gives rise to practices of race, in fact it is practices of race that produce perceptions and illusions of physical differences. These practices of differentiation and inequality Fields names "racecraft," a purposeful play on the notion of "witchcraft": scientifically indefensible social strategies for labeling prejudices and fears, used to punish marginalized people within society. She argues that race is constantly implemented and reinvented through social practice, and that it is a profound tool for creating and enforcing social inequality.

Critical race theorists also frequently attend to the ways that different structural identities can compound the dimensions of oppression of a given individual, such that a person may variously experience *intersectional* racial, gendered, classist, and/or sexuality-based discrimination simultaneously. One foundational example of intersectional theory is bell hooks's *Ain't I a Woman?* (1981), which outlines the histories of how race and gender have compounded one another to produce complex oppression and suffering for black women from the slavery period through civil rights.

Feminism

One of the blind-spots in early theories of practice was to the importance of gender as a social category and mode of being in the world. The rise of modern feminist scholarship, though, has encouraged attention to the ways that large-scale power dynamics get asserted and learned in small, daily interactions.

Perhaps the most widely influential theorist of gendered practice is Judith Butler. Building upon Foucault, Butler argues that gender itself is a product of practice (see, e.g. *Gender Trouble* (1990)). While gender is often presumed to be a natural and biological "given," Butler insists that gender is the product of thousands upon thousands of interactions and moments of self-presentation. The body is stylized according to the expectations of the surrounding culture, and this general process – by which individuals participate in the constant reproduction of cultural expectations – she refers to as "performativity." Because Butler envisions gender to consist of practice rather than biological nature, she also sees it as fundamentally fragile: because gender relies on being constantly performed, it is vulnerable to being refused and not-performed.

There have been a number of efforts to develop ethical theories out of the experiences of women, some of the most interesting of which have focused on the ways that women experience and are expected to perform care work. Sara Ruddick (1989) argues that maternal caregiving provides a profound and generalizable ethical model, in that a mother must not just neutrally respect her child's autonomy, but actively

protect, socialize, and promote that child's flourishing. Sara Lee Bartky (1990), by contrast, argues that women are socially pushed into caregiving, some of which is affirming and life-giving but some of which is oppressive and even morally problematic. Despite their often significant differences, all the discussions around feminist care-ethics emphasize the ways that ethics emerge through practices in relationships, and this prioritization provides a powerful insight for all subfields of ethics.

Postcolonialism

The postcolonialist turn began with the publication of Edward Said's *Orientalism* (1978), which identified all the ways that European scholarship characterized and constructed the colonized world as an exotic and timeless photo-negative of European rational modernity, flattening everything from Morocco to Vietnam as part of the mysterious Orient. Writers since Said have variously sought to reclaim the historicity and local specificity of the once-colonized world, and to point out ways that academic knowledge about the non-West has for centuries contributed to the West's political domination of the rest of the world. (See, for example, Dipesh Chakrabarty's *Provincializing Europe* (2000).)

Post-colonial scholarship thus insistently theorizes the practice of scholarship itself as a mode of domination, and demands of scholars a deep consideration of the ways that they participate in small- and large-scale practices of power. In *Genealogies of Religion* (1993), for example, Talal Asad historicizes the very term "religion," showing it to be a modern academic abstraction emerging from an explicitly Christian usage and worldview. Asad questions whether such a term can be productively applied to pre-modern or non-Christian contexts, and thereby invites readers to see all ostensibly neutral academic vocabulary as actually emerging out of cultural and historical contexts that have clear political and social-power ramifications.

Case Study: Saba Mahmood

To close, let us examine Saba Mahmood's *Politics of Piety* (2005), as an example of how theories of practice may deeply inform religious ethics.

Mahmood examines the *da'wa* (personal piety) movement in Egypt, the trend toward more conservative modes of Islam that includes veiling, fasting, and mosque-based adult education. *Politics of Piety* is based upon years' worth of interviews with Egyptian women participating in the movement, and asks how and why this movement allows her research subjects not just to find personal meaning but also to shape themselves as ethical and political actors.

In particular, Mahmood focuses on the ways that the specific practices of the *da'wa* movement allow women to inhabit their bodies and worlds in disciplined, stylized, and ideological ways: "women are summoned to recognize themselves in terms of the virtues and codes of these traditions, and they come to measure themselves against the ideals furbished by these traditions" (2005, 32). As a specific example, her interlocutors:

argue that the veil is a necessary component of the virtue of modesty because the veil both expresses "true modesty" and is the means through which modesty is acquired. They draw, therefore, an ineluctable relationship between the norm (modesty) and the bodily form it takes (the

veil) such that the veiled body becomes the necessary means through which the virtue of modesty is both created *and* expressed. (2005, 23)

In explicit contrast to rationalist Kantian models of ethics, then, Mahmood argues that ethics are learned and inhabited in the practices of the body.

In *Politics of Piety*, Mahmood synthesizes (and surpasses) many of the theoretical themes discussed above. By focusing on neo-traditionalist Muslims, she follows a similar impulse to Evans-Pritchard, sympathetically dissecting her contemporary academy's "incomprehensible other." By focusing on women, and by locating her focus in Egypt, she disrupts the tendency for inquiries into ethical action to normativize the experiences and priorities of Euro-American white men.

Mahmood also pushes against secular-humanist modes of engaging ethics and politics, particularly feminist understandings of ethics and politics, that emphasize individual self-actualization and the disruption or overturning of traditional paradigms. On the contrary, Mahmood argues that her research subjects find meaning in conservative, traditionalist models of religiosity that purposefully erase individualist aspirations and that insistently reinscribe traditional gender norms. Mahmood critiques feminist scholarship, including Judith Butler specifically, for envisioning all practices along a binary of suppressive/subversive – and only valuing the latter as “empowering” and meaningful. She calls for scholars within the secular-liberal academy to pay more nuanced attention to the ethics and subjectivities of conservative or traditional religiosities – not because she endorses these as necessarily better or correct ways of being in the world, but because she sees them as important human phenomena that can be invisible for being uncongenial to the implicit political projects of scholars.

In this way, Mahmood avows an intention to “parochialize [her] own political certitude” (2005, xxiv), and invites her readers to do likewise.

CHAPTER 36

Liturgy as Performance

Nicholas Denysenko

Fundamentally, liturgy is an event experienced by a local community that gathers in an appointed place. For Christians, liturgy is an event of encounter with God, and the community performs a series of acts of worship. These worship acts involve the recitation of official prayer texts (euchology), music (instrumental and singing), and the performance of diverse ritual gestures. Ritual gestures involve the body and the senses, such as beholding sacred art, hearing the proclamation of the word of God, smelling incense, lighting candles, and engaging bodily actions such as processions, greetings of peace, bows and prostrations, anointings with water and oil, and eating and drinking Holy Communion. As a multilayered event, liturgy assumes the active presence and performance of the community and of God.

The performance of the liturgy is a dialogue between God and the assembled community. God is the initiator of liturgy, calling the local community to assemble in the appointed place for worship, as evidenced by the etymology of the word *ecclesia* (*ek-kaleo*, or called out by God). A series of dialogical exchanges occurs once the assembly is gathered. The processional hymn is a performance of praise and gathering, completed by an initial prayer. The Bible lessons and homily proclaimed aloud for all to hear are acts of God speaking, with the assembly hearing and listening. At the Eucharist, the assembly offers God the gifts of bread and wine, fruits made by human hands from the soil given by God. God offers the gift of Jesus Christ in communion in the next part of the gift exchange. Just as God assembled the community, God dismisses them, and the community exits with a recessional, a song of praise.

While Christian Churches observe a variety of orders of the Eucharist, this brief, selective description illustrates how the dialogical performance is a gift exchange between God and the assembled community. God assembles, dismisses, speaks, offers the gift of Christ, and is present in many ways, especially through Communion. The community praises, petitions, offers, and receives gifts, and consumes the gift of Christ offered by God.

Throughout Christian history, the performative aspect of liturgy has been explained in diverse ways. From the late antique through the medieval periods, theologians of Western and Eastern Christianity have explained liturgy through the historical sequence of the life of Christ. In this scheme, each part of the Eucharist aligns with some event in the life of Christ. The reading of the word of God from the Bible lessons relates to Jesus' teaching at the sermon on the mount. The offertory, or the ritual of placing the bread and cup holding wine on the altar table, conveys Jesus' death and burial. The epiclesis (petition to God to transform the bread and cup into Christ's body and blood) symbolizes his resurrection from the dead. Liturgical mystagogy (pastoral commentaries on the liturgy and its components) that employs history was employed to catechize a largely illiterate Christian population, accompanied by sacred art depicting the life of Christ.

Some liturgical mystagogies adopt a tropological approach to explaining the meaning of the liturgy. Of these, the best known is the mystagogy of the seventh-century father Maximus Confessor, who depicted the Eucharist as an experience of the soul's ascent to God, with Holy Communion an experience of union with God. For most of Christian history, liturgical participants did not actually perform the ritual act of receiving Holy Communion, so there is a gap between the teaching and the experience.

In response to the times, an awakening occurred throughout the Christian world in the nineteenth and twentieth centuries that resulted in the impetus for renewal. Liturgy was identified as one of the sources for his renewal, especially since it functioned as the primary experience of Church for most Christians. The liturgical movement was an ecumenical phenomenon, with representatives from many Christian traditions appealing for reform, symbolized by significant changes to the liturgy introduced by the Second Vatican Council. Three themes stand out among the dozens of reforms proposed and achieved. Reformers lamented the alienation of the people during liturgical celebrations, observing that the people were disengaged and reduced to passive observers of perfunctory acts performed by the clergy. Reformers called for the active participation of the people in the liturgy, so that they would actually do the actions appointed to them: singing, praising, praying, acclaiming, hearing, touching, eating, and drinking.

Reformers identified the liturgy as the primary source of a renewal that would inspire the laity to embrace their vocation as God's holy people, called to apostolic witness for the life of the world. The second trend of liturgical reform was the act of revising liturgical components so that the people could engage them. With music, simpler melodies were used to encourage the people to sing the response. Many Churches authorized the use of the local vernacular language to promote understanding of the liturgy. People were encouraged to receive Holy Communion at each liturgy, including the act of drinking from the cup. Reformers encouraged creation and revival of local customs that would be familiar to the people as opposed to imposing one universal rite associated with a particular apostolic see or region in the practice of liturgical inculturation.

A selection of liturgical theologians and scholars of ritual studies attend to the larger objectives of liturgical reform, namely the transformation of the human being. Transformation was one of many terms that rose in popularity as the scholarship on liturgical reform increased, alongside terms such as divinization, deification, and theosis. Liturgical theologians appealed for a shift of attention from changes in liturgical aesthetics to the work performed by God that transforms the human participant in an event of synergy. Ritual studies scholars demonstrated how regular ritual performance contributes to the formation of the core values of communities and the development of virtues in human beings. Scholars of these fields presented their arguments through macro-and micro-level examples. The remainder of this entry will explain how the transformation of the participant occurs at the macro-level by analyzing the contributions of scholars such as Aidan Kavanagh, David Fagerberg, Mark Searle, and Kevin Irwin. The entry draws from a variety of liturgical traditions to demonstrate the cross-pollination of liturgical and domestic rituals, and how liturgy is designed to form and develop Christian virtues in the participant.

The Liturgy as God's Work Upon Us

Liturgical theologians depict God as the primary agent and initiator of the encounter that occurs at liturgy. Aidan Kavanagh is among the liturgical theologians who refers to the mystery of Christ's incarnation as a source of understanding how liturgy is an event that is not about God, but of God

(Kavanagh 1984). God voluntarily discloses God's self in the liturgy without becoming subsumed to the elements of rite, such as texts, materials, or actions. God's presence is incarnational, so the rites enacted are ordinary human actions of speaking, hearing, communicating, eating, drinking, and yet they are divine. The divine-human quality of liturgy is incarnational, God meeting the people where they are, through the idioms they can understand. The divine presence in form and matter accessible to the human is on account of human weakness, so that the encounter can happen (Kavanagh 1984). The liturgical event is powerful, as the community experiences a process of adjustment to the encounter from one liturgical event to the next. Kavanagh describes this adjustment as a process of working out, sustaining, and establishing the orders of belief and supplication in the community. Kavanagh does not explicate how the community becomes virtuous, but maintains a macro-level discussion emphasizing how the foretaste of the future life with God in the kingdom necessitates adjustment on the part of the community.

The liturgical encounter with God and the community's adjustment to the event form human action. Kavanagh writes rather generally about this adjustment without offering details. Liturgy is not limited to the appointed place, but is a universal event, with the participation of the whole cosmos. The purpose of liturgy is "reconciliation with God and all persons and things in Christ," irreducible to a specific purpose or cause, but for the life of the world (Kavanagh 1984, 153). Kavanagh emphasizes liturgy as an act, not an object to be read or studied. The human community partaking of the liturgy hosted by God is called to act by "doing" the world. As for the values of the community constituting the body of Christ, Kavanagh says only that the Church is the "embodiment in the world of the World to come, the kingdom" (Kavanagh 1984, 57).

David Fagerberg sustains Kavanagh's vision of liturgy as an act of God that makes its participants into theologians whose vocation is to do the world. Fagerberg revisited the story of Kavanagh's Mrs. Murphy, the nonexpert parishioner whose knowledge of theology is rooted in her liturgical participation and everyday life. Fagerberg takes another step in connecting liturgical participation to ethics when he claims that the laity cannot demonstrate theological knowledge by "articulating propositions," but rather by the "grammar they use to understand the world and to shape their own lives" (Fagerberg 2004, 141). Fagerberg acknowledges that this is a "macrocosmic" approach when he says the participant is "capacitated to read the world," and to "tell the world a truth about itself" (Fagerberg 2004, 151–152). Fagerberg intends to disclose the cosmic mission of liturgy, since it is not a self-contained act, only for Church people who are conducting Church business. The point of liturgy is action to be taken on behalf of everyone, a task irreducible to a specific cause or issue.

Kevin Irwin adopts an approach compatible with Kavanagh and Fagerberg in arguing that God completed the work of redemption of humankind in the liturgical act experienced by assemblies of faithful (Irwin 2018, 73). Irwin emphasizes the eschatological dimension of liturgy while cautioning that each liturgical act is provisional, awaiting fulfillment in the future life of the kingdom to come. The not-yet, in-between time is not one of passive observation while awaiting the kingdom to arrive. Irwin connects liturgical participation not only to belief, but also to spirituality, describing the formation capacitated by the liturgy as a continuous journey of deepening conversion for the participant.

Ethics form an important part of this process of liturgical formation. Irwin applies the ethical consequences of liturgy to the ordinary concerns of daily life, remarking that isolating liturgy from life makes the liturgical event an end in itself as opposed to a means. The participant, then, bears the responsibility of remaining faithful to their liturgical experiences, which means that their conduct must be consistent with liturgy's eschatological dimension, the kingdom of God. Irwin is sensitive to degree of fervor in maintaining fidelity to God's kingdom, hence the need to return to the liturgy as the source of ethical

nourishment on a regular basis (e.g. participation in every weekly Sunday Eucharist). Acknowledging the imperfections of humans who worship, Irwin cautions strongly against rigid evaluations of the effectiveness of liturgy in fostering an ethical life, and argues that regular liturgical participation should “over time, lead to forming how one looks at life and how one ought to lead the Christian life” (Irwin 2018, 591). Therefore, the role of liturgy in forming Christian ethics in the participant is a process of deepening conversion, one that remains in the present while awaiting fulfillment in the future.

Mark Searle reflected on the objectives of active participation in the liturgy by recalling the social, cultural, and political contexts of various stages of the liturgical movement. Searle reflected on the capacity of liturgy to reawaken faithful in the early stages of the liturgical movement, in countries where the Catholic Church endured decline, closures, and alienation from the state and the people (Searle 2006). Liturgical formation went hand-in-hand with social reconstruction. Searle summarizes the Benedictine liturgist Virgil Michel, who was particularly sensitive to the reformist movement within the Catholic Church that aimed to deliver social justice to workers exploited by wealthy landowners.

Liturgical formation is relevant beyond the celebration of liturgy, with liturgy functioning as a practical rehearsal for ethical action in the context of one’s daily life. Searle endorses the formational quality of liturgy and identifies the transformation of the participant as one occurring in three stages. Participation in the appointed rite leads to an encounter with Christ through baptism, and the meeting with Christ brings the participant to God. Searle accentuates the vulnerability of the participant in the presence of God, as God is not “reduced to a handy-dandy, pocket sized deity or convenient friend in the sky” existing only to give participants what they want or need, but God meets participants in a place where “God can be God for us” (Searle 2006, 39–40). Contact with the uncontainable holiness of God reveals the unholiness of participants as “finite, guilty creatures, called ultimately to struggle, to suffer, and to die” (Searle 2006, 40). The seemingly pessimistic tone of Searle’s point is designed to underscore the process of theosis, along with its development of an ethic, to be one that is constantly ongoing. Active participation in the liturgy does not merit a reward, or a certificate of completion because the participant is constantly engaging the process of being done unto by God.

Assenting to this encounter with the uncontainable God is possible through obedience to the order of the appointed ritual. Searle notes that the community engages the ritual together, so obedience is necessary for all to perform the appointed rite without opting out. Participating in the appointed ritual forms of liturgy is a way of conforming one’s self to its set forms of speech and behavior. Regular participation in these rites denotes commitment to certain attitudes. Acknowledging the tendency to confuse emotional feeling with commitment to rite, Searle accentuates that ritual performance is formative when the performers “make its attitudes our own” (Searle 2006, 25). Searle adds that liturgy is a rehearsal for enacting relationships to God, the community, and the world. It is this notion of liturgy as a performative rehearsal for the enactment of Christian ethics that enables a select demonstration of liturgical performances that translate to ethics in everyday life. The following micro-level examples of reconciliation draw from diverse Christian traditions.

Examples of Liturgy as Performance: Reconciliation

Christian Churches have multiple rites of reconciliation during the Eucharistic celebration, including rites of penance that begin the service and the exchanges of greetings of peace. The Evangelical Lutheran Church of America (ELCA) includes a rite of confession and forgiveness at the beginning of Sunday

worship. A variety of assembly configurations are recommended to establish the link between receiving forgiveness at the Eucharist and the remission of sins of baptism. One powerful option for churches with a visible baptismal font is to call the assembly to gather around the font for this rite. This is one suggestion of several, all designed for the assembly to see the baptismal font during the performance of the rite. This example illustrates the multiple dimensions of rite. Liturgical formation involves all of the senses, including sight and bodily posture, of gathering around the font or directing one's gaze toward the font while acclaiming a prayer that thanks God for forgiveness has the capacity to be formative. Furthermore, positioning the rite of reconciliation at the beginning of Sunday worship sets the tone for the rest of the celebration: the community confesses its sin before God, together; and the community receives divine forgiveness, together, before hearing the word of God and participating in the Lord's Supper.

A collection of related liturgical rituals from the Byzantine tradition identifies Lent as an annual school of liturgical ethics. Practicing the rituals can function as a regular rehearsal of ethics in everyday life. Two of the rituals are particularly formative. The first occurs during Forgiveness Vespers that begins Lent. Vespers continues the themes introduced at the Divine liturgy, centered on Jesus' commandment that all are required to forgive trespasses to receive divine dispensation. The hymns sung during Vespers encourage the faithful to seek and impart forgiveness. Following the dismissal, the people stay in the Church for a special rite of forgiveness. The pastor begins the rite by asking the people, "forgive me, a sinner," with the people responding, "God forgives." The pastor then performs a prostration before the people, symbolizing humility. In many parishes, a circle forms throughout the Church, with each participant approaching the other and following the same pattern: "forgive me, a sinner," with "God forgives," and a prostration following. The exchange of the kiss of peace finishes each encounter. Lent begins as a literal performance of Jesus' commandment in Matthew: forgive, and then God's forgiveness is assured. The process of granting and receiving forgiveness from each person in the assembly prepares one for the possibility of involuntary trespassing with family, friends, and strangers, especially when some people in the parish do not know each other well. It is customary for the choir to sing Easter hymns during the communal exchange of forgiveness.

The custom of singing Easter hymns during the rite of forgiveness provides a foretaste of the eschatological joy of the presence and companionship of the risen Lord shared by all in community. The Matins of Easter invites all to exchange the same kiss of peace exchanged in the rite of forgiveness. During the kiss of peace, a verse from the hymn sung by the choir exclaims the values of the Paschal community: "let us embrace each other joyously! Let us call 'brothers', even those that hate us!"

Rites of reconciliation have the capacity to facilitate a psychological change in practitioners, who can experience an improved quality of life through healing and reconciliation with one another. A survey conducted by Elizabeth Gassin and Timothy Sawchak on voluntary participants in the rite of forgiveness yielded informative results (Gassin and Sawchak 2008). Among the survey's prominent results were themes expressing an inner transformation and experiences of catharsis and purification. In their conclusion, Gassin and Sawchak assert that this ritual has the capacity to promote "relational healing within a community," which accords with the first part of twofold reconciliation, that of an individual with others in the community. The rite of forgiveness demonstrates the performative capacity of liturgy.

Similarly, the Days of Awe observed annually by Jews promote transformation and commemorate the divine act of creation and God's kingship. This season of liturgical observance begins with Rosh Hashanah and culminates with Yom Kippur, the day of atonement. Participation in the strict rituals of fasting, prayer,

and abstinence enable the observant Jew to learn the extent of their love for and fear of God (Agnon 1965, 189). The Western religious seasons of Christian Lent, Jewish Days of Awe, and Islamic Ramadan share the common feature of appointing ritual practices that sharpen one's focus on God and God's teachings.

Example: Cosmic Reconciliation and Ecological Stewardship

The liturgical traditions have expanded so that performative ethics are neither theocentric nor anthropocentric, but now have a cosmic lens. Christians embraced the movement for environmental protection and stewardship in the twentieth century, and have developed new resources to strengthen the formation of an ethic expressed in liturgy and adopted in daily life. Several liturgical scholars have demythologized the false dichotomy of sacred and profane to restore the biblical principle that God's creation is good. Liturgy requires the use of material items, and Irwin's taxonomy of symbols is helpful. For example, water, fire, and soil are natural symbols given by God to humanity, and the liturgical year presents a consistent narrative of God performing redemptive acts through the agency of water. The Jewish and Christian traditions of sacred topography privilege the Jordan as a holy place honoring the presence of God in the Old and New Testaments. Mountains, deserts, and the wilderness are also sacred places that host the encounter between the uncontainable God and humankind. The desert ascetical tradition and the hagiographical literature produced by it introduce a rule of fundamental stewardship of the environment for Christians. In cultivating the earth only for their basic necessities, the early monastic communities used water sparingly, and balanced the time appointed to prayer with caring for the earth. Their diets consisted of available resources, especially basic vegetables and fruits. Respect for the finite resources of the earth is organically connected to abstaining from overindulgence, which exploits the earth. The ascetical tradition enjoys a type of synergy with environmental stewardship.

The modern liturgical renewal began to integrate eco-centrism by enhancing awareness of the innate good in the materials used for liturgy. The major liturgical offices depending on natural resources were restored and enriched. The Eastern Churches have observed the blessing of Epiphany waters for centuries, and the Church of England adapted and integrated this office into the celebration of Epiphany, combining Jesus' baptism in the Jordan with the commemoration of the Magi on January 6. Pastors have invested in forming environmental ethics in the people through more intentional liturgical reforms. The United States Conference of Catholic Bishops offers several liturgical aids on caring for God's creation, including prayer of the faithful to be used at Mass, blessings for special occasions, and hymns on creation. The ELCA has prepared a Water Memorial worship resource consisting of a call to worship, hymn of praise, and several texts of thanksgiving at the baptismal font. An encouraging development in the Churches of the West is the sustained commitment to composing new Eucharistic prayers that retain traditional structures while revising the texts to accentuate the cosmos as a faithful servant of God that is redeemed by Christ along with humankind.

Conclusion

The liturgical renewal movement restored the centrality of liturgy in the lives of Christian people by emphasizing the capacity of liturgy to stimulate Christian growth. At the macro-level, contemporary liturgical theology proposes a sophisticated theological anthropology. The ordinary lay person can

become a theologian, a member of the lay apostolate whose values are of the kingdom of God and who is called to reconcile with neighbors and the world. The liturgy, then, becomes the primary space for the formation of the Christian person, whose performance of the appointed ritual functions as a regular rehearsal of adopting the attitudes of the Christian community and learning how to put them into practice in everyday life. Churches have intentionally integrated attention to global moral crises by naming them in the liturgy and exhorting the people to perform a collective response on the basis of their shared Christian values. Liturgical theologians emphasize that God's transformation of the world through the faithful observance of the people is one of potentiality and possibility because of human freedom and deficiencies. When divine grace is manifest through human performance of liturgical ethics, liturgy is no longer contained by the walls of a Church or worship space, since the people are performing the liturgy in the spaced shared by all of creation in the world.

CHAPTER 37

Reading/Recitation/Memorization

Lauren E. Osborne

This entry outlines the ethics of reading, reciting, and memorizing within the frameworks of different religious traditions. While religious texts are often studied as texts – that is, in so far as they are interpreted on the level of discursive meaning, providing key tenets or narratives that form the backbone of a broader religious tradition – scholars have considered less thoroughly the ways in which believers may engage with religious texts in embodied practices, including memorization, reading, or recitation. And yet, considering the ethics of reading, reciting, or memorizing can help shape the understanding of a religious tradition more broadly and the engagement with religious texts therein. These practices and the ideals to which they aspire are shaped not only by the contexts of the religious traditions to which they belong, but also by even further contextual factors. There are the social, historical, cultural, or even occasional contexts in which those practices may appear or be pursued, as well as by the material that is to be read, recited, or memorized and as well how it is understood within the religious tradition to which it belongs.

A particularly significant example of memorization and recitation practices in relation to a broader tradition is the recitation of the Qur'an within Islamic tradition. Considering the meaning and ethics of Qur'an recitation within Islam reveals the connections between ethical practices and broader concerns, ideals, or theological tenets held in Islam more broadly. And even further, considering a parallel tradition of recitation – in this case, the comparative counterpoint of recitation of Torah within Judaism – offers a potentially fruitful avenue for further study. While the points of contact and commonality between reading, reciting, and memorizing sacred texts in Judaism and Islam are many, perhaps the most striking distinction that arises in comparing the ethics of these practices is that much hinges on how the words or material being recited, read, or memorized is understood and embedded within its religious tradition.

In “Text and Canon,” in *The Blackwell Companion to Religious Ethics*, Michael Fishbane theorizes the canonization and interpretation of a religious text or set of sayings within a particular tradition as a process of “canon consciousness,” with the formation of the canon of the Hebrew Bible and its interpretation and reinterpretation in Jewish tradition providing a paradigmatic example of this phenomenon (Fishbane 2007, 69–70). He goes on to point out, and then to examine, how scriptural exegesis can provide a window on to moral reasoning in a tradition (through the case of ancient Jewish interpretation of the Hebrew Bible – called Midrash) (Fishbane 2007, 70–71). So too we may expand on Fishbane's example in considering the lives of religious texts in so far as they are engaged with through oral and embodied practices of reading, reciting, and memorization.

Why Recite the Qur'an

Traditionally, the Qur'an is transmitted orally, with the goal of individuals committing parts or even the whole of the text to memory. Although the written word and the physical copy of the Qur'an is important and treated with care (there is a word that is used specifically for a physical copy of the Qur'an, *muṣḥaf*, which etymologically refers to a collection of leaves, and is used to refer to written materials or physical books specifically), recitation and memorization of the Qur'an play a central role in religious life. In his 1987 *Beyond the Written Word: Oral Aspects of Scripture in the History of Religion*, William Graham has argued that the oral and aural aspects of and practices associated with religious texts have been overlooked. For Graham, the Qur'an and the practices of memorization and recitation associated therewith serve as a key example in support of this claim (Graham 1987).

As Graham and others have pointed out, since its inception, the primary mode of engagement with the Qur'an has been through oral and aural means. The verse thought to be the first revealed to the Prophet Muhammad begins with a command to read or recite: "Recite! In the name of your lord who created" (Qur'an 76:1). And many verses begin with the command, "Say!" directing readers or reciters to repeat statements or narratives that may follow. By extension, the Qur'an is often thought as commanding its readers and listeners to recite it orally in ritual practice. Recitation as a religious obligation is typically derived from a command given in the Qur'an itself. One oft-cited verse commands the qur'anic readers and listeners, "recite the Qur'an distinctly" (Qur'an 73:4). This verse is often seen as directing the ethical imperative of its own recitation, not only that the Qur'an should be recited, but that it should be recited in a particular way.

Others have also pointed to historical evidence in attesting to the key role of reciting and memorizing the Qur'an in the development of the Islamic tradition, and the key role of oral transmission in the tradition's history is also cited as directing an ethical imperative to continue emphasis on orality and memorization as they are key components to the tradition's origins. Navid Kermani has argued that the accounts of the early reception of the Qur'an – via its recitation – attest to its aesthetic power, particularly in the context of the importance of the recited word and oral poetics in seventh century Arabia (Kermani 2015). Beyond aesthetic reception, reciters and recitation of the Qur'an played a key role in disseminating the Qur'an and its message in the early period of Islam. In this way, recitation served as the medium through which the developing early tradition was spread. As Frederick Denny has illustrated, in the early centuries of the Islamic tradition, the development of Islamic exegesis (the body of literature, discipline, and associated standards and norms eventually called *tafsīr*) and the rules governing correct pronunciation and etiquette of the recited Qur'an (*tajwīd*) in fact developed in tandem, as two iterations of a shared set of concerns of the preservation, interpretation, and maintenance of the qur'anic text (Denny 1980).

While in the early period of Islam, memorization and recitation of the Qur'an may have initially served the purposes of dissemination and preservation of the sacred text, the reasons for reciting it are not limited to these. By the medieval era, there had developed genres of literature on the understandings and uses of the Qur'an – *adab tilāwa al-Qur'ān* (the etiquette of reciting the Qur'an) – as well as *faḍā'il al-Qur'ān* (the excellences or favors of the Qur'an). In these bodies of literature, there is, as Anna Gade points out, a strong sense that memorization and recitation of the Qur'an benefit both the individuals involved as well as the Islamic community more broadly (Gade 2017). In addition, by this time the rules of recitation – the rules of *tajwīd* – had come to be canonized, with the earliest extant treatises dating to the tenth century CE (Denny 1981, 145).

The proliferation of ethical guidelines surrounding memorization and recitation of the Qur'an attests to its theological status in the tradition more broadly. The Qur'an is understood as the literal words of God; memorizing and reciting the text is a significant point of contact for Muslims to the divine word and the original moment of revelation. The Qur'an itself attests to its divine origins, and ties this claim about origins to a further claim of aesthetic perfection, of which orality is a key component. This particular relationship between text and revelation has led some to liken the memorization and recitation of the Qur'an to the Christian practice of the Eucharist, for example (Smith 1993, 70). While one may draw a parallel comparing religious texts of different traditions (e.g. comparing the Hebrew Bible, the Christian Bible, the Qur'an, and so forth), the parallels of divine revelation between these traditions are somewhat different. In the case of Islam, the Qur'an is understood to be divine revelation (rather than a worldly text attesting to revelation in some other form), and when considering memorization and recitation in light of this theological tenet, the ethics that follow are significant (and described in further detail below). And it is for these reasons that the Qur'an is always recited in its original Arabic, rather than in translation, even if the individual reciting or those listening do not know Arabic.

Why Cantillate the Torah

Jewish recitation of the Torah is referred to most commonly in English as cantillation rather than recitation. That semantic distinction aside, a quick look into the basics of the ethics of cantillation of the Torah in the Jewish tradition reveals several points of commonality with qur'anic recitation, and the distinctions help further highlight the particularities of theology and ethics in both traditions more generally.

The recited Torah is most frequently encountered in Sabbath synagogue services, although its particular place in the liturgy and when else it may be heard or recited varies somewhat depending on the type of synagogue and community (Summit 2016, 41–42). While the most regularly occurring encounter with the recited Torah is in synagogue services, any individual who goes through the rite of passage of the bar or bat mitzvah also learns to recite some Torah for performance at that occasion. And as Jeffrey Summit has recently explored in *Singing God's Words*, many contemporary American Jewish adults now take on study of cantillation for the purposes of individual spiritual development and connection to tradition and community (Summit 2016). In this way, cantillation of the Torah is analogous to recitation of the Qur'an in that most active members of the religious community have some exposure to recited scripture in a liturgical context, at rites of passage, or may take it on themselves, and that recitation can be both part of the personal development of piety of a layperson, as well as a more specialized area of study.

Although the practice of reading the Torah aloud derives from the ancient period, there is not agreement about the details of its origins. Some have argued that the Torah service originated after the destruction of the Second Temple in Jerusalem in 70 CE. Upon its destruction, the Temple could no longer serve as the central site of Jewish identity, and this moment marks a shift in conceptualization of the Torah text as the center of Jewish worship and access to the divine, in the absence of the Temple (Langer 1998, 49). In the collective memory of tradition, the Torah reading is understood as commemorative or a reenactment of Moses receiving the law on Sinai. While the details of historical origins may be obscure, the Torah reading is understood as being tied to Jewish history.

Considering ethics and religious practice within the broader framework of everyday life, however, complicates the seemingly straightforward relationship between the origins of traditions and the choices

of individuals. Ethnomusicologist Jeffrey Summit points out that while academic texts may offer historical reasons for why the Torah is chanted, when asked, the origins of tradition may not be the first point of reference for individuals. In contrast to historical reasons pointing to the origins of tradition, Summit's interviewees typically frame their decision to study cantillation of the Torah in terms of a personal connection to their community and its history, framing as personal agency something that has also been conceived in terms of communal obligation (Summit 2016, 7, 18). So too, in my own interviews with reciters of the Qur'an, while individuals may offer "traditional" explanations for why one might recite connecting to the status of the Qur'an within Islamic tradition, seemingly mundane details of everyday life or technical considerations of vocal techniques also emerge as important factors shaping decisions, such as passage to recite, or what recording one might prefer to listen to (Osborne 2016). This is not to say that "traditional" reasons are not relevant, but rather that considering ethics with respect to both textual traditions and as practices embedded in the everyday may reveal a more complex portrait of the ways in which religious traditions are enacted and reinterpreted in conversation with other facets of life.

How to Recite the Qur'an

The recitation of the Qur'an is conducted according to the rules of *tajwīd*, the body of rules governing correct pronunciations, including features such as correct points of articulation for Arabic letters, elisions, or specific pronunciations between certain combinations of letters, extension of certain syllables, where a reciter may or may not pause, conventions such as formulas that one should say when beginning to recite, and more general conventions of etiquette. This body of rules was codified by the tenth century CE, with the earliest complete works on the subject articulating in a single form rules that had likely been practiced earlier. The ostensible purpose behind these rules is for the reciter to produce the clearest and most beautiful oral rendition of the Qur'an, clearly representing the meaning of the text, and neither obscuring it or making it secondary in importance to other aspects of the sound (such as the melodic or emotional arcs of a recitation), or misrepresenting the meaning by pausing in an inappropriate location.

Notably, the melodic practices of Qur'an recitation are not specified by the rules of *tajwīd*. Instead, melodic conventions are most frequently taught orally. Most commonly, melodies follow the modal system of Arabic music, the *maqāmāt*. The use of pitch and melody in reciting the Qur'an is always improvised. Improvisation in a mode is in keeping with the performance styles and aesthetics of Arabic music. But there is also a larger point about Islamic theological ethics and the complex relationship between the Qur'an as divine word and musical practices. Music has a contested history within Islamic thought and practice, with it being seen as neutral in status at best, but often problematic in that it may be associated with practices or contexts that are forbidden or inappropriate, either in general or when mixed with religious practice specifically. In short, music is seen as a human-made system or practice, and the divine status of the Qur'an and its recitation makes it inappropriate to fix it to a human-generated practice (Nelson 1985).

The ethics of Qur'an recitation may be found in different sources, depending on how one understands ethics in this case. For the technical details in terms of the mechanics of recitation and memorization, *tajwīd* manuals abound, and thanks to the proliferation of global media, anyone with access to the Internet may find instructional websites, videos, or recordings freely available online. It is important to

note, however, that *tajwīd* manuals and even online resources are not typically used on their own, such that individuals may memorize and learn to recite the Qur'an in isolation. Rather, the tradition continues that the text is taught and transmitted in person from teacher to student, with manuals and other resources serving as guides or memory aids in part of this process.

Two of the most extensive considerations of theological ethics of recitation and memorization are from medieval authors. Sufi thinker Abu Hamid al-Ghazali (d. 1111 CE) dedicated one volume of his *Revival of the Religious Sciences* (*Iḥyā' 'Ulūm al-Dīn*) to Qur'an recitation: *Kitāb Ādāb al-Tilāwa* ("The Book of Etiquette of Recitation") (Ghazzālī 1982). Shāfi'ī jurist al-Nawawī (d. 1277 CE) wrote a work on the etiquette of the Qur'an, including memorization and recitation, as well as other types of engagements and practices, *Al-Tibyān fī Ādāb Ḥamalāt al-Qur'ān* ("Exposition of the Etiquette of Bearing the Qur'an") (al-Nawawī 2012). The word in al-Nawawī's title as "bearing" – *ḥamala* – generally refers to carrying something, and similarly to the English idiom "carrying a baby" can refer to pregnancy, and as it is used in this title, the term may refer to an individual "carrying" the Qur'an, in the sense that they have committed it to memory and it is contained within them in a figurative sense.

Neither medieval work outlines the details of recitation techniques such as the rules of *tajwīd*. Instead, each focuses on placing memorization and recitation within a broader ethical framework that connects to the traditional Islamic understanding of the Qur'an and its role in tradition. Al-Nawawī introduces his work with a section outlining the merit (*faḍīla*) of reciting and bearing the Qur'an, citing numerous accounts attesting to the eschatological rewards awaiting those who recite. Some accounts emphasize a connection between recitation and understanding, in that those who recite understand the content of the text and behave accordingly. While al-Nawawī's work on etiquette with the Qur'an is detailed, its framing indicates that the knowledge found therein should be applicable and meritorious for any believer, with a strong emphasis on the imperative to recite.

Al-Ghazali takes a contrasting approach in his work on the etiquette of recitation, however, even though both authors cite several of the same accounts or sayings attesting to the merits of recitation. The practical mechanics of recitation (the rules of *tajwīd*) are again omitted, but in this case they may be assumed as a premise or background for a more specialized readership. Al-Ghazali divides his ethics of recitation into "external rules" and "mental tasks." The external rules cover in quick succession basic ethics for any reciter, such as being in a state of ritual purity when reciting, but quickly move to a higher level, discussing the details of reciting the entire Qur'an at once, for example, or specifying how much of the Qur'an someone pursuing a Sufi path may recite at once. The mental tasks of Qur'an recitation then outline contemplative tasks to be pursued along with recitation, akin to stations of a Sufi mystical path, allowing greater access to inner meanings.

How to Cantillate the Torah

Although the origins of the Torah service are ancient, the system of notating the technical details of cantillation was not codified until the ninth century CE, with the earliest treatise on the accents of cantillation being attributed to Aaron ben Moses ben Asher (Summit 2016, 59–60, 189). The systems of ethics of reciting the Torah and Qur'an were codified much closer to one another in history than the disparate dates of their respective compositions would lead one to expect. The details of Torah cantillation rules resemble the rules of qur'anic *tajwīd* in terms of general themes and ideals, although there are significant

divergences, particularly with respect to the use of melody. The rules of cantillation help shape a coherent and clear rendition of the text, in order to clearly convey the correct meaning. In addition to the requirement of correct pronunciation of the Hebrew, the main features of the rules of cantillation include the use of accents or emphasis on certain syllables or words, and the use of *te'amim* – symbols written on the liturgical text that indicate which melodies should be used.

The discourse surrounding the use of melody and melodic rendition of the texts marks a significant divergence in the ethics of reciting between the Jewish and Islamic traditions. While the notation of *te'amim* still leaves some particularities of melody up to the cantor, suggestions of melody are notably absent from the rules of *tajwīd*. Melodic practices in reciting the Qur'an are exclusively taught orally, and always improvisatory in their rendition. Reciters are discouraged from “fixing” the text to particular melodies, as doing so would constitute an unacceptable mixing of human-made melodies with the divine word. Relatedly, the improvisatory nature of the melody may be said to also reflect the ideal relationship between melodic rendition of recitation to the words of the Qur'an. Ostensibly, the words must always be rendered clearly and drive the performance of the recitation; and correspondingly, melody should not become the driving force of the recitation at the expense of the divine word. Although clarity of text and meaning is the ideal in both traditions, the discourse surrounding and transmission of melodic practices is a significant difference between the ethics of reciting in Judaism and Islam, respectively, that relates to much broader historical and theological concerns in both traditions.

Memorization

Given the strong emphasis on orality in relation to divine revelation, the memorization of the Qur'an is considered to be especially meritorious. An individual who has memorized the entire text is referred to as a *ḥāfiẓ(a)*, literally meaning one who is preserving something. Not everyone who learns to recite necessarily memorizes the entire text, however. But in order to perform the five required daily prayers (*ṣalāt*), an individual must be able to recite in Arabic and from memory the first sura of the Qur'an and at least some other short suras. The most extensive treatment of the particular challenges and some of the pedagogical processes used in memorization may be found in Anna Gade's *Perfection Makes Practice: Learning, Emotion, and the Recited Qur'an in Indonesia* (Gade 2004).

By contrast, in the Jewish tradition the Bible is recited from a scroll, with the physical object of the Torah scroll also taking on special significance in the Torah service. Liturgical scrolls, however, only indicate the consonants and notations indicating stress and melodies to be used, but do not include vowels, punctuation, or extended details on the rules of cantillation, so the reader must already be familiar with the material and the shorthand of cantillation markings (Jacobson 2017, 10). In this way, the scroll may serve as a memory aid but does not contain all of the information one would need in order to cantillate correctly without already knowing the text and its reading conventions. Written Qur'ans now always contain all vowels and notations indicating where *tajwīd* rules apply. Although a reciter must be knowledgeable about *tajwīd* rules, much more information is provided in a printed Qur'an as compared to a liturgical Torah scroll. That has not always been the case, however, as many have noted the earliest Qur'an manuscripts contain comparatively much less information, and some have cited this historical evidence in support of claiming an original orality to the Qur'an, that the earliest physical copies were likely memory aids. In part, the differences in the use of memory may stem from the broader understandings of these

texts within their traditions, with the Qur'an's strong claim to orality in relation to its aesthetics and to its preservation and dissemination. In this way, the imperative to memorize the Qur'an is not merely limited to contexts in which writing and written books were less widely available.

Current Trends and Possibilities for Future Research

The importance of memorization and recitation of the Qur'an in Islamic tradition is often cited as an example relating to orality as understood and practiced in the Islamic tradition more broadly. Although the imperative to memorize and recite the Qur'an looms large, it is by no means the only text that is transmitted orally through memorization and recitation. There is a small but growing body of literature focused on the oral transmission of hadith – the traditions or sayings most commonly attributed to the Prophet Muhammad that make up the main body of literature that forms the basis of ethical and legal traditions in Islam (with the Qur'an always being the primary source in name, but with ethical issues being treated more extensively and explicitly in the hadith). Orality and hadith transmission could be further studied in its role in the early development of Islam, for example, or in its continued practice in other historical contexts as well. Religious knowledge is often oral in nature in Islam, and further study of oral transmission and performance of Islamic texts and sayings could help fill in this understanding of Islamic epistemologies more broadly.

Currently, very little comparative work has been completed on ethics of reading, reciting, and memorizing across different religious traditions. A handful of recent works consider recitation practices within the frameworks of their respective traditions and contexts, comparative work – particularly in recitation practices in which there are historical and linguistic connections between traditions – is a desideratum in the fields of Religious Ethics and Religious Studies.

CHAPTER 38

Pilgrimage

Albertus Bagus Laksana

Pilgrimage: Then and Now

Pilgrimage, understood broadly as a multifaceted tradition centered around the act of visiting a holy place (shrine) with religious or spiritual motivation, is an ancient practice found in all major religious traditions. And it is on the rise in our day (Coleman 2006). Old routes and shrines have continued to be popular, such as Camino de Santiago, Lourdes, the Holy Land, Mecca and Medina, Benares, and so forth, while new routes have been recently created, such as Camino Ignaciano in northern Spain, following in the footsteps of St Ignatius Loyola (1491–1556) who made an arduous journey of penitence and spiritual conversion along this route. In many parts of the Catholic world, Marian shrines are mushrooming, while the ancient ones continue to be packed with pilgrims. In the Islamic world, the canonical pilgrimage of the *hajj* and the non-canonical *umra* becoming even more attractive, with explosive numbers of pilgrims annually (never below 1 million) with the concomitant massive physical development of the cities of Mecca and Medina (Bianchi 2004), while local pilgrimage traditions are also mushrooming, from Morocco in the West to Indonesia in the East (Laksana 2014). The annual *arba'een* pilgrimage now draws more than 20 million pilgrims, not only Shī'ite Muslims but also Sunni Muslims and even Christians. In the decentralized Hindu tradition of pilgrimage, we find thousands of *tirthas* or sacred places, ranging from local shrines to major pilgrimage sites with international clientele, from a humble shrine in the Himalayas to a splendid mother temple in Besakih, on the slope of Mount Agung, on the Indonesian island of Bali (Lochtefeld 2010). In the Buddhist world, pilgrims continue to flock to various holy places, from the Vajrasana in Bodhgaya, considered to be a central holy place in Buddhism, to the Borobudur temple compound in Java and other smaller sites.

The rise of global pilgrimage is surely spurred by cheap travels and easier transportation and better facilities on the site, making faraway and remote sacred places easier to reach and the journey and visit more enjoyable, such as Hindu and Buddhist shrines in the remote Himalayas (Lochtefeld 2010). However, the phenomenon of pilgrimage continues to be very complex. In our time, the pilgrimage traditions have become so diversified, customized, and hybridized. We can find every style and form of doing the pilgrimage, from the traditional one that is physically arduous, to the tourist-style pilgrimage that combines religious or spiritual journey with modern leisure and travel. Scholars have begun talking about the new phenomenon of “secular pilgrimage” (Margry 2008). Furthermore, places associated with an ascetic journey of purification and meaning seeking, such as Santiago de Compostela,

continue to draw pilgrims of all kinds, from a couple on their honeymoon to a comedian in search of life's meaning (Frey 1998).

The complexity of modern pilgrimage is well-illustrated by the practice on Camino de Santiago. Although the Santiago de Compostela pilgrimage has a strong religious foundation in Catholicism, it has been transformed in many ways. Here the original Catholic doctrine regarding sin and its remission and conversion endure, but we also find elements of transcendent spirituality, tourism, physical adventure, nostalgia, a place to grieve, and even esoteric initiation. For many, the Camino has served as a moment of deep union with nature, a vacation, an escape from the drudgery of the everyday, a spiritual path to the self and humankind, a social reunion, or a personal testing ground (Frey 1998).

Indeed pilgrimage has been a complex and unique phenomenon. Victor and Edith Turner, the pioneering figures in the anthropological study of pilgrimage, have pointed out that part of the enduring appeal of pilgrimage is the experience of liminality, that is, a moment where the structures of the normal society are left behind and a spontaneous new feeling of being united in a community (*communitas*) is born (Turner and Turner 1978). While acknowledging the innovativeness of Turner's seminal findings, contemporary scholars have moved beyond this Turnerian archetype of pilgrimage as a liminal moment that occurs across religious traditions and historical periods. These recent studies have been more attuned to the particularities of the theological or religious, historical, and cultural contexts of the pilgrimage in question. They notice different motives and dynamics, including contestations, involved in pilgrimage practice (Eade and Sallnow 2000). In our time, the practice of pilgrimage has become much more complex, customized, and hybrid in ways that reflect the particularities of our era, as shown by the Camino de Santiago. That is why, we find in the contemporary study of modern pilgrimage the term "intersecting journeys" to describe the meeting between different motives in the current phenomenon of pilgrimage (Badone and Roseman 2004).

As mentioned, local pilgrimage tradition is also mushrooming. In many places in Asia, this local practice is growing due to the fact that devotional and ascetic journey to a sacred place is emphasized by major Asian religious traditions as well as local indigenous traditions (Laksana 2014). This whole phenomenon is connected with the role of paradigmatic figures as well the power and spiritual attraction of natural or cosmic spaces. In many parts of the world, this phenomenon is part of everyday religion of the ordinary people and their communities. In Latin America, this popular pilgrimage would include veneration of Catholic saints, including Mary, that has become localized or acquired a national character as well, such as the veneration of Our Lady of Guadalupe in Mexico and Our Lady of Charity in Cuba. In Muslim North Africa, veneration of local saints continues to be popular, while local pilgrimage in the African church has begun to gain scholarly attention as well after a long neglect (Mueller 2011).

In most major religions, pilgrimage is an important part of the tradition. In certain religions, such as Buddhism and Sikhism, the practice was initially met with hostility, but eventually it was to become an integral part of these religions. However, theological debate about the propriety of doing pilgrimage to tombs or shrines of saints can still be found, especially in Sunni Islam, where the contention can at times be so dramatic, resulting in violent vandalism such as the destruction of Muslim pilgrimage sites in Timbuktu, Mali, in 2012 (Laksana 2014). But in general, the debate between traditionalist and modernist Muslims on the propriety of doing pilgrimage has subdued significantly.

Narrative Framework and Moral Agency

The significance of pilgrimage in the framework of religious ethics is related to the question of moral agency: what kind of role does pilgrimage practice across religious traditions play in the formation of a moral subject? What kind of moral agency does pilgrimage help to form? Pilgrimage tradition in its broadest sense can be understood as a space of moral formation that helps people better understand various challenges of their moral world and to empower them in becoming a better moral self. The significance of pilgrimage can be related to all the major dimensions of religious ethics, such as the descriptive, normative, practical, fundamental, and meta-ethical dimensions (Schweiker 2005, 5–10). More particularly, it is within the framework of narrative theory in religious ethics and moral theology that the distinctive significance of pilgrimage in the moral formation of the self can be fleshed out. Understood generally, narrative theory is set against the disembodied universalist enlightenment style of moral reasoning. It does not start with abstract first principles, but with a particular story that is typically found or embodied in a community's tradition. This story contains the fundamental experience, beliefs, and values of the community regarding itself, the world and the cosmos, and God (Lucie-Smith 2007).

Within the framework of narrative theology, the human story is understood as a rich meeting place between concrete persons and divine revelation. Here morality is best understood not as abstract principles, but as part of a story (Lucie-Smith 2007, 5). Along this line, pilgrimage tradition has often served as a milieu in which people make deeper connections of their life stories with the narrative of the larger religious tradition as well as with the local communities. In the context of pilgrimage, those narratives become distinctive as they integrate particular Divine figures, paradigmatic persons or saints, sacred objects and place, as well as foundational and miraculous events, through a complex dynamic which in practice includes communal, ritual, embodied, and cosmic dimensions that enrich the formation of a moral self. In this regard, pilgrimage is a complex mode of piety that occurs in the intersection between the most private and personal aspect of one's life and the larger framework of his religious tradition and community.

In terms of moral agency, it can be argued that doing pilgrimage enhances one's personal well-being and moral agency (Ogletree 2005, 36–44). Pilgrimage often serves as a privileged time when pilgrims clarify their minds and enjoy a moment of inner peace, especially in cases of spiritual darkness and moral confusion. The deep spiritual experience of pilgrimage energizes the will in cases of moral and spiritual paralysis. Doing pilgrimage helps pilgrims achieve a sense of personal wholeness and cure. Pilgrimage to Santiago, for example, has been practiced as the therapy of route (Frey 1998). In many settings, pilgrimage experience also puts the pilgrims in closer contact with the larger community, and thus helping create a kind of communal moral agency. That is why shrines typically play a role in the identity formation of the local and translocal communities.

On the personal level and in response to different kinds of crisis (personal, marital, professional), a short pilgrimage visit to a local shrine, which is accessible on an almost daily basis, and where pilgrimage can be done in the midst of everyday activity, tends to become a habit of the heart, rather than a memorable one-time journey to a faraway dream shrine. The dynamics of this type of pilgrimage might be related to virtue ethics, namely, the effort to live more meaningfully every day through the cultivation of virtues. Here, pilgrimage is perhaps not to be understood primarily as an extraordinary act of piety, but rather a small yet crucial part of a habitual mode of cultivating spiritual virtues for a good life. Those

virtues include perseverance, simplicity, solitude, constant spiritual awareness, companionship, connection with nature, inner peace and tranquility, authenticity, and so forth. As a place of the formation of the self, pilgrimage has an ascetic dimension that often attracts pilgrims of our time. It involves intense spiritual moments helped by physical hardships, where pilgrims undergo a period of self-questioning and spiritual discernment.

The other important feature of pilgrimage tradition, which is relevant to the formation of moral self and agency, is the distinctive role of paradigmatic figures both of the larger religious tradition and local communities. Pilgrimage tradition is a privileged place where the life stories and role of these figures are narrated, reinvented, and reenacted in the rituals of the shrines, as well as in the lives of the community and the pilgrims. Spiritual connection with these figures is considered important, maintained among others through the cultivation and continuation of the narrative of the virtuous life of these figures in rituals and festivals around the shrine. In many local pilgrimage traditions, the role of the life's narrative of the paradigmatic figures tends to be understood not only in the sense of being moral exemplars, but rather in connection with the communal ritual and spatial framework where the power of the saints goes beyond the rightness of the actions but has more to do with their continued spiritual presence and intercessory power. This presence and power are also related to the idea of saints as founders and protectors of the community, even the larger community of the nation, as shown by the role of Maulay Idris as the patron saint of the Moroccan city of Fez, Our Lady of Guadalupe in the formation of Mexican identity, Our Lady of Charity in the case of Cuban Catholic identity, Rachel in the Jewish Israeli national identity, and so forth. In this case, pilgrimage to the sites of these figures is ritual enactment of the narrative of the community's origin and identity.

This dynamic occurs often when a society or nation is in a "societal liminality," that is, a cultural upheaval when old symbols and metaphors became insufficient and the new ones have not yet crystallized, which led to new rituals. Pilgrimage tradition with its rich rituals can be seen as a way to interpret this moment by putting it in connection with the sacred history of the community, thus enabling the community to make sense of it and regain moral agency at a time of crisis and confusion. This is so, especially when aspects of the biography of the paradigmatic figure or saint corresponds to the current situation (Sered 1998).

However, this dynamic can be more complex, for it often involves different communities, both in conflicting situations where different groups are competing for support and legitimacy through a particular shrine or pilgrimage site, as well as in the more peaceful situation where different groups share a common pilgrimage site in a harmonious way. In the first case, a group of pilgrims who belong to the same social class and grouping is collectively empowered in a special way in relation to the practice of doing the pilgrimage, including the rituals and symbolisms or other aspects of the pilgrimage tradition. In this regard, it has to be noted that the nature of pilgrimage tradition is rich and open-ended; that a particular group's strong sense of being empowered can happen within a hierarchical or rivalrous social system. In other words, the opposite social group can have the same experience as well. Contestations and competing claims can be found in one pilgrimage site.

In the case of shared shrines, different religious loyalties are performed by pilgrims to the site where the saints or paradigmatic figures are venerated by diverse religious communities. Here the claims and values of these diverse communities may not always be in conflict with each other but rather intersecting in some ways (cf. Cuffel 2003; Sikand 2003; Gottschalk 2001). Based on the case of a shared shrine of Haider Shaikh, a Muslim saint in the town of Marlekotla, Punjab, Bigelow calls this "ethics of harmony"

(Bigelow 2004, 5). The significance of this particular shrine should be understood in the context of the history of the place where they resisted the bloodshed during the Partition of India in 1947 and maintained peace and harmony. It should be noted that Merlektola is a predominantly Muslim town in a Sikh majority state and a Hindu majority nation. This ethics of harmony between different groups is maintained through rituals, narrative, and regulatory practices around the shared holy figure and his shrine that also guide and structure social, political, religious, and economic exchanges between Muslims, Sikhs, and Hindus in Marlektola. This case shows how shrines serve as symbolic centers where the community's idealized identity and ethics may be enacted and grounded in the particularity of a place with their paradigmatic figures and narratives. Shrines and their stories become a discursive space for the plural communities to produce this ethics of harmony. The narrative of the saint, Haider Shaikh, has the power to boost the moral agency of different religious communities together, helping to forge a deeper sense of unity, peace, and solidarity, not through abstract moral values, but rather values that are embodied and becoming part of the community's self-understanding (Bigelow 2004).

In the more complicated world like ours, though, this ethics of harmony around a shared shrine might be in a fierce and at times bloody competition with contrasting visions of different groups in the larger society. For example, various shared shrines in Yogyakarta, Indonesia, have served as a space of harmony for generations, where the religious practice was inclusive and hybrid by incorporating local realities and cultures, drawing pilgrims from different religious persuasions (Laksana 2014, 2015). But this area now has become more complex with the presence of more radical religious groups with their iconoclastic ideologies. In recent years, there have been cases of vandalism of some sacred tombs of paradigmatic figures. Other shrines in Libya, Tunisia, and Mali have suffered the same fate. In 2002, during the Gujarat riots, many Muslim shrines in Punjab were destroyed, precisely due to their shared nature. In the context of this contestation, these shared shrines and their communities are challenged to maintain this ethics in a real way. Thus, its unique power might be more visible.

Cosmic Dimension

For some time now, we have heard lamentation against the disenchantment of the world brought about by modernity, as well as the longing for the re-enchantment (Brown 2005; Bennet 2001). In the area of ethics, there has been a plea to return to "a cosmos of personalized interactions within and between various levels of being that are ordered in ways that are rich with moral significance" as well as a longing for a primary religio-ethical cosmology that can be discerned through a direct experiential interaction with the natural world (Reynolds and Schofer 2005, 126–127). It is believed that aesthetic experience of the natural world boosts ethical agency as it helps create the right mood or landscape of affect for ethical decision and action. And this cosmological interaction is one of the most salient hallmarks of pilgrimage tradition in many world religions, as well as local religious traditions. Thus, the significance of pilgrimage tradition for ethics can be more clearly seen through the category of cosmology.

In ethical cosmology, the order of the universe has a religio-ethical implication on how humans behave in relation to the Divine, his own self, his fellow human beings and other creatures and the whole natural world, and how human beings organize themselves in communities. In this regard, pilgrimage in many religious traditions is closely connected to religious cosmology that has deep implications for ethics. The creation of pilgrimage sites typically involves a movement from a mere neutral space to a place laden

with meaning, where the shrine's spatial location is put in the larger sacred cosmic landscape of the area (Feldhaus 2003). At the origin of a pilgrimage site, there is always a role played by the narrative of the community, where cosmological beliefs regarding the meaning of the place and foundational event form an integral part. Due to this cosmological framework of sacredness, pilgrims conduct themselves differently in this area. In general, pilgrimage tradition and shrine culture, including its narratives, myths, rituals, material, and spatial symbolisms, serve as a place where cosmological insights have been conveyed, developed, appropriated, and reenacted by communities and individuals. At the shrine, the self of the pilgrim is a connected self, a communing self with "clouds of witnesses" (saints, pious ancestors) who are still part of the larger cosmic reality and interact with the natural and human world.

In the Christian theological parlance, the more specific role of cosmology can also be thought of in terms of "sacramentality." Sacramentality is a theological framework in which it is possible and desirable to enjoy the real presence of God as it is mediated by created realities in their materiality and particularities, as opposed to limiting God's presence in purely spiritual realm. In this framework, every created thing in the cosmos has the capability to be a real sign and container of God's presence. Things are sacramental, and pilgrimage tradition and saint veneration are imbued with this deeply sacramental worldview (Goizueta 2004). The framework of sacramentality leads to the appreciation of bodily experience, embodiment, materiality, and so forth.

In an age where it is increasingly more difficult for humans to appreciate bodily or sensory experience, pilgrimage practice across religious traditions stands out in its power to help humans to regain their full humanity. The undervalued and untrained bodies will hamper us in the world of action, and under this condition ethical life is impoverished and imperiled. With its integral cosmology, pilgrimage tradition helps us redefine our vision of humanity and its relationship with the universe and the natural world. Pilgrimage tradition springs from a religious encounter with the Divine mediated by embodied sainthood, materiality of the sacred, and sacramentality of the natural world. Scholars have identified the integral cosmological framework as the cultural home of many practices of popular religion, including the veneration of saints and the pilgrimage tradition (Goizueta 2004). The flourishing of pilgrimage tradition depends on the cultivation of this cosmology where God, humans (individuals and community), and the natural world interact with one another, where the experience of God cannot be reduced to the realm of inner self. Rather, this is a cosmology where the self has to cultivate its relationship with God and nature in order to be a full self, where God's presence is found in the natural world, the self, and the community, and the many connections between all these three. Again, this cosmological framework of the pilgrimage tradition helps form a more capable and balanced moral self. Contemporary ethicists have started talking about the cosmic good (Scheid 2016). For this to happen, there is the need to reconnect the humans with the natural world on the deeper level. And the pilgrimage tradition has something to offer due to its cosmological dimension.

CHAPTER 39

Meditation as an Ethical Practice

Georges B. Dreyfus

We have to cure our faults by attention and not by will.
Simone Weil, *Gravity and Grace*, 105.

Object of the Study

Meditation is often viewed as an activity irrelevant to ethics. This supposedly non-ethical character of meditation is celebrated by some as going beyond the limited categories of good and evil. Though referring here mostly to a popular misunderstanding of meditation, this view is not absent from the scholarly literature, where the goal of Buddhist traditions is sometime described as “beyond good and evil” (Horner 1950). Within the framework of these particular traditions, such a description makes sense, but it does not represent an adequate theoretical statement on the non-ethical nature of meditation and its goal. These statements, which are mostly pragmatic and performative, should not be mistaken as meta-ethical descriptions of the ethical nature or, rather, lack thereof, of the practices of these traditions.

Others view this perceived amorality with great suspicion, tying meditation to the modern culture of self-discovery, which, for them, displays an exaggerated sense of self-involvement and a narcissism deleterious to moral life. Whether they are right or not, one thing needs to be emphasized: it is a serious mistake to assume that the practice of meditation in modern culture reflects the “nature” of meditation in general. Meditation cannot be understood as being just a technique whose meaning remains independent of the cultural context in which it is practiced. Meditation is a technique of the self, in the sense that Foucault (1988, 16–49) has delineated, and we will come back to this point. This is quite different from the crude instrumental understanding often displayed by the modern practice of meditation. For a critique of the modern mindfulness movement, see Wilson (2014).

In this entry, some of the ethical aspects of Tibetan Buddhist meditations are explored. It should be clear that in examining the ethical nature of meditation, we are not interested in extolling the value of meditation. The point is not that meditation is good, but that ethical concepts are relevant to the development of a theoretical understanding of meditation. We believe there is a difficulty in modern academical study of Buddhism to address meditation adequately. Whereas we seem to find little problem to describe the myths, rituals, and narratives of Buddhist tradition, we seem to find it much more difficult to explain meditation in terms that are accessible to the educated public. When speaking about meditation, our usual conceptual

overflow dries up and we are reduced to using either emic terms or general concepts such as mysticism or religious experience. These terms are not necessarily false, but are certainly limited. These remarks address the common understanding of mysticism and leave out the more sophisticated views (De Certeau 1982). They tend to reinforce the stereotypes of meditation as alien, oriental, and as a part of “eastern religious practices.” Viewing meditation as a mystical activity or a “religious experience” removes meditation from the activities of daily life, isolating it into a possibly glorious but unbreakable isolation. Anyone who knows how meditation is actually practiced in Buddhist traditions, which is the focus of this entry, will realize how unfortunate and inadequate this understanding is.

To set the discussion on firm ground, we will limit ourselves to looking at the way in which meditation is practiced by Tibetan Buddhists and how this reveals its ethical character. Although it might be possible to make a few general statements about meditation, we hold that meditation is a practice that takes place in particular contexts from which it can hardly be divorced. Meditation is not a disembodied phenomenon that is identical regardless of how, when, where, and by whom it is practiced. To avoid the fallacy of decontextualization, we will limit our impressionistic comments to the practice of meditation as taught in the *lam rim* (Gradual Stages of the Path) literature of Tibetan Buddhism.

This type of text was introduced in an early form to Tibet in the eleventh century by the Indian teacher Atisha. His work, *The Lamp of the Path to Enlightenment and its Explanation* (Atisha/author name 1969), *byang chub lam gyi sgron me dan de'i bka' 'grel* (Dharmasala: The Tibetan Publishing House, 1969) became the model for a genre of Tibetan Buddhist literature, which later became known as *lam rim*, describing a large range of meditations preliminary to the practice of Tantra. This literature is particularly significant for our purpose. It represents a basic view of Buddhist practice which is widely accepted in Tibet, both among lay population and *virtuosi*. It is practiced by all the contemporary schools of Tibetan Buddhism. Moreover, its views resonate with the understanding of other Buddhist traditions, particularly Theravāda, which share a similar gradualist approach. Although the *lam rim* literature is Mahayanist, its framework includes the practices found in Nikaya Buddhist traditions as well. The term “Nikaya Buddhism” is meant to designate the traditions such as Theravāda which are depicted by Mahāyāna traditions as Hinayāna, while avoiding the loaded connotation of this term. Hence, several of our conclusions will be applicable to other Buddhist traditions.

Even when meditation is seen as relevant to the ethical domain, the relation between meditation and ethics remains external. In the Buddhist tradition, ethics, *śīla*, is mostly understood in terms of injunctions, such as the five precepts emphasized by the Theravāda tradition, or the ten virtues emphasized by the Tibetan tradition. The five precepts are an undertaking to abstain from: killing, stealing, sexual misconduct, lying, taking intoxicants. The ten virtues are: the former first four, plus abstention from slanderous, harsh or frivolous speech, abstention from covetousness, malevolence and false views (Keown 1992, 29–32). Many Buddhist writers have described how respecting moral rules is basic to the practice of meditation. The importance of this type of morality for the overall tradition is well illustrated by the anecdotal fact that Radio Sri Lanka starts every day with the taking of the five lay precepts. More preoccupied by practical considerations, these authors have emphasized the preliminary or auxiliary value of *śīla* with respect to meditation. H. Saddhatissa's statement that “the precepts were never ends in themselves, confined to the mundane level, but were the essential preliminaries, as also the permanent accompaniments, to the attaining to the Highest State” is fairly typical of the limited view of ethics in Buddhism (Saddhatissa 1970, 113). Many modern scholars have recognized the fundamental role of *śīla*

within the tradition. Following the statements of Buddhist thinkers, these scholars have tended, however, to see the role of *śīla* as preliminary. They have concluded that ethics play only a limited role within the Buddhist tradition.

In another essay some of the reasons for this distorted view of the place of ethics in Buddhist practice have been explored (Dreyfus 1995). Here we just need to realize that to understand the ethical nature of meditation we need a broader ethical model, in which ethics is not reduced to a kind of informed consumer's choice, but includes both internal and external domains of our lives. Internal emotions must be seen as fully relevant to the moral character of a person. It is true that we cannot be obliged to have certain attitudes toward our fellow human beings. It does not follow from this that these attitudes are irrelevant to ethical life, rather but that ethical life cannot be reduced to the domain of obligations and injunctions. In order to appreciate the ethical character of meditation, we need ethical models that transcend the dualism of most contemporary ethics, that overcome the divide between reason and emotion, activity and passivity, and that include the whole range of human endeavor, both internal and external, within the purview of ethics (Blum 1980).

How to Understand the Ethical Nature of Meditation

As several contemporary thinkers have emphasized, a richer picture of ethics can be found in the ancient Greeks' views, particularly those of Aristotle and the eudaimonic tradition. Following this tradition, our attention shifts away from the notions of obligation and choice to that of goodness. Ethics is to be understood as being about the good life, that is, the life oriented toward a good end. This *telos* is *eudaimonia*, that is, human flourishing and well-being, in which the good is a whole made up of interlocking parts, forms of activity, internal and external, in accordance with the practice of certain virtues. Philosophically informed Buddhist scholars have begun to realize the importance of virtue ethics (the view of ethics as being about the good life in accordance with the practice of virtues) and teleological models for the understanding of ethics in Buddhist traditions. Some of them have tended to assimilate Buddhist ethics to an Aristotelean perspective (Keowan 1992). The point here is not to cast aspersions on this approach but simply to emphasize that the use of a virtue ethics model does not necessarily imply an adherence to Neo-Aristoteleanism. There have been many teleological systems that were not Aristotelean. The Hellenistic ethical systems, for example, offer examples of virtue ethics that are teleological without being Aristotelean.

The goal of the Buddhist tradition, freedom from negative emotions, resembles that of many Hellenistic philosophers, freedom from disturbance. Moreover, like Hellenistic philosophies, Buddhist views emphasize the importance of certain virtues, detachment and compassion, which are both therapeutic and constitutive of the good. Buddhism is practical in the highest degree, holding that the value of philosophy is not theoretical but lies in its ability to transform humans. Virtues are not meant to just remedy some deficiency or resist some temptation, but to achieve a transformation of the person. Hence, both these traditions offer examples of teleological views that clearly differ from Aristoteleanism, despite being virtue ethics.

The ethical views of the *lam rim* tradition fall in this category of virtue ethics. It does not provide a complete view of the "good," but presents a broad model of Buddhist goals and practices. The *lam rim* leaves out goals in the domains that are not explicitly connected with Buddhist soteriological goals,

such as economico-political life (*artha*) and the life of sensuous and artistic enjoyment (*kamā*), which are described in traditional Indian culture as possible goals of a healthy human life. Hindu tradition describes four goals, the other two being the domains of norms and behavior (*dharma* in the Hindu sense), and liberation (*mokṣa*). See Bary (1958). Its literature describes Buddhist practice as aiming at three types of “good.” On a lower level is the attainment of a good rebirth through the practice of moral precepts. This goal is traditionally taken by laity in Buddhist societies, and is considered by the *lam rim* to be limited. On the middling level is Arhathood, the state of a person liberated from the causes of suffering, the negative emotions (*nyon mongs*, *klesha*). On the highest level is Buddhahood, the state of a person having reached the perfection of knowledge and compassionate activities. This is the goal emphasized by the *lam rim* tradition, and which corresponds to its Mahayanist perspective.

It is clear from this description that the *lam rim* tradition offers a teleological model. It posits certain goals to Buddhist practice which are reached by the development of certain excellencies that are constitutive of them. Although the goals posited are different, they all share in certain fundamental virtues that constitute the good life, summarized as being a life of compassionate detachment. In this broader picture of ethics, the whole of Buddhist practice becomes ethically relevant. Meditation in particular becomes central to ethical life, understood as the development of the virtues or excellences constitutive of human flourishing that is the goal of the Buddhist tradition. It is in the practice of meditation that the central virtues of the tradition, detachment, and compassion, are developed. Hence, far from being irrelevant to Buddhist ethics, meditation turns out to be central.

This is obviously not to say that the practice of Buddhist ethics requires that of meditation. Meditation is usually reserved in traditional Buddhism to religious *virtuosi* such as monks and nuns. Although the separation between these highly trained specialists and laity is more blurred in modernity (Bond 1988), the average person in Buddhist societies still never practices meditation. However, values central to the life of many Buddhists, such as compassion and certain forms of detachment manifested in giving, are related to the practice of meditation. According to the understanding of many Buddhists, these virtues can be fully developed only through the practice of meditation. Hence, meditation is central to a full understanding of Buddhist ethics, even for the majority, who will never engage personally in any meditation.

Meditation and Virtue

To develop a rich picture of the ethical role of meditation, we will have to analyze more closely the nature of meditation, and its relation to the development of virtues. In the Theravāda tradition, meditation is described as *bhāvanā*, that is, cultivation or development. In Tibetan Buddhism, meditation is called *sgom*, a word derived from the verb *goms*, to become accustomed. Meditation is a practice that aims at a process of self-transformation, in a cultivation of the desirable traits of one’s character. Certain nefarious habits due to the domination of negative emotions, such as attachment, are transformed and gradually eliminated. Hence, meditation can be described as a process of becoming accustomed to and developing virtues such as concentration, mindfulness, detachment, compassion, etc., as well as an attempt to uproot internal negative obstacles to the good life.

At this juncture, two questions arise: what is the nature of virtue developed by meditation, and what are the particular virtues that meditation develops? There is no exact equivalent to the word “virtue” in the *lam rim* literature. The closest term is probably *dge ba'i chos* (*kusala dharma*), that is, virtuous quality. The practice of meditation is virtuous in as much as they lead the self and others to happiness and well-being. In the Theravāda tradition, the Abhidharma provides lists of virtuous qualities, such as the five faculties (*indriya, dbang po*), which are: faith, energy, mindfulness, concentration, and wisdom. They are mental faculties to be developed by the practitioner, which lead to the development of liberating insight. The *lam rim* literature also refers to this type of list. Its central classification of virtue is different, however, for it emphasizes the central importance of the six perfections (*pāramitā*). The list is divided into two types of virtues. The first group constitutes virtues such as giving, ethics, and patience, which are described by the tradition as belonging to the method (*thabs, upāya*) aspect of the path, directed by compassion toward the welfare of others and leading to the development of the embodied aspect of Buddhahood. These virtues, which are part of the collection of merits (*punya, bsod nams*), are other-regarding in that they concern our relations with other beings. The second group is constituted by the self-oriented virtues, such as wisdom. These virtues, which take part in the collection of gnosis (*jñāna, ye shes*), concern our way of apprehending reality and lead to the development of the cognitive aspect of Buddhahood.

These two types of virtue resemble the usual distinction between emotional and cognitive virtues. The first three virtues are driven by compassion and imply a positive altruistic attitude toward other beings. Wisdom, on the other hand, is more cognitive. It brings about insight into the selfless nature of things, thus removing obstacles such as selfishness and attachment. Wisdom is not only insight into the selfless nature of reality, it is also the practical intelligence that is required by the practice of other virtues.

The Role of Attention

But what is the role of meditation in the development of these virtues? The *lam rim* tradition distinguishes two types of meditation: meditation of stabilization (*'jog sgom*) and meditation of investigation (*dpyad sgom*). This distinction is broader than the distinction made by most Buddhist traditions (Tibetan included), that between tranquility (*samatha, gzhi gnas*) and insight (*lhag mthong*). It is puzzling that many Theravāda scholars insist that insight is a specialty of this tradition. Insight is widely discussed and practiced in Tibetan Buddhist traditions as well as in several schools of East-Asian Buddhism. Meditation of stabilization involves a fixation of the attention on a single object, often one's breath or a visualized object. When the mind has reached a minimal level of calm and focus, the meditator has the choice between continuing to keep her attention on a single object, or opening the focus of her attention onto more than one object. The first type is a practice of concentration that leads to the development of tranquility. The second category, investigative meditation, is extremely broad, for it includes all the meditative exercises that are not single-pointed, such as the practice of insight, loving kindness, the recollection of the Buddha's virtues, or the meditation on death.

Among the two types of meditation, the *lam rim* tradition emphasizes the latter type. Investigative meditation, such as meditation on compassion or selflessness, is more important, because it is directly relevant to the practice of the path. In ethical terms, such a practice contributes directly to the development

of virtues. But concentration is also relevant in that it develops the attention without which the development of virtues would remain limited. Concentration is particularly important in the development of wisdom, which grows out of the practice of special insight. To reach insight, the practitioner must first develop a high level of concentration. Only when the mind is powerfully focused, can she develop the sharp vision of reality that is required to develop wisdom.

What all these meditations have in common is the development of attention, which is understood in Buddhist traditions to have an essential role in ethics. Its importance can be understood at several levels. At the simplest level, a person needs to be attentive in order to be ethical. A distracted person fails to see that a situation requires a particular course of action. The contribution of attention to the practice of ethics, however, goes much further than this simple requirement that one not be absent-minded. This is so because in most cases, our difficulty in behaving ethically does not come from cognitive difficulties, at least understood in the ordinary sense of the word. The cases in which we are genuinely puzzled do exist, but they are relatively rare. In most cases, our problem does not come from a lack of information, but from an emotional inability to see the ethically relevant features of a situation (DeSouza 1980, 127–151). For example, we see a homeless person. We know that this person is in trouble. We also know that we could help this person, but that would involve some trouble. We decide to remain uninvolved. This decision is not due to a cognitive deficit, but to an emotional inability to overcome our fear leading to an inability to feel strongly enough for the person. This fear and indifference lock us into a certain vision in which we focus on the aspects of the situation that threaten us. This prevents us from considering other perspectives, particularly the ethically salient aspects of the situation, the fact that a fellow human being requires help that we can provide. In particular, this precludes us from engaging in what Strawson (1974) describes as “the range of reactive feelings and attitudes that belong to involvement or participation with others in inter-personal human relationships.”

It is here that the type of attention developed by meditation becomes particularly relevant. Most forms of Buddhist meditation rest on the development of a form of attention usually described as mindfulness (*dran pa, smṛti*). It is the type of attention that we use when we focus on whatever appears to our mental or physical senses. When we are mindful, we are alive to the situation that unfolds in us and outside of us without identifying ourselves with the situation. This ability to detach ourselves from the immediate emotional reactions to the situation allows the mindful person to notice the homeless person as well as his reluctance to help him. The *lam rim* tradition insists on the centrality of this quality, which allows us to be aware of our attitudes and emotions.

Mindfulness is central to the development of a good life within the Buddhist tradition. It is the basic attitude that allows the practitioner to develop other forms of meditation, which as we have seen lead to the development of emotional and cognitive virtues. Mindfulness bridges the gap between domains that are often kept apart in modern ethics, such as activity and passivity. As both a state of heightened receptivity as well as a starting point for further action, mindfulness is both active and passive. Mindfulness also brings together emotion and cognition, acting as the basis of both, and thereby enabling and keeping together these aspects of the human psyche.

Mindfulness is directly relevant to the development of basic moral sensitivity. If we go back to our example, we can see that the development of mindfulness would have helped us to deal with the situation more appropriately. It would have given us the awareness of the emotional obstacles, here fear and indifference, that prevented us from helping a fellow human being. It would have allowed us to notice the limitations of our perception, and shift to another more compassionate perspective. Langer (1989, 137–173)

contrasts mindlessness, a capacity-fixing ability that tends to be rigid and inflexible, and mindfulness, a creative and capacity-increasing faculty that enables us to see the limitations of categories and contexts. Being mindless, however, we were carried away by our emotions. We were led to act unethically, not because we did not know what needed to be done, but because we were unable to resist our impulses. We walked away from the homeless person displeased with our inability to help and yet unable to do anything else.

Buddhist meditation is meant to address this type of problem. At a higher level, it is meant to modify these powerful emotions by eradicating self-grasping, their root. More immediately, though, the practice of meditation is meant to develop mindfulness. This basic virtue, which enables us to develop wisdom, is ethically relevant, for it helps us to gain some awareness and freedom from our emotions. This increases our ability to deal more effectively with negative emotions and develop positive ones. When it is well developed, mindfulness brings our emotions into focus very quickly, and we become almost immediately aware of our responses. This is quite important, for emotions such as fear develop gradually in our minds. Because we usually lack attention, we do not notice this process until these emotions dominate our minds. At this stage, it is often too late to do very much, for we are trapped by these emotions. The more we try to overcome them, the more we become entangled in them. Attention helps us, because it brings these emotions into focus right from the start. At this point, they are still weak patterns that are starting to set the tone without yet being dominant. Being attentive, we notice them and this may enable us to bring about other emotional responses. For example, instead of feeling fear and indifference, we become sympathetic to the plight of the homeless person. This in turn, allows us to open ourselves to this person.

A Few Misunderstandings

Although attention is essential to the development of a good life in the Buddhist tradition, it would be a great mistake to consider it as some kind of panacea. The development of attention and mindfulness do not ensure that our attitudes and actions will be ethical. Attention brings about a certain connectedness to the situation, but this connection is not inherently good. We can become engaged in an object that we are about to destroy. The ethical character of attention cannot be appraised in isolation from the overall framework of the practice in which we are involved. A related point is well made Gimello (1983, 61–88). In this example, attention becomes good only because it allows us to develop a more ethically informed attitude. Such an attitude is not just the result of attention, but depends on the moral education provided by traditions. It is because we have been made aware that helping is good that we can develop the appropriate virtues.

Another misperception is to see attention as providing an immediate and certain access to our mental states. This is again a mistake. The point in developing attention is not that by being mindful we unfailingly understand our emotions. The understanding of mental life gained through attention is not a direct knowledge by acquaintance. For example, we do not become aware of anger just by mere acquaintance with our mental states. The awareness that we are angry at somebody depends on a number of concepts and information that we have about that person. Thus, when we become aware of our anger, we are not directly noticing some kind of autonomous mental factor going on in our mind, like a fish swimming in a pond. Rather, we become aware of an emotional aspect of the global situation. This in turn allows us to pay some attention to this aspect, rather than being driven blindly by it. Only the forms of attention that

enable us to develop emotional virtues, such as compassion, and cognitive virtues, such as wisdom are virtuous. Attention is sufficient in the Buddhist tradition only when it becomes detached and compassionate. Then, it does embody the central virtues that make for the good life. It is only within the larger framework of a tradition that meditation is an ethical practice.

CHAPTER 40

Asceticism and Self-Cultivation

Niki Kasumi Clements

In *Genealogy of Morals*, Friedrich Nietzsche notoriously describes the historical development of “that other ‘somber thing,’ the consciousness of guilt, the ‘bad conscience’” (Nietzsche 1989, II.4). He extols the Arcadian freedom of “the noble” – “he who is by nature ‘master,’ he who is violent in act and bearing” – as honestly expressing the human instinct to conquer and dominate (Nietzsche 1989, II.17). The fall into the “bad conscience” comes with “the ascetic priest” who is physically weak and so must redirect his dominating instinct against others through cunning manipulation and “spiritual revenge” (Nietzsche 1989, II.2). Nietzsche declares: “an ascetic life is a self-contradiction: here rules a *ressentiment* without equal, that of an insatiable instinct and power-will that wants to become master not over something in life but over life itself” (Nietzsche 1989, III.11). Nobles conquer others, as ascetics conquer the vitality of life.

Despite this perversion, Nietzsche also recognizes the ascetic as productive precisely through their self-vitiation, coming to shape subjectivity at the intersection of physical weakness and psychological cunning:

All instincts that do not discharge themselves outwardly *turn inward* – this is what I call the *internalization* [*Verinnerlichung*] of man: thus it was that man first developed what was later called his “soul.”

(Nietzsche 1989, II.16)

Ascetics redirect dominating instincts inwards, negating the domination Nietzsche considers definitional for being human. This ascetic disciplining then renders the human being an “interesting animal” (Nietzsche 1989, I.6) who manipulates others into sharing constructions of “good” and “evil.”

In a fascinating tension, ascetics negate their own vitality through self-denying practices, while also forging internal mechanisms that enable the productive regulation of subjects and society. As Tyler Roberts argues, “Nietzsche’s writing does not reject but refigures asceticism” (Roberts 1996, 404). Ascetic mechanisms include not only world-denying forces of vitiation but also world-making forces of production. While Nietzsche’s ascetics deny their own virility, they cunningly affirm an interiority (the “soul”) regulated by moral injunctions and shape society in their life-subjugating image. Nietzsche critically transvalues modern morality, while also recognizing the productive side of asceticism. Even his invective suggests the intersection between vitiation and formation, subjection and production, asceticism and

cultivation. We can consider here not only constructions of power in asceticism (Valantasis 1995), but also constructions of ethics in asceticism (Clements 2020).

Analyzing asceticism in relation to cultivation involves Elizabeth Clark's attention to "what ascetics give up and what they get, in various particular historical situations" (Clark 1999, 15). Cultural and historical contexts shape constructions of asceticism that refuse transhistorical definition, as Vincent Wimbush and Richard Valantasis's *Asceticism* volume shows, even as common themes cross traditions (Wimbush and Valantasis 2002). Dialectics of divestment and cultivation attend constructions of asceticism, so to flatten asceticism to renunciation is to misunderstand its force. For this entry on asceticism and self-cultivation, three currents in the construction of asceticism are analyzed, while countering flattening oppositions. Next, three sociocultural contexts are presented in (a) early China, (b) the late ancient Mediterranean, and (c) the contemporary United States, as diverse case studies that challenge such oppositions. Finally, features common to accounts of asceticism and self-cultivation are delimited, while recognizing their embeddedness in political, social, and economic contexts.

Ascetic Currents

Academic discourses of asceticism have increasingly analyzed cultural practices of restriction and production – and of divestment and cultivation – as potential sites for embodied critical engagement with social practices and norms. In the United States, scholarly attention to asceticism relies on the discourses of practice (Bourdieu 1990), power (Foucault 1997, 1990a), and performativity (Butler 1997) that include bodily *habitus*, productive forms of discipline, and iterative social signifying practices. Scholars in the study of religion continue to advance constructions of asceticism in three main currents: as a practice or technology of the self, as a historically-embedded phenomenon, and as an ideological apparatus. This section establishes how these currents intersect with three unproductive oppositions, including "Eastern" vs. "Western"; pagan vs. Christian antiquity; and individualism vs. ideology.

"Eastern" versus "Western"

Discourses on asceticism include formal features such as "practices of self-discipline – both bodily and spiritual – by which relations between nature, culture, and self are articulated and enacted, transformed and performed" (Roberts 1998, 89), "any act of self-denial undertaken as a strategy of empowerment or gratification" (Harpham 1988, xiii), and "a form of conduct" or "action that is an end in itself (not instrumental) but is not in itself (spontaneously) good" (Khawaja 2016, 61). Sarah Coakley describes how "ascetic formation ... involves a demanding integration of intellectual, spiritual and bodily practice over a lifetime" (Coakley 2015, 18). Asceticism involves deliberate practices of bodily, affective, and intellectual discipline and the divestment of particular worldly values in pursuit of a desired end. Scholarly focus on renunciation and denial sometimes relies on oppositions between "Eastern self-cultivation and Western asceticism" (Yuasa 1993, 97), where renunciatory practices in Christianity and its "Western" inheritors contrast with practice-based forms of ethical cultivation in traditions like Confucianism and Daoism. Yet just as asceticism and cultivation might not be opposed, neither too should orienting constructions of "Eastern" and "Western."

Pagan versus Christian Antiquity

Such characterizations relate to the scholarly construction of asceticism as stressing a “particular set of beliefs and practices that erupted into high visibility during the early Christian era” (Harpham 1987, xi). Two polarized narratives attend this construction: in one, Christian asceticism is a decline from pagan forms of life; in the other, Christian asceticism offers liberation from “a sensuous and licentious antiquity” (Behr 2000, 2). Oppositions between pagan and Christian paint the latter’s focus on abstinence or restriction in alimentary and sexual practices as a renunciatory departure from the former’s “inner activities of the thought and the will” (Hadot 1995, 128). Paul Veyne cautions against this polarization of liberation and repression assuming “antiquity was a Garden of Eden from which repression was banished” (Veyne 1987, 202). Nuancing the declension narrative, Michel Foucault comes to assess continuities as well as differences in the *askēsis* of ancient Greek, Roman, and early Christian “technologies of the self” (Foucault 1990b, 1990c, 2018), extolling ascetics who cultivate “arts of living” that contest dominant norms. Challenging norms of social, political, and economic life, in pagan and Christian ascetic literature “profound transformations of the human person were possible” (Brown 1998, 603; 1988).

Individualism versus Ideology

Understanding asceticism as “sub-ideological,” Geoffrey Harpham describes the “ascetic impulse” as exceeding the particular religious ideologies that produced them. William James characterizes the spirit of asceticism as permeating wholly secular practices and institutions through culturally pervasive forms (James 1982). Max Weber identifies capitalism as a form of worldly asceticism (juxtaposed with otherworldly mysticism typified by Hinduism), where religious practices of deprivation and restriction intersect with economic practices of consumption and production in the Puritan idea of calling (Weber 2003, 111). The “ascetic impulse” has a two-fold force. On the one hand, it creates the perfect consuming subject, who pays money to submit to a rule; elite fasts, colonics, retreats, and ritual household declutterings offer their customers the opportunity of practicing peak purity through neoliberal efficiency maximization (Logan 2017). On the other hand, even this consumerist aesthetic can be seen as expressive of “intertwined methods of self-realization and social formation” and a desire for transformation (Logan 2017, 603). Valantasis argues the ascetic impulse can challenge the hegemonic operations of society, producing new social and cultural formations (Valantasis 2008, 103). Gavin Flood insists on asceticism as the internalization of religious traditions with robust cosmologies (Flood 2005, 2), limiting the sub-ideological ways ascetic impulses operate. Yet ascetic formation can exceed ideological subjection through the dialectical constitution of individuals and traditions.

Ascetic Constructions

To see these currents at work, three case studies illustrate the connection between asceticism and self-cultivation in the Warring States period of ancient China (fifth to third centuries BCE), the late ancient Mediterranean (fourth to fifth centuries CE), and the contemporary United States (twentieth to twenty-first centuries CE). These contexts help frame ascetic “motivations, meanings, and results” in relation to political, social, and economic factors (Harvey 1999, 317).

Case Study: Ancient China (Fifth to Third Centuries BCE)

Alongside political and military reforms, the Warring States period in ancient China saw philosophical schools develop to address tensions. From Confucianism (through Mencius and Xunzi) to Daoism (through Lao Tzu and Chuang Tzu), texts influential in this period include approaches to self-cultivation and ethics understood as ascetic; that is, as “a practice acquired through strong moral, mental, and bodily discipline” (Choi 2012, 456). Despite differences in politics and metaphysics, “embodied virtue” in early Chinese ethical and medical views of the human see mind and body as not dualized but continuous where practices shape and transform humans (Csikszentmihalyi 2004, 59). The everyday asceticism of Confucianism and Daoism includes “active participation in social and political life with disciplinary rigor” (Choi 2012, 458), and self-cultivation includes “dietary practices, exercise regimens, breath meditation, sexual cultivation techniques, and other technical traditions” (Raphals 2011, 147).

To understand the connection between asceticism and cultivation, consider the metaphor of archery. *The Analects*, attributed to Confucius, sees one’s character as laboriously cultivated through practice like an archer (Confucius 1979, 3, 7) and the texts of Mencius connect struggling with mistakes to the archer’s self-corrections (Mencius 2003, 3A3). Mencius describes “radiant qi” (Mencius 2003, 2A2) as involving both physical and moral cultivation, leading to a jade countenance (Wang 2010, 344) and “physiological transformation” (Raphals 2011, 150). The *Nei-yeh* (Inward Training) describes the intersection between energy and cultivation – “Therefore this vital energy, Cannot be halted by force, Yet can be secured by inner power” (Roth 1999, 13) – and the spiritual ideal of “wu-wei” sees action accord “with the normative order of the cosmos” (Slingerland 2003, 5). Self-cultivation contributes to the balance of society and the heavens, be it through Confucian order or Daoist power.

Case Study: Late Ancient Mediterranean (Fourth to Fifth Centuries CE)

Juxtaposing “Eastern self-cultivation” and “Western asceticism” becomes even more inaccurate when considering the similar stress on psychological and physiological continuity in the late ancient Mediterranean (Shaw 1998). From Stoic to Jewish to Christian texts, Greek *askēsis* refers to forms of exercise originally associated with the physical rigors of gymnastics, with asceticism “present to greater or lesser degrees in every religious tradition of the Roman empire, pagan, Jewish, Christian, and Manichaeon” (Harvey 1999, 317). Susanna Elm argues for continuities between Greek moral thought – notably “distinct stoic-platonic notions” – and early Christian ascetic stress on discipline (Elm 1994, 13). Philo of Alexandria describes the Therapeutae as a Jewish community organized through practices of fasting, prayer, and abstinence (Philo 1941), while late ancient rabbis reckon with bodily vulnerability in ethical cultivation (Schofer 2010).

While Pierre Hadot extols “spiritual exercises” of ancient Greek and Roman philosophers, late ancient Christian ascetics stress theoretical as well as practical forms of self-cultivation. Athanasius’s *Life of Anthony* enacts asceticism as separation from society through normative and physical distance, while regulating doctrinal orthodoxy on the basis of experiential wisdom (Athanasius 1980). Basil of Caesarea’s *Rule* describes Cappadocian asceticism as including daily regulation of dress, food, and prayer alongside spiritual practices of contemplation within liturgical and communal settings (Basil 2013). In the Egyptian desert, Evagrius Ponticus refigures the Stoic ἀπάθεια (*apatheia*) as an achievement reliant on the daily cultivation of πρακτική (practical wisdom) and θεωρητική (contemplative knowledge) (Evagrius 1972). John Cassian

carries Evagrius's emphases to burgeoning monasticism in southern Gaul, employing the metaphor of an archer who uses proximate and distal goals to stay motivated in the face of daily struggles (Cassian 1997, 1.5). For figures like Cassian and Abba Joseph in the *Apophthegmata Patrum*, Roberts stresses how "asceticism is aimed not at the repression but at the reorientation of desire" (Roberts 1998, 84).

Case Study: Contemporary United States (Twentieth to Twenty-First Centuries CE)

Discourses of "self-care" in the contemporary United States involve not just "what ascetics give up and what they get" but also what they give economically. Elite fasts, cleanses, and classes (from aerobics to spin to postural yoga) reject renunciatory language by reframing ascetic mechanisms of discipline and restriction through postindustrial capitalist consumption. Dana Logan illuminates dialectics of bodily evacuation and material consumption in the ascetic discipline metonymized by Gwyneth Paltrow's conglomerate *goop* that promises an adherent "accumulates through elimination" (Logan 2017, 622). Marie Griffith analyzes the Protestant background for this logic in movements like Women's Aglow, where narratives of bodily control and the construction of "fat" as indexing gluttony render bodily "imbalance" morally detestable (Griffith 2000, 143). From Weight Watchers to colonics to SoulCycle, programs of purifying consumption require participants' exertion, sweat, and financial investment. Despite its solipsism, the yearning for transformation also radiates, as Kathryn Lofton frames Oprah's power of "affiliating individual products with holistic lifestyle fantasies" forging "those moments in which ideology feeds action, in which her rhetoric of change might manifest in individual lives" (Lofton 2011, 26).

The potential for transformation also attends "lifestyle" disciplines derived from religious practices, including postural yoga and meditative practice. With the Sanskrit *yoga* applying to Hindu Brahminic traditions "of asceticism and praxis" (Fitzgerald 2012, 46), Andrea Jain illuminates the "everyday regimens" of *preksha dhyana* within the global economic movements of the yoga market, while also affirming a potentially transformative ethos (Jain 2015, xviii). Similarly, even as the "mindfulness revolution" can self-centeredly distract from addressing structural injustices (Purser 2019, 8), modern iterations of Buddhist practice can be seen both as "a personal spirituality and as a socially and politically active force for social and environmental justice" (McMahan 2008, 253). The sub-ideological reading of asceticism shows the tension between compulsory consumerism and the desire for transformation in practices appropriated from religious roots.

Ascetic Cultivations

These three historical and geographical contexts trouble oppositions and stereotypes in their inter- and intra-religious and cultural diversity. From Chinese feudal states, to late ancient Mediterranean landscapes, to contemporary American marketplaces, models of ascetic cultivation involve different political, social, and economic concerns. The intersection between embodied disciplines and religious ideologies nevertheless informs all three examples. Refusing to oppose asceticism as a tool of power and asceticism as a technology of self enables a framing of asceticism as productive of both modern disciplinary subjects and critical forms of self-cultivation.

Even as asceticism's meanings, motivations, and results shift, there are common mechanisms of formation across geographical, temporal, cultural, economic, political, social, environmental, and material differences. Asceticism, when read in relation to self-cultivation, involves the regularity and rigor of discipline exercised in an ongoing struggle to habituate in arduous practices and to transform through them over time. Such commitment involves an orientation towards a goal, as an archer towards its mark, which hones attention and stabilizes affective motivation within the struggles of privation. While ascetic cultivation can enable transformation over time, such transformation is never complete and even ascetic experts must dynamically adapt to the conditions of which they are a constitutive part.

Asceticism is not modern shorthand for deprivation or renunciation of self – nor does it signal purity and absolute separation from political, social, and economic concerns. While asceticism involves regulation, repetition, and symbolic orientation, it encodes complex relations between the intentional and ideological, between the cultivated and inculcated. The work it takes to engage and sustain ritual practices is related but not reducible to social subjection in those practices. Weber was right that hard work both signals the renunciation of particular worldly desires and contributes to the formation of a particular political, social, and economic life. Foucault's stress on "technologies of the self" alongside "technologies of domination" intensifies his attention to "arts of living" as the precondition for critical resistance to oppressive norms (Foucault 1988, 2011). Carolyn Walker Bynum and Amy Hollywood theorize this promise in medieval female ascetics' exercise of agency, reshaping societal scripts through bodily fasting and ritual piety (Bynum 1987; Hollywood 2016).

Social forces and relations shape subjects through regulative, disciplinary practices, but this captures only the compulsory side of asceticism or religious formation. Ideology is, indeed, a problem for asceticism, but only insofar as it delimits the range of possible values and aspirations that the ascetic might adopt. This is why Flood's tying of asceticism to religious traditions does not adequately account for the power of the ascetic impulse which does not just reinscribe traditions but also works to forge and contest them beyond the bounds of "religion" as well. Valantasis asserts a radically optimistic formulation of asceticism, where "body-builders, monks, gang members, environmentalists, community organizers – in short, anyone who resists in order to create new selves, different ways of socializing, and a cohesive way to relate to the physical world bespeaks the presence of an ascetical impulse" (Valantasis 2008, x). The radical potential of asceticism and self-cultivation that Valantasis, Foucault, and other scholars theorize lies not in the transformation of a particular subject but in the potential of this transformation to challenge political formations and economic practices. By forging disciplined experiments with forms of life and by opening up "tradition" to reinterpretation through embodied challenges, the intersection between asceticism and self-cultivation troubles dominant norms and requires analysis beyond limiting oppositions of "Eastern"/"Western," pagan/Christian, and individual/ideological.

This analysis of asceticism and self-cultivation reframes practices of regulation and even deprivation beyond a flat logic of self-renunciation as characteristic of "Western" forms of life. To transvalue Nietzsche's own derision of ascetics is to recognize asceticism as part and parcel of the cultivation of self and society. To counter negative assumptions and unproductive binaries concerning asceticism involves recognizing (sometimes extreme) practices of deprivation and regulation oriented towards the cultivation of self, rooted in the world even if in critical tension with its norms. To recognize the possibilities for self-cultivation in asceticism is also to refuse the dogmatism of humans as dominating or dominated, considering instead constructive possibilities for habituation, orientation, and transformation.

Challenging what forms of life might look like vis-à-vis disciplined, arduous formation is part of an ethical project to not just *think* differently, but to *live* differently. This genealogy of the desiring subject, as Foucault reflects in his late work, is a history of the transformations of desire from a straightforward Nietzschean imposition of force to a dialectical constitution between subject formation and self-cultivation in “the forming of oneself as an ethical subject” (Foucault 1990b, 28). Appreciating the possibilities for cultivation in asceticism involves understanding the dialectic between critique and construction, the giving up of comfort and ease for a transformed self and the production of new forms of sociality. Self-cultivation is never necessarily progressive and the radical potential of asceticism requires the ongoing critique of norms, opening up different ways of inhabiting and reshaping worlds.

CHAPTER 41

Comparison in Religious Ethics

Sumner B. Twiss

Overview

Religious ethics in the comparative mode represents cross-traditional and cross-cultural ethical inquiry with simultaneous hermeneutical, critical, constructive, and theoretical dimensions. The hermeneutical dimension entails interpreting moral and religious cultural systems, thinkers, practices, and patterns of reasoning in social and historical context. The critical dimension involves analyzing the social, political, economic, and institutional influences on these systems, thinkers, practices, and patterns. The constructive dimension requires identifying and developing intercultural moral resources for articulating new self and social understandings as well as practical strategies for advancing human well-being. And the theoretical dimension involves reflecting on systemic issues raised by the preceding dimensions; for example, ethnocentrism, methodological distortion, universalism versus relativism, justification and truth, the role of imagination, and relations among understanding, interpretation, and explanation. As presently understood and practiced, comparative religious ethics embraces methodological pluralism (and complementarity) and accepts the role of the comparative ethicist as a transformative public intellectual. Although some would argue that this field of inquiry is a discipline, others prefer to regard it as an ongoing conversation among scholars of different disciplines united by the aforementioned dimensions (see Stout 1994).

Whether discipline or conversation, comparative religious ethics has a complex history that crosses disciplines and is marked by intellectual controversy over goals, methods, and results. Its emergence as a focused academic subject is often dated to 1978, when three works simultaneously appeared: Green (1978), Hindery (1978), and Little and Twiss (1978). This coincidence was made all the more remarkable by the fact that the authors were working independently of one another and had somewhat different lineages, ranging across and combining social theory, anthropology, history of religions, and philosophical ethics. The coincidence may be explained in part by the desire of religious ethicists to break from the ethnocentric hegemonies of Christian ethics and purely Western philosophical ethics. Despite the apparent watershed year of 1978, it is important to be aware of earlier developments. These are never far from the view of current scholarship and identify certain themes and issues that are still part of the conversation. In lieu of an exhaustive survey of this development, only a few prominent and illustrative figures and landmarks will be cited, along with features of continuing significance.

History

From the period of classical social theory and philosophy, the illustrative landmark figures are Émile Durkheim, Max Weber and Ernst Troeltsch, and Edward Westermarck and L. T. Hobhouse. Durkheim pioneered the idea of developing a positive science of social life. A science of morality should treat moral and religious beliefs and practices as natural phenomena for which were sought the causes, functions, and laws on a *sui generis* social plane (Durkheim 1915). From Durkheim's perspective, the science of morality provided an intellectual basis for guiding enlightened social and political policy. In fact, he played a significant role as a transformative public intellectual during the period of the Third French Republic.

Unlike Durkheim, Weber distinguished between politics and scholarship. He developed a program of value-neutral scientific inquiry into social phenomena. Weber's distinctive methodology of *Verstehen* uncovered the subjective motives of agents – complemented by causal and historical explanation and involving the use of ideal types of rational behavior (Weber 1963). Using this methodology, Weber pioneered sociological inquiry into distinctive types of religious ethical systems within correlated political economies. This was informed by an overarching evolutionary view of rational social development.

Although in significant agreement with Weber's method, Troeltsch crystallized the meaning and challenge of historicism for dealing with the moral and religious diversity and the internal development of supposedly absolute ethical and religious values (Troeltsch 1971). Unlike Weber, Troeltsch was not shy about playing a public intellectual role in German political society, particularly after World War I.

While not trained social scientists, philosophers Westermarck and Hobhouse undertook comparative surveys of moral phenomena all over the world. Their contrasting normative and theoretical conclusions – ethical relativism and moral universalism, respectively – illustrated the challenge of Troeltsch's "crisis of historicism" for the field of ethics (Westermarck 1906; Hobhouse 1916). Both Westermarck and Hobhouse played significant public intellectual roles in, respectively, Finnish and English politics.

The major themes of this first phase of development are: interest in a science of morality with evolutionary overtones; attempts to articulate a method of systematic comparison; awareness of how historicism poses the acute challenge of universality versus relativism in the sphere of ethics; and a tendency to accept the role of public transformative intellectual.

The second phase is marked by anthropological interventions, whether pursued by professional anthropologists or by philosophers guided by such professionals. Two philosophers, Richard Brandt and John Ladd, did limited fieldwork among the Hopi and Navajo, respectively, utilizing Western moral theory (theory types) to expose the logical structure of the reasoning and worldviews of their subjects (Brandt 1954; Ladd 1957). Both were widely read in the ethnographic literature and used informants and professional translators for limited periods of field research. Both used "ideal types" to guide their inquiry and to analyze their results. They regarded their studies as forays into what was called "descriptive ethics," that is, analyzing the moral reasoning of subjective agents from their internal perspective. Yet their work also compared Western patterns of reasoning and justification with those of indigenous peoples. Neither Brandt nor Ladd envisioned himself as a transformative intellectual.

By contrast, the anthropologist Bronislaw Malinowski undertook intensive field studies of the people of Melanesia. Curtailing the use of theoretical ideas and professional informants, he relied on long-term participant observation in order to ascertain how they reasoned and made sense of their world (Malinowski 1948). Malinowski's ethnographic method was influenced by American pragmatism (specifically, William James).

He attempted to determine how his subjects' behavior made sense or was reasonable inasmuch as it pragmatically satisfied their basic needs. The total field of data was scrutinized from the perspective of how the data fit holistically and pragmatically in order to form an intelligible world. Malinowski was not interested in comparison per se, or in using ideal types as bridges of comprehension, which might distort the data and do an injustice to the way his subjects actually reasoned.

By way of summary, the main themes of this phase of development are: a contrast between methods of inquiry about moral reasoning (inquiry into its logical structure guided by a descriptive typology versus intensive fieldwork guided only by a non-theoretical pragmatic holism); movement toward explicit systematic comparison versus a suspicion of such comparison; and the apparent demise of the role of the public or transformative intellectual.

The third phase of development begins with the aforementioned watershed books of 1978, followed by intensive scrutiny of their presuppositions, methods, and results. Ronald Green's book was predicated on a theory of moral and religious rationality derived from Kant's moral philosophy (and to a lesser extent John Rawls' theory of justice). This theory was used to probe the structure of reasoning in Judaism, Christianity, and the religions of India (Green 1978).

Roderick Hindery was guided in part by Weber's work on religious ethics, as well as other methodological studies. He used primary sources and history of religions literature to challenge simplistic views of the ethics of Hindu and Buddhist traditions (Hindery 1978).

David Little and Sumner Twiss explicitly adapted Ladd's descriptive ethics – by adding definitions of certain key concepts (morality, law, religion) – to probe the reasoning and justificatory patterns of selected data from three moral traditions: the Navajo, early Christianity, and Theravāda Buddhism. This study was also informed by contemporary ethnological and historical scholarship (Little and Twiss 1978).

The response to some of these works was immediate and sustained. Green was criticized for imposing an *a priori* and ethnocentric account of rationality on religious–moral traditions that distorted their views. Little and Twiss' study was criticized for being overly positivistic and deploying categories and ideal-typical structures of reasoning that were too static and unnuanced to capture the dynamics of reasoning within the complex worldviews in which they are embedded.

In reaction to these criticisms, Robin Lovin and Frank Reynolds published an anthology of essays in 1985 on cosmogonies and ethics that explicitly propounded a Malinowski-like pragmatic holism as the proper way to study texts and phenomena within diverse moral traditions. This continued the suspicion of systematic comparative work in ethics, while opening the possibility that pragmatic holism could be used for non-systematic comparison in the future (Lovin and Reynolds 1985). The majority of essays in their anthology were particularistic studies of limited texts and traditions (considered within themselves), not explicit comparisons across traditions or cultures. The majority of the authors were historians of religions and anthropologists. For this phase as a whole, none of the scholars advocated the role of the comparative ethicist as a transformative intellectual.

A number of trends are remarkable in light of the preceding phases: a continuing interest in a grand theoretical (although not explicitly evolutionary) account of morality across traditions; the continuing use of ideal types (even if challenged) in comparative ethics; and a continuing interest in deploying less systematic and more pragmatic approaches to the subject. In addition, the theme of universality versus relativism carried through many of these works. Green's theory presupposed moral universalism. Little and Twiss' patterns of moral reasoning were portrayed as descriptive universals. Lovin and Reynolds worried about the possible relativistic implications of their pragmatic holism.

Contemporary Situation

In order to fill out the picture of comparative religious ethics and lay the groundwork for looking toward the future, it is important to ferret out certain themes and trends within current work. It is useful to distinguish these themes and trends into two broad categories: (1) internal features of comparative scholarship and (2) substantive focal concerns of that scholarship. *Internal features* include aims, depth of comparison, categories of analysis, methods, social and intellectual location, and variegated subtraditions. *Focal concerns* refer to the emergence of substantive areas of scholarship which use comparative methods to enrich such fields as moral psychology, history of religions, biomedical ethics, environmental ethics, and political ethics, to mention but a few.

As presently practiced, comparative religious ethics encompasses a number of aims, ranging across enriched cultural moral self-understanding, appreciation of other traditions, enhancement of cross-cultural communication, addressing shared social problems, and systematic theorizing about religion and ethics. While individual scholars may emphasize certain of these aims more than others, all appear to accept the fact that their work is relevant to advancing these aims. There appear to be two types of depth of comparison: implicit and thin, and explicit and robust. The thin type of comparison brings categories of analysis – whether Western-derived or adapted from previous historical and comparative study – to bear on describing, interpreting, and analyzing one tradition, thinker, text, or genre. This analysis is followed by critically revisiting (and possibly revising) the original categories of analysis. More robust comparative studies explicitly compare two different traditions, thinkers, texts, or genres in order to elicit significant similarities and differences between the objects of comparison. Categories of analysis employed in either of these types range across intentionally theory-thin bridge concepts (way of life, notion of agency), more normatively loaded concepts (particular moral norms, a particular notion of rationality, a theory-type such as natural law or virtue theory), and the inductive elicitation of comparable themes from the materials under scrutiny (discursive strategies, elements of worldview, praxis). The methods used by scholars are myriad and range across a number of options; for example, formal-conceptual (using moral theories as sortals), historical-philological (focusing on key normative terms), phenomenological-ethnographic (investigation of lived reality), hermeneutical-dialogical (mutual interrogation of moral worldviews, reasoning, praxis) (Twiss and Grelle 2000). Although these methods are hardly exhaustive, they are legitimate options for inquiry that can be selectively used and combined in the comparative task, depending on the choice of aim and material. The spirit of methodological pluralism and complementarity is now a leitmotif for this field of study.

As scholarship has progressed, and as appropriate in a world characterized by global intercultural communication, transport, and education, non-Western scholars have entered the conversation of comparative religious ethics. They are guided by similar or analogous aims, methods, and categories, although now enriched by indigenous social and intellectual locations. This trend is likely to continue and strengthen, eroding perceptions (or misperceptions) of the hegemony of Western scholarship. This trend, in turn, has surfaced – or at least emphasized – the fact that non-Western traditions embody diverse sub-traditions (an internal moral pluralism) that accounts for the fact that previous scholars have offered seemingly competing readings of non-Western traditions, thinkers, and texts. Monolithic interpretation of these traditions is forever eroded.

Some of the most important work in comparative ethics is now being done by indigenous scholars interested in philosophical and practical issues and the way that their societies and traditions deviate

from Western moral reasoning and praxis. This scholarship is complemented by Western scholars equally interested in the reasons for such deviation, as well as being alert to ways that Western reasoning and praxis might have something to learn from non-Western traditions or at least be enriched by them. Illustrative examples of this development range from comparative studies of the self (relevant to moral psychology), to cross-cultural studies of human rights and just war theory (relevant to political ethics), to comparative studies of health, medicine, and healthcare delivery (relevant to biomedical ethics), to cross-cultural studies of ecological thought and practice (relevant to environmental ethics). The list could continue because so many substantive focal concerns are now involved in the comparative enterprise.

The fact that comparative inquiry is being integrated into substantive areas reflects a maturation and acceptance of the field by other scholars. It also points to the re-emergence of the role of the comparative ethicist as a public intellectual committed to working with others – locally, nationally, internationally – in the attempt to resolve social problems shared by diverse peoples and traditions (Twiss and Grelle 2000). This development, while welcome, does not gainsay scholars' continuing interests in other more theoretical issues and aims. The fact is perhaps aptly illustrated by continuing dialogue about issues of universality versus relativism, now within the form of arguments and counter-arguments about prospects for a common morality or global ethic. The parameters, then, for the conversation or discipline that is comparative religious ethics are both expanding in certain respects and reflective of concerns that originated with its emergence.

Future

In order to concretize further the maturity attained by comparative religious ethics and to illustrate directions for future scholarship, it is necessary to note in more detail work now being pursued. As mentioned previously, comparative ethics is now being undertaken in substantive focal areas of concern.

(1) Comparative inquiry into selfhood and moral agency subsumes study of particular topics, such as self-cultivation, the sources of human moral evil, particular virtues, notions of conscience and their analogues, among others. Much of this work constitutes rather thin comparisons between non-Western conceptions of self and related phenomena, on the one hand, and somewhat broadly cast notions of Western metaphysics and virtue theory, on the other (Allen 1997). By contrast, other studies are much thicker and more robust comparisons between particular thinkers or key normative concepts from two different traditions – for example, Mencius and Aquinas, Augustine and Xunzi, *jen* (Confucian humane-ness), and *agape* (Christian neighbor-love) (see Yearley 1990). These studies push comparisons in the direction of trying to solve a genuine human problem, such as how to relate reason and emotion, how to overcome moral evil, or how to sustain the project of becoming a good person. This type of robust comparison is especially difficult, since it requires mastery of two different traditions, their languages, and their internal historical development, in addition to using a combination of methods (philological, conceptual, historical) and carefully controlled bridge concepts (person, will, rationality, virtue). Nonetheless, scholars are increasingly trained to undertake such studies, and one can anticipate more such work in the future.

(2) The emergence of social, applied, or practical ethics from the perspective of non-Western moral traditions, while not explicitly comparative, is a phenomenon worthy of note. It portends the general

potential for scholars of non-Western and Western traditions to collaborate on seeking answers to shared moral dilemmas cutting across traditional and cultural boundaries. It is simply a fact, for example, that scholars of Buddhism, Confucianism, and Hinduism – whatever their social and intellectual location – are probing moral issues concerning medicine and healthcare, ecology, statecraft, business, and human rights (see Keown 2000). Given the processes of globalization, one can easily anticipate an explosion of such work that can only benefit the scope and quality of comparative inquiry in applied ethics.

As one example of how far this general phenomenon has developed, the area of comparative medical ethics and healthcare delivery is represented by not only ground-breaking tradition-focused work (Hinduism, Buddhism, Native-American traditions, Confucianism), but also explicit cross-cultural comparison of, for example, concepts of health and disease, issues of suicide, euthanasia, and human experimentation, and patterns and modes of healthcare delivery (see Coward and Ratanakul 1999). This work has thus far focused on challenging Western paradigms for handling these concepts and issues, which are often controlled by the influence of the scientific biomedical model. Similarly, there have been challenges to the Western biomedical focus on individual patient autonomy versus other traditions' openness to family and community consultation and decision making. Western healthcare delivery that values high-technology medicine over community-oriented preventive and palliative strategies is also challenged. Again, evidence indicates that this area of comparative ethical inquiry will intensify and become more robust in the future.

(3) One encounters similar developments in the area of ecological and environmental ethics, although with a twist. Disenchanted environmentally minded Western scholars are taking the lead in looking toward non-Western traditions for conceptual and practical resources to mitigate environmental pollution, ecological destruction, species extinction, and depletion of non-renewable energy sources that are exacerbated by modern industrialized economies. The hope is that comparative study of non-Western moral traditions will yield new ways of conceptualizing a positive regard for nature, as well as correlated practical strategies for reining in energy and resource-hungry Western societies. There is a spate of studies on non-Western traditions focusing on conceptions of nature, ecological balance, appropriate land use, and harmony between humans and other species, among other related topics (see Callicott and Ames 1989). As the environmental crisis constitutes a worldwide problem, one can, again, anticipate increasingly robust comparative work in this area.

(4) Comparative ethics and political theory has been high on the agenda of comparativists for the last two decades. It has been intensified by recent political, military, and terrorist events. Amid claims of an inevitable clash of civilizations, scholars of comparative ethics have been patiently addressing issues of war and statecraft – just war theory and its analogues – and human rights that are increasingly translated into discourse for public consumption and education. With respect to just war thinking, the comparative work thus far is focused on Islam, Christianity (or Western tradition more broadly), and Buddhism (see Kelsay 1993; Bartholomeusz 2002). In regard to human rights, comparative work has focused on the enlightened retrospective interpretation of myriad non-Western and Western moral and religious traditions in light of their congruence with or deviation from traditions of international law and human rights (see Bloom et al. 1996). Increasingly, this work is also taking on a public intellectual dimension in the form of cross-cultural dialogues, both non-governmental and governmentally sponsored (see Twiss 1996). As human rights atrocities and war continue to plague the peoples of the world, one can confidently predict that this area of comparative ethics will grow in importance.

(5) The final substantive area – search for a common morality – brings us full circle to a perdurable concern of comparative religious ethics since its earliest inception: universality versus relativism. While theoretical in tone, this issue has a very practical moral dimension, since if there is (or can be) a universal, common, or global ethic or morality, a strong groundwork is provided for intercultural moral dialogue and praxis. Comparativists have been working on the prospects for a common morality from a number of angles: deploying diverse philosophical theories (Kantian, Aristotelian) informed by comparative data; forging a practical overlapping normative consensus among diverse moral and political traditions; showing pragmatically that a common set of moral norms is the best way to solve shared problems and advance human well-being (see Outka and Reeder 1993). In addition, this search – which is likely to continue into the foreseeable future – continues to press the theoretical issue about whether comparative ethics can produce generalizable moral knowledge indicating some deep truths about our human moral nature.

CHAPTER 42

Comparison as a Discipline

David A. Clairmont

Moral theorists do not typically consider comparison a topic deserving much attention. After all, moral theory is the work of theorizing about morality – about the meaning of good and evil, right and wrong, and their presence or absence in community standards and ways of life. In everyday life, comparison functions as a basic way of making sense of the world, of differentiating similarity and difference in physical space, in the use of language, and in negotiating individual identity and social relations. In this sense, comparison is natural, inevitable, without conscious deliberation, and not of theoretical concern.

Comparison becomes deliberate when it is cultivated as a skill, often first in early childhood education. Young people are asked to compare and contrast, to find similarities and differences, when they learn to read or when they learn scientific methods of investigating the world in classroom settings. The rationale for comparative thinking in these situations is not linked to any particular goal but rather is the acquisition of a translatable skill to assist in all areas of life. In some cases, comparison is linked to a desire to understand new situations, social settings, and people from different backgrounds. Although the rationale in these cases is not explicitly ethical, such instances do provide early life examples of how comparison might function for ethical purposes.

If comparison is therefore an inevitable feature of human life on the one hand and something which also can be deliberately cultivated as part of general education and early childhood socialization, how is comparison a theoretical concern for an academic field such as religious ethics? As Sumner Twiss argues in this volume, comparison as a distinctive approach to religious ethics emerged from the confluence of the historical and philosophical study of religion. “Religious ethics in the comparative mode represents cross-traditional and cross-cultural ethical inquiry with simultaneous hermeneutical, critical, constructive, and theoretical dimensions” and Twiss goes on to explain that “As presently understood and practiced, comparative religious ethics embraces methodological pluralism (and complementarity) and accepts the role of the comparative ethicist as a transformative public intellectual. Although some would argue that this field of inquiry is a discipline, others prefer to regard it as an ongoing conversation among scholars of different disciplines united by the aforementioned dimensions” (Twiss 2005, 147).

Following Twiss, we might set the organizing question of this entry in the following terms: *What is the advantage of thinking about comparison as a discipline?* In the study of religious ethics, any answer to this question must clarify both what is meant by comparison and what is meant by a discipline. In the

remainder of this entry, I begin with the latter question, reviewing the various uses of the term discipline: as a way of life cultivated by teachers in conversation with their students, as a domain or field of study, and as a community with distinctive aims and recognizable forms of excellence. Next, I will explore how these different senses of a discipline help us to understand the reasons why comparison is important for religious ethics, specifying the various rationales that support the comparativist's work. I conclude with a brief account of the different kinds of communities that receive the work of comparativists and probe the responsibilities of these religious ethicists in our increasingly interconnected, reflexive, global religious space.

The History and Senses of Disciplines

It is customary to think of academic disciplines as kinds of work that parallel specialized jobs in other professions (Berry 1996, 19). However, the idea of a discipline has a history which is useful to review if we are to understand the various ways we can speak of comparison as a discipline. In our ordinary usage, the word “discipline” denotes a form of training (sometimes even a form of a punishment intended to reform a behavior deemed undesirable), but the original meaning of the term is actually the one who is trained – that is, the student – from the Latin word *discipulus* which refers either to the student or to the follower of a teaching (from which we derive the word “disciple”) (Oxford English Dictionary 2013). This sense of discipline focuses both on the one who is trained but also on the way of life (or in a more limited sense, the way of knowing) through which one receives training from a competent authority in intellectual, moral, or spiritual matters. So the first sense of discipline denotes a *way of life and teaching* and suggests that in some way what one knows (indeed, what one can know) depends in some way upon the quality or dispositions of the knower. If this is true, then we can begin to see how the meaning of a discipline could be a relevant concern for moral theory.

In a second sense, we can speak of a discipline as a *field of study* and here we find a more familiar connection to academic fields such as religious ethics. To say that one has been trained in a discipline is to say that one has sufficient knowledge and the requisite skills in a particular area of investigation and that those involved share questions and topics in close enough relation one to another that conversations and debates can be meaningful and productive. Yet, as William Schweiker explains, “With the rise of the modern Western world there were extensive debates about what constituted a discipline of thought. There emerged the conviction that any genuine discipline must have a distinct subject matter, even as there was the need to define a ‘system of the sciences’ around a fundamental principle or scientific method in order to ensure the coherence of knowledge. The core of the modern project was to understand the world and free human beings from ignorance and illusion. One did so by specifying the method, purpose, and criteria of various disciplines in such a way that each was autonomous and yet consistent with all others because they shared a rational structure. . . . What is rejected by a range of thinkers in various fields [today] is a depiction of knowledge gained and justified through autonomous disciplines tenuously held together by one formal rational structure or method of inquiry” (Schweiker 2005, 3–4). In other words, with the development of academic fields according to a unified understanding of the purpose and scope of human reason and the standardization of scientific methods of investigation, all observable reality could be subdivided into fields and each field guided by that expression of universally acknowledged rational principles most appropriate to the kind of thing being investigated. Human

beings as one part of observable reality occupied an interesting place in such investigations since they could be studied for their continuity with nature as bio-chemical systems, or as animals exhibiting recurring and predictable individual and group behavioral patterns. Although the behavioral and other social sciences adapted rationally generated scientific methods for the study of human beings as a distinctive type of natural phenomenon, they still assumed a basic continuity between the methods of the social and natural sciences.

Religion too was studied on the model of disinterested scientific inquiry, either in its earliest form in the philological and historical study of sacred texts or later in the anthropological study of human behaviors and cultures. The truth sought was the truth gained through observation, description, experimentation, analysis, prediction, and control yet this approach to the study of religion no less than other forms of human activity seemed to require something more to approach its subject matter appropriately (Pals 2015; Joy 2014). Although we cannot provide here an adequate review of the rise of the modern field of religious studies, at least two points are relevant to understanding comparison as a discipline. First, although human beings are animals, they are distinctive as reflective, self-interpreting animals. They think about what they do and question it in light of what other people observe and report to them about their behaviors. They process feedback and change their behaviors to varying degrees according to that feedback. This feature of human behavior, essential to socialization in groups, means that the human person exists in the world as a questioning being that constantly interprets and calls out for interpretation (Ricoeur 1981; Schweiker 2005). So whatever methods are used to study human beings, those methods will inevitably be incomplete unless they join scientific and humanistic study. Second, although human beings are trained to think comparatively at an early age to navigate personal relationships and social situations, adopting an explicitly comparative approach to human behaviors, including their religious dimensions, presents its own challenges. The history of comparative religion as a field of study shows the difficulty of such analysis because religious groups are not static. Like the individuals that constitute them, religions are historically and linguistically situated phenomena that change over time in response to internal discussions within those communities and new challenges from the outside. So when we think of comparison as a discipline in the sense of a field of study, not only do we inherit the complex relationship between the human sciences and the humanities, we are also joining two difficult histories: the history of the scientific study of humanity and the history of interreligious encounter, interpretation, and conflict.

In a third sense, we can speak of a discipline as a *community with distinctive aims and forms of excellence*. As Twiss noted in the lines quoted earlier, those who work in the field of religious ethics are aware of the difference between a field of scholarship and a community of scholars, and some (Twiss cites Jeffery Stout as one example) understand religious ethics as a community of scholars who share some overlapping interests rather than viewing it as a separate field unified by adherence to a single method. Arguing that “Comparative ethics is less a discipline than a sort of floating seminar in which scholars from various fields trade information and discuss methodology,” Stout goes on to suggest that “A comparative ethics worth having will be about ethical rhetoric in its many varieties, good and bad, as they manifest themselves in various contexts, happy and grim. But it will also be an ethical rhetoric, in the sense of being a complex rhetorical performance that expresses and advances genuinely ethical concerns” (Stout 1994, 356–357). Yet to say that one shares scholarly interests with others while differing on the methods by which one approaches a shared body of research data naturally raises the question of what kind of academic community this might be (Clairmont 2010). Some scholars, such as Alasdair

MacIntyre, have offered sharp critiques of the modern academy's disciplinary structure, arguing that without a single coherent understanding of what a human being is and what the final purpose of human life is the modern academy will remain fractured and unable to make progress on any genuinely important human question (MacIntyre 1990). On MacIntyre's view, such progress would only be possible if the academy could come to some agreement on the nature and purpose of human life, and such agreement would inevitably require access to religious discourse across traditions that address these questions. The difficulty for MacIntyre, as for many others who debate the scope and biases of human reason, is that there is no place separate from existing frameworks of knowledge from which to make arguments to convince others who have radically different views of human life, the nature of human reason, and even the very notion of an overarching human purpose. MacIntyre's solution is twofold. First, cultivate strong communities that share a view of the nature and purpose of human life (these are usually, but need not be, explicitly religious groups) and then allow those communities to form their members in the intellectual and moral virtues necessary to recognize and cultivate the truly human good. Second, engage in current academic debates rooted in one's own moral or religious tradition and rely on the argumentative strategy of narrating the histories of rival moral, religious, or academic traditions, pointing out especially those instances where those communities cannot on their own terms account for historical changes or deploy their own resources to meet new challenges – a strategy meant to keep argument rooted in the history of traditions and the arguments that can be heard and understood by the communities they are meant to persuade. A tradition, as MacIntyre explains it, is “an argument extended through time in which certain fundamental agreements are defined and redefined in terms of two kinds of conflict: those with critics and enemies external to the tradition who reject all or at least key parts of those fundamental agreements, and those internal, interpretive debates through which the meaning and rationale of the fundamental agreements come to be expressed and by whose progress the tradition is constituted” (MacIntyre 1988, 12).

MacIntyre argues that each tradition must cultivate in its members a distinctive set of virtues rooted in that tradition's own particular understanding of what is truly good for human beings and these virtues are cultivated through practices. A practice, for MacIntyre, is “any coherent and complex form of socially established cooperative human activity through which goods internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended” (MacIntyre 1984, 187). Virtues, which are distinct from but closely related to practices, are “those dispositions which will not only sustain practices and enable us to achieve the goods internal to practices, but which will also sustain us in the relevant kind of quest for the good, by enabling us to overcome the harms, dangers, temptations, and distractions which we encounter, and which will furnish us with increasing self-knowledge and increasing knowledge of the good” (MacIntyre 1984, 219).

Academic fields have their own distinctive kinds of practices that cultivate in their participants certain kinds of virtues. What exactly these virtues are depends on the goods at which we take academic work to be aiming and it is here that we begin to see the importance of thinking about disciplines as communities with distinctive aims and forms of excellence. Are there certain practices and virtues peculiar to deliberate work of comparison in religious ethics as well as other fields? Lee Yearley has suggested that there are, although he does not follow MacIntyre's more restricted understanding of virtues being bound to the histories and narratives of particular moral or religious traditions. Although Yearley would affirm that

"A virtue is a disposition to act, desire and feel that involves the exercise of judgment and leads to a recognizable human excellence, an instance of human flourishing," he proposes that the virtues deriving from the comparative study of religious ethics are not bound to traditions and that new virtues can in fact develop as the result of personal and communal educational experiences (Yearley 1990, 2). Reflecting on his own experience studying medieval Christian and classical Confucian texts comparatively with his students over many years, Yearley says that

Religious ethics for me is that special kind of journey we call an adventure. . . . in which I examine and develop ideas of the self and virtue in traditional classics in order to illuminate where we as moderns encounter the sacred. ...To do justice to such texts, we must bring them into a kind of reasoned conversation with our own ideas and do so in a way that gives absolute pride of place to neither. Only by this process can we show adequate respect not only for our own ideas and procedures but also for these of the alien texts we want to engage. This kind of conversation is usually evident neither in the texts themselves nor in most contemporary approaches to subjects these texts treat. Only by generating it, however, can we avoid the harmful effects that misreading can have: effects such as the sentimental appropriation of the alien ideas or the untutored rejection of them.

(Yearley 1997, 128–129)

For Yearley, the comparativist is part of a community of accountability which extends to other contemporary readers and interpreters (one's colleagues and students) but also to the traditions that produced these texts. One is accountable in a twofold sense: one is in the process of giving an account of oneself before the text by explaining one's interest in the challenge it poses, but one is also accounting for the text before its community of origin, not because religious texts or practices are the exclusive property of the community that produced them but because the comparativist enters that world as a respectful outsider in need of training to understand the religious world on its own terms and whose own experience sets questions for the text, even as she or he stands ready to be challenged, perhaps even transformed, by what one finds there.

Engaging in these practices has the capacity to produce new virtues. Yearley states that "Spiritual regret is one of those virtues that concerns the appropriate response to the recognition that extremely varied, legitimate religious ideals exist and that no person can possibly manifest all of them. Like all virtues, it is a corrective of a corresponding weakness, in this case the tendency to overlook the challenge produced by the presence of other integral and even tempting religious goods. It is also new in that it both responds to challenges that were not fully understood before and develops capacities that were previously undeveloped" (Yearley 1994, 12–13). Cultivating this virtue requires a particular set of practices which begin with one's own encounter with religious traditions, either as a student, a teacher, or as an interested non-specialist. Such practices might begin deliberately under the instruction of another person, or they might arise from life experiences or be triggered by certain significant events. Yearley explains that "Spiritual regret arises when we recognize three things. First, that various, legitimate ideals of religious flourishing exist. Second, that the conflict among them means no single person can come close to exhibiting all of them. Third, that those ideals or states which one can pursue or possess will usually be largely determined by forces either beyond one's immediate control or beyond anyone's control. This regret can arise in different forms at different times in one's life. It seems, however, normally to be linked to maturity, to a well understood fund of experience" (Yearley 1994, 12–13).

The key is that these practices, following MacIntyre's insight, are cooperative activities that are undertaken in conversation with others. Moreover, there are particular goods that result from the practices of comparison that can only be realized through that activity. For example, certain goods are realized by the comparativist: the skill of studying texts carefully, interreligious understanding, patience with religious or moral differences, humility about one's own tradition's history and indeed about one's own moral life. Other goods are realized by the community: investment in the academic questions of others, perhaps even investment in their scholarly biographies and the histories of their fields; appreciation for what different kinds of expertise bring to an academic community which can affect decisions about department hiring and culture; new ways to cultivate students' interests in the humanistic disciplines and so on. Comparative practices cultivate goods which may, in time, become virtues of individual scholars or of academic groups.

Rationales for Comparison and Communities of Accountability

Considering how scholarly practices form a particular set of virtues naturally leads us to ask what are the reasons for engaging in comparison in the first place. Elsewhere, I have identified five rationales for a comparative approach to religious ethics: facilitative, persuasive, dialectical, reconstructive, and transformative. A *facilitative rationale* for comparison "fosters the sort of tolerance for and appreciation of difference necessary for frictionless exchange in a global marketplace"; a *persuasive rationale* seeks to convince others of the moral or religious truth one has discovered "where the friction produced by comparison is frequently seen as a necessary condition for the appropriation of new religious truth"; a *dialectical rationale* "aims at the sort of understanding between religious traditions that highlights shared values and practical moral programs"; a *reconstructive rationale* "acknowledges that traditions must use age-old resources to speak to contemporary human problems, while also calling upon the experiences of contemporary communities to form the new moral questions that demand our attention today"; a *transformative rationale* for comparison aims to "bring religious communities to more acute sensitivity to their own past moral failures and future possibilities" (Clairmont 2011, 193). Such rationales may be present explicitly at the beginning of comparative projects or may begin more implicitly and then move toward explicit articulation over time. It is also possible that more than one rationale may be present at any point of a comparative project. For example, in MacIntyre's account of traditions, or Stout's account of ethical rhetoric, or Yearley's account of new religious virtues, we can ask both which of these rationales guide the initiation and maintenance of their comparative projects, but we also can ask whether and to what extent their rationales have changed as they have advanced in their research and in their conversations with other scholars and with people from the traditions they engage.

It is persons not fields of study that articulate and refine scholarly rationales and these purposes of comparison affect scholarly communities. In constituting communities of comparison, each rationale comes with a certain kind of accountability to one's fellow scholars, to the communities one studies, and to the discipline in each of the senses noted above (as a way of life, as a field of study, and as community with discernable goals and forms of excellence) (Holt, Kinnard, and Walters, 2003). As William Schweiker has noted, the act of giving an account is a complex endeavor which involves not only acknowledging what one has done but also the interpretive horizon of one's own action – how others might conceivably understand what we have done and the possible reasons why they might make such an interpretation

given their own questions and life experiences. “Not only do we give an account of our ends-in-view, and why we think they are good and worth pursuing, but we can also hold agents accountable for the ability to respond to anticipated responses” (Schweiker 1993, 243). In our discussion of comparison as a discipline, we can see that any comparison will yield responses, both from other scholars making the same or similar comparisons but also from the traditions being compared, including those who are practicing members of those traditions. This should in no way impede the scholar’s investigations into those traditions but we would be well advised to “develop a level of transparency about our own investment in the traditions we study and the extent to which our own work contributes to the ongoing creation and recreation of those traditions” (Clairmont 2010, 102).

So for example, when Jeffrey Stout suggests that comparative ethics is not only about ethical rhetoric but is itself a kind of ethical rhetoric, he is suggesting that the comparative discipline has a purpose, at least part of which is to show how religious discourse manifests itself in public conversations about ethics (Stout 1994, 356–357). When members of those religions hear his interpretations, they now have an enlarged sense of their traditions – it includes the public interpretation of their religious discourse and they now need to respond to it. This means that Stout is accountable for what he has said that these traditions do in public since they are now interpreting his interpretations of them. His rationale for comparing (some combination of the facilitative, dialectical and transformative) helps us to understand the form of accountability appropriate to his work. Or to give another example, when Lee Yearley counsels his students that comparative study may cultivate the virtue of spiritual regret (a virtue best described as a subset of prudence, which is the cardinal virtue that deals with fitting response to a just goal), he is adding to the kinds of questions his students and colleagues ask about the traditions they study. Do these traditions make claims meant to draw me in and test my belief? Are they challenging me to accept their claims or clarify the kind of claims I make in my moral or religious arguments? Should I cultivate the conviction that they ought to exist as real options for a good life even if I do not want them for myself or those I hold most dear? Yearley’s rationale for comparison (some combination of the persuasive, dialectical and reconstructive) conditions the form of accountability he has to his community.

The preceding discussion was meant to help those thinking about comparison in religious ethics to be more reflective about the kind of work they are doing, why they are doing it, and the effects of their work on their scholarly communities and the communities they study – the reasons why it is helpful to think of comparison as a discipline. It is also offered as an invitation to those considering adding an explicitly comparative dimension to their work and to those thinking about the nature of academic life and the current status of disciplines, for which comparison in religious ethics may offer helpful examples. It is meant, above all, to emphasize the humanity, fragility, and nobility of the scholar’s vocation and of investment in scholarly communities despite their many challenges in our age of global religious and political ambiguity and conflict.

CHAPTER 43

Religious Ethics and Religious Studies

Richard B. Miller

Religious ethics is an academic specialization that examines how religion and ethics are interrelated. Religious ethicists investigate how religious sources – e.g. sacred laws, images, norms, adages, rituals, metaphors, narratives, and symbols – can be drawn upon to shape moral conduct and character, and to address classical or contemporary ethical problems. But religion and morality can also conflict. Accordingly, religious ethicists also identify resources in non-religious ethics to assess how well religions carry out their responsibilities to human welfare and public life. In so doing, religious ethicists presume that secular ethics can offer an independent set of criteria for evaluating religious traditions.

Religious ethicists thereby integrate materials from two areas of academic specialization: religious studies, on the one hand, and ethics (or moral philosophy), on the other. Conceived in this way, religious ethics is a hybridized, interdisciplinary specialization that borrows from two broader humanistic discourses. It is a species of two different genera. As a subfield of *religious studies*, religious ethics informs and is informed by questions, problems, data, and concepts in the scholarly study of religion. As a subfield of *ethics*, religious ethics draws from moral theory and the history of ideas to address theoretical and practical problems that arise out of religious traditions.

Religious ethics thus straddles the discourses of religious studies and moral philosophy. But this fact is more a matter of theory than practice. Owing to the origins of the field and the secular nature of moral philosophy, religious ethics finds its institutional home in the academic study of religion. It often recruits resources from moral philosophy to clarify one or another matter, e.g. about whether the language of virtue or duty best captures the ideas of an influential thinker or school of thought. In this respect, religious ethicists are like biblical scholars who enlist concepts from literary theory, or historians of religion who draw on methodological tools from the field of history, to make sense of their materials. In all of these areas, the aim is to find insights from traditions of inquiry in the humanities and social sciences to sharpen our understanding of religion's connections to the moral life, textual traditions, and history, respectively. That said, in theory at least, religious ethics can contribute to knowledge in moral philosophy and may increasingly do so as philosophy diversifies itself to include religious sources and traditions.

With these thoughts about the interdisciplinary nature and institutional parameters of religious ethics in mind, this entry will focus on the place of religious ethics in the academic study of religion. After describing two principal models in religious ethics, paying special attention to the relation between religion and ethics, it will conclude by addressing how religious ethics and the scholarly study of religion can inform each other in mutually enriching ways.

Intellectual Models

Religious ethics is shaped by two main models. Each model functions as an ideal type for organizing an understanding of work in the field, and each presumes that religion and morality are distinguishable domains of value and action. According to one, ethics is dependent on religion as its necessary or sufficient condition. According to the other, ethics is independent of religion. Call these two ideal types the Dependent Model (*Sacred Canopy*) and the Independent Model (*Ethics of Belief*). Religion thus has a dual relationship with the concept of authority. It can authorize ethical claims about the right and the good by guaranteeing and grounding them. Or it can be subject to ethical assessments that possess their own rational authority, independent of religious beliefs or practices.

The Dependent Model/The Sacred Canopy

One model in religious ethics views religion as a fundamental resource for shaping the character and guiding the conduct of individuals, groups, and institutions. It does so by focusing on humans' relations with, and obligations toward, deities, semi-deities, and holy figures as well as humans' relations with, and obligations toward, other humans. Religion thereby offers a *sacred canopy* for thinking about their adherents' relationships and obligations (Reeder 1988). Religion can be understood either in ostensive terms, e.g. Buddhism or Judaism, or in non-ostensive terms, e.g. as referencing "sacred matters" along with a variety of attitudes, practices, and tenets related to such matters. Conceived in either of these ways – ostensively or non-ostensively – religion offers resources that have a direct bearing on human existence and the moral life. On this view, ethics is dependent upon religion.

That dependency takes various forms. Ethics might be *logically dependent* on religious concepts, or it might be *psychologically motivated* by religious attitudes, or it might be *epistemologically conditioned* by religious ways of knowing. For that matter, ethics might be conceived as *historically dependent* on religious traditions, or *linguistically dependent* on religious forms of language, or *fundamentally guaranteed* by religion. In all of these instances, the general movement is *from religion to ethics*, wherein religion provides an organizing backdrop that helps to make sense of ethics. Religion is understood to provide theoretical and practical guidance for identifying and resolving problems in human existence and for conceiving right and good relations in social life. When ethical concepts are connected to religious sources, they guide human conduct and social life in ways that enable religious practitioners to connect to sacred phenomena. Such conduct might either provide a path to religious blessings or may reflect the fact that the practitioner is already blessed as evidenced by his or her moral rectitude.

Religious ethicists who follow this movement from religion to ethics examine how religions generate, interpret, sanction, and apply ethical norms, attitudes, or ideals as a basis for evaluating human character and conduct as right or good. By providing a sacred canopy for ethics, religion functions meta-ethically. The operating idea is that religion enjoys an authority that justifies ethical claims and values. That idea can be either an empirical or conceptual one. It may be a working premise that shapes a scholar's research, perhaps heeding the meta-ethical attitudes that religious adherents in fact assume about the authority of their own tradition. Or it may derive from the conviction that religion is autonomous and thus immune from questions about its moral probity from other sources of human wisdom. The practical result of either assumption is the same: religious ethicists ask what difference religion makes for ethics. They want to know, among other things, if religion can offer something to the moral life that is missing from secular morality.

Morality's meta-ethical dependence on religion can be that of *necessity* or *sufficiency*. Adherents of some ostensive religions hold that their beliefs alone are necessary for true morality. They thus reject the idea of acceptable religious pluralism or the idea that secular morality offers moral wisdom. They understand morality as depending on religion "all the way down" and view true morality as relying on the truth of their religion (Reeder 1997). The picture is holistic: morality stands within, and is thus relative to, a wider web of beliefs and practices.

Religious ethicists who study ostensive religious ethics on this holistic description examine the inner logic and patterns of moral reasoning in a specific religion (or in specific religious teachings) to see whether the relevant claims all hang together. They think about religious ethics as having a logical nature according to which religious and moral instructions rely on coherent relationships among premises, warrants, and backings that structure an argument or matrix of ideas. In that respect, religious ethicists approach religious traditions much like philosophers examine the arguments of one or another school of thought, e.g. utilitarianism or deontology.

When conceived holistically, religions are denied the ability to address concerns from persons who stand outside of them. One possible exception occurs when basic, thin moral or legal categories emerge for expressing political solidarity or moral indignation across religious or cultural boundaries during social crises. But those thin concepts nonetheless repose against a thicker set of beliefs, customs, and practices (Walzer 1994). If religious ethicists (or others) critique a religious tradition holistically understood, they must do so as connected critics, drawing from resources from within that tradition to identify internal weaknesses, contradictions, or ways to reinterpret a traditional idea in order to offer an alternative (and presumably better) basis for its adherents to address a moral or religious problem (Walzer 1987). A critic thus assesses aspects of a religious tradition on that tradition's own terms. Here the critic faces ethical questions about her own intellectual practice, namely, whether she is overly deferential to the tradition under review, limiting her critical toolkit to a religion's resources for critique and reform. But on a holistic picture of a religious tradition, criticism posed in terms that exist outside a tradition would be morally and perhaps conceptually alien to those to whom it is directly addressed.

Religious ethicists who work with a non-ostensive account of religion may also view religion as necessary for morality. Here the idea is that morality is entirely dependent on sacred matters or some broad, comprehensive rubric that may include but extend beyond ostensive religions. If a religious ethicist conceives of "religion" in this inclusive way, she likely considers the fact of religious pluralism as good. Yet religious ethicists who develop non-ostensive categories for understanding "religion" and who view it as necessary for morality draw the line of acceptable pluralism between religious and secular morality. They see religion as offering sources of wisdom for justifying morality that have no real equivalent in secular sources.

Religions that claim that religion is *sufficient* for morality, in contrast, can accept religious and moral pluralism. This fact holds whether we are thinking about religion in ostensive or non-ostensive terms. Religions that adopt this outlook see various traditions as offering different ways of justifying moral ideas, concepts, and forms of wisdom that have currency within a variety of contexts and cultures. Morality can then be conceived as free-standing, on the one hand, but enjoying an overlapping consensus from a variety of religious and secular traditions, on the other. For example, we might view the Golden Rule as a moral tenet that makes sense on its own but as also compatible with a range of different religious and cultural traditions. Religious ethicists who study religion and ethics on this description view ethics as a "common morality" or "natural law" morality (Outka and Reeder 1993). They can draw

on that picture of ethics to identify trans-religious patterns of reasoning or non-relative sources of normativity according to which religions and their ethics can be described, compared, and evaluated.

The two groups of scholars who operate according to the Dependent Model thus agree that ethics depends on religion. What distinguishes the first group from the second is that the former views *all* ethics as depending on religion, whereas the latter views *some* ethics as depending on religion.

The Independent Model/The Ethics of Belief

The second main model in religious ethics examines logical and ethical questions about religion's ethical teachings. It reverses the direction between religion and ethics that we observed in the Dependent Model in that it proceeds *from* ethics *to* religion. This model assumes the independence of ethics from religion and finds non-religious sources to describe and/or justify ethical claims (Little and Twiss 1978). Here the organizing question is how ethical values place rational and normative constraints on what religions avow as their sacred obligations. In order to answer this question, religious ethicists who operate according to this model presume the existence of non-relative standards for carrying out the *ethics of belief* (Miller 2016). In this respect they function like philosophers of religion: religious ethicists and philosophers of religion focus on religion as the object of their inquiry. Philosophers of religion ask whether religious claims are *true*, whereas religious ethicists ask whether religious claims are *right* or *good*.

Religious ethicists who carry out an ethics of belief, like those who situate ethics within a sacred canopy, examine the inner logic and patterns of moral reasoning in a specific religion (or in specific religious teachings) to determine how well the relevant claims cohere. But religious ethicists who carry out an ethics of belief reject the idea that religion is autonomous and instead subject it to assessment according to free-standing criteria. They also reject the idea that religion is necessary for morality and thus view themselves as free to offer either internal or external critiques. When carrying out external critiques, they face the charge of parochialism or ethnocentrism. Once again the critic faces ethical questions about his or her own intellectual practice – in this case, about whether the critic, as an outsider, has the moral credentials to speak as an authority regarding the practices or beliefs she criticizes (Miller 2016).

Religious Ethics and Religious Studies

As noted above, religious ethics is a subfield that straddles two broad discourses, one of which is religious studies. Historically, religious ethics developed in North American departments of religious studies that took shape or expanded in the 1950s through the late 1960s in response to questions connected to religion and ethics, often in the context of political change and social turmoil. Religious ethicists studied the relation between religion in ethics in ways that were distinct from those used to study religion in seminary settings, area studies programs, and departments of philosophy, while nonetheless borrowing from traditions of inquiry important to work carried out in those other contexts. They thus carved out a new regime of academic discourse with its own procedures for producing, distributing, and assessing ideas about religion and ethics (Miller 2016).

Religion's dual relationship to authority helps to explain the rise of religious ethics in the 1950s and 1960s. As noted above, religion can either authorize ethical claims about the right and the good, or it can

be subject to ethical descriptions and assessments that enjoy their own rational authority. That dual relationship likewise helps to explain the Dependent and Independent Models for conceiving the relationship between religion and ethics. Owing to crises in authority across a range of institutions and professions in North America during the 1950s and 1960s, and owing to the rise of religious pluralism and cultural diversity during that same era, scholars and citizens were compelled to take a fresh look at resources for thinking about the good life and the good society (Jonsen and Toulmin 1988). Previously esteemed sources of moral wisdom and guidance were seen as unreliable or untrustworthy. Religions offer their own guidance and different visions of the right and the good, inviting scholars to probe religious traditions for their moral wisdom, to think about morality's relationship with religion, and to compare religious and secular traditions of moral thought. Not surprisingly, then, approaches to religious ethics that were organized according to the Dependent Model took shape. Yet religion was not, and is not, morally innocent. Religion's own crisis of authority, and its complicity in morally questionable political policies and practices in North America and abroad, cried out (and continues to cry out) for normative analysis. Thus the importance of the Independent Model for conceiving of religion's relationship with ethics.

Grasping the need to speak to social problems where matters of social and religious authority were contested, the first generation of North American religious ethicists largely saw themselves as contributing to the domain of ethics. That fact has generally gone unchanged over the last 50 years. Whether they see religion as a sacred canopy for ethics, or whether they carry out an ethics of belief, religious ethicists generally view themselves as contributing to knowledge about the moral life rather than to knowledge about religion, even though a good number of them exist in religious studies or theology departments. They view their subfield as widening our understanding of the moral life and offering resources for addressing questions that arise out of an expanded understanding of morality. Religious ethicists often presume a wider understanding of what counts as relevant to morality than do standard approaches to ethics in moral philosophy. But thinking about how religious ethics compares with moral philosophy might detract from considering religious ethics as a potential source of knowledge about religion. If we shift our gaze, we can see that religious ethicists can contribute to and benefit from the study of religion in a number of ways. Consider these eight possibilities.

First, religious ethicists can liberate the guild of religious studies from a positivist, naturalistic, and behavioristic view of religion. They can enable scholars and students to see that religions offer visions of the right and the good that provide reasons for action. Religions motivate their adherents, informing and shaping matters of personal identity in first-personal, "subject-referring" ways. Naturalist and behaviorist models for studying religion fatally distort the phenomena under their scrutiny because they picture human beings as a part of the natural order as it was understood according to canons that shaped the scientific revolution in Europe during the seventeenth century (Taylor 1984). Alert to matters of human agency and responsibility – fundamental to matters of ethics – religious ethicists can help scholars of religion re-shape how they view human action and subject/agent-formation in relation to religious experience, training, and enculturation. They can catalyze attention to how religions work to impart feelings, ways of seeing, and practices of self-examination among their adherents. These are matters of interest to religious ethics and scholars of religion alike, especially scholars interested in religion, psychology, and culture, and attention to them can expand the range of materials that scholars of religion can study and compare. Religious ethicists can provide a lexicon and set of resources for understanding religion's relation to moral formation and how religions seek to move and shape humans as self-interpreting animals (Taylor 1984).

Second, religious ethicists can identify how matters of ethics are often central to the religious traditions and practices they study – that no religion can be adequately represented without reference to its ethical resources for addressing (capably or not) questions of the right and the good in personal and political affairs. Religions are historically implicated in the contested considerations of gender, race, sexual orientation, class, power, the environment, and cultural difference. The study of religion can offer religious ethicists rich, concrete historical and sociological material for carrying out their work. Moreover, religious ethicists can make plain that religions have ways of reasoning about such matters that are themselves the proper topic for scholarly analysis and assessment. Religions are not only drivers of human action; they are sources of reflection, criticism, and argumentation. Ensuring that the study of religion critically engages religious reason-giving is a crucially important task for the religious ethicist as a contributor to the guild.

This fact means that religious ethicists can read canonical materials in the study of religion in a fresh light – and can encourage historians and philosophers of religion to do the same. Herein lies the third way in which religious ethics and religious studies can enrich each other. Typically, theoretical materials in the study of religion are read as if they were posing questions about the truth of religious claims or as if they are seeking to provide theories for studying religion in an academically legitimate way. Religious ethicists can remind their colleagues that many canonical materials, e.g. Hume, Marx, Nietzsche, and Freud, raise questions about whether religion is *good* for its adherents. Scholars of religion and ethics can thereby broaden the humanistic parameters according to which theoretical materials are understood and brought to bear on the study of religion.

In a related vein, and fourth, religious ethicists can benefit from discussions in the study of religion about basic theoretical questions that have helped to shape the discipline, e.g. the meaning of religion, theories about its origins and persistence, debates about the definition of religion, accounts of religion's psychological and social functions, concepts of religious language, theories of religion's ideological and utopian tendencies, and the like. Many of these topics have been taken up in the literature of cultural anthropology and the social sciences. All too often, religious ethicists view religions as only a form of meta-ethical or practical reason-giving without fully considering the humanistic aspects of religion that are queried by their colleagues in religious studies. Engaging these broader questions in the guild can help religious ethicists avoid their own kind of reductionism and expand their repertoire for understanding religion and ethics in everyday life.

Fifth, the study of religion can contribute to religious ethics insofar as religions enable us to understand the need for morality. Many, perhaps all, religions adopt a picture of human beings as social and interdependent, thereby making sense of the need for morality to help humans co-exist in ways that are right and good. Moreover, some religions have a picture of human fault that provides a framework for setting moral expectations when thinking about improving conditions of social and political life. For these reasons, the study of religion can identify accounts within religious traditions that aim to make sense of their many rules, norms, ideals, and the like.

Sixth, religions often offer patterns of practical moral reasoning to guide the conscience and ethical deliberation (Kelsay 2007). Religions not only have substantial norms, ideals, and values; they often include *methods* according to which such substantive ideals are deployed to address moral doubts, conflicts of duties, and matters of personal liability. Religions with rich traditions of law, pastoral advising, or jurisprudential reasoning have established methods for tackling questions that range from those concerning the individual conscience to matters of policy assessment (Jonsen and Toulmin 1988).

Religious ethicists can draw from the history of these traditions for their own work and can enrich the study of religion by clarifying patterns of moral reasoning and personal self-analysis that are central to religions themselves.

Seventh, religions can identify matters of importance that exist beyond or apart from morality. Not all of life can be assimilated to morality, however broadly it might be conceived. Matters of meaning and commitment – about things that we care about – lie beyond the grasp of ethical categories (Frankfurt 1998). We care about more than ethics and our relationships with others; we also ask about what is important to ourselves. With that fact in mind, the study of religion can point to where religions draw the limits of morality when thinking about human existence, and what they construe as important for adherents to have as sources and objects of care.

Eighth, religions often address how the pursuit of the right or the good is frustrated or foiled. Here the idea is that human existence includes the challenge of responding to the immoral or the non-moral – to what goes by the terms “moral evil” and “natural evil.” While religion might claim to guarantee or ground morality, it does not guarantee that humans will comply with the demands of morality or that life is without setbacks, disappointments, and tragedies. Religions address these non-ideal facts of everyday life. Scholars of religion and religious ethicists can enrich each other’s work by identifying how the traditions they study address such facts.

In these ways, religious ethicists and their fellow scholars of religion can mutually enrich their respective understandings of religion and can expand the concepts, theories, and resources for studying it.

CHAPTER 44

Secularisms: From Political to Ethical

Slavica Jakelić

From “Secularization” to “Secularism”

Over the last two decades, the notions of “secularism” and “postsecularism” have become something of a scholarly fad. While this development became an opportunity for interdisciplinary engagements, its result was also the absence of conceptual clarity. What is more, in the midst of global and interdisciplinary interest in secularisms and postsecularisms, it was easy to forget that, until recently, concerns with all things secular were principally the domain of social sciences. For classical social theorists, the transformation of the role religion plays in social life was central to their understanding of modernity: they saw the impending demise of religion (Karl Marx), wrote about the rationalization of religious norms in the modern capitalist societies (Max Weber), and asked about the diminishing force of religions as a source of solidarity (Émile Durkheim).

Drawing on the ideas of the founders of their discipline, most twentieth-century social scientists argued that the processes of modernization (industrialization, urbanization, scientific and technological advancements, democratization) inevitably led to religious decline on institutional and individual levels. As a result, most social scientists but also scholars in other disciplines, including theologians, treated secularization teleologically – as an unavoidable result of historical changes associated with modernity. Only a few lonely voices of dissent – such as sociologists David Martin, Andrew Greeley, and Jeffrey K. Hadden – pointed to secularism as constitutive of the philosophical and ideological platform of modernization, and as such, an impetus for secularization.

The secularization thesis came under scrutiny in the 1980s and 1990s, when events such as the Iranian revolution and the fall of communist atheist regimes raised questions about the resurgence of religion. It was increasingly evident that religion was not alive and well only exceptionally (as in the case of the United States); the whole world looked as if it were undergoing religious revivals. Even Peter L. Berger, once among the most prominent advocates of the secularization thesis, changed his mind. In 1968, he was confident about the unstoppable march of secularization: he declared that, by the year 2000, “[t]he traditional religions are likely to survive in small enclaves and pockets,” as sects that would resist “a worldwide secular culture” (“A Bleak Outlook is Seen for Religion,” *The New York Times* 1968). At the end of the millennium, however, Berger saw the world “as furiously religious as it ever was” and, in some places, even more religious than it ever was (Berger 1999).

One implication of the religious vitality Berger described was the distrust, even dismissal, of the secularization theory. It was in that context that José Casanova's book on "public religions" introduced much needed nuance and clarity (Casanova 1994). Arguing for the reappraisal rather than rejection of the theory of secularization, Casanova distinguished three components of secularization: *as differentiation* of the secular from religious spheres, *as decline* of both religious beliefs and practices, and *as privatization* of religion. As Casanova convincingly argued, one of the main problems with the old paradigm of secularization was that it conflated historical processes with predictions, causes with consequences, and analysis with normative assumptions. Thus, if the differentiation hypothesis and privatization hypothesis (correctly) indicated some processes that happened with modernization of societies, the secularization thesis also carried the prophecy of what will or ought to happen (decline of religion).

Casanova's careful examination of the secularization thesis highlighted that the proximity between the notions of secularization and secularism was not simply etymological but also normative. This insight was pivotal as it gestured toward the exploration of the secularist assumptions built into the social sciences. Others noted this problem as well. Thus, although Radical Orthodox theologian John Milbank acknowledged that the notion of the *saeculum* did exist prior to the advent of modernity, he also argued that it was social theory that enabled the imagining, establishment, and maintenance of the secular as separate from the religious domain (Milbank 1990, 9). For Milbank, secular social sciences are in effect "theologies or anti-theologies in disguise" (Milbank 1990, 3).

Some scholars saw Milbank's arguments as simplistic, but others argued for an analogous understanding of the relationship between secularization and secularism in social sciences. Scholar of religion and social theorist Adam Seligman maintained not only that secularism is a component of the epistemologies and methodologies of social sciences; secularism has been long assumed, he wrote, to be a very condition of social inquiry (Seligman 2009). Likewise, political scientist Elizabeth Shakman Hurd argued that the idea of separation between religion and politics is the foundational belief of international relations (Hurd 2008).

Such discussions reflected an important shift in academic interests – away from secularization as an unavoidable historical process, toward secularism as a normative and ideological phenomenon. Scholars now explored the varieties of meanings, institutional and cultural formations, of secularism. They also offered powerful normative critiques of secularism, its imaginaries, and the ways in which it shaped the taken-for-granted structures of modern life. I look at the crisis of political secularisms that gave empirical impetus for the probing inquiries into genealogies of secularism; I also consider the critiques of secularism as an ideology, form of power, and a sensibility that shape modern political and cultural formations of the secular approach to authority and agency.

Secularisms: Concepts, Crises, Critiques

Whether scholars examined secularism through empirical, or theoretical, or normative lenses, they have most often presented it in two ways: as plural in character and as in conflict with religion. We can trace such a twofold, and at times conflicting, understanding of secularism in the discussions about its relation to science and political life (Jakelić 2010).

The modern history of science-religion relations seems to suggest that secularism here emerges as a form of antireligiousness, with various junctures of that story attesting to the science's putative anti-religious drive: the trial of Galileo Galilei in 1633 and the Scopes Trials in 1925, the ascent of the so-called “New Atheists” (who position science as religions' foe) and the revived, contemporary debates about the place of science in public education and in religious schools. Without much doubt, historical and normative understanding of the religion-science contestations, and the “scientific secularism” that often accompanies them, remains an important task (Plantinga 2009). But as scholars continue to think through the ways in which Western rationalism helped constitute the philosophical and methodological foundations of secularism as an anti-religious disposition, it remains equally vital to explore the complex iterations of the religion-science encounters, and to do so within but also beyond the confines of the Western historical experiences.

The theme of unavoidable conflict between secularism and religious communities and institutions also shapes the explorations of secularism as a framework for ordering modern political life, explorations that have dominated secularism studies. The latter reflects the extent to which secularism has become central to our understanding of modern democracies (Taylor 2010), especially the ideals of the separation between politics and religion, between state and religious institutions (Hurd 2008; Kuru 2009; Ferrari and Durham 2003; Sullivan 2005). Most models of political secularism that organize these relations carry a powerful democratizing impulse – the aspiration to create a public sphere open to all, regardless of their particular identities (Bhargava 2010; Hasan 2010). But as scholars often emphasize, political secularisms also entail forms of hegemony, especially in those instances in which they legitimize the homogenizing nationalist projects (in France or Turkey, for instance), and political ideas and practices attempting to confine the space of religion.

The hegemonic drives of political secularism greatly shaped the background of its crises over the last few decades. Thus, while secularism linked to science experienced somewhat of a revival at the start of the second millennium, the crises of political secularism have been global and have been developing regardless of the particular model that political secularism assumes – whether it is more assertive as in Turkey and France, “passive” and “ecumenical” (Kuru 2009) as in the United States, or stands as a model of “principled distance” and normative ideal as in India (Bhargava 2010). These crises, which to a great extent correspond to cultural pluralization and the global rise of public religions and religious fundamentalisms, have been especially evident in the legal arenas. Thus, from the UK to Australia, from Greece to Russia, one can see the emboldened religious actors' challenges to the established definitions' religious-secular distinctions and institutions that embody them, affecting the public expressions of religious identities and beliefs.

The global character of the crisis of political secularisms underscores not only the revival of religions but also the need to uncover the deeper, often unspoken normative meanings of secularism as they have come to shape and ground cultural, political, and legal cultures in different contexts. Drawing on my earlier work on this topic (Jakelić 2010, 2014, 2015), I highlight here three normative critiques of secularism – critiques of its Western Christian roots, its parochial views of agency and authority, and its links to modern states.

The Critique of Western Christian Roots of Secularism

While the history of the “the secular” is characterized by multiple meanings and shifting boundaries, scholars generally agree that the provenance of ideas and institutions of secularity and secularism is the

world of Western Christianity – from the ways in which the notion of *saeculum* (age/world/century) originated in medieval Latin Christendom's canon law, to its contemporary meaning linked to "expropriation and appropriation" of church property that occurred with the rise of modern states and the Protestant Reformation (Casanova 1994, 12–13, 15).

For Milbank, this particular genealogical account of the secular carries a proposition that secular was somehow latent and "gestating in the womb of 'Judeo-Christianity'" (Milbank 1990, 9), which is a notion that he rejected. But for other scholars, especially those who explore the instantiations of secular sensibilities and politics beyond Christianity and beyond the West, the Christian roots of secularism are the starting point of their inquiries. Indian scholar T. N. Madan, for example, begins with the notion of secularism as "a gift of Christianity" and a whole worldview that "establishes a hierarchical relation between the secular and the religious," which counters the Indian experience where the secular is encompassed within the religious (Madan in Bhargava 1998, 22). Similarly, Adam Seligman proposes that secularism (just like the idea of "religion") arose in a particular period of Christian history and cannot be applied to the histories of non-Christian civilizations (Seligman 2009).

One of the most influential critics of secularism, anthropologist Talal Asad – who has contributed to each of the three normative critiques articulated here – strives to unmask the connections but also the "breaks between Christian and secular life" (Asad 2003, 25, 26). For Asad, it is in these spaces that we can expose "the secular" as it circumscribes the "secular redemptive politics," which seems similar to Christian redemptive sensibilities but is distinctively democratic and anticlerical" (Asad 2003, 61). Moral philosopher Charles Taylor, whose work shaped many conversations on religious-secular problematic since the late 1990s, also does not question the Western Christian origins of secularism. But unlike Madan or Seligman or Asad, Taylor does not seek to retrieve the roots of secularism in order to dismiss them but in order to highlight one current of its normative history. In so doing, Taylor counters the subtraction narratives about the emergence of the secular age with his more nuanced and more constructive genealogical account of the immanentization of virtue in the context of the late medieval Catholic Christianity (Taylor 2007). Moreover, he wants to recover one thread in the normative history of secularism to posit it as the principle for liberal modern democracies, Western and non-Western (Taylor 1998, 31–53).

Stated differently, even if their normative objectives are different, scholars who acknowledge the Western Christian origins of secularism concur that this particular location makes secularism's claim to universality and objectivity unsustainable. The same is the case with the critics of secularism's views of agency and authority.

The Critique of Secular Understanding of Agency and Authority

At the heart of much of Asad's critiques of secularism is his exploration of the type of agency that secularism assumes – the one asserting autonomy and freedom against the authority of tradition. For Asad, this secular notion of agency entails the "romance of resistance" (Asad 2003, 71), that is, the idea that one can act freely, make history, and overcome suffering solely through contestation of and resistance to external authority. While this understanding of agent as self-empowering, Asad maintains, came to define the notion of agency as such, there are different grammars and forms of action that can shape agency. As he explains, if secular agency is posited against suffering, religions often think of suffering as an essential element of the human condition and, moreover, not as an absence of agency but a particular form of it (Asad 2003, 67).

Building on Asad's ideas, Saba Mahmood critiques the manner in which the secular view of agency structures feminist approaches to freedom and empowerment. In her exploration of the women's piety movement in Cairo, Mahmood finds that the scholarly interpretations of these women's actions generally arise within a framework of suppression/subversion and, as a result, focus on what women's reform movements work against, not what they stand for (Mahmood 2005, 22, 24, 25). Following Asad's insights, Mahmood declares that one's capacity for agency entails "not only...acts that *resist* the norms" but those through which one "*inhabits* norms" (Mahmood, 25, *italics mine*). Put differently, Asad and Mahmood both strive to unmask the secular view of agency as parochial. They also want to expose the idea of secular agency as the use of reason against passions ascribed to the realm of religious subjectivity, positing that secular agency is not a universal notion but is based on normative, emotionally fraught assumptions about human nature (Asad 2006, 93–106; see also Mahmood 2005, 5).

Several decades ago, political philosopher Michael Sandel pointed to the type of agency established in a liberal-democratic state: he argues that a democratic polity legislates and institutionalizes a particular, liberal idea of personhood, which prioritizes of individual rights and self-mastery over common good. Sandel's arguments thus encompass the critiques of secularism's claim to neutrality and objectivity and a critique of secularism's connections to the modern state, to which we turn next.

The Critique of Secularism as a Legitimization of Nation-States

According to the ideals of the liberal-democratic doctrine, the modern state is based on the principles of liberty, equality, and neutrality, giving no preference to either religious or non-religious beliefs, and guaranteeing that conflicts can be resolved not with an enforcement of belief but, to paraphrase Jürgen Habermas, by the force of the better argument. For Marc Galanter, nothing could be further from the truth: as he declared several decades ago, the modern state not only defines the boundaries of neutrality and nature of social institutions differently from religion, it also defines what religion is.

Madan's critiques of secularism as established in the context of the modern Indian state echo Galanter's views. Madan maintains that the Indian model of secularism cannot claim to be the foundation of equality or peace because it privileges some religious traditions over others and, in so doing, becomes conducive for religious fundamentalism and fanaticism. For Asad, too, secularism is not the promotor of peace but a technology of control and governance that nation-states use but to "classify and regulate. . . religion, education, health, leisure, work, income, justice, and war" (Asad 2003, 188). Countering one of Charles Taylor's propositions, Asad declares that secularism is not a question of political legitimacy but an attempt to transcend and replace religious and other particularities by demanding full loyalty to some nation-state.

We find similar arguments in the work of theologians, religious studies scholars, and social scientists. For political theologian William T. Cavanaugh, the nation-state colonizes the Christian imagination and wants to submit all types of attachment to itself, affirming itself through violence and the legitimate use of violence (Cavanaugh 2011). Religious studies scholar Markus Dressler follows Asad's ideas in his own studies of Alevites in Turkey, to show that Kemalism's form of power attempts to govern religion and determine its meanings and scope, in order to establish and promote the Turkish's state's hegemonic idea of national identity (Dressler 2010). Echoing Asad but also drawing on Peter Van der Veer's work, scholar of international relations Elizabeth Shakman Hurd writes that nationalism – whether defined by French, American, or Turkish nationalists – feeds on the symbolic repertoire of religion and then transforms it by nationalizing and, hence, secularizing it (Hurd 2008, 105, 110).

The critics of secularism as a foundation of modern states, in other words, argue that secularism replaces one type of violence (religious) with another, that of the nation-state and imperial wars (Asad 2003, 11; Cavanaugh 2011, 15). They, moreover, propose that secularism does not help mitigate the challenges of religious pluralism, but provides a vision for and institutional enforcement of the projects of national homogenization, which are directed against plurality of collective identities and especially against religious particularisms.

Critique of the Critiques of Secularism

The critics of secularism discussed above introduced many valuable insights into the studies of secularization, secularism, and religion. They correctly pointed out the unsustainability of secularism's claims to universal justice and rationality – not simply because of the particular, Western and Christian, origins of secularism, but more importantly, because of the ways in which secularism enacted by nation-states always privileges some worldviews and communities over others. The critics are especially forceful when they question secularism's capacity to address the pluralism of worldviews if it posits itself both as an arbiter and a participant of that pluralism.

Yet, there are important reasons to problematize the critiques of secularism. This is particularly the case if one does not approach the religious-secular problematic in the way many of secularism's critics do – as the upshot of the powers of the modern project or as determined by the genealogies and politics inherent to the religious-secular binary – but rather considers this problematic as dialectical in nature, and defined through contestations *as well as* convergences. One productive trajectory of the critique of secularism's critics emerges from the act of historicization of nationalisms'-religions'-secularisms' links. What this type of approach demonstrates is that modern nation-states are hardly secular in nature and that the critics of secularism most often operate with a flattened, reductionist view of modernity, which a priori shapes their analyses and interpretations in ways that take away the agency from religious actors and institutions. Furthermore, to historicize nationalisms'-religions'-secularisms' connections is to create a site for a critical assessment of the discussions of “religious” and “secular” agency as well. Scholars like Asad assert the need to contextualize these concepts, yet his focus is on the differences between the religious and the secular forms of agency, which ultimately and inadvertently essentializes the two categories. Rather than opening the analytic approaches to the questions of freedom and authority, then, the studies of religious v secular agency foreclose such inquiries.

Put differently, against several articulations of the normative critiques of secularism, it is plausible to suggest that secularism is a phenomenon that ought to be considered historically, sociologically, anthropologically, and theologically, thus beyond the questions about the place, time, and context of its origin. This is vital not only, as sociologist Nilüfer Göle suggests, to acknowledge the “civilizational powers of Western modernity” (Göle 2010, 244); this is pivotal because only a global and comparative perspective that does not carry an a priori analytic framework could show how the religious and the secular, in their various iterations and constellations, have shaped and continue to shape the multiplicity of modern projects in the contemporary world. On this view, one aspect of the normative critiques of secularism that especially needs probing and problematizing is a thin, reductionist view of secularism inherent to these critiques – the idea that secularisms are foremost, or merely, a political phenomenon, whose relations with religions are exhausted within the framework of power. This is a problem that characterizes postsecularity scholarship as well.

It is important to see that secularism is also a moral orientation in and toward the world, guided by a drive to enable human flourishing. As Rajeev Bhargava points out, when viewed as inherently normative, secularisms cease to be just the property of the West – a concept or an ideal that could have been only imposed on, or appropriated by, the non-Western societies. Rather, as Bhargava shows, secularism as a normative project had precedents in other historical and cultural experiences. Furthermore, as the exploration of various social movements indicates, the enactments of secularism as a moral disposition reveal how they do not relate to religions solely through power contestations and conflicts but through shared moral sources as well. For example, the secular ideas and practices in the context of Solidarity, the Polish movement against the communist regime, calls attention to the fact that secularism had more than one meaning even in the context of communist, atheist societies – one political, to legitimize the powers of the anti-religious Marxist state, and the other more ethical, which framed a powerful critique of those atheist states.

The case of Solidarity and the type of secularism it affirmed is not an exception. If we compare the Polish case with other cases – for example, the civil rights movement in the United States, or the anti-apartheid movement in South Africa – the conclusions would be similar: we cannot reduce the grammar of secularism and practices of secular activists only to questions of power or self-empowerment. As social theorist James Jasper underscores, the importance of protests in the context of social movements lies not in their practical accomplishments but in the fact that they provide the contexts in which individuals and citizens can probe their moral intuitions. Social movements, in other words, present themselves as particularly productive sites for a greater understanding of not just the politics but also the ethics of secularism in the twenty-first century.

CHAPTER 45

Postsecularisms: The Politics and Ethics of Postsecular

Slavica Jakelić

“Postsecularism:” From Heresy to Orthodoxy

According to James Beckford, some of the earliest thinking about postsecularity can be traced back to 1966, and Andrew Greeley’s article “After Secularity: The Neo-Gemeinschaft Society: A Post-Christian Postscript.” As a dissident of the sociological community, thus in accord with his broader misgivings about the secularization thesis, Greeley argued in this article that, as scholars observed secularization and rationalization of religion, they also needed to attend to the new emerging types of religious fellowship – those gesturing toward the spaces of the Gemeinschaft-like community (Greeley in Beckford, 2012). Sixteen years later, one of the most forceful American critics of secularism, Richard John Neuhaus, wrote of a new period in American history – the moment of “the collapse of the 200-year old hegemony of the secular Enlightenment” and the need for a new “overarching meaning system” in public life (Neuhaus in Beckford 2012). For Neuhaus, this new system was religion.

Greeley’s and Neuhaus’s propositions did not immediately spark the talk of postsecular, at least partly because they appeared at the time when secularization theory was still taken for granted. The turning point for scholarly conversations of postsecularity was Jürgen Habermas’s use of this notion, most early in his speech in 2001 (Boy 2017). To be sure, between sociologist Greeley and theologian Neuhaus, on the one hand, and political philosopher Habermas on the other, theologians of postmetaphysical and postliberal disposition developed a particular view of postsecularity, reflecting, according to John Boy, the increasing interdisciplinary interest in “going ‘beyond’ something” (Boy 2017). But it was Habermas’s interest in postsecular that legitimized this concept beyond theology, religious studies, and scholarship of postmodern orientation. Thus, it was only after 2005 that the term acquired prominence in a range of disciplines.

Scholars have since systematized the meanings and uses of the concept of postsecularism in various ways. I recognize their insights below but also diverge from them, to argue that the postsecular moment has been identified and the notion of postsecular probed in three major ways, all of which we can trace in Habermas’s thinking about postsecularity: to *describe* and *explore* religious changes in the late modern world; to *diagnose* and *reflect on* a particular moment in the understanding of religions; and, to *alter* approaches to religious-secular problematic intellectually and politically.

Postsecular as a Way to Describe and Explore Religious Changes in the Late Modern World

Philosopher Hent de Vries wrote in 2006 that “[a] society is ‘post-secular’ if it reckons with the diminishing but enduring – and hence, perhaps, even more resistant and recalcitrant – existence of the religious” (de Vries 2006). Berger’s and Casanova’s 1990s work directly addressed the reckoning de Vries described, even if they did not explicitly use the notion “postsecular.” That is to say, Berger’s and Casanova’s ideas about the desecularization and deprivatization of religion respectively represent some of the earliest attempts to understand the rise of “strong religions” and the need to move beyond the idea of modernity as a secular condition (Almond et al. 2003).

Berger’s thesis about the desecularization of the world, contrary to some interpretations (Stoeckl 2012), did not suggest the incompatibility of religion with modernity but constituted his more complex arguments about the relationship between religion and modern pluralism. Interested especially in the role of evangelical and Pentecostal Christianities in the modernization processes beyond Western societies, Berger did not think of desecularization simply in terms of religious rejection of, or challenges to, modernity but also – and in line with his Weberian disposition – in terms of religious contributions to it. Descriptively, Berger asked: how are we to study and understand the place of religion in the context of desecularization of the world? Normatively, he looked at religious changes to explore (what had long been his primary) concern – ontological pluralism as a condition of modern religious experience.

Casanova’s historical-sociological analysis of global religious changes provided, as discussed in this volume, empirical lenses for a nuanced theoretical re-envisioning of secularization theory. But what Casanova’s project especially brought forth was the framing of religious revivals as the deprivatization of religion – the process he understood as the refusal of religious actors and institutions to be confined to the private arena, thus anticipating de Vries’ point about the “recalcitrant” religions.

The extent to which Casanova’s ideas influenced Habermas’s own thinking about postsecularity has often gone unnoticed, despite the fact that Habermas is explicit about this connection. The latter is especially evident in Habermas’s argument that postsecular does not signify the end of secularization or a historical moment in religious developments that warrants the dismissal of secularization theory. Contrary to suggestions and hopes expressed by Neuhaus or, as we shall see shortly, of Radical Orthodox theologians, Habermas does not use the notion of postsecular to describe some new triumph of an unchanged religion. Rather, like Casanova, and similarly to sociologist Shmuel N. Eisenstadt (2000), Habermas sees postsecular as a moment in which religions constitute and reconstitute modernity’s multiple cultural and political programs.

It is in light of recognition of religious transformations *and* transformative roles of religions in social life that postsecularism acquired another layer of meaning – to signify a new moment in the scholarly appreciation of religions.

Postsecular as a Way to Diagnose and Reflect on a Particular Moment in the Understanding of Religions

Sociologist Kristina Stoeckl argues that, as far as sociology and political theory have been concerned, the notion of postsecularity often points to scholars “somewhat open to the topic of religion” (Stoeckl 2012). Stoeckl is not isolated in her diagnosis of the postsecular moment as a “religious turn” in the academy; William Barbieri’s synthetic reflections on postsecularity indicate this as well. In this regard, Barbieri

particularly highlights theorists Michael Hard and Antonio Negri (literature and political science respectively), who offer a critique of globalization that contains various biblical themes; literary theorist Terry Eagleton, who responds to “New Atheism” while unhesitatingly drawing on his own religious background; and philosophers Alain Badiou, Giorgio Agamben, and Slavoj Žižek, who directly engage with religious scriptures and traditions in their writings (Barbieri 2014, 146). To this list of scholars who attest to the religious turn in scholarly circles one should also add sociologists with no prior interest in religion – for example, one of the leading European sociologists Ulrich Beck, who discovered the vital importance of religion for modern pluralism only in the age “after secularization” (Beck 2010). For feminist scholars, too, postsecular is an opportunity to, as Elaine Graham writes, “correct (often hidden) gendered nature of our thinking about faith and reason, . . . sacred and secular” (Graham 2012, 243, 239), and, even more, to explore *and* expose religion for the ways in which it both inhibits and empowers women.

It is in the context of such proposals that the interdisciplinary engagements surface as especially desirable: one can find, for example, significant resources for postsecular theological approaches to religion and gender in social sciences, among others, in Göle’s and Mahmood’s work, which explores the complex ways in which Islam shapes women’s agency in public life (Göle 1996; Mahmood 2005). At the same time, what the feminist considerations of postsecularity also uncover is that postsecularity does not signify only a new interest in, or openness to religion, but a deeper process – what Habermas calls a “change in the consciousness” (Habermas 2017 and 2010). This change, on the one hand, reflects an increased awareness that scholars need to move beyond European parochialism and triumphalism in the approach to religious matters. On the other hand, this postsecular also signals the need to leave behind perspectives that, arising within political theory, defined much of the thinking about the role of religion in democratic life – the ideas of John Rawls, when these implied the exclusion of religious particularities and reasons from the domain of public reason, but also Habermas’s own classic approach to public life and the arena of civil society as spaces shaped by reason and rationality. For Habermas, then, postsecular as a change in the consciousness has significant theoretical and normative implications because it stands as a twofold possibility: first, to envision public life as constituted by religious and secular perspectives alike, and second, to appreciate religions as enriching for conversations about the common good.

This particular trajectory in thinking about religious-secular plurality and place of religions in the public arena had been charted out already in Casanova’s work, which was both analytic and normative in character. Drawing on Habermas’s (pre-postsecular) concept of communicative interaction, Casanova conceived of public religions as critical for social integration “through the discursive and agonistic participation” in civil society, that is, as enabling both the contestation and construction of common good (Casanova 1994, 230–231). Thus, while Casanova thought of public religions as a challenge to the Enlightenment premises of modernity “comparable to those of feminist and republican critiques of liberal theory” (Seligman 1994, 488), a post-2001 Habermas argued that religions assert values and ideals of human dignity, solidarity, and social justice in a way that provides critical and emancipatory perspectives in the world dominated by capitalist economic logic. For both Casanova and Habermas, religions can energize democratic institutions.

Put succinctly, the postsecular moment shaping a variety of disciplines emerges as a moment of reflexivity, which demands scholarly rethinking of the very categories of religion. One result of that reflexivity is the notion of the postsecular as a way to redefine and transform the ways in which scholars approach religious-secular encounters, as scholars and as citizens.

Postsecular as a Call to Alter the Approaches to Religious-Secular Problematic Intellectually and Politically

Scholars who engage postsecularity as an analytic and normative category do not only reconsider their approaches to religion but also develop constructive projects concerned with rethinking of the religious-secular problematic and relations. They do the latter in a variety of ways: by affirming the religious and secular voices alike, by inviting the reestablishment of religion at the center of social life, and by proposing that we redefine the meanings and scope of secularism.

The first form to revising the religious-secular encounters in the time after secularization was articulated by one the forerunners of scholarly concern with postsecularisms, Richard Neuhaus. As we saw, he viewed the movement “beyond” secular as the one in which the religious order replaces the secular order. Theologians of postmodern, postliberal provenance, especially those in the Radical Orthodoxy camp, follow a similar trajectory. For most of theological thinking developed in this vein, as Stoeckl (with anxiety) recognizes, postsecular signifies the “regime change” that brings societies back to religion (Stoeckl 2012). Or, on Barbieri’s reading, postsecular here has for its “organizing purpose the restoration of religious credibility” (Barbieri 2014, 145).

Habermas develops ideas for the second type of religious-secular realignment: his attempt to construe a different account of religion is intertwined with political questions about the religious-secular relations in the contexts of a postsecular, hence, pluralistic society. On the one hand, this type of society means the equal participation of religious and secular citizens in public life. On the other hand, postsecular pluralistic society requires tolerance. Similarly to philosopher Bernard Williams (1998), Habermas does not think of toleration as an appreciation of other’s perspective but endurance of it. Unlike Williams, Habermas considers postsecular toleration in terms of recognition that others have rights to “convictions, practices and ways of living that” that we ourselves reject (Habermas 2017) all the while everyone taking part in public life remains accountable to each other for their own political contributions. According to Habermas’s vision, then, the postsecular civil society reconciles the ideals of the Enlightenment and of pluralism through equal citizenship and respect for cultural differences respectively.

We see the contours of the third understanding of the postsecular as a moment requiring a different disposition toward religious-secular problematic in the works of political theorists Rajeev Bhargava and William Connolly. Bhargava’s ideas are radically different from Milbank’s or theologian William Cavanaugh’s (Connolly 1999) since Bhargava does not think that the problem of secularism is its normative origins but that these origins have been forgotten. He therefore proposes the need for an alternative conception of it, and develops a constructivist account of secularism while drawing in particular on the history of secularism, modern and premodern, in the Indian context (Bhargava 1998, 2010). Similarly, Connolly argues that we ought to refashion secularism into one possible perspective among other religious and non-religious perspectives. For Connolly, who is, like Casanova and Habermas, interested in the agonistic aspects of democracy, the tension that emerges from critical engagement between religious and non-religious views is good for both: while informing each other, they also constrain each other.

Critiques of Postsecularisms: Thin Imaginings of “Religion” and of “Secularism”

As the category of postsecular rose in prominence, so much so that some see it as a new orthodoxy, it also gained powerful critics (Mufti 2013). On the one hand are the objections to its conceptual muddiness and

incoherence (Mufti 2013; Beckford, 2012); on the other hand are critiques of postsecularity scholarship because it “refuses to examine the legal and political forces at work in regulating what counts as ‘religion’ in public life” (Beckford 2012, 51). Sociologist Michelle Dillon sees both of these problems in Habermas’s work: his postsecular, she maintains, does not only have multiple meanings, but it also does not recognize religions in terms of their “embodied experiences and emotions” and the internal plurality of religious contestations (Dillon 2012, 153). In other words, while the scholars of postsecularity might see it as a chance for a redefined understanding of, and attitude toward, religion, their act of defining religion often confines it.

Aamir Mufti critiques postsecularity as incoherent and analytically confusing but, even more importantly, as “evasive about the transition it supposedly marks” and purposefully obfuscates (Mufti 2013, 9). To sociologist Gennaro Ascione, the transition from secular and secularization toward postsecular is not a transition after all but an attempt to provide a different foundation for the classical modernization narrative about Western geocultural superiority, this time in postmodern terms (Ascione 2017). Scholars of religion Markus Dressler and Arvind-Pal S. Mandair similarly view the notion of postsecular as forgetful of its own history and preventing an inquiry into that history, arguing that instead of the postsecular, scholars should move toward the idea of “the post-secular-religious” (Mandair and Dressler 2011). The latter concept, Dressler and Mandair declare, would acknowledge “the irresolvable contradiction, or aporia, that lies at the heart of the religio-secular paradigm and remains open to the questions raised in light of the experience of our postcolonial democracy” (Mandair and Dressler 2011, 4). More recently, Dressler affirmed the political critique of (what Casanova calls) “the knowledge regimes” of secularism, arguing for the need to move beyond the walls of academia in order to dismantle the religio-secularist agendas in specific contexts (Dressler 2014).

The critics of postsecularity and the proliferating literature on postsecularism correctly stress the need for greater analytic clarity in the uses of this term and for a more reflexive approach to its genealogies, especially as the latter manifests in the postsecular attempts to delineate and restrain the proper domain of religion. Yet, the difficulty with the ideas of postsecularism and postsecular literature is not only that they reaffirm the unreflexive and often reductionist accounts of religion; the problem, as James Beckford argues, is also that the ideas of postsecularity trade on the simplistic notions of the secular (Beckford 2012, 16).

It is at this juncture that the scholars of postsecularity meet the normative critics of secularism discussed in this volume’s entry on secularisms: both groups ultimately point to the secular and to secularism as a matter of politics and of power relations that constitute and reflect the Western project of modernity. Habermas, even as he uses the secular to describe the citizens’ ontological positions, all too easily slips into defining the secular as it shapes the elements of the state’s “neutrality.” Charles Taylor rejects the subtraction story of the victory of the secular over the religious, affirming the “immanent frame” as a space that both believers and nonbelievers share and within which they make normative evaluations (Taylor 2007). Yet, in Taylor’s rendering of the story of secularity, the moral “drive to Reform” he discerned at the root of the immanent frame, seems to lose its moral forcefulness due to the very processes of immanentization – due to its becoming secular (Taylor, 2007).

In contrast to the thin and often reductionist readings of secularism that shape many critiques of secularism as well as much of the literature on postsecularism, it is possible to understand secularism more broadly as a fundamental disposition toward the world driven by a desire to support and enable human flourishing. While enactments of secularism will always arise within a particular context, as a moral orientation in and toward the world, secularism cannot be claimed or deemed the property of any one tradition or culture, and it certainly cannot be claimed as primarily or solely the property of politics.

2 Approaches

CHAPTER 46

History of Religions

Donald K. Swearer

Exploring Religious Ethics

Previous chapters have explored topics in religious traditions, ranging from the metaphysical backing of moral beliefs to the dynamics of text and canon. This chapter examines the place of the history of religions with respect to the work of comparative religious ethics. It is hardly surprising that the development of the study of the history of religions has also attended to matters in ethics. And it is thereby also not surprising that many of the themes that occupy scholarly attention in exploring religious ethics come to light from the perspective of the history of religions.

Among the several contributions that the history of religions makes to the study of comparative religious ethics, two, in particular, stand out. First, as part of a religious system, ethics is informed by the several components that constitute the polychromatic network of a religion; for example, cosmology, soteriology, and ritual. Second, the history of religions brings to the work of religious ethics an emphasis on the descriptive historical and contextual, but not at the expense of inductively derived general truths or general ethical patterns. My examination of these and other contributions of the history of religions to reflection about the nature of religious ethics follows the recent history of the development of the interaction between historians of religions and ethicists. I configure the ongoing process and results of this interaction around the following themes important for comparative reflection: particularism and holism; cosmology and ethical naturalism; narrative ethics and soteriology; history of religions and a global ethic.

The history of religions was one of the midwives assisting at the birth of comparative religious ethics in the 1970s. These beginnings were characterized by a debate between ethicists trained in the methodologies of Western philosophy and social sciences, and historians of religions schooled in the historical traditions (texts, languages, social and institutional histories) of the world's religions. Although neither side was monolithic and the dividing line between the two was fluid and overlapping, the historians of religions challenged the ethicists on the grounds of methodological reductionism and theoretical overkill, and for imposing Western analytical models and formal structures of moral reasoning onto richly diverse, historically and culturally embedded indigenous religio-ethical systems. The ethicists, in turn, saw the agenda of the historians of religions as promoting a religio-cultural particularism lacking analytical rigor, unable to provide a coherent framework or general structure essential for meaningful normative and comparative work. Analogues to this debate can be found elsewhere in disputes between a

communitarian, virtue approach to ethics versus a formal, universalizable structure of moral reasoning, and postcolonial critiques of the imposition of essentializing categories forged in the academic and political cultures of the West on quite disparate cultures.

Historians of religions challenge interpretations of religious ethics that require precise analytical concepts and a primary focus on moral reasoning. We argue for a more holistic approach that includes not only doctrinal texts and seminal philosophical concepts, but also the lived tradition in its greater complexity – its rituals and practices, its popular stories as well as grand narratives, and the cultural ethos in which religious traditions are embedded. Historians are not opposed to conceptual frameworks per se, but question “their degree of precision and specification, their source, and their illuminative powers. Hardened conceptual tools may break as much as they dig out, and inappropriate tools may damage the terrain” (Childress 1979, 4).

Historians of religions consider that their discipline avoids reductive, univocal conceptions of religion/religious ethics or preconceived frames of reference imposed on historically distinctive and dynamic living traditions. Instead, they bring a holistic, comparative-inductive approach to the study of religion that investigates a wide variety of continuities among different systems of belief and practice without reducing them to a single referent (Bianchi 1995, 400). This contextual, historical approach does not depend on or lead to a universal theory. Its interdisciplinary approach results in the construction of a historical, typological, multi-dimensional map of the actual religious terrain. In brief, the history of religions proposes that religious ethics should be mapped within the contextual frameworks of the worldview and ethos of a particular religious tradition. But what does this claim mean in practical terms? The remainder of this chapter proposes to forge a response to this question using recent history of religions’ contributions to the field of religious ethics.

Particularism and Holism: The Example of Buddhism

In the 1980s and 1990s Buddhist ethics emerged as a major field of study, not only as part of Buddhist studies but also within the context of the history of religions/religious ethics discussions. Several factors contributed to this development: the provocative interpretation of Theravāda ethics in *Comparative Religious Ethics: A New Method* (Little and Twiss 1978) and the resultant debate between David Little and several historians of religions, in particular, Frank E. Reynolds; the appearance of the digital *Journal of Buddhist Ethics* (JBE) in 1994 and its online conferences; a dramatic increase in published monographs in the area of Buddhist ethics, most notably the work of Damien Keown, who co-founded JBE with Charles Prebish; and the impact of socially engaged Buddhism on both the development of American Buddhism and Buddhist social ethics.

Until quite recently, the study of Buddhism in the West tended to romanticize the tradition as an esoteric “other,” defined it in terms of an other-worldly soteriology, or approached it as a philosophical system constructed on the seminal teachings of suffering (*dukkha*), not-self, emptiness, and nirvāna. Much that went on in Buddhist societies and cultures was ignored, or perceived as epiphenomenal, or critiqued as an accommodation to uneducated lay folk who lacked the intellect and spiritual dedication of monks. Buddhism, then, was constructed as a two-storey affair: “real” Buddhism was a monastic, soteriological religion; Buddhist ethics was either provisional or essentially assimilated into Buddhist soteriology. Scholars who contributed to this dualistic construction included Max

Weber, who represented Buddhism as an otherworldly mysticism type of religion, a shadow that fell on *Comparative Religious Ethics*, characterized by one reviewer as “Weber’s progeny, once removed” (Stout 1980).

Metaethically, Little and Twiss (1978) propose that a religious ethic integrates a *religious action guide* and a *moral action guide*. The first is based on the supreme authority ascribed to a religion’s cosmology or object of ultimate concern, such as *nirvāna* or God, an authority that resolves life’s deepest enigmas (e.g. suffering). A moral action guide addresses problems of other-regard, cooperation, and caring for the material welfare of others. In the case of Buddhism, Little and Twiss argue that the ultimate vindicating authority of *nirvāna* as the supreme *dharma*, predicated on the deconstruction of the self (*anātman*), so dominates Theravādin practical reasoning that an ethic of regard for the material welfare of others is problematized and undermined. Consequently, moral action guiding texts that stipulate norms of mutual responsibility, cooperation, and other-regard are judged to be provisional because of Buddhism’s “fundamental belief in the ultimate unreality of human persons” (Little and Twiss 1978, 241).

In contrast to models for the study of comparative religious ethics built on the structure of moral reasoning *à la* Little and Twiss or neo-Kantian rationalism (Green 1978), Frank E. Reynolds proposes that the historian of religions’ approach to comparative religious ethics should begin with a broad, general understanding of the religions under investigation; then focus specifically on their ethical dimension; identify the central religio-ethical pattern that plays a predominant role in the traditions; investigate the substantive similarities and differences among the ways the common pattern has been articulated in these religious contexts; and compare the ways in which these patterns have functioned in the lives of religious communities (Reynolds 1980). The descriptive picture or map that results from this process challenges rigid distinctions between soteriology and ethics; specifically, in the Buddhist case between a teleological, *nirvānic* ethic and a consequentialist, *karmic* ethic. Reynolds does not obviate such distinctions; instead, he integrates diverse ethical “modalities” into a broader whole bound together by a common religio-ethical pattern. This pattern correlates modes of moral reasoning with multiple cosmologies and different social locations. It situates ethics in relationship to other components of the Buddhist worldview (viz. cosmology, epistemology), modes of activity and practice (viz. meditation, ritual), and sectors of the Buddhist community.

Methodologically, the history of religions approach to the study of ethics is holistic in the sense proposed above. It does not presume to account for the entirety of a religious tradition or construct an “essence” that defines the whole tradition vis-à-vis its “manifestations.” Rather, the history of religions maps action guides and ethical discourse within a general picture and a central pattern, but not a general theory. This approach involves an “intensive study of the structure, dynamics and social implications of the normative modes of action which different traditions have, at various times and places, expressed in their teachings and manifested in their community life” (Reynolds 1979, 23). While some Buddhologists attempt to correlate Buddhist ethics with particular Western metaethical theories, such as Aristotelian eudaemonistic ethics (Keown 1991, ch. 8), others argue that Buddhist ethics should not be constructed in terms of a particular theory and that to do so robs a reading of narrative texts, in particular, of their rich particularity as discursive ethical sites (Hallisey 1996). As the preceding discussion indicates, the history of religions may be said to bring the twin perspectives of historical particularism and inductive holism to the enterprise of comparative religious ethics. An investigation of the historical and contextual particularity of religions enables one to derive a general picture or map and a common religioethical pattern.

Cosmology and Ethical Naturalism

Historians of religion contend that moral reasoning should not be treated as an isolated system but studied as part of a complex cultural whole that includes not only moral beliefs but also beliefs about reality. This view rests on the assumption that how one acts and reflects on the meaning and reasons for one's actions mirrors the larger picture of how one understands the nature of the world (i.e. the cosmology). In this context, the term "cosmology" is broadly construed as a "study of the ways in which cultures and individuals relate their basic notions of the origins of the reality in which they live their lives to the patterns of action that they consider to be ... worthy of choice" (Lovin and Reynolds 1985, 8). Historians of religions argue that within the scope of religious ethics an account of moral action and moral reason that does not engage the cosmology in which it is set will be restricted; that is, the picture justifying a particular course of action will be incomplete; and, of even greater significance, the symbolic web of meaning that informs moral agency will be lost. For example, it has been argued that the uniqueness of Confucian ethics reflects its embeddedness in a non-dualistic, organismic worldview (Geaney 2000, 467). Furthermore, historians of religion contend that the purview of investigation should not be confined to formal schema of moral reasoning but should include a wide variety of expressive modes, including narratives, doctrinal treatises, legal codes, ritual, and ceremonial patterns (Lovin and Reynolds 1985, 4).

The correlation between the way people identify their moral choices and how they identify and test their beliefs about reality has been characterized as ethical naturalism. The empirical cast of ethical naturalism challenges both *a priori* and descriptive formal patterns of moral reasoning: "[it] seeks to describe the relationships between worldviews and norms in ways that accurately reflect the tensions and controversies in a community's experience, in ways that reproduce the complexity of a tradition and allow the identification and meaningful comparison of the most crucial elements within it" (Lovin and Reynolds 1985, 30). Ethical naturalists, therefore, affirm ethical pluralism over-against both universalistic formalism and subjective relativism or idealist versus positivist analyses of moralities (Bird 1981, 162). While embracing cultural diversity, ethical naturalism also sees similarities among the limits and possibilities of human experience that make moral judgments and choices intelligible across cultures (Lovin and Reynolds 1992, 273). These similarities emerge inductively from the dialogical practice of comparative religious ethics itself, rather than being imposed as a deep structure or derived as a universal pattern of practical reason. This practical engagement calls for an imaginative act of translation more akin to metaphor than to syllogism, to mimetic performance than to logical argument (Schweiker 1992, 269ff.).

The historian of religions' dialogue with different religio-ethical systems can and has been extended to include systematic analyses of religious ethics, as well. In her descriptive study of Aztec cosmology, for example, Kay Read demonstrates that Aztec myths embody a paradigm of transformative sacrifice that guides all levels of conduct in Aztec society. Charles Reynolds and Ronald Green find Read's analysis of the ways in which Aztec myths validate and vindicate the moral norms of Aztec society a model of what comparative ethics can be if ethicists and historians of religions engage one another in serious dialogue (Reynolds and Green 1986, 147). They suggest a "thick theory" for understanding the ethical significance of cosmogony, a universal feature of religious traditions that would pursue the following questions: how do cosmogonies vindicate basic ethical norms of individual conduct, social institutions, and moral virtue; how do they validate normative ethical standards; how do they guide individuals and groups in the

selection of specific ethical principles and rules; how do they help individuals and groups answer the question of why be moral, and how to deal with moral failure; and how do social forces and cultural traditions inform cosmogonies (Reynolds and Green 1986, 146). With these questions, Reynolds and Green are proposing a “conceptual agenda” with the intention of bridging the gap between theory and description in order to enhance both (Reynolds and Green 1986: 147). The issue remains, however, whether such a conceptual agenda with its emphasis on moral reasoning, vindication, and validation does not overly constrain the ethical textures embedded in the broad mythologized and ritualized cosmological frameworks at the core of religious traditions.

Soteriology: Saints and Virtues

I ... recommend that an hour spent in the company of a Pachomius ... or a Saint Martin can tell us ... how to begin to answer the challenge posed by Dietrich Bonhoeffer: “It is becoming clear every day that the most urgent problem besetting our church is this: how can we live the Christian life in the modern world.” (Brown 1987, 14)

Saints are models from whom one learns “patterns of life for which no principle or code can serve as an adequate representation” (Hawley 1987, xiv). Saints’ lives bridge the gap between soteriology and ethics, between social and personal, moral and religious virtues. Saints are exemplary models – both examples of something and examples to someone. They embody the core pattern of a tradition, not in an abstract or theoretical way, but particularized in narratives, modes of behavior, and specific communities. Saints’ lives are concrete expressions of a religio-ethical tradition as a whole and the core pattern/value of the tradition. They are not merely examples typifying the whole; rather, they are convincingly the whole, showing the way to a coherent personhood that contrasts markedly with the “world of shards and fallen fragments by which they are surrounded” (Hawley 1987, xv).

For historians of religions, the narrated lives of saints instantiate and thereby mediate moral principles for a community of faith or members of a society. In this sense they provide an alternative to a model of comparative religious ethics that focuses primarily on modes of moral reason. Narrated lives of saints, furthermore, also uniquely integrate religious and moral action guides. They embody a religio-moral perfection that paradoxically reflects but goes beyond the moral systems that govern ordinary morality and cannot be precisely articulated within the confines of practical reason (Hawley 1987, xvi). For example, the Confucian “paradigmatic individual” or *chün-tzu* exemplifies the spirit of *jen* (human heartedness, compassion) without slavish adherence to conventional rules of propriety (Cua 1992, 58). A Mother Theresa embodies the Christian ideal of agapic love that judges the inadequacies and imperfections of the ethics of distributive justice; yet, at the same time, she creates a community dedicated to the equitable treatment of the impoverished poor and, in doing so, is venerated as a source of beneficent succor for devotees from all walks of life for all kinds of reasons. As Hawley observes, saints are perceived not only as exemplars of individual moral perfection or even of an imagined fellowship of faith and morality, but also as living agents of moral transformation and even physical well-being (Hawley 1987, xxi). They serve as models of moral aspiration and inspiration. For the historian of religions, furthermore, the lives of saints offer both a paradigm of exemplary

behavior and an approach to the study of comparative religious ethics that challenges the focus of philosophical ethics on moral reasoning.

Narratives of saints' lives serve a holistic function. They integrate the plural ethical modalities within and among religious traditions, and bridge the divide between the rational and affective dimensions of the moral life. As William Barbieri observes of narrative ethics more generally, it broadens the horizons of contemporary ethics beyond its characteristic concern with moral principles and criteria for decision making (Barbieri 1998, 361). Saints' lives have the capacity to convey more about the motivational and aspirational dimension of the moral life, one of the key features of religioethical traditions and also of any reasoned consideration of descriptive and normative ethical agendas.

Religions and Global Ethics

Human beings are held to have access to human rights and to be accountable and obligated to live up to them *not* because they are Muslim or Christian or Buddhist or Jewish or Hindu or a member of any particular religious or philosophical tradition (Little 1999, 166).

The ethicists' critique of the particularism and pluralism of the history of religions' approach to comparative religious ethics assumes special cogency in the debates over the prospects of a global ethic, especially with regard to the urgent and pervasive issue of human rights. Critics of efforts to promote a global ethic, such as the United Nations' Universal Declaration on Human Rights adopted in 1948, include proponents of cultural diversity with views not unlike the historians of religions' claim that religious ethics are historically and culturally embedded, not abstract systems of moral reasoning (Nino 1991, 90). Questions about universal human rights standards have also been raised from the perspective of differing worldviews and cultural traditions; in particular that the UN Declaration frames human rights in terms of a distinctively Western conception of the autonomous self or individualism.

Historians of religions bring to the discussion of a global ethic a respect for historical and cultural pluralism both within and among traditions, while at the same time rejecting a skeptical moral relativism. We are not positivists; our maps of religion depict generalizable contours and patterns, not simply discrete particulars. Our descriptive, inductive method does not preclude the possibility of normative claims regarding moral competence and moral responsibility, but disagrees with the position that the idea of human rights requires a neutrally formulated normative regimen. Views resonant with the method of the history of religions include Tore Lindholm's (1992) notion of overlapping consensus; Sumner Twiss' (1998) contention that intercultural dialogue can lead to a shared sense of human moral capacity, common vulnerability to suffering and oppression, and analogous moral principles; and John P. Reeder Jr.'s neo-pragmatist proposal regarding concrete universals achieved through the discovery of convergences among moral, valuational, and factual beliefs (Reeder 1993, 194). Historians of religion agree with the neo-pragmatist's position that religio-cultural traditions are not locked into fixed conceptual schemes between which there is no possibility of translation and the compatible view that concrete universals may be extrapolated analogically over a range of moral experiences (Reeder 1993, 200–201). Although the historians of religions' inductive approach values pluralism, we affirm that comparative religious ethics is not merely a descriptive study of diverse moral traditions, but is also a dialogical

process to which our discipline brings a distinctive perspective, one fundamentally attuned with William Schweiker's observation regarding comparative ethics:

The practice of comparative ethics contributes to the enactment of a shared moral universe in which the diverse ways of being human are preserved amid the claims of [shared] responsibilities ... It reaches its goal when through encountering others in the performative act of interpretation there is some apprehension of the shape, texture, and direction of their lives and our own within a shared space of meaning and responsibility. (Schweiker 1992: 285).

In a world increasingly fraught with ethnic and religious violence justified politically by religio-moral absolutes, the history of religions' valuation of diversity and plurality, while affirming that all human communities share not only a physical planet but also a moral universe of meaning and responsibility, has more than an academic import. I suggest the contribution of the historian of religions to the future of comparative religious ethics is nothing less than a moral imperative.

CHAPTER 47

Culture and Moral Pluralism

Bruce Grelle

Many pressing issues upon which religious ethicists reflect involve disagreements or conflicts among competing social groups that hold and act upon disparate worldviews and values. Such conflicts occur not only *between* groups that hold opposing worldviews and values, but also *within* groups where there may be disagreement about the meaning of shared beliefs and values or about priorities among them. The concept of culture is an inevitable part of efforts to understand such conflicts, just as it must be an inevitable part of efforts to find possible resolutions to them. Likewise, the social-historical reality of “cultural pluralism” is the inevitable context for religious and moral reflection in this era of globalization, with its unprecedented degree of interaction between the diverse peoples and cultures of the world. In this entry I will briefly discuss the concept of culture and its significance for religious ethics.

The Concept of Culture

There are many excellent accounts of the origins and development of the concept of culture (see Eagleton 2000; Lincoln 2000; Masuzawa 1998; Tanner 1997; Williams 1981). Scholars typically remind us that “culture” was initially a noun of process, having to do with the cultivation and tending of crops, the rearing and breeding of animals, and the active culture or cultivation of the human mind. In the eighteenth century, “culture” became a more general designation for the “spirit” (whether ideal, religious, or national) that informed the “whole way of life” of a distinct people. This “spirit” was believed to be manifest in all human activities, but was most evident in specifically “cultural” activities such as language, morals, and styles of art. It was in this connection that J. G. Herder first used the plural “cultures” in deliberate distinction from a singular sense of “civilization.” This broad pluralistic usage of “culture” became central in the development of comparative anthropology, where it continued to designate a whole and distinctive way of life (Williams 1981, 10–11).

Understood as ways of life, cultures include language and modes of verbal and nonverbal communication, technologies and material artifacts, learned and customary patterns of behavior and social organization, and so on. Cultures also consist of socially inherited and community-specific “ideas about what is true, good, beautiful, and efficient” (Shweder 2000, 163). The terms “worldview” and “ethos” best describe the aspects of culture that religious ethicists are typically most interested in. As Geertz has explained these concepts,

A people's *ethos* is the tone, character, and quality of their life, its *moral and aesthetic style and mood*; it is the underlying attitude toward themselves and their world that life reflects. Their *worldview* is their *picture of the way things in sheer actuality are*, their *concept of nature, of self, of society*. It contains their most comprehensive ideas of order (Geertz 1973, 127; emphasis added).

The idea that cultures are whole ways of life constituted by a unity of worldview and ethos is important because it helps us to see that moralities themselves must be understood as cultural systems (see Bird 1981). Recognition that “moral concepts are embodied in and are partially constitutive of forms of social life” (MacIntyre 1973, 1) underscores the historicity and cultural specificity of moralities and acknowledges the importance of contextual understanding. It is not only a mistake to isolate the analysis of moral reasoning from the analysis of moralities as a whole, it is also a mistake to isolate ethics from the study of history, society, and culture (Gustafson 1972, 52). On this view, the study of religious ethics should focus not only on forms of moral reasoning but also on forms of life, not only on moral argument and justification but also on the full range of “normative activity that creates and sustains an ethos” (Reynolds 1979, 23).

Culture, Ideology, and Hegemony

Thus far we have focused on cultures as whole ways of life characterized by distinctive blends of intellectual, moral, and aesthetic sensibilities, values, and behaviors that are shared in common by particular groups of people in specific times and places. Yet a problem with this way of thinking about cultures is that it tends to obscure the political uses and ideological functions of religions, cultures, and moralities. We can begin to move beyond an overly romantic conception of culture as a seamless whole way of life by viewing cultures in the context of struggles between competing groups over who is going to exercise intellectual and moral leadership (or hegemony) in society. According to Gramsci (1971), the supremacy of a social group is exercised and maintained not only through the exercise of coercion and force, but also and more commonly through the exercise of intellectual and moral persuasion. Through its occupation of positions of leadership in the religious, educational, and other “cultural” institutions of society, the dominant group’s “view of reality” informs all tastes, morality, customs, religious, political and legal principles, and all social relations, particularly in their intellectual and moral connotations (Femia 1975, 30–31). It comes to constitute the “common sense” of the majority of the population – “the conception of the world absorbed uncritically from the various social and cultural environments in which the moral individuality of the average man develops” (Gramsci, cited in Counihan 1986, 5).

Many traditional “anthropological” approaches to culture tend to emphasize the role played by religious and moral ideas in the collective self-expression of human communities and in the intellectual and moral integration of social systems. Recall here Durkheim’s famous definition of religion as a “unified system of beliefs and practices ... which unite into one single moral community ... all those who adhere to them” (1965, 62). By contrast, the concept of hegemony shifts our attention to a consideration of the extent to which cultural formations are characterized by conflicting interests and by lived patterns of domination. It focuses our attention on the heterogeneity that typically exists within a society (subcultures, counter-cultures, etc.) and upon the political interplay between dominant and oppositional cultural expressions (Williams 1978, 110).

Whether or not this recognition of an inevitable connection between moralities and cultures on the one hand, and the interests of social groups and the exercise of domination on the other hand, commits us to viewing moralities as nothing more than rationalizations or reflections of group self-interest is a question to which we will return below.

Cultural Pluralism

At this point I want to shift from the concept of culture to a discussion of *cultural pluralism* as a chief context for, and approach to, the study of religious ethics. More specifically, we return to the comments made at the outset of this chapter regarding conflicts of worldviews and values between and within cultures. Whether described as “culture wars,” “clashes of civilizations,” or “struggles for hegemony,” such conflicts are a fact of religious and moral life.

Though “pluralism” and “diversity” are often used interchangeably, “pluralism” understood as a philosophical and ethical–political stance toward diversity must be distinguished from “pluralism” understood as the sheer fact of diversity. As *an approach to cultural and moral diversity*, “pluralism” is conscious that “many legitimate goods exist and that whatever goods you pursue, they are but one among many possible sets of goods” (Yearley 1994, 9). This approach contends that while it is possible and useful to compare alternative cultures and ideals of human flourishing, it is not possible to rank them according to a single universal standard or make them fit into a single comprehensive conception of the good and virtuous life (Berlin 1990, 1–19; Fiorenza 2001; Yearley 1994). “The Greek hero, the Christian ascetic, [the] Nietzschean critic, the twentieth-century analytical philosopher, the Buddhist monk, the capitalist entrepreneur, and the Confucian scholar ... stand alongside one another as alternative visions of the virtuous life” (Fiorenza 2001, 81).

Anthropologist R. A. Shweder (2000) has articulated a persuasive yet problematic example of a pluralistic approach to cultural and moral diversity by contrasting pluralism with “cultural developmentalism.” Shweder contends cultural developmentalism is favored by many first world economists and policy makers; by various agencies promoting Western-style globalization and by the international human rights movement; by “monocultural feminists” for whom traditional and non-Western forms of family life, gender relations, and reproductive practices should not be tolerated; and by a growing number of anthropologists who take an interest in other cultures “mainly as objects of scorn” rather than as sources of illumination (Shweder 2000, 159, 161–162). Cultural developmentalism believes there is only one way (the West’s) to lead a morally decent and rational life. The goal of the cultural developmentalists is to lift cultures, civilizations, and religions “up from error, ignorance, bad habits, immorality, and squalor, and refashion them to be more progressive, more democratic, more scientific, more civic-minded, more industrious, more entrepreneurial, more reliable, more rational, and more like (the ideal) us” (Shweder 2000, 160–162; see Harrison and Huntington, 2000, for examples of “cultural developmentalism”).

By contrast, Shweder’s own ethical–political project as a cultural pluralist seeks (1) to defend the idea that there are a variety of ways of living as rational and morally decent human beings; (2) to defend diverse cultures against ethnocentrism and chauvinism; and (3) to maintain that other cultures should be viewed, at least initially and potentially, as sources of illumination rather than as obstacles to the spread of Western beliefs, values, and styles of life. He wants to resist the idea that either “we” or “they” have implemented the only credible and morally legitimate manifestation of a good human life.

According to this position, it is simply not possible simultaneously to maximize all the good things in life, “which is why there are different traditions of values (i.e. cultures) and why no one cultural tradition has ever been able to honor everything that is good.” This is why we frequently find ourselves in situations where “it is possible for morally decent and fully rational people to look at each other and at each other’s practices and say, ‘Yuck!’” (Shweder 2000, 61, 164, 315).

Even so, it remains possible to make evaluative judgments regarding the moral progress or decline of various cultures. “Progress means having more and more of something that is ‘desirable’ (i.e. something that should be desired because it is ‘good’). Decline means having less and less of it” (Shweder 2000, 165). The problem is that before we can make evaluative judgments we must first select some specific good to measure, and which good to select is not always self-evident. For example, if we choose maximization of child survival during the first nine months after birth as the good by which to measure a culture’s success, then the United States is objectively more advanced than Africa or India. But if “maximizing the likelihood of child survival during the first nine months after conception (in the womb) is the measure of success, then Africa and India (where abortion rates are relatively low) are objectively more advanced than the United States (where abortion rates are relatively high).” There is “much that is discretionary (i.e. not dictated by either logic or evidence) in any decision about how to name and identify specific ‘goods’ and thus morally map the world ... And when it comes to constructing narratives about progress ... there is lots of room for discretion (and ideology) in how one tells the story of who is better and who is worse” (Shweder 2000, 165–166).

Cultural Pluralism, Ideology, and the Common Good

Along with many scholars in religious studies, I continue to believe, like Shweder, that it is important to resist ethnocentrism as far as possible. The cultivation of a “dispassionate capacity to comprehend and explain other people’s experience of their worlds without interjecting one’s own preferences” (Paden 1992, 73–74) remains basic to the practice of comparative scholarship. Likewise, I accept pluralism’s claims that human goods are multiple and irreducible to one another, that there are a variety of ways of being rational and morally decent human beings, and that these multiple ways are nurtured in and embodied by different cultures in different times and places. Moreover, I concur with the idea that it is best to view other cultures as potential sources of illumination rather than primarily as obstacles to one’s own values or ideology. There are both existential and practical benefits to be gained through sympathetic engagement with diverse cultures and ideals of human flourishing (see Schilbrack 2002; Twiss and Grelle 2000; Yearley 1994).

But Shweder seems to believe that a genuinely pluralistic stance toward cultural and moral diversity necessitates the abandonment of efforts to articulate a common or “universal” moral language that is applicable within and across multiple cultures. For example, he implies that efforts to promulgate a moral language of universal human rights inevitably involve the imposition of a uniform and imperialistic approach to moral values that is inconsistent with genuine respect for cultural diversity. Thus, he applauds the decision of the executive board of the American Anthropological Association (1947) not to endorse the United Nations “Declaration on the Rights of Man” on the grounds that it was an ethnocentric document, adding: “in 1947, anthropologists were still proud of their anti-colonialist defense of alternative ways of life” (Shweder 2000, 164). Shweder is not alone in this view. One can find human rights skeptics among representatives of particular cultural traditions and among some scholars of those

traditions who believe that the language of human rights represents a Western moral ideology intended to supplant the moral perspectives of diverse cultural traditions (Twiss and Grelle 1995, 30).

But this is an incomplete and misleading picture of the nature, source, and function of contemporary human rights discourse and of the relationship between human rights norms and particular cultural moral traditions. It is a mistake to conclude from this that a pluralistic approach necessitates the abandonment of efforts to develop moral languages that both recognize the irreducibility of cultural and moral diversity while also seeking to identify values that can be shared in common across cultures.

Through cross-cultural dialogue and negotiation about problems that they face in common – tyranny, torture, starvation, lack of access to education and healthcare, discrimination and violence along religious, racial, and ethnic lines – increasing numbers of people around the world have begun to employ the language of human rights as one way of speaking about certain core moral values that appear to be shared by a number of different cultural traditions (see Bird et al., 2016, 33–58; Evans 1998; Kelsay and Twiss 1994). Indeed, the language of human rights has increasingly become a kind of “moral creole” that people from a variety of cultural backgrounds have found to be very useful for communicating with one another in an effort to stake out a practical moral consensus among diverse traditions regarding basic conditions necessary for the respect of human dignity (Stout 1988, 80–81, 243, 294).

The language of human rights has gradually developed alongside and sometimes been combined with the variety of more particular moral languages traditionally spoken by people from different cultures around the world. This does not mean that human rights can substitute for or replace these richer, more specific and complex moral languages. The discourse of rights is too minimal, too thin, to provide the motivation and sense of direction necessary for the pursuit of human fulfillment. While the human rights movement has sought to establish principles by which all people – regardless of their identity as members of particular communities and traditions – ought to live in order to render social life as peaceful and beneficial as possible, it has necessarily been associated with a relatively narrow conception of morality-as-constraint – a morality of rights, duties, and obligations.

By contrast, the world’s cultural and religious traditions offer broader conceptions of morality that set forth concrete visions of human fulfillment and that focus on the cultivation of virtue and the formation of character. Far from being autonomous from the particularities of traditions and cultures, such visions and virtues are intimately linked to one’s identity as a member of a specific community. Among themselves, members of particular cultures will continue to speak their native moral languages, translating the subject matter of “human rights” into the richer more variegated and nuanced moral idioms that are rooted in their own specific cultural conceptions of human nature, community, and moral rationality. Likewise, they will translate elements of these moral idioms into the more generic language of “rights” when they seek to communicate with “others” who do not share the same cultural conceptions (Twiss and Grelle 1995, 33–35). What one describes and justifies as “human rights” in international and cross-cultural settings when speaking moral creole will likely be described and justified differently when speaking a moral language indigenous to one’s own local culture or religion.

This is not to suggest that the consensus regarding basic human rights (in the form of international treaties and covenants) that has emerged over the past fifty years is complete. There remain tensions and disagreements between the particular moralities of cultures and the “universal” morality of human rights – especially with regard to the rights of women, children, and homosexuals – just as there remain tensions within human rights discourse itself between civil-political rights, social-economic rights, and cultural-developmental rights (see Kelsay and Twiss 1994, 31–59; Okin 1999).

This ongoing contestation regarding human rights suggests several things about the relationship between morality, ideology, and culture. It reminds us that all moral ideas and discourses are employed by particular people in specific times and places and are inevitably linked to the interests of those who employ them. But this does not mean that religious ethics should abandon efforts to identify a common good shared by multiple social groups and by diverse traditions within and across cultures. Some moral discourses are more “universal” than others, in the sense that they do not simply reflect or rationalize the narrow self-interest of the groups that employ them but actually do succeed, at least *to some degree*, in encompassing and representing broader human interests. In other words, the mere existence of an ideological connection between moral discourses and sectional interests does not necessarily mean that all claims to moral universality are a mere pretense or form of deception (Grelle 2017, 121–133). Likewise, while there are undeniable tensions and conflicts between the ideal of universality and the reality of cultural diversity, this does not mean that it is impossible to find common ground between traditions and cultures (An-Na'im 1992). The international human rights movement illustrates that it is sometimes possible, through dialogue and negotiation (rather than through some form of *a priori* philosophical analysis), to identify common interests shared by disparate groups with alternative cultural and moral orientations.

In this world of competing and conflicting worldviews and values, one of the main tasks of religious ethics must be to assess and compare the *degrees of universality* that are embodied in the moral discourses of diverse cultures and traditions. To what extent do they reflect or rationalize the narrow sectional interests of particular social groups? To what extent do they succeed in identifying or creating and expressing what might be regarded as “universal human interests” that are shared by disparate groups in a given society or historical epoch? Which discussions are more and which are less inclusive of the interests of the widest number of human beings – whatever their religion, race, class, gender, ethnicity, sexual orientation, and so on?

Rather than oppose efforts to develop common, “universal,” cross-cultural moral languages in general – whether human rights or similar efforts, such as the interfaith movement’s attempts to articulate a “global ethic” (Küng and Kuschel 1995) – cultural pluralists should look at how these languages are being used in specific times and places, by whom, and for what purposes. When such avowedly “universal” moral languages are employed in self-serving, ethnocentric, imperialistic fashions, they should be opposed. But when they are employed to help find common moral ground in the midst of conflict and competition between social groups and amid cultural and religious diversity, they should be promoted as a basis for uniting people in the task of building a world where the human dignity of both individuals and cultures is more fully respected.

An approach to religious ethics that takes culture seriously must seek to analyze moral discourses in the context of cultures as a whole, in the context of struggles for hegemony among competing social groups within and between cultures, and in the context of a recognition of the practical need to develop ways of speaking about a common good even while recognizing the irreducible cultural and moral diversity of the world in which we live.

CHAPTER 48

Conceptual Approaches in Comparative Religious Ethics

Aaron Stalnaker

Aims and Methods in Comparative Religious Ethics

Conceptually oriented approaches to comparative religious ethics have become sufficiently refined that they now constitute a distinct form of ethical inquiry. This kind of study focuses on analyzing ethical and religious ideas, and exploring their implications and systematic relationships in larger theories. Such work is close in style and some aims to moral theology, moral philosophy, and intellectual history. But it can range far wider culturally than the frequently European core subject matter of these disciplines as typically practiced in the West. Comparisons of this type can go on at many levels. Comparative ethical inquiry can examine debates between contemporaries, either within or across religious traditions; or track differing interpretations over time as traditions change; or it can compare the views of various thinkers from different traditions. While “comparative religious ethics” is typically thought to concern only the last of these, that is, explicit cross-traditional analysis, the forms of study and reflection involved are continuous across the full range of these possibilities, albeit with gradually increasing linguistic and historical challenges as cultural distance increases.

While cultural distance covered can seem important, often the deeper distinctions between different examples of comparative religious ethics (hereafter “CRE”) hinge on the primary intellectual goals of the interpreters. Aims for CRE are usually either historical-interpretive, comparative-typological, or philosophical-theological, albeit with frequent cross-pollination and combinations of various sorts, depending on the needs of the study. Primarily historical studies aim to sort out and evaluate differing interpretations of religious texts or other data, in order to chart changes over time in a tradition or region. Much of the scholarship that has gone by the name of “religious ethics” could fit under this category, especially when it is primarily focused on studies of past thinkers or themes in a tradition. This may happen with Christian or other Western materials (e.g. MacIntyre 1988), or with non-Christian materials (e.g. Kelsay 2007).

The most explicitly comparative goals in CRE originally grew out of efforts to construct typologies of differences across religions. This sort of maneuver is perhaps most commonly identified with classic versions of the phenomenology and history of religions (e.g. Eliade 1959). But some of the most illuminating and early versions of the typological method of comparison relate to the sociological study of religious ethics, as with Ernst Troeltsch (1931 [1912]) and Max Weber’s (1958 [1905]) examinations of the differences between “church” and “sect” types of Christian social organization. And as explored further

below, many more recent works that present themselves as examples of CRE construct analogical relationships between ideas that are roughly typological in character.

The third main kind of intellectual goal is philosophical or theological, and is frequently central in conceptually oriented comparative scholarship. Studies in this vein explore fundamental ethical issues through analysis of key concepts and theories, via imagined or extant debates between positions, in order to articulate precisely the best account of some difficult, morally or religiously significant matter. Some classic works in CRE exemplify this sort of approach, such as Yearley (1990), which compares the virtue theories of the early Confucian thinker Mengzi and the medieval Christian theologian Thomas Aquinas. Yearley probes these thinkers' accounts of virtue in general, as well as their conceptions of the virtue of courage, in order to raise and address fundamental ethical questions about dispositions and moral psychology, as well as the nature of virtue. Yearley (1990) also exemplifies the way in which comparison can generate creative new ideas, not just with regard to particular moral concepts, but also in terms of laying out productive theories and approaches in religious studies more broadly. In this case, Yearley explores the differences articulated by anthropologists of religion between experience-near "primary theories" and experience-distant, frequently more "religious" "secondary theories" about reality. Yearley uses his case study to suggest that there is another, mediating realm he calls "practical theory," in which he contends comparative studies of ethics are likely to be most fruitful.

The three types of aims laid out above are not mutually exclusive, and the most successful books are able to accomplish more than one. Angle (2002), for example, has elements of all three, although he primarily pursues historical and philosophical goals. The study examines the intellectual history of "rights talk" in modern China, from the initial adoption of the Japanese-derived neologism *quánlì* 權利 for "rights," to the subsequent debates in Chinese about this novel concept, traced up to the post-World War II era of "human rights." *Quánlì* may mean "power," "right," or "privilege," and so debates about this idea took distinctive forms, because of this range of meaning. All of this illuminates the contested history of human rights ideas in China, and does so without presuming the adequacy, necessity, or sufficiency of Western language accounts of rights or human rights. Nevertheless, Angle is well aware of Western language debates about rights, and does a fine job explicating the ways in which Chinese debates about *quánlì* were similar to and different from Western accounts. He does this in order to probe strengths and weaknesses in both Western and Chinese accounts, and through this analysis he defends a novel approach to a fundamental ethical concept ("rights"), while also articulating an astute general approach to historically and culturally self-critical conceptual analysis.

Angle describes his approach as a combination of "rooted global philosophy" and "constructive engagement" between thinkers shaped by various traditions (2009, 6–8). "Rooted global philosophy" combines rootedness in a developed intellectual tradition, such as Confucianism, Augustinianism, or Kantianism, with a concern to engage and learn from other traditions across time and around the globe. "Constructive engagement" suggests the attitude of open-ended debate and truth-seeking, with the possibility that particular positions, even if well rooted in some tradition to which one is loyal, might be revised or developed if warranted. While Angle prefers the language of philosophy, scholars of religion might well practice some version of "rooted global theology" if the traditions they study are theological in character. Or scholars of religious ethics might engage in a form of CRE that Yearley has called a new form of "natural theology," focused on the human self as a nexus for encountering "the sacred" (1997, both 151; for critical discussion, see Lee 2013). Many variations are possible.

Engaging across intellectual and cultural differences in these ways presents both possibilities and dangers. Different thinkers and traditions have different emphases, and discern a variety of problems, quandaries, and issues, which they articulate in a great variety of languages, as well as a wide variety of explicit, logically structured theories. Relating and comparing different religious ethics is above all a challenge of interpretation: how to understand, learn from, and possibly criticize various others, in relation to our own concerns. And interpretations of religious ethics are inevitably interwoven with evaluative judgments of various sorts, which generate their own difficulties (Stalnaker 2008).

The fundamental tension of all versions of this endeavor concerns the relation or balance between “understanding the other” and “relating to our own concerns.” This is a challenge precisely because cultures and religions vary in their characteristics and emphases, just as languages do. Real variations invite curiosity but also generate possible confusions, as unfamiliar theories and ideas may be shoehorned into ill-fitting but familiar intellectual boxes.

One evasive approach to these issues is tempting, but should be rejected. Some scholars confidently report that they are representing some Other “in their own terms,” thereby avoiding the problem of how to relate *our* account of another thinker or tradition’s views to our own ethical or scholarly concerns. But as Hans-Georg Gadamer has shown (1989), all interpreters bring certain prejudices, values, and interests to their studies, which are formed by their own education and experience, and are unable to function as purely neutral vehicles for representation of other human cultures or ideas. For a fuller version of this argument, focused on religious studies and CRE, see Lewis (2015, 83–118).

With regard to ethics, Enlightenment-derived Western ways of understanding human life, ethics, and politics may or may not be the best or most adequate ways of framing the problems of life, or of offering responses to them. That these formulations are framed in universal terms is hardly unusual, when compared to other philosophies and religions around the world, and does nothing to settle the question of their adequacy; perhaps the ultimate philosophical or theological question is which of the many ethics that make universal claims is best, if any are. CRE reveals that there are no logically inevitable starting places for ethics, despite Enlightenment pretensions; CRE also provides the most explicit and globally open way to grapple with the ethics that humans have developed so far.

A more nuanced comparative question would be, what are the strengths and weaknesses of Enlightenment-derived and other forms of ethics? This way of posing questions about truth and value in religious ethics is better because it recognizes the complexities of different traditions, constituted in part by lively debates and various possibilities, which ought to move people beyond the MacIntyrean hope of “vindicating” one tradition against all others, as if traditions were discrete packages that might be weighed up to see which was heaviest (1988, 368; and 1990). MacIntyre too would reject any idea of a uniform weight scale for judgment of this sort, of course. But he does not want to give up the idea that entire traditions might be evaluated as wholes, even if there is no universal measuring stick or standard of judgment all can agree on. For an aggressive and stimulating recent effort to defend whole tradition comparisons in ethics (although not religion ranking and the “vindication” of traditions), especially with regard to conceptually oriented comparisons, see Decosimo (2018). Decosimo seems more concerned to exonerate suspect traditions like Islam than to vindicate his own tradition. Looking for both strengths and weaknesses also recognizes the range of theoretical possibilities in ethics, and the diverse ways in which different ethical theories chart difficulties in life that may require regulation or at least response.

Positions on various specific issues may be intellectual rivals because they logically conflict, but whole religious and philosophical traditions are much harder to characterize simply as friends, enemies, or

anything else, because they are not individual agents, but instead contain multitudes – of people, ideas, and possibilities. In any case, it must be a matter of interpretation and argument, rather than assumption, that elements of different ethics are in competition or conflict, rather than harmony or some other relation. To reify wholes and see these as antagonists, as in MacIntyre's talk of "rival traditions" (1990), risks blinding us to the details that make all the difference when pursuing conceptually attentive comparative analysis. It may also skew a scholar's interpretive stance so that learning from others becomes suspect, rather than a primary aim of comparative inquiry.

Nevertheless, all of this is simply an abbreviated argument for the *difficulty* of adequately characterizing the ethical commitments of whole traditions by typical scholarly standards of accuracy and insight, not the impossibility or in principle wrongness of such efforts at holistic understanding. As Decosimo has argued (2018), comparisons of such accounts are certainly possible, and even at times warranted. Scholarly reticence with regard to characterizing the ethics of whole traditions can leave the field of debate clear for bigots and demagogues who do not hesitate to characterize whole traditions or peoples, often very simply, in order to mobilize people's loyalty and/or antipathy for others in ways they find congenial. Analyzing and criticizing such bad arguments certainly falls within the realm of reasonable comparative ethics, even if all scholars understand the limitations of generalizations about whole traditions. However, if one is not trying to fight against ill-considered prejudices, but is instead looking to pursue more typical scholarly goals like those discussed earlier, precise handling of various ethical positions is easier to achieve when studying and comparing objects of smaller scope than "Christianity" or "Islam" (Stalnaker 2006, 13–17).

Thick and Thin

Probably the most common way of theorizing the hermeneutical problems endemic to CRE and cognate activities builds on the metaphorical contrast between "thick" and "thin," which scholars have frequently applied to moral concepts but which also imply larger theories of interpretation and comparison. While he drew on a version of the distinction introduced by the philosopher Gilbert Ryle, Clifford Geertz (1973) is almost certainly the original and most influential source for the thick/thin distinction in contemporary CRE. Here Geertz gives an account of ethnography as deeply interpretive "thick description," in contrast to "thin," uninterpreted recording of visible actions. His point is that because human action is, with few involuntary exceptions, intrinsically social and meaningful, ethnographic analyses must consist of interpretations of human beings' mutual interpretations and the actions they accordingly take in constant response to each other. To capture the meaningfulness of this action, informed by a shared web of symbolic significations, such ethnographic description must be "thick," in the sense that it gives a holistic, evocative account of how particular actions are informed by broader horizons of meaning that give them their sense and point.

Philosophers such as Bernard Williams (1985), Martha Nussbaum (1988), and Michael Walzer (1994), among others, took up the thick/thin distinction and applied it in various ways to specifically moral concepts and discourse. Two strands of this discussion are most relevant for CRE. First, exemplified by Walzer's treatment, the distinction can be tied to social criticism and the challenges of building solidarity across different cultures and traditions, which partake of different "thick" languages and theories of morality and politics, but likely share commitments to "thin" but important values such as human rights.

And second, as with Nussbaum's treatment and subsequent discussions, such as Van Norden (2007), the distinction is deployed to help sort out similarities and differences between different moral discourses in order to make differences and disagreements more perspicuous and productive. When used this way, "thin" comes to refer to abstract, generally shared ethical concepts, such as "virtue" or "flourishing," which can serve as anchoring or guiding terms for comparative analysis of different "thick" moral discourses or theories. Local ways of knowing and judging deserve some contemporary version of "thick description," because of their richness, complexity, and interest. But to make that richness and import salient, that description needs to be organized in relation to suitable "thin" concepts that are more easily grasped by potential readers.

This pattern of comparing different religious ethics with reference to more abstract and common general ideas, in order to organize and elucidate the significance of more detailed study of particular objects to be compared, is so common as to seem inevitable in CRE. (For further general discussion about comparison in religious studies, which goes far beyond the subject matter of ethics, however broadly construed, see Patton and Ray 2000, Smith 2004, and Freiburger 2019). Different interpreters do use somewhat different terminology: besides "thick" and "thin," Robert Neville (2001, 9–16), for example, discusses "vague categories" that facilitate productive comparisons. Stalnaker (2006) discusses these points in terms of a contrast between "bridge concepts" that are designed to organize comparisons around productive general themes that highlight significant similarities and differences between the ethics to be compared, and the more embedded and densely described "vocabularies" of moral practice, analysis, and argument that make up the ethics to be compared. But all these various ways of putting the methodological point are ways of updating the ancient Aristotelian idea of general types, of which several particular things may be seen as examples, because they share some or all of its general features, and thus stand in analogical relations to other tokens of the type.

All of this may seem uncomplicated, but choosing and properly characterizing the "thin," "vague," or "bridge" concepts can be very challenging, depending on the objects compared. And no decision procedure will guarantee success. Consider some examples. In his discussion of "thick" and "thin" concepts, Van Norden (2007, 17) begins by discussing various "thick" theories of what the sun is: a god, a hot stone, the quintessence (*jīng* 精) of the *qi* 氣 of fire, or a mass of fusing hydrogen and helium. These are certainly incompatible accounts of the sun, but by choosing an example that has such an objectively obvious and singular referent, Van Norden in this example obscures the difficulties that often crop up in CRE studies where no such universally available obvious object of theorizing is available, as is frequently the case.

Sometimes it seems that two different traditions are not debating about a single topic, even if a "thin" description can be concocted that might seem to cover both. Consider divine grace in the Christian tradition, compared with *qi* 氣, "vital energy," in various Chinese traditions. Trying to bring these two ideas together for comparison, a scholar might reach for some highly abstract description such as "extra-human forces that are necessary to flourish as a human being." But the underlying theories, vocabularies, and religious practices are so different that healthy skepticism about this comparison seems warranted, unless and until it could be assuaged through illuminating analysis. And the sheer vagueness and abstractness of the "thin" bridge concept in this case seems unlikely to generate unexpected but revealing avenues of interpretation into either object compared.

In other cases, what seems like a promising topic for comparison turns out, on closer examination, to be treated with much more care by one thinker or tradition than another, despite first impressions to the

contrary. For example, Decosimo reports that he had to abandon a planned comparative study on the virtue of religious outsiders in Thomas Aquinas and al-Ghazālī, because al-Ghazālī had so much less to say about this topic than Aquinas (2018, 11). While explaining such divergences does seem like a potentially interesting problem, it does not seem likely to generate substantial philosophical or theological developments on the topic, precisely because the sparse treatment on one side provides little material to work with.

There are many intermediate cases where it is simply unclear, before proceeding to do deeper research, whether asymmetries of treatment between sources are a problem sufficient to eclipse potential comparative insights. There is, for example, a much more developed and systematic account of courage in Aquinas than in Mengzi, but Yearley (1990) was still able to generate a number of suggestive insights from this comparison.

A different sort of asymmetry can creep in when a natural language term for some potential thin concept carries with it suppressed webs of connotation from its history in the language. This issue affects many important ethical terms that have potential as comparative topics, such as “justice,” or “love,” or “freedom,” or virtue terms like “humility” or “bravery.” Noting and correcting particular shadings of meaning in such ideas seems essential to redeploying them as a thin concept that can bridge between religious worldviews or ethics, and even then the natural language sense of the term is always latent in the study and the mind of the scholar. For example, Van Norden discusses a thin concept of “humility,” which he articulates as “the stable disposition to have an appropriate attitude toward one’s own worth as a person, as well as having the feelings and reactions that fit with that attitude” (2007, 19–20). As a stipulative definition of a comparative topic, this seems both substantive and precise, and articulates a fundamental ethical issue, so it seems promising as a topic for inquiry. But the English word “humility,” with its connotations of low self-regard, seems more appropriate for certain (more or less Augustinian) Christian accounts of proper attitudes toward one’s self, than another example Van Norden notes, that of Aristotle on “great-souledness” or “magnanimity.”

Another important and basic issue is the potential complexity or multivocality of even seemingly singular “thin” or “bridge” concepts. This cuts across the difference between abstract and embedded concepts or theories highlighted by the terminology of “thick” and “thin.” It also addresses a fundamental *theoretical* question in comparative ethics, which is how various thinkers and traditions parse the moral life and emphasize some parts rather than others. For example, Stalnaker (2006) decided to use “the will” as a bridge concept, despite its multiple meanings and aspects in Augustine’s late antique context, as well as his own thought. While there was no cognate word in Xunzi, the early Confucian thinker that was the other subject of the study, that gathered together the same issues, let alone one that was equally central to his thought as a whole, Xunzi did have numerous ways of discussing aspects of what we call the “will,” which provided a considerable amount of suggestive material for comparative study. And one could construct a comparative study around a richly multivocal ethical concept that is highlighted in Confucianism, such as *li* 禮, “ritual” or “ritual propriety,” that is relatively less central in many Western thinkers, especially after the eighteenth century. In either case, the value of the comparison would have to be demonstrated by what it illuminated on one or both sides, in the service of whatever historical, comparative, or philosophical/theological goals the scholar was pursuing. And individual scholars’ judgment when pursuing comparisons is essential to whatever success they may achieve.

CHAPTER 49

Ethnographic

Jung H. Lee

Ethnography refers generally to interpretive work that aims to produce descriptive accounts of a people's culture, most often through qualitative fieldwork and various methods of participant observation. Although ethnography has long been a disciplinary focus of anthropology since the late nineteenth century, its practice continues to gain currency across disciplines, particularly in those fields where analysis can profit appreciably from detailed, nuanced descriptions of comparative forms of life. Presumably, such “thick descriptions” can bring into relief dimensions of local systems of meaning that can speak to a people's specific religious and ethical beliefs. In this regard, ethnographic approaches to comparative religious ethics (CRE) attempt to provide holistic accounts of the moral life in comparative contexts that give voice to the concrete, lived quality of ethical existence that is often lost (or never fully articulated) in theory and text.

Historically, ethnography has involved “the peculiar practice of representing the social reality of others through the analysis of one's own experience in the world of these others” (Van Maanen 2011, xiii). Although the general notion of an empirical approach to the study of ethics can be traced as far back as the early twentieth century in the work of anthropologists like Bronislaw Malinowski and sociologists like Edvard Westermarck (1906–1908), it has only been within the last thirty years that there has been a concerted effort by anthropologists, religious ethicists, and moral philosophers to self-consciously apply the methods of ethnography or what Bernard Williams (1986) called the “ethnographic stance” to the study of ethics. This concern with lived ethics informs the more specific focus on the formation of the moral subject in regard to notions of practice, the emotions, agency, and virtue. Beyond thicker descriptions of the moral life, ethnographic approaches to the study of ethics also present opportunities for examining how different discursive communities appropriate moral vocabularies, share patterns of reasoning, and embody their respective institutional memories. Likewise, advocates have suggested that assuming the ethnographic stance enables ethicists to not only examine the lived ethics of everyday actors in fine, descriptive detail but also to facilitate a genuine, self-reflexive engagement with the normative commitments of the ethnographer herself.

Historical Context

According to James Laidlaw, there is no connected history of moral inquiry in the discipline of anthropology that includes “sustained debate on specific interpretive problems, or distinctive concepts contributed by particular authors or schools, or which reflects changes in general theoretical orientation” (Laidlaw 2002, 311–312). The historical roots of this lack of engagement can be traced to the strength of certain disciplinary orthodoxies in anthropology and philosophy that proved resistant to the idea of an anthropology of ethics. On the one hand, Durkheimian (1924) and structuralist voices in anthropology tended to conflate the good with the social so completely that conceptual space for an independent understanding of ethics did not seem necessary. Conversely, the reputation of anthropologists among moral philosophers and religious ethicists as conceptual relativists who had not seriously considered the philosophical implications of their view of cultures limited the willingness of philosophers and religious ethicists to seriously engage the resources of anthropology.

While Laidlaw is certainly correct to note the lack of a connected history in both anthropology and philosophy, there are historical precedents – some as far back as the early twentieth century – in the social sciences, philosophy, and religious studies that anticipate and sometimes prefigure the kind of self-conscious application of ethnography to the study of ethics that has emerged across disciplines in the last thirty years. One striking early example of an ethnographic approach is the work of the anthropologist Bronislaw Malinowski, particularly his *Crime and Custom in Savage Society* (1926). Although the putative subject matter of Malinowski’s study is “primitive jurisprudence” in Melanesia, the particular method that he employs in studying the application of law and order among the Trobrianders reflects a “new line of anthropological field work,” or what he described as “the study by direct observation of the rules of custom as they function in actual life” (1926, 125). Malinowski suggests that the holistic understanding of the “cultural context of a primitive system of rules” may be as important, if not more so, than the mere “enumeration of rules” or the recital of a reductive *corpus juris*. By engaging in such methods of inquiry, the ethnographer brings into relief how “the commandments of law and custom are always organically connected. . . that they only exist in the chain of social transactions in which they are but a link” (1926, 125). Thus, the true problem is not simply how “human life submits to rules” but “how the rules become adapted for life” (1926, 127).

Malinowski’s study of Melanesian jurisprudence, though not explicitly concerned with ethics or morality *per se*, provides a template for how contemporary anthropologists, religious ethicists, and moral philosophers are attempting to employ the methods of ethnography to examine the ethical lives of moral actors and communities. In essence, Malinowski suggests that the goal of the ethnographer should be “to grasp the native’s point of view, his relation to life, to realize *his* vision of *his* world” (1922, 25). He notes that the ethnographer, if she is to actually grasp the native’s point of view, cannot be solely concerned with the official documents of the community nor the canons of its normative traditions but with what he called the “*imponderabilia* of actual life,” or “such things as the routine of a man’s working day, the details of his care of the body. . .” (1922, 18). According to Malinowski, it is through the study of such *imponderabilia* that we can begin to appreciate the ways in which normative concepts and principles get woven into the fabric of the moral life.

The work of Richard Brandt (1954) and John Ladd (1957), the former on Hopi ethics and the latter on Navajo ethics, represent early attempts on the part of moral philosophers to engage in ethnographic

fieldwork to examine particular moral communities. Their excursions into ethnography were animated in some measure by a frustration that anthropologists had largely ignored ethical questions or had not answered those questions in ways suitable for a philosophical audience. Although both works are limited in terms of their ethnographic sophistication – indeed, Brandt and Ladd readily acknowledged their lack of linguistic competence (both worked primarily through interpreters) and brief exposure to their host communities – they suggest how ethnography can be employed by ethicists in the service of normative reflection and anticipate later, more fully realized studies.

Unlike earlier anthropologists who were only vaguely familiar with ethical theories in moral philosophy, Brandt and Ladd approached their fieldwork as students of ethics who were guided by certain theoretical questions appropriate to mid-century Anglo-American philosophy. Brandt employed such techniques as asking various informants to evaluate the ethical propriety of assorted actions (e.g. gambling, adultery), the desirability of certain normative goals, and how certain stories could be explained in terms of their moral lexicons. By engaging in such techniques, Brandt hoped to arrive at psychological explanations of Hopi norms that would provide a fuller picture of the fine structure of the Hopi value system, a system that he ultimately believed was largely premised on the principles of utility and reward.

Building on Brandt's research, Ladd ambitiously set out to provide a general theory of descriptive ethics that could be applied to diverse cultural contexts. Like Brandt, Ladd engages in his own fieldwork among the Navajo, though unlike Brandt Ladd understands his own work as self-consciously assuming the ethnographic stance insofar as he aims to present the Navajo ethical system as it appears to the "Navaho moralist informant." Although the work of Brandt and Ladd possesses certain shortcomings in regard to the integration of ethnography and ethical analysis, these studies represent an important departure from analytic moral philosophy in expanding the methodological imagination of the ethicist to consider new forms of data for analysis and to seriously reflect on the ethical dimensions of the human condition in different cultural contexts.

We can discern the influence of Brandt and Ladd in the field of CRE when it first emerges as a focused academic subject in the 1970s, most notably in the work of David Little and Sumner Twiss. In *Comparative Religious Ethics* (1978, ix) Little and Twiss self-consciously align their "new method" with the "social scientific tradition" of Weber as well as the work of anthropologists like Malinowski in highlighting the "processes of practical reasoning in different cultural settings." They explicitly adapted Ladd's descriptive ethics to capture the justificatory patterns present in the normative traditions of early Christianity, the Navajo, and Theravada Buddhism. Although anthropological work clearly informs Little and Twiss's understanding of the moral life, it does so narrowly in regard to the ideal-typical structures of reasoning and the patterns of justification in the normative beliefs of each respective tradition.

Unlike Malinowski who drew on the imponderabilia of everyday life to compose a picture of the moral life in the round, Little and Twiss privilege the propositional content of norms and principles and largely ignore the "day-by-day operational beliefs of practitioners" (Little and Twiss, 252), not to mention the concrete practices and actions that constitute their lived realities. For Little and Twiss, the productive value of the ethnographic case material produced by anthropologists like Malinowski, at least in comparative contexts, is diminished by its "non-theoretical pragmatic holism" that supposedly only seeks to render intelligible the cultural worlds of its subjects. This critique of ethnography as limited in terms of its theoretical and analytical value for the study of religious ethics remains a concern in the field even as more ethnographic approaches to CRE have emerged.

The Ethnographic Turn

The “ethnographic turn” in contemporary ethics can be interpreted as the result of certain historical and institutional forces within the past fifty years in moral philosophy, anthropology, and religious ethics that have conspired to make this movement possible. We can appreciate the current maturation of ethnographic approaches in CRE most fully by contextualizing the intellectual pressures that led to its current revival across disciplines.

In modern moral philosophy, there has been a frustration on the part of critics over the abstract and highly theoretical nature of much ethical analysis and the seeming lack of recognition of the complexity of moral life. Elizabeth Anscombe (1958), Alasdair MacIntyre (1981), and Bernard Williams (1985) noted in different ways the poverty of modern moral philosophy, primarily in the forms of deontology and consequentialism, to speak to the richness of moral life, beyond the realm of moral reasons, in the emotional and social dimensions of human experience. What these critics suggested was that moral philosophy required a “dimension of social explanation” (Williams 1985, 131), a thicker description of human life, to provide a more complex picture of moral speech and action.

Bernard Williams describes such a dimension of social explanation in what he terms the “ethnographic stance,” or “the situation of an observer who has an imaginative understanding of a society’s ethical concepts and can understand its life from the inside, but does not share those concepts” (1986, 203–204). Having an imaginative understanding from the inside allows the sympathetic observer to “report, anticipate, and even take part in discussions of the use they make of their concept” (Williams 1985, 142), to understand the evaluative content of ethical concepts in ways beyond the reach of an external evaluator.

While modern moral philosophy suffered from being unable to provide an adequate account of the substance of ethical life, the historical impediment to the development of something like an anthropology of ethics or ethnography of ethics in the field of anthropology seems to have stemmed not so much from a general lack of exposure to moral phenomena or normative behavior among research subjects but from the dominance of approaches and theories within the field that tended to reduce the moral to some variety of the social good. Accordingly, anthropologists have tended to focus on questions of power, structure, and institutions even though ethnographers commonly report that their subjects are constantly speaking and acting in ways that involve the human good. Thus, unlike moral philosophers who have lacked the empirical data to pursue an ethnographic study of ethics, anthropologists have in some ways lacked the theoretical imagination to discern the moral contours of their research subjects and communities.

For comparative religious ethicists, the turn to ethnography and ethnographic methods was animated by a reaction against the more formalist and positivistic methodologies of earlier generations and the perceived elitism of textual studies centered on orthodox traditions. Beyond embracing a general methodological strategy of pragmatic holism, ethnographic approaches to CRE held the promise of dynamically capturing the lived realities of moral agents and communities. Religious ethicists would no longer be doing “veranda ethics,” writing and reflecting on ethics at a social remove from the subject matter, but instead observing and participating in the forms of moral life that had previously been ignored or only partially chronicled.

It was also thought that a greater focus on ethnographic methods and the retrieval of ethnographic data from fieldwork would diminish the dependence on textual sources that had for so long defined the discipline, even among holists who for the most part still relied heavily on sacred texts and their

commentaries. Exacerbating the problematic nature of the exclusive focus on textual studies in religious ethics was the fact that most of the energy in the field was directed at canonical works in orthodox traditions that tended to privilege the intellectual production of elites. Particularly for comparative religious ethicists, the opportunity to study non-Western moral communities through the vehicle of ethnography held the promise of breaking away from the perceived ethnocentrism and imperialism of Christian ethics and Western moral philosophy.

Beginning in the early 2000s, anthropologists and religious ethicists like Richard B. Miller (2003), Saba Mahmood (2005), and Anand Pandian (2009) initiated a rehabilitation of the study of ethics within anthropology and religious ethics not merely as a sub-discipline or one object among many objects of inquiry but as a central dimension of social analysis more generally. This acknowledgment of the centrality of ethics in all spheres of human life has led anthropologists and religious ethicists to take this fundamental insight and examine the particular manifestations of the ethical in the everyday speech and action of moral agents, especially those dimensions centered around practice and discipline, virtue and tradition, and agency and freedom. Although these competing approaches to ethnography and ethics draw on different theoretical and philosophical sources and reflect, to a certain extent, different methodological and disciplinary goals, they seem to share certain assumptions about moral inquiry.

First, in viewing ethics as an integral part of the human condition, ethnographers have privileged the everyday or ordinary rather than the discursive production of the elites or the formal theorizing of professional ethicists and philosophers. In other words, the ethical is to be found in the details of everyday life “from the bottom up” (to use Richard Miller’s phrase) in our habits and practices, in our mundane speech and insignificant utterances, rather than the explicit rules and principles of the normative tradition or the theoretical abstractions and sacred ideals of philosophers and religious founders.

Second, many recent works in the field have recognized the ethnographic utility of the concept of subjectivity or subject formation in addressing the complex location of the individual within a moral community. The study of subjectivity, particularly when it is documented in ethnographic detail, can reveal how human beings in their everyday speech and action reflectively negotiate their sense of agency and freedom within the sociocultural structures in which they are embedded.

Third, the recent work in the anthropology of ethics implicitly makes the argument for the essential comparative dimensions of ethnography. Assuming the ethnographic stance requires not only understanding the worldview and ethos of a moral community from the inside but also demands that the observer recognize that there are “alternatives to any such system” (Williams 1986, 204). Saba Mahmood’s work on the women’s mosque movement in Egypt illustrates just how ethnographic accounts can dramatize ethical variety in ways that challenge some of our deepest held convictions. In *The Politics of Piety* (2005, 5) Mahmood provides an ethnographic account of women pietists in Cairo as a way of “parochializing” the discourse of Western liberal feminism in regard to notions of subjectivity and moral agency. Mahmood argues that secular feminist liberalism lacks the conceptual resources to appreciate the “conceptions of self, moral agency, and politics that undergird the practices of this non-liberal movement.” Through framing “ethnographic vignettes” against key analytic concepts in liberal feminist thought, Mahmood is able to ask whether a new form of agency is possible in a social imaginary where women can be attached to “patriarchal forms of life” and not resist “the subordinating function of power” (2005, 154). For Mahmood, to do justice to the ethnographic stance challenges the ethnographer to be a witness to the richness of particular moral systems as well as the existence of the variety of moral worlds.

Finally, the ethnographic approach to ethics encourages self-reflection in ways that are often lost in traditional ethical theory or normative inquiry. In fact, some scholars like James Laidlaw have argued that ethnography itself can be considered a kind of ethical practice in the sense that it requires “*taking seriously* the forms of life we describe” (Laidlaw 2014, 46). Although in principle other forms of ethical reflection may be just as fruitful as ethnography in promoting the kind of reflexivity that Laidlaw describes, the wager is that in the ethnographic encounter itself the observer, if she is to be successful, will come to know the forms of life she is thickly describing in ways that reflexively challenge her own.

Current Challenges and Future Prospects

There is little doubt that the recent ethnographic work of anthropologists, religious ethicists, and moral philosophers has pushed the methodological boundaries of the study of ethics and contributed significantly to contemporary debates in moral philosophy, religious ethics, and anthropology, most notably in regard to notions of lived or ordinary ethics, subjectivity, and virtue and tradition. Having said that, there are questions and points of tension that need to be addressed if it is going to have the kind of impact envisioned by its leading advocates.

Toward the end of his career, the eminent anthropologist E. E. Evans-Pritchard supposedly had some misgivings over the methodological direction of anthropology. In particular, he worried that the discipline, haunted by a sense of insecurity about the adequacy of data and the propriety of inference and theory, was being transformed into a cult of fieldwork where you could putatively eliminate the gap between data and theory by *seeing* everything and *immersing* yourself completely into one’s cultural context (see Gellner 1981). John Kelsay makes a similar observation in regard to the use of ethnography in CRE, noting how over the last thirty years a number of “edifying discourses” have been produced that show great sensitivity to context and the stance of the interpreter but do little in terms of critical analysis or moving the theoretical debate forward (see Kelsay 2012). For Kelsay, the preoccupation with the ethnographic stance can lead some researchers to focus almost exclusively with communicating the ethnographic detail of their subjects and social locations rather than engaging in the critical work of analysis where the normative assumptions of the subjects *and* interpreter can be examined and perhaps even challenged. Such a poetics of the moral life can also marginalize the relevance of political and institutional questions in regard to the dynamics of power in the interpersonal and social contexts of the agent.

In a similar vein, while there has been a renaissance of ethnographic writing in comparative contexts, ranging from richly textured accounts of embodied ethical listening in Egypt (Hirschkind 2006), the ethics of the everyday in India (Das 2006), and the phenomenology of suffering in Micronesia (Throop 2010) among others, comparative ethicists seemingly lack a critical vocabulary or classificatory scheme for thinking through the theoretical consequences of competing ethnographies. Indeed, there does not seem to be a consensus about what case material should even be considered “ethical” or “moral” since most accounts tend to be hyper-particularistic or non-committal in regard to terminology.

Lastly, while ethnographers have extolled the virtues of ethnography in creating the conditions for greater self-reflexivity for the interpreter, the meaning of reflexivity needs to be articulated so that it does

not become an exercise in intellectual indulgence. Beyond merely reflecting about the forms of life under study vis-à-vis the worldview and ethos of the interpreter, the exercise of reflexivity must go further to actually questioning and challenging the ethical worldviews of the subjects and interpreter, to articulate and ultimately justify one's normative commitments. This further critical act would be the real meaning of taking different forms of life seriously as an ethical practice. The challenge, then, for ethnographic approaches is not just bringing into focus dimensions of human experience and conduct historically ignored by the discipline but critically engaging the "case material," theoretically and normatively, to truly sustain an empirical study of ethics.

CHAPTER 50

Pragmatism

Michael R. Slater

Pragmatism is an American philosophical movement that traces its origins to the writings of Charles S. Peirce (1839–1914) and William James (1844–1910). Along with John Dewey (1859–1952), these three philosophers are widely regarded as the major “classical” pragmatists, and virtually all later pragmatists have drawn inspiration from one or more of these seminal thinkers. Although the term is sometimes used in ways that suggest a single, cohesive philosophical outlook or set of views, it is difficult to specify exactly what it means to be a pragmatist, and there have been and remain significant philosophical differences between different versions of pragmatism. To give but a few examples, Peirce, James, and Dewey were all empiricists and verificationists, whereas many pragmatists today tend to downplay or reject these epistemological views. Peirce was a staunch realist who saw nominalism as a threat to both science and philosophy, while most later pragmatists have tended to defend various forms of nominalism; and James saw pragmatism (among other things) as a means of defending religious faith in a modern scientific age, in contrast to fellow pragmatists who have either had little interest in religion or seen it as incompatible with pragmatism. Despite these important differences, however, it is possible to identify some philosophical commitments that most pragmatists have tended to affirm. These include *fallibilism*, or the view that all (or at least most) of our beliefs are corrigible and incapable of being known with absolute certainty; *experimentalism*, or the view that the experimental methods of science can and should be applied to other domains such as philosophy, morality, and religion, with the aim of arriving at progressively better theories and practices; and, very broadly speaking, some version of *semantic pragmatism*, usually either in the form of views that take the meaning of words, sentences, and other signs to consist in the practical consequences or effects which follow from them, or in the form of views which understand meaning as determined by use (and by the norm-governed social practices in which language-use occurs).

Since pragmatism is primarily a philosophical movement, and also for reasons of space, this entry will focus mainly on the ideas of major philosophers in the pragmatist tradition, with special attention given to Peirce, James, and Dewey. And since pragmatism was but one aspect of the larger philosophies of these thinkers, it will also leave many other aspects of their philosophies out of account, such as Peirce’s semiotics and James’s radical empiricism. Given the purpose of this volume, however, it will briefly touch upon Peirce’s, James’s, and Dewey’s religious and ethical views, with the proviso that none of them can be straightforwardly described as a “religious ethicist.” Having examined their respective versions of

pragmatism, it will then briefly consider the “renaissance” of American pragmatism that began in the latter part of the twentieth century. For works that cover the history of pragmatism in greater detail, see Misak (2008 and 2013), and Talisse and Aikin (2011).

Peirce

Charles S. Peirce was the founder of pragmatism, and as will become clear, he conceived of the doctrine far more narrowly than most later pragmatists. Indeed, Peirce initially conceived of pragmatism simply as a theory of meaning inspired by the methods and assumptions of modern science, and in his famous 1878 essay “How to Make Our Ideas Clear” (Peirce 1992, 124–141) he argued that it gives us our best account of the meaning of unclear conceptions. There we find him arguing that what is “tangible and practical” is “the root of every real distinction of thought, no matter how subtle it may be; and there is no distinction of meaning so fine as to consist in anything but a possible difference of practice” (Peirce 1992, 131). Peirce goes on to formulate what he termed the “pragmatic maxim” as follows: “Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object” (Peirce 1992, 132). Although Peirce often stipulated that his pragmatism was strictly a theory of meaning and not a theory of truth, he perhaps unwittingly invited this connection by offering a pragmatic account of the meaning of terms like “reality” and “truth.” As he writes toward the end of the essay, “[The] opinion which is fated to be ultimately agreed to by all who investigate, is what we mean by the truth, and the object represented in this opinion is the real. That is the way I would explain reality” (Peirce 1992, 139).

Peirce eventually came to worry that his initial formulation of pragmatism was too nominalistic, a worry that was confirmed, in his view, by how his idea had been appropriated by self-described “humanist” pragmatists like F. C. S. Schiller, who regarded concepts simply as human tools for solving human problems. In order to keep his idea safe from such “kidnappers,” Peirce renamed it “pragmatism,” and increasingly stressed the realist philosophical assumptions behind his conception of pragmatism (although “ideal-realist” assumptions would be more accurate, as some scholars of pragmatism have observed). Under the terms of Peirce’s mature pragmatism, truth should be understood as “that to a belief in which belief would tend if it were to tend indefinitely toward absolute fixity” (Peirce 1998, 336), or variously, as the opinion that would “ultimately prevail if investigation were carried sufficiently far” (Peirce 1998, 457). This mature formulation of Peirce’s conception of truth is, by design, incompatible with the claim that truth is reducible to properties like utility or justification, as some pragmatists have held (or at least been accused of holding). But at the same time, it also appears to assume that truth is ultimately determined by the future outcome of investigation – a social practice that we and possibly other finite, sentient beings engage in – and not by reference to an objective reality that exists independently of our representations of it.

Peirce regarded ethics as one of the “three normative sciences,” along with aesthetics and logic; but he did relatively little work in this field, especially when compared to his extensive work in theoretical areas of philosophy such as logic, philosophy of language, epistemology, metaphysics, and the philosophy of science. Yet, as the work of contemporary philosophers like Karl-Otto Apel (1922–2017), Cheryl Misak (b. 1961), and Robert Talisse (b. 1970) shows, Peirce’s ideas can be creatively and fruitfully applied to a number of fundamental issues in ethics and political philosophy.

Finally, while Peirce did not write extensively on the subject of religion and had a notoriously dim view of theology, he nevertheless produced several highly original essays in the philosophy of religion, notably “Evolutionary Love” (Peirce 1992, 352–371) and “A Neglected Argument for the Reality of God” (Peirce 1998, 434–450), both of which provide insights into how his Christian faith informed his philosophy. The latter essay, in particular, reveals not only Peirce’s interest in traditional theological topics such as natural theology, but also brings together a number of important themes in his philosophy in highly creative ways, including his abductive approach to inquiry, his views on the fixation of belief (or how beliefs are formed), his categories of firstness, secondness, and thirdness, and his Galilean doctrine of the natural light, which maintains that our minds have been created in such a way that we can discover the truth about reality.

James

Although Peirce was the founder of pragmatism, it was William James who began the pragmatist movement in his 1898 essay “Philosophical Conceptions and Practical Results” (James 1977, 345–362). There, and more extensively in works like *Pragmatism* (1907) and *The Meaning of Truth* (1909), James developed his own distinctive and influential version of pragmatism that drew inspiration from Peirce’s ideas but took them in a new direction. Whereas Peirce conceived of pragmatism as a theory of meaning designed to help make philosophy more scientific, James conceived of it above all else as a metaphilosophical view, a “mediating way of thinking” or approach to philosophy that could be put to effective use in resolving a host of traditional philosophical problems, not only by professional philosophers but by everyday people as well. By applying the pragmatic method of examining the practical consequences that follow from accepting one philosophical view rather than another, James believed, we can show whether it makes a practical difference to anyone if one view rather than another were true (James 1977, 377). Although philosophers tend to be drawn to extreme positions in the name of intellectual consistency, James believed that what many of us want today is a philosophy that can combine a “tough-minded” commitment to the scientific method and a respect for empirical facts with a “tender-minded” commitment to human values and freedom, as well as a desire to connect with and find fulfillment in something greater than ourselves (James 1977, 362–376). Enter pragmatism, which “preserves a cordial relation with facts” but “neither begins nor ends by turning positive religious constructions out of doors – it treats them cordially as well” (James 1977, 376).

James’s pragmatism performs the above-mentioned balancing act by accepting the experimental empiricism of modern science without accepting the materialist metaphysics that is often wedded to it. If, James argues, we conceive of theories in general in the same way that they are conceived in modern science – namely, as “*instruments, not answers to enigmas, in which we can rest*” (James 1977, 380) – then the primary question becomes not whether our theories are absolute transcripts of reality, but rather whether they are useful instruments for achieving the particular aims that we have as inquirers. Theories of a religious or theological nature can be useful instruments, too, even if they serve a different function than scientific ones.

Another important and often misunderstood feature of James’s pragmatism is his pragmatic theory of truth. Considerable disagreement exists among scholars over how to understand James’s account of truth, but some of its general characteristics can be described in fairly straightforward terms. James accepted the traditional view that truth is a property of agreement or correspondence between things like beliefs and propositions on the one hand and reality on the other (James 1977, 429). But he also maintained

that this traditional conception of truth – the correspondence theory – is incomplete and practically useless without an account of what it *means* for a belief or proposition (or an idea, as James usually says) to “agree with” or “correspond to” reality. What the pragmatic theory of truth presents is an account of the meaning of truth, in which – at least for practical purposes – having an idea that agrees with reality means having an idea that we can *verify* through a process of inquiry (James 1977, 430). Such inquiries can be either theoretical in nature (as when we verify a scientific hypothesis through investigation, or when we confirm that we have the right answer to an equation by checking our math) or practical (as when we determine that a map is accurate when it successfully leads us to our destination). But in either case, *successfully doing something* is required for us to determine that our ideas are true; we cannot arrive at the truth in any other way. For practical purposes, then, truth should not be thought of as a transcendent, ready-made, and static property that obtains between ideas and their objects – which is a decidedly metaphysical view of the nature of truth, and one that is premised on the representationalist idea that true beliefs copy or mirror their objects. Rather, truth should be understood as something that is *made* through successful inquiry. A theory of truth of this sort raises many questions, including what sort of role reality plays in determining the truth of an idea (in addition to the role of human inquirers), and what sort of relationship obtains between having a true belief and having a useful one. James’s answers to these questions are not always consistent, but he often took pains to insist that his theory of truth was realistic as well as “humanistic,” and that an idea could not be true if it did not successfully lead us to its object or put us into successful working relations with reality (see, for example, James 1975, 104–119).

Unlike Peirce, James wrote extensively on the subject of religion, and in many cases we find that his religious and ethical views are deeply interwoven. Indeed, in works such as “The Moral Philosopher and the Moral Life” (James 1977, 610–629) and *The Varieties of Religious Experience* (James 1985) we find him arguing that although morality is autonomous from religion there are nevertheless certain moral goods that cannot be realized apart from religious faith. James’s religious and ethical writings have had relatively little direct impact on the field of religious ethics, however, perhaps due in part to the tradition-oriented nature of the field and the fact that James did not squarely stand within a religious tradition. Yet, the last decade has witnessed a growing scholarly interest in James’s religious, ethical, and political thought, and the time is ripe for a reassessment of his contributions to the fields of theology and religious studies. For two recent examples of this trend, see Bush (2017) and Slater (2009 and 2014).

Dewey

John Dewey’s mature philosophical views were deeply influenced by James’s, in particular James’s empirical psychology and pragmatism. Yet, Dewey began his philosophical career as a Hegelian, and in many respects his version of pragmatism (which he sometimes called “instrumentalism”) represents a synthesis of Hegelian and Jamesian ideas. Like James, Dewey thought that our minds are not merely passive but active in relation to the world; that concepts, beliefs, and theories are human instruments for dealing with human problems, and that they should be evaluated (and if needed modified) in light of how well they work as responses to those problems; and that the tasks and problems of philosophy need to be reformed in light of modern developments such as the rise of the scientific method and of modern democratic values and institutions. But like Hegel, Dewey also believed that we are fundamentally historical and social beings who exist in a dynamic relationship with the natural and social worlds of

which we are part, and that the various dualisms that we have inherited from our philosophical and religious forebears are problematic and need to be overcome.

Dewey's version of pragmatism – and, indeed, his philosophy in general – is based on the novel account of experience that he encountered in James's writings, and understanding this distinctive conception of experience is of crucial importance for understanding his major philosophical works, including *Experience and Nature* (1925), *The Quest for Certainty* (1929), and *Art as Experience* (1934). One of the clearest and most concise presentations of Dewey's pragmatism and conception of experience appears in his seminal 1920 essay "The Need for Recovery of Philosophy" (Dewey 1973, 58–97). Here we find Dewey rejecting the "orthodox" view of experience that has dominated the history of modern and contemporary philosophy, and arguing that experience, properly understood, is not primarily a matter of knowledge, but rather "an affair of the intercourse of a living being with its physical and social environment"; is not essentially subjective or private, but rather suggests about itself "a genuinely objective world which enters into the actions and sufferings of men and undergoes modifications through their responses"; is not restricted to the past or what has been "given," but is also experimental, an effort to change the given that is characterized by "projection," or reaching forward into an unknown future; is not discrete, but rather marked by connections and continuities; and is not opposed to thought or reason, but rather "full of inference" (Dewey 1973, 61). Experience, furthermore, always occurs in an environment, involves reference to activities that are either favorable or unfavorable to the organism that undergoes it, and is prospective, in the sense that it is connected with "activities whose import lies in their objective consequences – their bearing upon future experiences" (Dewey 1973, 68). What successful living for human beings requires is "reflective intelligence in the process of experience" (Dewey 1973, 69), or what Dewey elsewhere simply calls *intelligence*, a form of reflective, collaborative, and experimental inquiry in response to perplexing or problematic situations. The aim of intelligent inquiry is not to arrive at beliefs which correctly represent their objects, but rather, as Dewey writes in "The Development of American Pragmatism" (1931), to take account of "the way in which more effective and more profitable relations with these objects may be established in the future" (Dewey 1973, 54).

Another important feature of Dewey's pragmatism is his belief that our inherited traditions need to be modified or even rejected when they inhibit the solution of pressing problems or the growth of thought and human values. In the case of the Western philosophical tradition, what needs to be overcome are inherited philosophical assumptions and problems that inhibit our attempts to deal satisfactorily with what he called "the problems of men." Chief among these is the false assumption that experience is centered in a subject that lies outside the natural world, which gives rise to what Dewey calls "the spectator theory of knowledge" and a fruitless preoccupation with arriving at knowledge of Reality in general and of knowledge in general (Dewey 1973, 74–97). Indeed, Dewey's philosophy rejects a number of dualisms that have dominated the history of philosophy since Plato, including subject versus object, mind versus body (or mind versus matter), and theory versus practice, on the grounds that these distinctions are not merely false but pernicious in their effects. In the case of religious traditions, Dewey held that supernatural forms of religious belief and the practices and institutions associated with such beliefs have not only had the historic effect of depreciating natural social values, but have also inhibited human beings from fully realizing those values. What he proposed was not the elimination of religion per se, but rather the need to emancipate what he called "the religious function in experience" – its capacity to "lend deep and enduring support to the processes of living" – from its historic bondage to religion (Dewey 1934, 15). A fully naturalized and secularized "common faith" in

which individuals and communities can achieve a form of self-unification in the service of ideal ends, Dewey believed, could allow us to preserve and increase the historic goods of religious faith while also allowing us to dispense with supernatural beliefs (as well as practices and institutions connected to such beliefs) that are neither tenable nor desirable in the modern world.

Dewey wrote more extensively and systematically on the subject of ethics than any pragmatist before or after him. His major work on the subject, *Ethics* (1st ed. 1908, 2nd ed. 1932), co-authored with James Hayden Tufts (1862–1942), covers a wide range of topics including the history of morality in Western civilization, moral theory, the nature of moral reasoning, and issues in applied ethics such as political, economic, and business ethics. Dewey also discussed the nature of morality at great length in his other major works, notably *The Quest for Certainty* (1929), where he argues (among other things) for the need to integrate our beliefs about matters of fact with our beliefs about what is valuable, and that inherited moral values and practices have no intrinsic value per se, and only *become* valuable when they result from a successful and critical process of inquiry.

Dewey's reception by religious ethicists has been mixed, ranging from Reinhold Niebuhr's trenchant criticisms of his moral and political philosophy (in particular its profound optimism about human beings and their capacity for social improvement) to Jeffrey Stout's more recent Dewey-inspired synthesis of pragmatism, Hegelianism, and democratic values in works such as *Democracy and Tradition* (2004).

Neo-pragmatism

Pragmatism was the major current in American philosophy until the 1940s, when it began to be supplanted by new philosophical trends emerging from Britain and Europe. Beginning in the 1970s, however, a renewed interest in pragmatism emerged due to the work of influential philosophers such as Richard Rorty (1931–2007) and Hilary Putnam (1926–2016), both of whom traced many of their most important philosophical insights to James and Dewey. Rorty's version of pragmatism, developed in such works as *Philosophy and the Mirror of Nature* (1979) and *Philosophy and Social Hope* (1999), represented an attempt to combine certain strands of James's and Dewey's versions of pragmatism with the philosophical views of a number of later philosophers including Wittgenstein, Heidegger, Sellars, Davidson, and Derrida, and sought in its own way to carry on Dewey's aim of radically reconstructing philosophy. Putnam's version of pragmatism, in turn, sought to show the enduring relevance of James's and Dewey's thought, particularly with regard to perennial philosophical issues such as the relationship between mind and world, the nature of rationality, and the relationship between facts and values, while also seeking to correct certain mistaken views that he identified in James's, Dewey's, and especially Rorty's versions of pragmatism. More recently, novel anti-representationalist versions of pragmatism that build upon the work of Sellars, Davidson, and Rorty have been developed by two of Rorty's students, Robert Brandom (b. 1950) and Jeffrey Stout (b. 1950), and also by the Australian philosopher Huw Price (b. 1953)).

Stout, in particular, is noteworthy for having established the importance of pragmatism as an approach in the field of religious ethics, and his major works *Ethics after Babel* (1988) and *Democracy and Tradition* are arguably the most important works in ethics in the pragmatist tradition since Dewey. Some of the distinctive features of Stout's approach to religious ethics include its non-confessional character; the primacy of its philosophical commitments, including its commitment to anti-essentialism, anti-representationalism, and historicism; its acceptance of the fact of ethical pluralism; and its critical attention to and defense of the role of traditions in moral life.

CHAPTER 51

Cosmology

Frank E. Reynolds[†] and Jonathan W. Schofer

Introduction

Throughout history human beings have developed and deployed cosmologies representing their environment and their own place within it. Cosmologies generally depict temporal and spatial dynamics at the broadest scales: the full expanse of the universe, with a time span from creation to end or radical transformation. With the exception of those developed by modern science, most cosmologies have been explicitly religious. Some have given a prominent position to one or more divinities that transcend cosmic time and space. Some have affirmed the importance of sacred beings, forces, and/or processes that operate within the cosmic milieu itself. Some have done both. All of these distinctively religious cosmologies have focused attention on various connections between the structure and dynamics of cosmic realities on the one hand and the meaning and direction of human life on the other.

Religious cosmologies exhibit tremendous variations, not only in their contents but also in the modes through which they have been expressed, which may include myth, narratives, poetic expressions, and visual images (both two dimensional and three dimensional). In addition, cosmological insights have been conveyed, developed, and appropriated through ritual performance, divination, philosophical reflection, and other means.

The ways in which specific cosmologies have been correlated with ethical orientations are clearly a matter for empirical study. In each case there are at least three issues that need to be considered. First, virtually all established cosmologies set out background understandings of the world and human nature that provide contexts for ethical claims concerning social organization, communal activity, and individual character. Second, these cosmologies delineate various levels of reality (divine, natural, social, and individual) that condition norms for action and character, specifying their relative importance and modes of interaction. Third, most cosmologies have also included discussion of ethical attitudes and behavior, identifying unethical attitudes and activities and setting out sanctions that encourage ethical compliance.

This chapter examines three examples of the relations between cosmology and ethics in traditional religious contexts, each highlighting a particular issue: multiple cosmologies within a given tradition, the degree of order in a given cosmology, and practices of divination. In the final section we will consider the split that developed between cosmology and ethics during and after the European Enlightenment, and also the recent surge of interest in new ways of understanding the relationship between them.

[†]Deceased.

Overlapping Cosmologies, Overlapping Ethics

Many religious traditions affirm multiple cosmologies. Among these traditions there are a few in which overlapping cosmo-ethical orientations, taken together, reveal important aspects of religio-ethical structure and dynamics. In Christianity, for example, cosmo-ethical orientations preserved in the Hebrew Bible are maintained in creative relationships with related but quite different cosmo-ethical orientations associated with the life, death, and resurrection of Jesus Christ. A comparable but quite different example of this pattern is found in the Buddhist tradition in which an ethically oriented “samsaric” cosmology coexists with an ethically oriented “Buddhic” cosmos brought into being by the achievements and teachings of the Gautama Buddha. Though these two cosmo-ethical orientations coexist in most Buddhist communities, we will here focus attention on the Theravāda tradition that developed in Sri Lanka and Southeast Asia (see Reynolds 1985).

The samsaric cosmology of Theravāda teaching affirms that all phenomenal realities arise from the co-dependent interaction of a set of twelve different components (ignorance, dispositions, consciousness, name and form, the six gateways, contact, craving, grasping, becoming, birth, old age, and death). In the many individual world systems that come into being within this all-encompassing samsaric universe (particularly our own), human beings occupy a central position. They have the capacity, through meditation and various forms of moral action, to generate a great deal of happiness and pleasure while minimizing the extent of their pain and suffering in their present life and in their future lives as well. This samsaric ethic has several different dimensions. It includes an emphasis on the mitigation of vices and the cultivation of virtues. It includes a notion of karmic retribution for evil deeds and karmic reward for good deeds. It includes a sense of social responsibility that involves generally applicable rules of individual behavior, as well as specific responsibilities associated with particular social functions. It also includes an ethic of care that places great value on care for Buddhist teachings and institutions, as well as care for human persons and other sentient beings.

However, Theravādins have also affirmed the reality of another, closely correlated cosmology. It includes the samsaric cosmo-ethical order but also recognizes the availability of a higher level of religio-ethical practice. Ignorance is overcome by wisdom, craving is replaced by compassion, and the ongoing experience of impermanence and suffering gives way to liberation. Theravādins often characterize this higher level of ethical practice as the Noble Eightfold Path – a mode of religio-ethical activity that includes right view, right thought, right speech, right conduct, right effort, right mindfulness, and right meditation. Nibbana is the name for the final liberation that is achieved when the practice of the Noble Eightfold Path is perfected.

Within the Buddhist cosmology where its samsaric component and its distinctive soteriological component overlap, the relevant ethical tensions and continuities for individuals and for society are legion. For example, there are actions that are directed toward the proper acquisition of wealth and the proper exercise of political power that are positively valued in the context of samsaric ethics. Yet they are irrelevant, if not antithetical, to the life that is to lead as quickly as possible to the transcendence of samsaric limitations. Conversely, there are other aspects of samsaric ethics, the rooting out of vices and the cultivation of virtues, that are given particular salience because, in addition to their positive contribution to human flourishing within the samsaric process, they also serve as appropriate preparation for future entry into the Noble Path that culminates in liberation.

Some Theravāda practitioners take a more negative ethical approach that focuses on rooting out samsaric vices, the practice of a version of the Noble Path that emphasizes a radical form of ascetic withdrawal, and an interpretation of the goal of nibbana as cessation. A far larger group takes a much more positive approach that involves the cultivation of samsaric virtues, the practice of a version of the Noble Path that features more moderate forms of ascetic practice, and an understanding of nibbana as liberating fulfillment.

Despite (or perhaps because of) the complicated pattern of overlapping cosmologies with different but closely correlated ethical implications, this Theravāda approach has – over the centuries – proved to be remarkably flexible and resilient.

Cosmologies of Ethical Order

One very pervasive cosmological concern is setting out some form of order in the universe. This order can appear in a number of variations. One type, common in Indian and European religions, asserts that there exist homologies between the individual, the society, and the cosmos, and right action consists in maintaining and reinforcing those correspondences. A second type argues that a harmony between individuals, society, and cosmos can be earned, either through individual attunement with the cosmos (as in forms of Daoism) or through communal and ritual alignment (in forms of Confucianism). A third type of order, our focus in this context, concerns not structure but process. The cosmos is presented as being just, such that good actions bring good results and bad actions bring bad results. This kind of account is expressed through the concept of karma in Hinduism and Buddhism, and through images of divine justice in the Hebrew Bible and the religions that have emerged in relation to that corpus, including Judaism, Christianity, and Islam. Within and across these groupings there is of course a wide range of cosmological images and concepts, and a given religion or person may maintain more than one.

Accounts of cosmic justice assert human notions of good and bad, just and unjust, are somehow embedded in the nature of existence. The ethical order may be preserved by one or more deities or by impersonal forces, but a key feature is that human actions or character states generate consequences according to a normative assessment. From this relatively simple starting point, many variations and debates appear: the relative significance of actions and intentions, the possibilities for transfer of merit and culpability, whether or not an individual may receive the reward or punishment of a larger community, whether the consequences of an action appear during life or after death, and others.

We can focus on notions of justice in rabbinic Jewish literature, which classical or late ancient develop various cosmologies from the Hebrew Bible (see Knight 1985). In rabbinic accounts of divine justice or “reward and punishment,” cosmology and theology intertwine. In many cases rabbis present God as central to the maintenance of justice, at the center of a perfect heavenly judicial system that includes an honest judge along with witnesses and attorneys. Other passages present consequences as emerging from an action, without any specific mention of direct divine involvement. In such ethically charged cosmological contexts, human action does not consist of singular, discrete events, but rather each action brings results that come at some point in the future. One is placed in a constant state of anticipation, always looking ahead to the possible consequences of one’s actions. Such an anticipatory state can be maintained indefinitely, particularly when the ultimate consequences are deferred to an existence after death.

The consequence of a given action may have varying degrees of correspondence to the act itself. In some cases, rabbis assert that there exists an exact correspondence, such that the results match the act “measure for measure.” In other cases, God’s excess compassion and mercy can mean that punishment is suspended or annulled. A third possibility is when an apparently trivial sin brings great consequences. A rabbi may claim “malicious speech” is a greater transgression than the three paradigmatic sins of rabbinic culture (idolatry, incest, and murder), or that a moment of arrogance can bring death. Such hyperbolic claims exhort the reader or listener not to ignore the seemingly small aspects of religious and communal life. In these cases and others, scholars need to address the pedagogical and homiletic features of claims concerning the workings of the cosmos (Schofer 2005).

Cosmic order is a far from universal feature of religious ethics. Many cosmologies portray flawed or conflicting gods, or impersonal forces, shaping the world and impacting human life. One of the great distinguishing features of modernity, in fact, is the break with ideals of order (Nietzsche 1967; Foucault 1977). From these latter perspectives, notions of cosmic homologies, harmony, or justice may appear naive or problematic. However, with all their difficulties, cosmologies of ethical order represent a creative attempt to highlight human action as immensely significant, and to assert, despite great evidence to the contrary, that the world reinforces and upholds notions of what is right and wrong.

Cosmic Divination

When cosmology is prominent in ethical outlooks and practices, a key question emerges in situations of conflict and ambiguity: how can the cosmos be interpreted in order to find guidance? In many cultures, philosophical and casuistic modes of inquiry have become highly legitimated approaches for resolving such conflicts. However, in numerous religious frameworks, hermeneutic methods broadly characterized as “divination” have been (and remain today) crucial for deciding questions of ethical import.

Scholars have discussed the links between divination and ethics, characterizing divination as an attempt to align human action with divine intent, or a way of thought that interprets a given person’s situation and clarifies relationships with other individuals, the community, and cosmic powers (Turner 1975; Sullivan 1985; Grillo 1992). One can illustrate links between divination and ethical behavior through the case of the Quiché of Guatemala.

The act of consulting the universe through divination is on occasions modeled as an essential element in cosmogony itself. In the opening chapter of the great Mayan account of cosmogony, the Council Book or Popol Vuh, the gods strive to form human beings as creatures who can walk, work, talk, visit shrines, give offerings, and call upon their creators by name. After their first two attempts fail, they consult a divine elderly couple who are both “daykeepers,” versed in the skills of divination. This couple counts out the days according to the Mayan calendar, sets out lots of corn or coral seeds, and asks if the gods’ plans for creating humans will succeed. The reading is affirmative, and creation moves forward.

Today, Quiché divination centers on methods associated with the elderly divine couple of the cosmogonic myth. The full process is called “understanding” (*ch’òbonic*) and the subject matter may include any of a wide range of problems concerning right action. Some clearly concern ethical matters, such as whether one owes work or a favor to another person. Others are initially diagnostic (what is the cause of

a given illness) or concern decisions that may not be primarily ethical (whether or not to take a trip), though even in these cases, the conclusion of the divination may be ethically significant.

The process of understanding centers upon the diviner's experience of internal "lightning" (*coyopa*), a sensation that has been described as tingling, jumping, or twitching in the blood or muscles. This lightning is seen as similar to the sheet lightning that occurs over sacred lakes in the four directions of east, west, north, and south, and these lakes are invoked in given acts of divination. A diviner interprets the lightning through a complex system based on where it occurs in the body. Internal lightning at the front of the body indicates a present or future event, while that on the back indicates the past. Movement on the left side of the body concerns a female, while that on the right concerns a male. As a daykeeper, the diviner's expertise stems from knowing the Mayan calendar and the particular meanings and powers associated with each day. In the divining process the daykeeper counts out the days of the calendar, and when lightning occurs in the blood, the day that is counted becomes significant for the daykeeper's counsel. In addition, the daykeeper sorts lots that mirror the authority of the municipal hierarchy.

The cosmological symbolism of this divination is multi-layered. Spatially, the diviner's body is a microcosm of the natural world, drawing upon its powers. Temporally, cycles of time are invoked through the counting of days, and the movement from past to future is examined through the location of the internal lightning. The social world, moreover, is integrated into the process, whether through the lots representing the community, or through the place in the body where lightning appears (Tedlock 1992, 1993, 1996).

Cosmic divination is a process in which the diviner works at the intersection of her or his body and intuition, knowledge of the client and the case at hand, and rituals such as counting the days and the sorting of lots. Divination is an interpretive, homiletic practice of making cosmo-ethical orientations and particular objects or texts "speak" to a given situation in order to generate knowledge and guidance for action in practical real life situations (Smith 1982).

Developments in the Modern Context

For many contemporary thinkers this discussion of ethics as intertwined with cosmology may seem odd. Or, if not odd, at least seemingly unconnected to normative ethical reflection viable in an intellectual community influenced by the European Enlightenment. This section discusses the turn away from religiously oriented cosmologies that has characterized influential ethical approaches that have emerged in the Enlightenment and post-Enlightenment context. We will then go on to consider the work of one outstanding contemporary philosophical ethicist who has been a leading figure in *The Return to Cosmology* (Toulmin 1982).

The Rejection of Cosmology

There are at least two very powerful factors in Western European history that have contributed to the severing of the traditional bonds between cosmological understandings and ethical orientations. One factor has been the decline in the ethical legitimacy that the various European religions (and their teachings) have suffered, beginning with their involvement in the wars that tore the continent apart during the fifteenth and sixteenth centuries. A second factor has been the somewhat later

emergence and rise to prominence of a powerful and convincing scientific cosmology that is devoid of any intrinsic ethical significance.

In the face of these developments a number of Western thinkers in the seventeenth century began a search to find a new basis for philosophical reasoning that would not depend on accounts of the cosmos (Toulmin 1990). During the last four centuries the many influential ethicists who have participated in this Enlightenment project have focused their attention almost exclusively on interactions among human beings and have grounded their characterizations of ethical action in various forms of rational formalism and/or the exercise of practical reason. Though it is true that the presence of positively oriented cosmological thought and imagery has never been completely eclipsed, it has definitely been relegated to the periphery.

A more recent departure from traditional religious cosmologies and the ethical orientations associated with them came to the fore in the existentialist movement that flourished, particularly in France, during the middle decades of the twentieth century. Most existentialist thinkers did not reject the connection between cosmology and ethics. Quite to the contrary, they had a cosmological orientation of their own and affirmed an ethical orientation that was directly correlated with it. From the existentialist perspective the cosmological environment in which human beings are inextricably trapped, including both its natural dimensions and its social dimensions, was characterized by nastiness, meaninglessness, and absurdity. The ethical response that they called for, the only one that seems at all viable in the kind of cosmos that they experienced and portrayed, was an individual assertion of human freedom and defiance made with the full knowledge of its ultimate futility.

Within the past several decades there has been a remarkable resurgence of interest in cosmological orientations associated with very different kinds of ethical imperatives. These more recent cosmological orientations are distinguished by ways in which they set the stage for mutually beneficial interactions between human beings and the natural world in which they are situated. In some instances this interest is focused on the way in which human interactions with the natural world can provide an antidote to the spiritual and ethical malaise that characterizes so much of modern life. In other instances this interest is focused on the formulation of a new kind of environmental ethic designed to assist in the effort to stem the ever-rising tide of non-sustainable “development” that is wreaking havoc in the natural world on which human life depends. In many cases these two closely related foci of interest are addressed jointly by a single author.

A Return to Ethical Cosmology

The writings of the Czech philosopher Erazim Kohák provide a powerful example of a bifocal approach. In *The Embers and the Stars* (1984) Kohák sets forth a two-staged interpretation of the development of the spiritual and ethical malaise that pervades late modern experience. The first stage involves the formulation of what he calls “theoretical nature-constructs,” a process that he associates with the rise of the natural sciences. The second stage is characterized by the development of a world of technologically developed artifacts that embodies these theoretical constructs (the world of denatured, dehumanized, depersonalized experience that is so vividly depicted by existentialist authors).

In response to this situation Kohák evokes for his readers a cosmologically oriented philosophy of personalism that has, as its central component, the recovery of a moral sense of nature. The approach involves a phenomenological “bracketing” that suspends the impersonal world of theoretical constructs and technologically generated artifacts. This process of bracketing opens the way for the recovery of a

direct experience of the natural environment within which we live. The natural world that he claims to uncover through this strategy is a cosmos of personalized interactions within and between various levels of being that are ordered in ways that are rich with moral significance.

Kohák is not proposing to replace the modern scientific cosmology with the cosmoethical orientation. Rather, he advocates a dually structured cosmological understanding that has certain affinities with the paired cosmologies in the Theravāda Buddhist context (see above). In Kohák's case, the dual understanding encompasses a primary religio-ethical cosmology that can be discerned through a direct experiential interaction with the natural world. It also encompasses a secondary cosmology that is associated with the abstract constructs of the natural sciences and the world of technological artifacts that they have generated. Certain areas of overlap are envisioned between the two cosmologies as well as tensions between them. In the areas where there is overlap he affirms that the personalistic and moral orientation of the primary cosmology must take precedence over the highly useful but essentially amoral and impersonal orientation of the secondary cosmology.

In a postscript in which he identifies his own approach to ecological ethics, Kohák affirms the fundamental need "to think through and live through the whole philosophical question about the place of humans in the cosmos and in nature" (Kohák 2000, 161). This is required in order to evoke the sense of cosmic belonging that provides the experiential basis for an ethic of human frugality and environmental sensitivity. Though rejecting the notion that technologies can solve the ecological problems that we presently face, he does recognize that they have an important secondary contribution to make.

In addition to Erazim Kohák, there are many other ethicists, including many who work in the context of major religious traditions, who are now creatively involved in the effort to relate viable cosmological understandings with urgent ethical concerns. There is every reason to believe that this is a trend that will continue far into the future.

CHAPTER 52

Ritual

Francisca Cho

Ritual and Moral Action

In common parlance, the term “ritual” – both religious and secular – denotes a pattern of regularly performed or scripted behavior, usually in a ceremonial context. At first blush, rituals seem to have little to do with moral actions, if the latter are understood as deeds that are guided by principles that help people to negotiate their way through everyday life. A link between ritual action and moral action has been suggested, however, by historians of religion who see rituals as outward expressions or enactments of myths. Myths, in turn, are understood to be narrative accounts of a society’s most profound beliefs about the world – such as the way it came into existence, our personal roles in relation to it, and the ultimate destiny or purpose of existence in such a world. These beliefs, in turn, comprise the fundamental principles that help us to see what is moral. Moral acts can be expressed in specific ritual behaviors, such as the custom of widow burning (*sati*) in India, based on beliefs about the identity and duty of a wife in relation to her husband. Or they can be negotiated day to day based on the reasoning supplied by the mythological worldview. One might decide against an abortion, for example, based on the reasoning that all matters of life and death should be left to the will of a creator God.

This way of linking ritual to myth participates in a longstanding interpretive strategy that sees religion as primarily an intellectual activity. Myth, ritual, and even morality are outgrowths, in this view, of the human need to make sense of the world. Sense making, in turn, is a function of making propositions about the world that will allow us to act meaningfully and properly within it. In the recent history of ritual studies, however, scholars have become more interested in ritual as a qualitative experience in and of itself, rather than as the mere physical execution of an intellectual text. In this view, ritual is “pure activity,” completely meaningless with respect to intellectual propositions, but quite meaningful relative to itself. Ritual and ritual players may be sustained through time as a social institution or fact, but the viability of ritual is a matter of the sensual, aesthetic, psychological, and neurological satisfaction attained by the participants. Hence, rituals have no objectives external to themselves, such as making sense of the world or even building collective solidarity. Contrary to functionalist interpretations, ritual is its own aim and its own value (Staal 1979, 9).

The focus on ritual as an experience to be enjoyed rather than as a text to be read displays the influence of performance theory, which is the study of theater, and the work of sociologist Erving Goffman, who extends the concept of performance to social and cultural action. Victor Turner, for example, extends the

category of ritual from discrete ceremonial settings to larger social dramas in which historical tensions and ruptures are negotiated and social change is brought about. Contrary to the prior reading of ritual as socially conservative, always acting to preserve existing ideologies and world-views, Turner suggests ritual is a form of cultural performance that negotiates reality in an ongoing manner. This nexus between ritual performance and social innovation suggests a new way of tying together the categories of ritual action and moral action. The new link can be forged upon the basis of a qualitative experience rather than an intellectual operation. The focus on experience and performance allows one to encompass the possibility of social change and, more importantly, predicates such social evolution on the transformation of the individual. And to the degree that ritual action can be transformative of the individual, it is also a moral practice. It will help to examine specific historical expressions of these ideas.

The lack of precise linguistic equivalents to the terms “morality” or “ethics” in comparative religious traditions points out, of course, the cultural specificity of these words and their traditions of inquiry. More importantly, however, this problem of translation opens up an opportunity to enhance our moral investigations by forcing us to accept rough terminological equivalents from other cultures, with the result that new connotations and meanings of morality come into view. Hence, this chapter on the role of ritual in moral inquiry will draw upon the examples of Chinese religions – particularly the articulate and text-based traditions of Confucianism and Daoism. Although neither of these traditions has a history of discussions that parallel the Western discourse on morality, both of them, by virtue of their religious goals, are profoundly concerned with how people should behave. The goals of sagehood and unity with the *Dao* (“the Way”), respectively, may be described as forms of spiritual realization that are predicated on proper conduct within the social and natural spheres. This conduct is a matter of ritual action, which is expressed as forms of cultural and physical performance. And like the recent moves in ritual studies, performance is a matter of a qualitative experience that is self-referentially “holy” and which expresses a level of skillfulness that is a form of transformative and “great” knowledge (*dazhi*).

These Asian paths, to be sure, are embellished by their own mythologies and systems of meaning-making – they are, after all, highly literate traditions. This entry will draw upon their meaning systems in order to help the reader make sense of their practices. These texts, however, repeatedly aver that intellectual knowledge is inferior to the embodied knowledge of action – a point we would do well to keep in mind.

Ritual Action in Confucianism

The conflation of ritual and moral action is superlatively expressed in the Confucian concept of *li*, or “rites.” For the philosopher Confucius, the goal of sagehood, which entailed the rectification of one’s mind (*xin*), first presumed the mastery of formal social behavior, codified in the rites. The rites originally derived from the highly formalized court rituals of the Zhou dynasty (1046–221 BCE). In the hands of Confucius, however, the rites were centered on social behavior, and hence came to signify “propriety.” The specific rules of social interactions derived from the five major social relationships recognized by Confucianism, which are posed as reciprocal, though mostly hierarchical, relational pairs: ruler and minister, father and son, elder and younger brother, husband and wife, friend and friend (*Doctrine of the Mean* 20). These “universal ways” of Confucianism define a social and moral world. As a social-ethical system of thought, the emphasis on *li* evinces the belief that order and harmony depend on the ability of

every individual – especially the ruler – to play his social role to perfection. Role playing consists of action that is observable to all: “Look at the means a man employs, observe the path he takes and examine where he feels at home. In what way is a man’s true character hidden from view?” (Lau 1979, 64). Proper social performance was a matter of attaining an intuitive knowledge of the appropriate words and actions in every social situation. No act was exempt from this demand. As Confucius states:

Do not look unless it is in accordance with the rites; do not listen unless it is in accordance with the rites; do not speak unless it is in accordance with the rites; do not move unless it is in accordance with the rites. (Lau 1979, 112)

To be sure, Chinese history has demonstrated that the principle of the rites/propriety, with its attendant value of righteousness (*yi*), is perhaps more conducive to the rule of an oppressive social conformity than to the production of sages. In addition, given the hierarchical nature of most social relationships, the actual practice of Confucian moralism has tended to be expressed in the oppression of those on the low end of the power scale. The Confucian fixation on outer appearances as a reliable indicator of moral worth has also encouraged an ethos of “saving face” that values ceremonial behavior in its most pejorative, empty sense rather than sincere action. History demonstrates that it is easy to reduce Confucianism to formalism and political advantage. Such practice neglects the religious and cosmological sides of Confucius, which cherish ritual social action as a method of completing the individual and bringing her into harmony with society, as well as the natural world.

The religious ideal of sagehood is grounded in a cosmological view that unites human action to the larger natural environment. The Confucian “heaven” (*tian*) is an amalgamation of both nature and a moral consciousness that does not entail supernatural agency or will. Heaven is better described as the principle of synchronous activity so prevalent in Chinese correlative cosmology. The body politic, as well as the individual human body, are microcosms of the natural universe, and all three work in sympathy. As one text states, humans form a triad with heaven and earth. Individual cultivation leads to the cultivation of others, to the development of the nature of things, and ultimately to the nourishing of heaven and earth (*Doctrine of the Mean* 22). Socially prescribed action does not take society as its end; rather, it is the means by which individuals can actualize the Way (*Dao*) that ultimately unites all things. Ritual action is therefore more than an arbitrary set of rules and social customs. On the other hand, the value of ritual action does not lie in its enactment of metaphysical principles or truths, but rather in its very performance – in its qualitative experience that actualizes the ideal of becoming fully human.

The Confucian concept of humanity, or humanness (*ren*), is the linchpin of its moral system in that it is entirely focused on human interrelationships. The teaching can be reduced to “love your fellow men” (Lau 1979, 116), and an inverse rendition of the Golden Rule: “Do not impose on others what you yourself do not desire” (Lau 1979, 135). These familiar injunctions do not flow from an omnipotent lawgiver, or from rational principles. They articulate the fact that it is only in the course of social and familial interactions that one can experience the grace and fulsomeness of the *Dao*. Significantly, the rites include the meanings of “etiquette” and “refinement,” which are more matters of ritual norms than rational discernment. It is primarily by appropriating the external forms of culture that humans can attain the experience of graciousness. Social rules both define and create such harmony because without them, we do not know “where to put hand and foot” (Lau 1979, 118); we do not know what to say, or what to do, and as a result, others cannot know our meaning nor our intentions.

Ritual performance is a key element of peak religious states such as ecstasy, trance, and meditation. The quality of consciousness denoted by these states is usually induced by ritual contexts and practices. This connection between ritual performance and qualitative experience is also present in the secular arenas of theater and the kind of social performances specified by *li*. What ritual induces, ideally, is the reality of what is symbolized, so that “the invisible world referred to in ritual is made manifest and the subject placed within it” (Myerhoff 1990, 246). Such states, to be sure, cannot be scripted or willed, and may hinge on the triggering of certain neurological activity – an event more easily subject to direct physiological than social manipulation. More important, however, is the observation that ritual actions pack a punch precisely because they are embodied – literally performed by the body to create distinctive spaces and experiences, all within the moral course of human interaction. The terminology of “performance” indicates the priority of embodied action in determining the nature of our thinking as well as our emotions. The social choreography of the Confucian rites is certainly liable to affectation, but it nevertheless forms the necessary condition for the fusion of symbol and consciousness that paradoxically transforms choreography into sincere action.

Contrary to some cultural tendencies to separate the rational faculties from the “baser” instincts of the body, Chinese traditions might be described as practices of self-cultivation that view the body as foundational. The generalization can be sustained across disparate Chinese practices such as Confucianism and Daoism, in spite of their significant intellectual disagreements. Confucianism, as we have seen, is primarily enamored of the social body, with its emphasis on the proper enactment of hierarchical, rule-governed relationships. This social play, however, rests upon the cultivation of individual physical performance, with much emphasis on propriety of appearance, physical comportment, and speech. The rites go beyond a system of action guides and hold out the ideal of ritualizing every social interaction so that each encounter is fully moral and humanizing. Daoism, on the other hand, with its severe allergy to systems of rule-governed behavior, is pointedly critical of the rites but nevertheless in harmony with the Confucian focus on physical self-cultivation. Indeed, its textual references to “concentrating the breath in order to become supple like the babe” (Lau 1963, 66) and making the body like a “withered tree” and the mind like “dead ashes” (*Zhuangzi* ch. 2) attest to the cultivation practices broadly known as “inner alchemy” (*neidan*) that make up a large part of Daoist tradition. Perhaps more literally embodied than Confucian action, this vast system of exercise, breath control, meditation, sexual yoga, and dietary practices are rituals in the most specific sense. Concomitant with its rejection of the rites, Daoism turns to concrete physical forms of self-cultivation as a path to moral excellence.

Daoist Ritual Action

The reputation of Daoism, both in the eyes of its Confucian critics and in much of Western scholarship, is that it is an amoral (if not downright immoral) philosophy that laughs at social obligations and, indeed, at civilization itself in an anarchistic pursuit of individual freedom and spontaneity (*ziran*). Daoism turns the Confucian faith in social rituals upside down by envisioning a path of action that arises effortlessly (*wuwei*) when the mind has been released from conventional discriminations. Daoism has not been appreciated as a moral system because of a prevalent tendency, across cultures, to associate morality with value discriminations between “good” and “bad” that are encoded in specific rules of behavior. This emphasis on the discriminating mind as the basis of right action is evident in

contemporary Western concerns with moral reason (Cho 1998), as well as in the Confucian principle of the “rectification of names” (*zhengming*).

Daoist morality, on the other hand, challenges us to imagine right action in the space beyond value distinctions and certainties. This goal is anchored in the observation that values, in and of themselves, are never self-sustaining. Both aesthetic and moral distinctions are defined relative to each other in some particular social context, rather than signifying absolute properties. In modern terminology, we might say that perceptions of beauty and goodness are notoriously culture and time specific. Cultural conventions, however, develop an aura of absoluteness and weaken our ability to respond appropriately to evolving circumstances. “Therefore the sage keeps to the deed that consists in taking no action and practices the teaching that uses no words” (Lau 1963, 58). Besides expressing Daoism’s minimalist ethic, this passage counsels detachment from fixed moral conventions.

Daoism addresses the apparent contradiction of a morality outside the boundaries of fixed values and rules by exchanging social rituals for the rituals of self-cultivation. Perhaps even more pervasive than its reputation for amorality, Daoism is portrayed as a madcap, bohemian way of life that values individual freedom above all else. This picture obscures the centrality of inner alchemy practices that are governed by all of the disciplines and exactions of ritual. To be sure, there is nothing overtly other regarding, and hence morally inclined, about yogic disciplines and the pursuit of physical immortality. The current popularity in the West of Daoist practices such as *taijiquan* might be attributed to a highly self-regarding interest in health and fitness, in fact, and seems to betray a similar self-centeredness on the part of Daoist adepts. This conclusion is predicated, however, on the large assumption that physical and moral cultivation are strictly autonomous, or even mutually exclusive. Rational traditions that see the body as inimical to the superior functions of the mind may advocate a physical regimen designed to constrict bodily desires and gratification, but certainly not a system of cultivation that seeks to enhance physical energy and longevity. In *neidan* practice, in contrast, union with the *Dao* most immediately meant conforming the body to the larger patterns of the seasons so that physical life was fully enhanced:

The sages followed the laws [of nature] and therefore their bodies were free from strange diseases; they did not lose anything (which they had received by nature) and their spirit of life was never exhausted. (Veith 1972, 104)

Following the patterns of nature entailed conformity to very specific seasonal rules of living, expressing the belief that the body is essentially parallel to and an extension of the forces and energies found in nature:

Those who rebel against the basic rules of the universe sever their own roots and ruin their true selves. Yin and Yang, the two principles in nature, and the four seasons are the beginning and the end of everything and they are also the cause of life and death. (Veith 1972, 104)

Chinese correlative thinking is demonstrated in the Daoist conception of the body, with its four main arteries and twelve subsidiary vessels, which correspond with the four seasons and twelve months. The tremendously detailed elaboration of bodily organs, mapped to Yin and Yang energies, forms the basis of seasonal practices, diet, and medicine. Harmonizing one’s physical life to the cycling energies of nature brings good health and long life, but, most importantly, it also leads to the moral and spiritual perfection of sages:

Their spirit followed in harmony and obedience; everything was satisfactory to their wishes and they could achieve whatever they wished. Any kind of food was beautiful [to them]; and any kind of clothing was satisfactory. They felt happy under any condition. To them it did not matter whether a man held a high or a low position in life. These men can be called pure at heart. No kind of desire can tempt the eyes of those pure people and their mind cannot be misled by excessiveness and evil. (Veith 1972, 98)

To cultivate one's physical life, one must ritually integrate oneself with the macrocosmic patterns and movements that are the *Dao*. This discipline naturally results in the regulation of desires and the ability to find satisfaction in all things. Hence, physical, moral, and spiritual health are different facets of the same "way." More specifically, physical self-cultivation precedes mental cultivation in a direct cause and effect relationship. This principle is put into practice across various Asian traditions of spiritual training. The regulation of posture and breath in Indian yoga form the basis of mental cultivation, for example, and the Buddhist use of the arts (including martial arts) in East Asia uses physical discipline in the same way. Hence, in contrast to the assumption that the mind should rule over the body,

the tradition of Eastern self-cultivation places importance on entering the mind from the body or form. That is, it attempts to train the mind by training the body. Consequently, the mind is not simply consciousness, nor is it constant and unchangeable, but rather it is that which is *transformed* through training the body. (Yuasa 1993, 26)

Hence, the discriminating mind is not the basis of moral knowledge, but rather the obstacle that is overcome by physical training. The Daoist aim of effortless action is a prerogative of those who, after considerable discipline, can throw away the rules because they have gone beyond the need to rely on mental calculation and effort. The fact that these sages can be found among an indiscriminate variety of laborers and the leisured – a cook, a wheelwright, a hunchbacked cicada catcher, a ferryman, a woodworker, a swimmer, an illustrator (*Zhuangzi* chs. 3, 19) – suggests that all common activities, much like all human interactions for Confucius, can be the actual moments of, rather than simply the means to, self-transformation.

Ritual Action and Morality

Chinese traditions move religious ethics significantly beyond the view of ritual as action that is made meaningful only by virtue of an interpretive reading. Confucian and Daoist rituals may be aligned with cosmological maps, to be sure, but their *doing* is an intrinsic value, one which instantiates the *Dao* rather than merely referring to it. In Confucianism, ritual actions are performed within the social body, and morality is expressed in the full attainment of humanness in interaction with others. In Daoism, ritual actions are performed within the physical body, and morality is expressed in the full cultivation of the self that eliminates all injury to self and others. As ritual actions, both paths give priority to the body, and, by extension, to physical performance.

Performances are not just the stuff of formal theater or ceremonial event, but are also the making of meaning and identity in everyday public as well as private life. In this respect, the moral person may also

be seen as a performer, not in the sense of one who “puts on” an act, but of one who attains morality in the moment of action. Action is the primary context in which moral consciousness and experience materialize:

Cultures are most fully expressed in and made conscious of themselves in their ritual and theatrical performances. A performance is a dialectic of “flow,” that is, spontaneous movement in which action and awareness are one, and “reflexivity,” in which the central meanings, values, and goals of a culture are seen “in action,” as they shape and explain behavior. (Schechner and Appel 1990, 1)

The absence of a direct linguistic equivalent to “morality” in traditional Chinese thought has led us to look at other terms with family resemblances. Confucian *li* and *ren*, and Daoist *neidan* practice, which seek to “nurture life” (*yangsheng*), all point us in the direction of ritual action. Their compatibility with the explanations of performance theory creates a marriage between the Asian tradition and contemporary scholarship, both of which encourage us to push back the boundaries of moral discourse. Specifically, we are encouraged to see the links between morality and aesthetics by paying attention to the phenomenological qualities of the former. Confucian benevolence and Daoist “great knowledge” (*dazhi*) and daemonic skill (*shen*) bear a great resemblance to the “flow,” “concentration,” and “presence” attained in performance, and inspire us to imagine morality as a similar quality, or aesthetic, of experience.

CHAPTER 53

Saints and Exemplars

Lamin Sanneh[†]

Saints and moral exemplars are an important subject in religious traditions, for they define and demonstrate the hopes, desires, practices, and moral ideals of their community. The lives of these persons provide inspiration and guidance, typically providing devotees with help on complex moral demands and personal struggles. This entry expounds the subject of saints and exemplars with detailed attention to the Muslim tradition and its encounter with indigenous African ideas. Every tradition, it is true, has its own saints and moral exemplars, but it is hoped that attention here to the particular examples in one tradition may provide more general insight into the importance of saints and moral exemplars in religious ethics broadly conceived. The cases discussed in this entry may be viewed as exemplary of the larger theme.

A substantive distinction is drawn in the Muslim tradition between “saintship” (*wilāya*) and “sainthood” (*walāya*). Saintship concerns the organization and expression of saintly power, while sainthood relates to the personality of the saint and the dynamics of personal saintly power. Saintship is bequeathed and perpetuated in an organized fashion, whereas sainthood is acquired by individuals. Sainthood is personal charisma, while saintship is institutional charisma. Both concepts are related to the idea of *baraka* (“favor,” “grace,” “virtue”).

The common Arabic word for saint is *walī*, strictly speaking a friend or patron. It occurs numerous times in the Qur’an with this meaning, often with God being the friend or patron (Qur’an 2:258; 3:61; 6:51, 69; 17:111; 41:34; 42:7, 27; 45:18; 2:101, 114; 9:75, 117; 13:37; 18:25; 29:21; 32:3; 42:6, 30, 42; 4:77, 122, 173; 6:14; 18:16; 33:17, etc.). The Qur’an’s major stress is on God as the only *walī* worthy of trust and dependence (*tawakkul*) (Qur’an 7:2, 11:22, 115; 13:17; 17:99; 18:48, 102; 25:19; 29:49; 39:4; 42:4, 7, 45; 45:9; 60:1). A special place is also reserved for those whom God regards as his friends (*awliyā’*) (Qur’an 3:27; 4:91, 138, 143; 5:56, 62, 84; 7:28; 9:23; 10:63; 60:9). A further step is taken when a forensic meaning is applied to the term and human patrons are given a status in contract law such that they may act as deputies for their clients (Qur’an 2:282).

There is Qur’anic justification for the claim made by and about many of the saints of Islam that God may enter into a relationship of special intimacy with his creatures, so that they hold the status of “friendship” or “nearness in favor” to God. They are close to him: “near ones” (*al-muqarrabūn*), who will receive the superlative reward of Paradise (Qur’an 61:11; 83:21, 28). The word for “near ones” is from the same root (q.r.b.) that is at the base of the standard terms for a relative or kin (*qurbā*). Making up for the abolition of natural kinship in Islam (Levy 1969, 55–56; Qur’an 49:13; Baydāwī 1848, 276), the Qur’an

[†]Deceased.

assures believers that God will provide for them a next-of-kin, and the word used is the same as that for nearness (Qur'an 19:5). Perhaps the most striking image of God's closeness to human beings occurs in this trenchant verse:

We indeed created man, and We know
what his soul whispers within him,
and We are nearer to him [*aqrabu ilayhi*] than the
jugular vein. (Qur'an 50:15; Arberry 1967, 234)

Súfis interpret "nearness to God" as a life marked by prayer and supererogatory devotion. The "saint" is one who leads a life of religious devotion, keeping close to God in prayer, praise, supplication, and attentiveness, and to the people in various acts of guidance, mediation, and intercession. When he or she becomes manifest to people after receiving the inner assurance of divine "friendship," the saint becomes worldly exemplar, although often the public manifestation of sainthood precedes confirmation of inner assurance.

The Holy and the Sacred

A word or two may be in order on general notions of the holy and sacred in African traditional religions. African notions of the holy and sacred are infused by a sense of danger and avoidance. The sacred is contagious, and it renders persons vulnerable to invasion by spirit forces, a contamination that can spread from contact. Muslim notions of the saint and sanctity are influenced by ideas of merit and reward at the hands of the elect. Ordinary people receive protection through the mediation of saints and exemplars. Holy men and holy women, accordingly, have their social function defined for them as brokers of popular religion.

North African Impulses

In contrast to the tradition of Christian saints, saintly virtue in Muslim Africa was typically cultivated with a worldly end in view rather than as solitary retreat. For example, in the military redoubts of Northwest Africa saints emerged committed to defying the world with sacred word and consecrated sword. Ascetic practice (*zuhd*) developed alongside the study of law (*fiqh*), and together they helped sharpen the instruments of armed struggle (*jihād*). The religious recluse occupied their time with studying juridical sources, often with an eye to reforming society and local practice. The exemplary religious life made little distinction between worldly means and spiritual ends. One writer observes that whereas elsewhere in the Muslim world the ascetics (*zuhhād*) who abandoned all worldly contact were pitted against the jurists (*fuqahā*) who were immersed in worldly affairs, in North Africa they made common cause, and many religious figures combined the two functions.

In Ifriqiya, *fuqahā*' became *zuhhād* without ceasing the study of *fiqh*, or cutting off relations with the *fuqahā*' who demonstrated no interest in asceticism. As *zuhhād*, however, they did not become detached from the world, and they remained in constant communication with the people. They

were guardians of the common people's interests, and challenged the rulers to show regard for these considerations. They were admired by the people for their piety, devotion, and independence with respect to rulers. They were not marginal to the mainstream of Islam in Ifriqiya, but rather its core. They were the true leaders of the people (Levtzion 1979, 80)

Through jurisprudence and asceticism the *jihād* tradition was strengthened, and holy personages carried their call into the citadels of power. In the numerous eruptions of reform and renewal the saintly ideal – that is, the exemplary force of the holy and learned figure – was the ideological trigger and guide for action. Struggle against the flesh (*nafs*) was matched by struggle against the unbelieving world (*dunya*), a double role that qualified the saint for political and spiritual leadership at the same time.

An example was 'Abd Allāh ibn Yasīn (d. 1059), who in 1040 CE launched the religious revolution in North Africa that led to the creation of the Almoravid empire. Ibn Yasīn was a commanding, ascetic figure. He was rewarded with miracles as God's recognition of his saintly stature. The seal of *baraka*, of efficacious virtue, came to be attached to his person, and after his death he became a transmitter of blessings for people who came to his tomb seeking rescue from various pains and obstacles in ordinary life. The Arab chronicler al-Bakrī, writing in 1068 CE, recounts how a cult grew up around the tomb of Ibn Yasīn:

On his tomb stands today a mausoleum, which is well frequented, and a hospice [*ribāṭ*] always full of people ... Even now a group of them [the Almoravids] would choose to lead them in prayer only a man who prayed behind 'Abd Allāh, even though a more meritorious and more pious person, who had never prayed under the guidance of 'Abd Allāh, was among them. (Al-Bakrī 1913, 168; Hopkins and Levtzion 1981, 74)

Yet Al-Bakrī was scornful of Ibn Yasīn and his followers, scrutinizing the man's heritage with the unsparing eye of a rigorist. Along with the scholars ('*ulamā*'), al-Bakrī held the saintly heritage (*wilāya*) in Islam, defined as a synthesis of *zuhd* and *fiqh*, of renunciation and the code, to be in excess of accepted guidance. Yet the saints (*awliyā*) have been the real architects of the changes that the '*ulamā* idealized in doctrine; they gave practical expression to the aims of the code.

The successors of the Almoravids failed the challenge of living in the world and against it at the same time. These were the Almohads, whose leader, Ibn Tumart (d. 1130), claimed the title of Mahdī, meaning Messiah, in 1127. Ibn Tumart sought to make a firm distinction between *fiqh* and *zuhd*, between religious legalism and free-wheeling experimentalism – a legalism that stressed the binding authority of received tradition, and an experimentalism that narrowed down to the individual and his cultivated insights, including direct access to truth. In that cleavage he asserted his own towering authority, burdened by few scruples and buoyed by the single idea of a victorious monotheism. For Ibn Tumart, too, worldly reward was a natural appurtenance of religious virtue. (For a brief but authoritative account of Ibn Tumart, see Macdonald 1965.)

The Almoravid movement and its Almohad sequel together combined to transmit an enduring element of devotion to jurisprudential sources (*uṣūl al-fiqh*) into the stream of religious life and practice, with an impact on Muslims of sub-Saharan Africa. By that channel, *fiqh* and *zuhd* arrived in sub-Saharan Africa.

Cenobitic Overtures in West African Islam

The Almohad empire eventually collapsed, in Spain first (1235) and then in North Africa (1269), although Hafsid rule in Tunisia continued the Almohad line. The religiopolitical unity of North Africa virtually ceased after the Almohads; the only carryover was the tradition of saintship, which continued unabated. The Sūfī orders, inspired by Qādirī devotional materials and by interest in *fiqh* and *tafsīr* (exegesis), grew in power and influence. The Qādirī order, founded after the twelfth-century scholar and mystic ‘Abd al Qādir al-Jīlānī, was transmitted widely in many parts of the Muslim world, spawning a number of smaller orders that developed their own autonomous rules. One such order was the Shādīlīyah, founded after Abū’l-Ḥasan al-Shādhilī (1196–1258), although it was his disciple, Ibn At’a’Allāh (ca. 1250–ca. 1310), who established and popularized the order in the Maghrib. It had its base in Fez, and in the eighteenth century it was taken from there to sub-Saharan Africa by a returning student.

We only have fragmentary knowledge of the Shādīlīyah in West Africa. Bits and pieces of information, picked up from a disparate spread of sources, are strung together in many accounts without a central figure or idea. The man responsible for introducing the Shādīlīyah to West Africa was ‘Alī al-Sūfī, described in the sources as “the apostle of Shādhilism” in his part of Africa. He received the *wird*, the office of initiation, from a Moroccan spiritual director (*murshid*) in Fez and subsequently brought it in the eighteenth century to the plateau area of Futa Jallon in Guinea. His litanies emphasized attachment to Fez as his spiritual birthplace, and his disciples went on to give it a veneration second in importance only to Mecca and Medina. A disciple of ‘Alī al-Sūfī, Modi Sellu (1760–1813), the political head (*alfa*) of the district of Labé in Futa Jallon, expanded Shādhilism in Labé.

Tcherno Isma’īla, a student of ‘Alī al-Sūfī, made the order a political success. At first he concentrated on broadening and deepening the spiritual resources of the movement, creating a religious center he called Diawia (*zāwiya*). Its focal point was the *missidi*, the word for “mosque” in the Fula language. The *missidi* was then replicated in numerous adjacent communities, resulting in a network of ideologically related centers. At the head of *missidi* was the *walī*, reassuring symbol of virtue and its reward, and under his authority the devotees bound and consecrated themselves in service. The *missidi* was the vanguard of virtue, and the *walī* the unique spiritual commissar who wafted over his motley amalgam of *refuseniks* the breath of felicity. Diawia, in Labé, became the prototype, and from there sympathizers ranged far and wide.

Diawia came under a cloud following the death of Tcherno Isma’īla, although Shādhilism continued to expand in other areas. With the accession of Tcherno Mamadou Sharif, the youngest son of Tcherno Isma’īla, however, the center underwent a revival. Shādhilism regained the initiative and the *diaroré* rites, for a while interrupted, were reintroduced on an organized basis. All the Labé country was now engulfed by the rites, and the flame of devotion spread from there to numerous important locations in the Fula country and beyond. One leader, Tcherno Jaw (d. 1865), chief of the district of Ndama in Labé, gave the rites a strong political basis by refashioning his subjects into the butt of military operations against adjacent non-Muslim populations. The attacks combined religious ardor with political boldness. Tcherno Jaw, at the head of such attacks, achieved an elevated status through it and was accordingly ascribed the title “*walī* of Ndama” – another worldly exemplar.

Tcherno Jaw’s initiative was inherited by his second son, Tcherno Ibrahima, whose influence extended far beyond Futa Jallon. The French, recognizing that fact, wooed him in a gambit to exploit his influence, but in 1899 the two sides collided over a conflict of interest. French involvement compounded an incendiary urge that Shādhilism had exploited so successfully in an earlier era, and gave local grievances a new external focus.

The man whose career brought matters to a head was Tchernō Aliou (ca. 1828–1912) – frail, lame, and partly blind, but so considerable a force in the area that he was given the title *walī* of Goumba, whose *baraka* transfused the whole region. His retreat center at Goumba, situated on the lower escarpment of the Futa Jallon plateau, was perceived as a challenge to the French, who responded by according him the treasonable status of Mahdī – Messiah. The French soon controlled the area and captured the centers of Shādhilī influence. Shādhilism had reached a watershed in Muslim West Africa, and the saintly virtue that propelled it, for so long a force to be reckoned with in the rarefied political atmosphere of the plateau, was driven to the low ground of accommodation with the French colonial authorities.

The history of Shādhilism shows there were real and enduring links between West African and North African Islam. The synthesis of law and devotion and of involvement and retreat had assumed a firm basis in West Africa as well. In neither area did the *awliyāʾ* avoid controversy. On the contrary, they often became the public focus of social and political unrest, and, by their own claims, the channels and instruments of divine sanction. They perceived no dichotomy between the word of God and the world of politics, and showed little hesitation in looking to crowds to take command of events. For them, saintly virtue had a robust, worldly face to it; they viewed worldly success as the proof and validation of personal virtue. In their minds, faith and works, form and content, dogma and practice, harmonized naturally.

Virtue and Spells

It is instructive to set this understanding of the saint alongside indigenous African conceptions. Unlike his counterpart in the indigenous culture who specializes in spells, incantations, and other forms of divinatory control, the *walī* is distinguished by *baraka*, understood as social capital rather than as spirit power that one fears and, thus, one has to avoid. *Baraka*, for this reason, can be institutionalized and organized with public following and support, centered in the *walī* and ratified in his devotees. The structural and social dimension of saintly power is integral to the Muslim tradition: sainthood – individual charisma – is buttressed by sainthood, a historically transmitted line of personal succession. In traditional divination, *baraka* existed as potent power that could harm the uninitiated. The code regulating it emphasized avoidance and the negative results of breaches. In effect, *baraka* in traditional Africa was a magical force possessed by unusual individuals who developed a specialized art for it. In such circles the magician is answerable primarily to his or her art, not to any public or popular accreditation. Thus, if the evil eye is potent enough to accomplish its objective, then it does its work irrespective of whether or not the harm being inflicted is ethically justified. Magicians are vindicated by the intrinsic potency of their art, not by public social approbation. This tradition is quite different from the Muslim notion of *baraka*, or at least from the Islamic transformation of the notion, which implies both personal virtue (the saint is “the blessed person,” *al-mubārak*) and efficacious power. The ultimate source of *baraka* is God, not magical power.

Sainthood and Saint Veneration: The Mourides of Senegal

The founder of the Mouride (Arb. *muṭīd*, “disciple”) brotherhood of Senegal was Shaykh Amadou Bamba (ca. 1852–1927), a man deeply influenced by the interior devotion of the Tījānī order of Sūfīs, although his own roots lay in Qādirī soil (Dumont 1975, 71–72). Over the course of time, his Mouride

brotherhood outpaced its counterparts in vigorously cultivating the unthinking obeisance of rank-and-file neophytes, called by the Mourides themselves *tālibés* (Arb. *ṭullāb*, sing. *ṭālib*). Wrapping themselves in the mantle of *baraka*, the Mouride leaders' claim over the bodies of their disciples came to be complete and total, so much so that, after a point, religious instruction, with its accompanying initiation into grades of spiritual enlightenment, was almost entirely missing in the otherwise close relationship between the postulant and his spiritual axis. Instead, the shaykh mounted the disciples like cavalry, driving them into virgin fields of submission and physical labor on the peanut plantations of the brotherhood, a cash-crop enterprise conducted for the exclusive benefit of the *shuyūkh*. At its extreme form this submission may in fact, if not in theory, substitute for submission to God, with *baraka* investing the *shuyūkh* with a semi-divine status.

The manifestation of this kind of enthusiastic *baraka* over crowds of illiterates brought the Mourides to the hostile attention of the French colonial power. Paul Marty, whose acute analysis of the Mourides remains a classic, describes the extraordinary appeal of Amadou Bamba. Describing what he saw in 1913, Marty wrote:

The mere sight of Amadou Bamba at prayer or giving his blessing with a stream of saliva on the prostrate faithful plunges some into hysterical outbursts which everyone wants to share. They roll at the feet of the saint, they kiss his sandals and the hem of his robe, they hold out their hands to him. With compunction he lets fall a stream of saliva on the open palms, which close up, clasp together, and spasmodically rub the face and body. Then there are shudderings, fainting fits, epileptic convulsions, followed by contortions and extraordinary leaps, all this accompanied by a horrible yelling. Madness finally takes hold of everyone. (Marty 1913, 52–3; cited in O'Brien 1971, 53)

The French took strong measures to curb Amadou Bamba's power, or what was perceived as his power. He and his followers were harassed. Having first installed themselves at the village of Mbake-Baol in the rural hinterland of Senegal, the shaykh and his followers moved to a new center he built at Touba, also in Senegal, in 1887. Since there was no abatement in the hostility of local commandants, Amadou Bamba and his disciples removed to St. Louis, then the capital of colonial Senegal, in 1891. But proximity to power merely served to inflame official sensibilities further, and the shaykh was apprehended by French troops. He was sentenced to imprisonment and exile in Gabon from 1895 to 1902 on charges of political subversion. His *baraka* guaranteed his popularity with the crowds. In turn, that cast him into a feared political figure in the eyes of the French. Furthermore, Amadou Bamba's association with the *Tijāniyā*, which was regarded in colonial circles as inherently subversive, established his culpability as needing no further proof. Amadou Bamba returned to Senegal in November 1902, but he was arrested again the following year and condemned to a fresh term of exile, this time in Mauritania, from 1903 to 1907.

The tenacity of *baraka* has roots in pre-Muslim society. The spontaneous and overwhelming nature of the response to Amadou Bamba as *séringe* (Wolof for holy man, saint) cannot, therefore, be explained solely on the grounds of strong Islamic influence. Most of his followers were ignorant of even the most basic tenets of the faith. For them, Amadou Bamba cut the figure of the familiar charismatic personality, which in the pre-Islamic era was designated as *borom bayré*, a Wolof phrase meaning the possessor of success and fame. The Muslim saint, when he appeared, was assimilated to this traditional African paradigm as both *borom bayré* and *borom barké*, a man of both worldly and spiritual achievement (Dumont 1975, 21–22).

This double level of understanding allowed Amadou Bamba's influence to grow among his disciples, who transmitted it to surrounding areas. In his own mind Bamba was a devout, humble Muslim, eager to behave and think in strict accordance with orthodox requirements. Indeed, when first approached by an overzealous disciple who saw in him the marks of greatness, Amadou Bamba rebuffed him as unsound, sending him packing with the advice that he put his mind to better and more useful pursuits (O'Brien 1971, 143). Even later in his career he forbade his disciples to render him obeisance that he deemed properly due to God (O'Brien 1971, 54). In his rules for novices he stressed submission to God above all else (Dumont 1975, 85), and in his prolific writings, the theme of obedience to God is persistent and unyielding. He spoke with sincerity about his unworthiness and expressed distress at evidence of his weakness. Praying to God, he said:

I desire your help in the midst of terror and vengeance. Today my heart is overburdened with sadness. My being is too weak to bear what I face. Forgive. My misfortune is plain, and my heart is anguished. (Dumont 1975, 123)

These words were spoken shortly before his first exile, an exile that was to resonate with the rising chorus of popular adulation.

Whatever his inner feelings of inadequacy, Amadou Bamba responded eagerly to the undeniable strength of his support among the peasant populations, and, reacting to the chaos around him, he tried to form order by moving in the direction of undisputed authority. In one of his devotional manuals he listed four qualities as necessary in the disciple: (1) a sincere and unshakable love for the shaykh, (2) unquestioning obedience to the commands of the shaykh, (3) abandonment of all opposition, including inward resistance, to the shaykh, and (4) the giving up of any preference for the disciple's own private thoughts (Dumont 1975, 88). Elsewhere, he wrote that he who does not have a shaykh for his training will come to grief, "for he who does not have a shaykh for his guide will have Satan for his shaykh" (Dumont 1975, 90). "Truth," he said, "consists in the love for one's shaykh" (Dumont 1975, 90). In another work Amadou Bamba says that the *wali* inherits the power of miracles from the Prophet to whom the *wali* is attached by a mystical chain of initiation (Dumont 1975, 95). "Saints," he wrote, "are the authentic signs of the Prophet's religion, and of his truth ... Saints are preserved from error and invested with honor" (Dumont 1975, 96). This point of devotion to the Prophet is stressed in the numerous details on performing the *dhikr*. At its height, the *dhikr* is nothing but the imitation of the Prophet, the Perfect Man (*insān al-kāmil*) or the true intercessor (*shafi'*, *mushaffa'*) (Dumont 1975, 112).

Recognizing that his disciples needed the iron hand of discipline more than the persuasive pen of the scholar, Amadou Bamba elevated physical labor to the status of a religious obligation. "Work," he contended, "is a part of true religion. The human body, since its creation, exists only to accomplish the work ordered by God" (Dumont 1975, 114). It would be unfair to blame Séringe Bamba entirely for the coarse bearing of his followers, for he was following where they led. Amar Sambe, a local Senegalese scholar, testified to the compelling interior impetus produced in the shaykh by his following when he recalled that in his youth, wandering, drunken *awliyā'* were a familiar sight; yet their followers remained undaunted. He writes:

When I was a child in Koranic school at Kébémér [Senegal], a marabout passed frequently in front of the school, staggering, held upright by his *talibés*. The *séringe* always had a foot in the vineyard

of the Lord. Despite this fact, his followers liked to maintain that their shaykh had so much *baraka* that strong liquor transformed itself into milk when it reached his stomach. (Sambe 1964, 185; cited in O'Brien 1971, 89)

Such marabouts were the early precursors of the confluence of pre-Islamic ideas on *baraka* with their Muslim analogues. Amadou Bamba was not nearly that idiosyncratic, mainly because by the time he arrived on the scene there had occurred a general elevation in the practice and understanding of Islam. However, as it stands, the anecdote suggests the wide margin of credulity available to the local *walī* if he wished to avail himself of it. The central importance of discipleship per se in Mouride practice is dramatized in the nature of its simple initiation ritual, which has supreme value for the Mouride *tālibé*. It is called *njebbel* in Wolof (Arb. *bay'a, talqīn*), meaning personal and physical surrender, and is the crux of Mouride life and philosophy. In the *njebbel* the neophyte declares to his master, "I surrender to you my body and soul. What you forbid, I refrain from, and what you command I obey" (O'Brien 1971, 85). That unadorned formula binds the disciple to the shaykh in a relationship that is, for all practical purposes, indissoluble, though in theory the disciple can repudiate the link in an extreme crisis (O'Brien 1971, 88). The neophyte is told by the shaykh to make unquestioning obedience his watchword. *Del deglu ndiggel*, he says: "You must hear words as commands" (O'Brien 1971, 85). *Baraka* became muscular piety.

Disciple and Exemplar

We need a broader perspective to understand the wider connections of Mouride extremism. Its counterpart in the wide spectrum of Sūfī spirituality is the call to physical renunciation, an arming of the soul with the weapons of struggle and vigilance against the lures of the carnal body. This, essentially, is *zuhd*, and it was powerfully preached in the Tijāniyā brotherhood, with which the Mourides had some affinity. There the devotee was urged to beat the carnal self

with the whip of the Book, bind it with the halter of reproach and judgment, set limits upon it with conscientious rebuke and reprimand, and place the saddle of firm intention upon it with the girth of determination. Then mount it with the profession of the holy law [Sharī'a] and ride it into the fields of Truth [*al-Ḥaqq*, a Sūfī term for God]. (Tcherno Bokar Salifu Taal (ca. 1883–1940), as quoted by Brenner 1984, 114)

Even for the seasoned adept the challenges of genuine spirituality demand superhuman resources. The Mouride instinct to have recourse to saintly intercession is fed from this reality. Unaided human effort is too bedeviled by uncertainty to guarantee success. Through the servile channel of farm labor the Mouride masters have taken individual responsibility out of the hands of ignorant crowds and offered instead the duty of collective subservience and the privilege of the blessed assurance they as leaders can give. *Baraka* is in the eye of the beholder, but especially in the face of the beholden one.

The power of the shaykh in the Mouride tradition is a function of the adulation of the disciples. As Mouride theology affirms, the *shuyūkh* occupy the ranks of honor (Arb. *maqām*) to which their followers' faith and enthusiasm carry them. It seems, therefore, that the cultivation of saintly eminence is but a shorthand for the cultivation of society. Today, despite a number of premature jeremiads, the Mourides number well over a million, and at the Grand Maqāl, their annual pilgrimage to Touba, up to

half the total membership may attend. One could scarcely ask for a more impressive demonstration of group and religious solidarity, of tangible expression of charisma, of what has been called the “versatility” of charisma. (See, for example, O’Brien 1971, who later revised his own position; see O’Brien 1977.)

Conclusion

“Sainthood” is personal charisma, and represents the social production of *barakah*. “Saintship,” on the other hand, is the structural expression of saintly power and influence. The two complement each other as when disciples, infused with the *barakah* of the saint, acknowledge their master as guide and exemplar. It is by virtue of assured popular adulation that the true mettle of *barakah* is proved. The Mouride case is an outstanding example, the extreme, wild point of a broad spectrum that includes at a different point the more sober Shādhilī *awliyā’* and other moral exemplars.

CHAPTER 54

Cosmogony and Eschatology

Markus Höfner

Introduction: Cosmogonies, Eschatologies, and Ethical Orientations

Ideas about the ultimate beginning of the world (*cosmogonies*) and visions of the ultimate telos and goal of worldly existence (*eschatologies*) shape human self-understandings and ethical orientations deeply. While “cosmogony” and “eschatology” are later (Western) terms, the content they refer to can be found early in human history, especially in religious traditions. Religious cosmogonies are typically universal in scope. They speak about the ultimate beginning of everything, and they frame the whole world, human and non-human life, in light of this origin. Religious eschatologies may also be universal, so envisaging the ultimate telos and goal of the cosmos, but are also focused on human life or a specific human community. Central to religious cosmogonies and eschatologies are questions regarding the relations between – and distinctions between – God or gods, on the one hand, and the created cosmos, on the other; the status and purpose of human life in relation to non-human existence; and the relative continuity or discontinuity between the ultimate origin and the ultimate telos or goal.

Cosmogonic and eschatological perspectives are not first articulated as theories, but presented in various myths, symbolic forms, and narratives, often embedded in rituals and thus related to specific religious communities. While cosmogonic myths and symbolic forms are nearly universal across religious traditions, eschatological imaginaries are especially accentuated by the prophets of early Israel. It is mainly due to the *Wirkungsgeschichte* (the history of reception and influence) of the Jewish prophets and the prophetic texts codified in the Hebrew Bible that the monotheistic world religions Judaism, Christianity, and Islam are all marked by the *connection* of cosmogonic and eschatological thoughts and images. This connection constitutes the most comprehensive framework within which the dynamic relation of God, individual and social human life, and non-human existence can be perceived and articulated. As such, the ultimate beginning and ultimate telos of this world can be – and traditionally are – understood as marking the end points of the linear timespan of world history within which the religiously conceived “salvation history” of God’s engagement with this world unfolds.

Though one can have reservations about using cosmogony and eschatology to construct a “story of all stories” (see Ricoeur 1985, 463), the *ethical* import of religious cosmogonies and eschatologies cannot be overstated. For the ethical orientation of human action is intrinsically linked to a *perception* of the nature and the possibilities of the cosmos, as well as of the human life in it. In religious traditions, this perception

is thoroughly shaped by cosmogonic and eschatological visions, and the way both are related. Such interconnections can be expressed implicitly in symbols, narratives, or myths, but it is in explicit theological reflections that they are articulated in a way that makes their ethical consequences visible.

A closer look at some exemplary theological positions will illustrate the varieties of interconnections possible and show how specific religious cosmogonies and eschatologies can sustain and motivate an ethics of goods (Augustine of Hippo), an ethics of hope (Jürgen Moltmann), or an ethics of responsibility (Muhammad Iqbal). It will then be shown how analyzing the interconnection between cosmogony and eschatology allows an articulation of the “deep grammar” of religious traditions. Finally, directions for further study will be indicated.

Varieties of Cosmogonies, Eschatologies, and Ethical Orientations

Augustine of Hippo: Creation, Eschatology, and an Ethics of Goods

Cosmogony is a central theme in the work of Augustine of Hippo (354–430), probably the most influential patristic author of Western Christianity. Augustine unfolds his cosmogonic thinking through various interpretations of the biblical creation stories found in the book of Genesis (e.g. Augustine 2012, 12, 2013, 11–14). Augustine thereby underlines the idea that, from a Christian perspective, cosmogony is *creation*: the coming into being of the cosmos through the free and sovereign decision of God – the God that Christians confess as the father of Jesus Christ and as the sole origin of life (*fons vitae*; Augustine 2012, 3, 16).

This account of cosmogony as creation is directed primarily against the dualist Manichaean worldview, with its sharp distinction between the (material) cosmos created by an evil power and (spiritual) redemption effected by a good God. It is against that backdrop that Augustine’s Christian cosmogony aims to defend the *goodness* of creation. All that God creates is good, and all good is created by God (Augustine 2005, 36); while all evil is to be understood as (just) a privation of this goodness (*privatio boni*; Augustine 2013, 11, 22). However, the goodness of creation is for Augustine a relative one and depends on God’s *ongoing* creative activity. For while God as the supreme being exists in *eternity* – understood as total presence – the cosmos is bound to the form of *time* in which being and nothingness (*nihil*) are intertwined (Augustine 2005, 35, 2012 11). And, it is marked by the destructive effects of human sin following the “fall,” the disobedience of Adam and Eve against God resulting in their expulsion from paradise (Augustine 2013, 13f.).

Understanding the cosmos as creation, Augustine holds, is essential for any Christian (and indeed, any human) *ethics*. This is because the cosmos as creation is structured as a hierarchical *order of goods* (or “things,” *ordo rerum*; Augustine 2010, 2) which can and should orient human moral action. This order ranges from lower goods (like material things) through medium goods (like reason and will), to the greater goods, namely the virtues like justice. The highest good, however, in Augustine’s view is not found within the cosmic order, but only in God (as the *summum bonum*; Augustine 2010, 2). Now for human moral action to occur, this order of goods must, in Augustine’s view, not only be recognized by the human intellect, but appropriated by the human *will*: The “objective” order of goods has to be matched by a “subjective” *order of love* (*ordo amoris*; see Augustine 2013, 15, 22).

The dynamics underlying this centerpiece of Augustinian ethics become fully visible only when his cosmogony is combined with *eschatology*. Augustine’s ethics of love refers back to the origin of the world and human life as it looks forward to their ultimate goal. And this goal, Augustine holds, is communion with God as the highest good and the everlasting peace and joy this communion grants (Augustine 2013, 19 and 22).

This ultimate telos becomes manifest already in the linear process of *history*, which in Augustine's view is centered in the salvific work of Jesus Christ. Jesus re-opens the possibility of communion with God by overcoming the guilt of human sin (Augustine 2012, 10, 2013, 18f.). Full and unchallenged communion with God, however, remains a strictly *future* reality, only to be expected *after* the end of history. In emphasizing that this eschatological communion with God fulfills the original intention in God's creation of human life, bringing the resurrection of human beings to a new, eschatological corporeality (Augustine 2012, 1, 1, 2013, 13, 23), Augustine highlights the continuity between his cosmogonic and eschatological visions. However, marks of discontinuity pervade his account. Augustine restricts the ultimate goal of communion with God to a distinct number of human beings confessing the Christian faith. The final divine judgment at the end of history will assign all other humans to eternal damnation, while non-human creation in total is set to be annihilated and replaced by another, new world in the eschaton (Augustine 2013, 20f.). Above all, Augustine modulates the eschatological transition as a passage from the flow of *time* – as an intrinsic mark of creation – to the total presence of *eternity* (Augustine 2012, 11, 11). The ultimate goal of this world thus lies *beyond* this world.

It is in this eschatological horizon that Augustine's ethics both highlights and relativizes the created order of goods, and the appropriation of that order in human love. Augustine emphasizes that the morally right order of love is only established when all love of earthly goods is embedded in, and regulated by, human love of God. As the highest good, God alone is to be “enjoyed” (*frui*), namely loved for his own sake, while all created goods are to be “used” (*uti*) as a means toward the ultimate goal of communion with God (Augustine 2013, 19). Thus, the ethical quality of both individual and social human life (e.g. in the state) depends on treating created goods as transitory cf. an eschatological future which leads beyond the conditions of creation.

Jürgen Moltmann: The Eschatological Transformation of the Created Cosmos and an Ethics of Hope

Christian theology in the West has often relegated eschatology to an appendix of Christian doctrine. German Protestant theologian Jürgen Moltmann (born 1926) is one of the most influential critics of this tendency, which he reverses, putting “last things” first in theological thinking. Eschatology, Moltmann holds, is the very condition of the possibility of Christian theology – and of Christian life (Moltmann 1993a, 15–36).

Moltmann promotes a Christian eschatology centered on the coming of God into this world – a future event, but one already operative in the present. Moltmann emphasizes that this coming of God is not to be thought of as the mere prolongation of present realities into the future (*futurum*), but must be understood as God's creative engagement with this world opening up new possibilities (*adventus*) (Moltmann 2004, 22–28). The history and person of Jesus Christ are at the center of this approach. The cross and resurrection of Christ, in Moltmann's interpretation, constitute a dialectical unity. On the one hand, both events are antagonistic, because the cross of Christ is the revelation and critique of godlessness in this world, of death and destruction; while his resurrection signifies the creative presence of God and the overcoming of death in a new life. Yet, on the other hand, it is the same Jesus Christ who suffers death on the cross and experiences the new life of the resurrection. Thus, in his person there is continuity amidst radical discontinuity. The new life of the resurrected Christ does not entail a replacement, but rather a *transformation* of his earthly existence. Now this transformative dynamic of Christ's resurrection does not only point back to the earthly life of Jesus, but entails the promise of the eschatological transformation of this world by the future coming of God. The resurrection of Christ is a new creation

(*nova creatio*) that inaugurates a process of eschatological transformation leading to full communion of God and creation (Moltmann 1993a, 165–229, 2004, 321–340).

On the basis of the particular history of Jesus Christ, then, Moltmann unfolds a Christian eschatology that is universal in scope. With respect to individual human life, Moltmann stresses that Christian hope is not limited to the immortality of a disembodied human “soul,” but rather awaits individual resurrection as a transformative event for the whole of human life (Moltmann 2004, 58–76). As individual human life in Moltmann’s view is always embedded in, and affected by, social relations; this individual hope for an “eternal life” in communion with God cannot be separated from the social and historical dimensions of the eschatological future, a future that is symbolized in the biblical notion of the “kingdom of God.” While warning against any kind of “historical millenarianism” which identifies this coming kingdom of God with a given historical, political or religious reality (e.g. the Christian Church), Moltmann does promote an “eschatological millenarianism.” The eschatological future inaugurated by the resurrection of Jesus Christ is already operative in present social and historical realities, which are thereby disclosed as being in need of (and open to) salvific transformation (Moltmann 2004, 192–194). This salvific transformation is not limited to a group of (Christian) believers, but directed toward the inclusion of *all* human beings into full communion with God and one another (Moltmann 2004, 235–255).

As such, Moltmann’s eschatological vision is not only inclusive of all humanity, but encompasses non-human creation as well. This inclusiveness shows how eschatology is interconnected with *cosmogony* in Moltmann’s thought. From a Christian perspective, the cosmos is discerned as God’s creation in the light of God’s self-revelation in Jesus Christ (Moltmann 1993b, 53–71). Contrary to anthropocentric concepts of this creation which tend to isolate human life from its non-human context, Moltmann underlines the interrelations between human and non-human creation in a universal “fellowship of creation” (Moltmann 1993b, 186f.). Given the embeddedness of human life in non-human “nature,” an eschatological future for human lives in Moltmann’s view is unthinkable without the “redemption” of the *whole* cosmos (Moltmann 2004, 257–319). This cosmic dimension of his eschatology highlights that not the substitution, but the salvific transformation of this world, is the ultimate future and goal inaugurated in the history of Jesus Christ.

In its individual, social, and cosmic dimensions, the eschatological process Moltmann envisages depends on *God’s* engagement with this world. But, this divine engagement calls for *human action* to witness, and to participate in, the work of God. The eschatological coming of God is thus inseparable from the human hope this future motivates. Consequently, a Christian “ethics of hope” will motivate critique of any given status quo that does not correspond to the coming of God and solidarity with a suffering world (Moltmann 1993a, 272–303). Above all, such an ethics of hope calls for human efforts to *transform* present realities so as to anticipate God’s eschatological transformation of this world (Moltmann 2012, 3–41).

Muhammad Iqbal: The Cosmic Process, Personal Immortality, and an Ethics of Responsibility

Cosmogony and eschatology are central themes in the thought of Muslim poet and philosopher Muhammad Iqbal (1877–1938). Their combination undergirds the ethical vision he seeks to promote in his attempt to reconstruct religious thought in Islam (see Iqbal 2013). Drawing on Islamic traditions, as well as Western philosophy and science alike, Iqbal developed a revisionist interpretation of Islam that seeks to highlight its compatibility with and importance for the modern world. Central to this endeavor is his notion of the Self (*Ego*) which, in his view, allows us to draw together into a comprehensive vision,

God, human beings, and non-human nature. This allows us to imagine how religious traditions – and especially Islam – can fuel and direct human ethical aspirations.

In his cosmogony, Iqbal presents the creation of the cosmos as the outcome of God's "creative will" (Iqbal 2013, 50). This creation, Iqbal holds, is not to be understood as an isolated event in time and space. Rather, the created cosmos is to be understood as a (partial) expression of the inner possibilities of, and *continuous* creative activity, of God as the supreme Ego (Iqbal 2013, 52). As such, the created cosmos itself is to be understood as an ensemble of Selves or Egos which express the creative energy of God to different degrees, ranging from material things, upwards to human beings as the climax of egohood in the cosmos (Iqbal 2013, 57f., 82–85).

This cosmogonic vision in Iqbal's view is consonant with the anti-classical orientation of the Qur'an, as well as with modern physics in overcoming the Aristotelian concept of a fixed and static cosmos (Iqbal 2013, 56, 110–113). Iqbal's vision acknowledges the goodness *and* plasticity of the created world as realm of human ethical action – a point Iqbal emphasizes in contrasting the narrative of the Fall of Man in the book of Genesis with its reformulation in the Qur'an (7th and 30th Sura). The latter, Iqbal holds, does not speak of a divine curse on the cosmos due to human sin, but rather depicts the created world as the positive resource of human life and the supposed fall as an awakening of mankind to self-consciousness and creative power (Iqbal 2013, 65–70).

This ethical orientation of Iqbal's cosmogonic view is complemented by his eschatology. This focuses on the immortality and resurrection of *individual* human beings who, in his view, are marked by the aspiration to develop an ever richer and more distinct personality (Iqbal 2013, 77f., 82f.). While this process of human individualization has a beginning in time, with the individual's birth, it does not end with physical death, but is meant to continue infinitely. As this personal immortality of the human ego is neither a mere postulate of practical reason (as per Kant), nor the immortality of a disembodied "soul" (as per Plato), it presupposes the future *resurrection* of individual human beings (Iqbal 2013, 95–98). It is this focus on the continuing evolution of the human Ego that determines Iqbal's discussion of all contents of the eschatological imagination found in the Qur'an, such as the universal destruction of the created cosmos and a future "second creation." For Iqbal, all these symbolic expressions describe, not so much singular eschatological events, but moments in the evolutionary process of human individualization. This process starts in the here and now, and is directed toward the ultimate goal of full communion with God as the supreme Ego – a communion that does not dissolve, but ennoble human individuality and self-possession (Iqbal 2013, 93–97).

Iqbal is quick to emphasize, however, that not *all* human individuals will experience resurrection and personal immortality. Rather, individual human action and effort will be registered at the eschatological day of judgment. Failing in one's deeds will result in the dissolution of the human Ego with physical death (see Iqbal 2013, 93–95). This is why, according to Iqbal, the idea of redemption is rejected in the Qur'an in favor of individual *responsibility* (Iqbal 2013, 76).

It is this idea of individual ethical responsibility that both Iqbal's cosmogony and his eschatology aim to promote. While it is the goodness and plasticity of the created cosmos, in Iqbal's view, that make ethical action possible and meaningful, his eschatological vision is meant to motivate such action. Confronting pious fatalism and a religious preoccupation with otherworldly realities (Iqbal 2013, 87–90, 132f.), the prospect of personal immortality is meant to motivate ethical action in the here and now – ethical action that must start with individuals, but should aim at establishing a free and egalitarian society (Iqbal 1977).

Restitution, Substitution, and Transformation: Uncovering the “Deep Grammar” of Religious Traditions

Religious cosmogonies and eschatologies come in many different forms and can be connected in many different ways, thus being able to sustain various distinct ethical orientations. As religious visions of the ultimate origin and the ultimate goal of this world offer the widest possible framework for the articulation of a religious faith, connecting these visions touches on many other themes important for the respective religious tradition (such as religious anthropology, concepts of salvation, or a theology of religious community). Analyzing specific connections of religious cosmogony and eschatology thus offers a privileged access to the theological “deep grammar” of a religious tradition and the ethical orientations it promotes. Such an analysis can be facilitated by heuristically differentiating three possible models of such a connection (Thomas 2009, esp. 22–25).

In the *restitution* model, the eschatological future leads back to the cosmogonic origin by restoring and repairing what had been lost or damaged, for example by human sin. The emphasis here is on continuity amidst all discontinuity. In the *substitution* model, the original cosmos or life is eschatologically replaced by a second cosmos or life, thus positing radical discontinuity between cosmogony and eschatology. In the *transformation* model, continuity and discontinuity between ultimate origin and ultimate goal are balanced as the new possibilities of the eschaton come to bear on the original cosmos and life.

One will certainly have to reckon with an overlap of these models when describing concrete examples from religious traditions. Augustine’s thoughts on cosmogony and eschatology may be explicated as a combination of restitution (for human beings) and substitution (for the non-human cosmos); while Moltmann’s and Iqbal’s positions exemplify the transformation model; though, with Iqbal, there are also some motifs of substitution (with respect to the non-human cosmos).

Cosmogonies, Eschatologies, and Religious Ethics: Directions for Further Research

The impact of religious cosmogonies and eschatologies and their ethical implications in a globalizing world continue to be debated within religious traditions and by non-religious publics. Three aspects of this complex field deserve special attention and call for further research:

(1) Under conditions of modernity, religious cosmogonies and eschatologies (and their related theological reflection) have to reckon with insights into the past, present, and future of the cosmos articulated by modern *science*. Positing religious cosmogonies and eschatologies as strict alternatives to scientific accounts is no longer viable for most modern theologies. But, while most modern theologies can agree that religious and scientific perceptions of this world constitute different epistemic perspectives, that insight may lead to so great a separation of religion and science that any dialogue is rendered meaningless. A more promising way forward seems to respect differences of these perspectives, while searching for points of germane dialogue between scientific insights and theological articulations of religious cosmogonies and eschatologies. This affirms that religious traditions aim to speak about the one cosmos shared by all (see Polkinghorne and Welker 2000).

(2) Religious cosmogonies and eschatologies, and especially their connection in theological reflection, much depend on an underlying concept of *time*. Traditional theologies, especially in the Christian tradition, have often presupposed a contrast between the flow of time and a timeless eternity, the latter thought to be a property of God *and* of the eschatological new creation. This strategy, however, threatens

viewing the ultimate goal as an exit from time to eternity, thus calling into question the goodness of the created cosmos. Many modern theologies thus aim to conceptualize “eternity” not as alternative to, but as an ennobling intensification of time (see Fergusson and Sarot 2000). A related challenge arises from the growing awareness that many modern Western Christian eschatologies suppose a unidirectional teleology of history and subscribe to a metanarrative of progress. There is thus a danger not only of overemphasizing human action at the expense of the work of God, but also a danger of losing sight of the (ecological) costs and the (human) victims of modern progressivism. Articulating religious eschatologies (and cosmogonies) and emphasizing their differences to one-sided concepts of inner-worldly progress remains an important task for those engaged in explicating religious traditions (see Tanner 2001, esp. 97–124).

(3) Present theological attempts to relate religious cosmogonies and eschatologies have to reflect on the *inclusivity* of the eschatological vision they promote. One aspect of this inclusivity is the status of the non-human cosmos. While religious eschatologies have often exclusively focused on the future of human lives, growing ecological sensibilities have led many modern approaches (e.g. Moltmann’s) to articulate religious eschatologies that encompass non-human life as well (see Thomas 2009). Another aspect of inclusivity concerns human beings outside one’s own religious community – their exclusion or inclusion within the frame of eschatological redemption. In both cases, exclusivist religious eschatologies risk promoting problematic ethical attitudes and actions such as ecological brutalism and disregard for (or even violence against) people subscribing to other faith traditions or none. At the same time, inclusivist eschatologies risk compromising human responsibility.

Further research into these – and other – questions from scholars within and outside religious traditions will help to articulate religious cosmogonies and eschatologies as resources for ethical orientation in today’s world. Moreover, they may sustain and motivate religious ethics that neither legitimize any given *status quo* nor negate the goodness of life in this world.

CHAPTER 55

Myth

Brian Collins

In modern parlance, the word “myth” is used to describe something that is commonly believed but not true, as in the sentence, “It is a myth that childhood vaccinations lead to autism.” Conversely, others have understood myths as “true lies,” stories that, while fictional, nonetheless contain profound truths. Important examples include the psychoanalysts Sigmund Freud (1856–1938) and Carl Jung (1875–1961) who saw myths as representations of personality development. Their perspectives differed in that Freud focused on the Oedipal conflict, while Jung built his theory around mythic archetypes that connect us to a collective unconscious.

The relationship of myth to ethics (religious or otherwise) depends on one’s understanding of whether myth itself is ethical. That is to say, does it lie or does it tell the truth? This entry will trace the development of two distinct understandings of the ethical dimension of myths. The first is the positive valuation of myths as truthful insofar as they are narrative representations of human aspirations like generosity and courage, or as revelatory insofar as they express deep human truths that provide a starting point for ethical reasoning. The second is the negative valuation of myths as lies insofar as they function as ideology, papering over a society’s arbitrary hierarchical divisions or concealing its foundational violence.

Myth as Truth and Falsehood

Scholars generally agree that the discourse of myth in the West goes back to the ancient Greek distinction between the truth of *logos* and the falsity of *mythos* and Plato’s warning in *Republic* that the violent stories of the gods and heroes told by Hesiod and Homer could prove corrosive for impressionable young listeners. In his essay “The Terror of Fables,” the Italian thinker Roberto Calasso (b. 1941) writes that, for Plato, “Homer, the enemy, is nothing but the representative of a realm, the realm of metamorphosis, and he is the bearer of the knowledge of metamorphosis. For philosophy, this is the enemy realm, the realm of ungovernable powers, whose witnesses – the poets – should be expelled from the city” (Calasso 2002, 261).

Subsequent turning points in the West include positive (to varying degrees) valuations of myth’s power to narrate the absolute. Thinkers who subscribed to some version of this idea include the Renaissance humanist Francis Bacon (1561–1626), the Enlightenment counter-critic Giambattista Vico (1668–1744), the Romantically-minded theologian Friedrich Schleiermacher (1768–1834), and the philosophers Johann Gottfried von Herder (1744–1803) and Friedrich Wilhelm Joseph von Schelling (1775–1854),

who regarded myth as foundational to human thought, language, and culture. We could also mention here the debate in the early 1820s between the neo-Platonist Georg Friedrich Creuzer (1771–1858) and the Pietist Karl Otfried Müller (1797–1840). Both men saw the symbol as central to mythmaking, but Müller emphasized the importance of historical context, while Creuzer focused on what he saw as the purpose of myth, namely, “to transpose what has been thought into what has happened” (Creuzer 1819–1821). For all these thinkers, recognizing the proper place of myth as privileged discourse was essential to maintaining perspective on humanity’s place in the world, without which pure instrumental rationality would preclude ethical engagement.

Myth and Modernism

Others carried forward Plato’s critique of myth into the modern era, when it became an important topic of conversation as Western hegemony expanded into Asia, Africa, South America, and the Pacific. These thinkers included the anthropologist E. B. Tylor (1832–1917), who reinvigorated the suspicion of myth with his societal understanding of the evolutionary theory of Charles Darwin (1809–1882), and the classicist James George Frazer (1854–1941), who collected myths from all over the world with little attention to context but with great artistry and ingenuity in what became his massive 12-volume study *The Golden Bough* (1911–1915). In it, Frazer attempted to use comparative mythology to suggest that all religions developed from the once widespread primitive agricultural fertility cult that worshipped the dying and rising god of vegetation.

While Tylor and Frazer more or less saw myth as attempts to explain natural phenomena in the absence of scientific reason, another early twentieth century trend in comparative mythology called the “myth-ritual school,” exemplified by the work of English folklorist Lord Raglan (1885–1964), posited that one specific type of myth (the hero myth) followed a recognizable pattern across cultures and ultimately derived from ritual dramas. This school was short-lived but left its mark because of its influence on *The Waste Land* (1922) of T. S. Eliot (1888–1965), which attempted a mythological bricolage to put back together the Western soul that had been shattered by the dehumanizing experience of World War I.

Another modernist work is *Weltenmantel und Himmelszelt: Religionsgeschichtliche Untersuchungen zur Urgeschichte des antiken Weltbildes* (*World Cloak and Sky Canopy: Religious-Historical Investigations on the Prehistory of the Ancient Worldview*, 1910) by the Austrian polymath Robert Eisler (1882–1949). Going beyond Plato (the origin point of the discourse of myth) in search of the conditions of knowledge that gave rise to the earliest Greek philosophy, Eisler identified two distinct and incompatible cosmological systems spread from the Near East into the Hellenic world, one that pictured the vault of heaven held up over the flat earth by a tree or pillar, and another that pictured the cosmos as a spherical shape, like the Hiraṇyagarbha (“Golden Egg”) described in the Sanskrit *Matsya Purāṇa*. The first of these systems has been dominant for most of history, but was eventually supplanted by the second, which was more amenable to a scientific picture of the universe. This work is little read today but went on to inspire Giorgio de Santillana and Hertha von Dechend’s controversial but widely published and translated 1969 magnum opus *Hamlet’s Mill: An Essay Investigating the Origins of Human Knowledge and Its Transmission Through Myth*.

Though he has now faded into obscurity, Eisler went on to publish much more about mythology, art history, Christian origins, economics, and philosophy, and, after spending 15 months in Dachau and Buchenwald, he wrote *Man into Wolf: An Anthropological Interpretation of Sadism, Masochism, and Lycanthropy* (1951), where he made use of myths, rituals, and Jungian archetypes to trace the origins of

the cruelty he witnessed in the camps to a stage in human evolution in which what was originally a group of vegetarian, polyamorous hominids was forced to imitate the hunting practices and hierarchical social structure of the wolf pack to survive the deprivations of the Ice Age in Europe. Because the cruelty and sexual possessiveness of humans are not innate to the species, Eisler argued that by “changing our social organization and our environment” we could “throw off the fatal wolf’s mask” (Eisler 1978, 29–30).

Myth and Indo-European Studies

Described in the late eighteenth century by the colonial jurist and orientalist Sir William Jones (1746–1794), the Indo-European language family includes Greek, Latin, Sanskrit, German, Russian, Hittite, and other related languages found from India to Ireland. One of the foremost scholars in Indo-European studies was Georges Dumézil (1898–1986), the son of a classicist and a polyglot from childhood, whose interest in Indo-European myth and language led to him doing research among an isolated group in the Caucasus Mountains called the Ossetes. In Ossetic mythology, he found a legendary people called the Narts who were divided into three great clans: the intelligent Alægataë, the courageous Æxsærtægkataë and the wealthy Bor(i)atæ. He identified the clans as counterparts to the ancient Indian *varṇas* of Brāhmaṇa, Kṣatriya, and Vaiśya and to the Roman trinity of Jupiter, Mars, and Quirinus. From this connection, Dumézil hypothesized that Indo-European society (or at least the Indo-European ideal of society) consisted of three functions: the priestly-sovereign, the warrior, and the producer. Among the groups who spoke a language of the Indo-European family, including the Romans, the Norse, the Indians, and the Iranians, traces still remained in their myths and epics of this trifunctional model. Dumézil’s important contribution to the study of myth was his insistence that myth replicated and instilled hierarchical social structures, which goes somewhere toward explaining his role as the mentor of the post-structuralist philosopher Michel Foucault (1926–1984).

After an early career spent producing myth analyses indebted to the work of Dumézil, Bruce Lincoln (b. 1948) began in the 1990s to expose the political implications of his work and the work of others in the field of Indo-European studies, joining the Italian historians Arnaldo Momigliano (1908–1987) and Carlo Ginzburg (b. 1939) in charging Dumézil’s trifunctional model with having fascist overtones. It is undeniable that Dumézil developed his idea of the tripartite structure in 1938–1942, when he was also openly supporting the ultra-right-wing Action Française movement, whose ideal of a social hierarchy closely resembled what is described in his work, but there is disagreement over what to make of this. In reading him, every scholar must decide for herself whether or not Dumézil’s politics make his theories unusable.

Another figure of importance in the field of Indo-European studies was the Lithuanian archeologist and anthropologist Marija Gimbutas (1921–1994). In 1956, Gimbutas proposed that the original speakers of *Proto-Indo-European, the hypothetical language from which the entire family developed, were nomadic pastoralists and mound-builders from the Pontic steppe on the northern shores of the Black Sea. She is as well known for her theory of matriarchal prehistory, the idea that Neolithic religion was centered on the worship of fertility goddesses and that it supported a matriarchal society more harmonious and egalitarian than the subsequent patriarchal religions and societies of the Bronze Age. Gimbutas’s work has inspired many feminist scholars to attempt to recover the lost voices of ancient women, but one feminist scholar, Cynthia Eller, has critiqued both Gimbutas’s methodology and the value of her work for empowering women in *The Myth of Matriarchal Prehistory: Why an Invented Past Will Not Give Women a Future* (2000).

Myth and the History of Religions

The most influential scholar of the “Chicago School” of the History of Religions and one of the most influential in the study of religion in the twentieth century was the Romanian Mircea Eliade (1907–1986). Eliade understood myth as a narrative that serves to anchor primitive or archaic societies in the sacred by allowing them to experience time as cyclical and to participate in the paradigmatic actions of their gods and ancestors. Like Dumézil, Eliade’s political affiliations around the time of the Second World War, unknown to most of his colleagues and students until after his death, have led some to cast aspersions on his scholarship. In a series of newspaper articles from 1937 to 1938, Eliade expressed support for an anti-Semitic, xenophobic, and strongly Eastern Orthodox nationalist movement called the Iron Guard. After the war, Eliade remained apolitical in his work and life, and the debate over how scholars’ knowledge of Eliade’s activities in the late 1930s should affect their treatment of his impressive oeuvre is an ongoing one, culminating in the conference volume *Hermeneutics, Politics, and the History of Religions: The Contested Legacies of Joachim Wach and Mircea Eliade* (2010).

Seminal representatives of the “Chicago School” associated with Eliade included the aforementioned Joachim Wach (1898–1955), a German sociologist of religion, and two of his students, the Japanese-American scholar Joseph Kitagawa (1915–1992) and Charles H. Long (b. 1926), an African-American scholar who grew up in Little Rock, Arkansas during the era of Jim Crow. Long’s 50-year career is especially noteworthy for his having made significant (and too often overlooked) contributions to the methodology of the field by insisting upon the centrality of colonialism to the study of religion, emphasizing the importance of studying discourses on matter and materiality, and focusing on West African and African-American forms of religion. Combining his critique of Eliade’s tendencies toward ahistoricism and the insights of the Pan-African activist and sociologist W. E. B. Dubois (1868–1963), Long has attempted to “come to terms with the reality of black bodies in the Atlantic world not simply as data of the economic sciences but equally as modalities of symbolic clusters for a renewal and reform of discursive meaning of cultural languages through the matrix of the history of religions and its methodological resources” (Long 2018, 6).

A successor of Eliade, who differs from him significantly while still practicing the comparative method, is the Indologist Wendy Doniger (b. 1941). After an early structuralist study of the myths of the god Śiva, she has since expanded her research to include a wider range of shared narratives, focusing on the issues of gender, sexuality, and identity in Hindu and Greek myth, the Hebrew Bible, Shakespeare, and cinema. In her work, Doniger demonstrates the ways in which myths from one group can be used to illuminate myths from another when we pay equal attention to context, difference, and the kinds of human experiences that are shared across cultures.

Myth and the Bible

In his 1941 essay “New Testament and Mythology,” theologian Rudolph Bultmann (1884–1976), accepted that the Bible was deeply mythical and incapable of being understood as a true representation of the world in light of modern science, and so began the process of “demythologizing” it. He used this word to distinguish what he was doing from “demythicalizing,” a practice that is often traced back to Euhemerus (ca. 340–260 BCE), whose own ideas on the subject of myth are traced by Nicholas Roubekas in *An Ancient Theory of Religion: Euhemerism from Antiquity to the Present* (2017). Demythicalization (or what has been

called Euhemerism) focused on uncovering the true events that had become “mythologized” over time by repeated exaggerations, such as the skirmish that was remembered as the Trojan War. Bultmann rejected this as a naïve approach while simultaneously rejecting the losing game of Biblical literalism. “Myth,” he argued, “should be interpreted not cosmologically, but anthropologically, or better still, existentially” (Bultmann 1961, 10). He saw the mythic events of the Gospels as representations of the types of events associated with and problems faced by the developing Church. The crucifixion and resurrection of Christ he demythologized quite differently, as an “event” that functioned (and functions) as a call to an authentic form of life.

René Girard (1923–2015) had a different approach to myth’s relationship to the Bible. Girard’s theory of myth was connected to his own anthropology, in which he proposed that humans possess an imitative (mimetic) instinct that inevitably leads to mimetic rivalry (when we think the same thing, we agree; when we want the same thing, we fight). As this rivalry took hold in early proto-human groups, the multiplying rivals became an undifferentiated crowd turning against one another in a war of all against all. And then, spontaneously, the mob turned its violence on a single victim, experiencing their first taste of unanimity as a result. Afterward, the victim was identified by the now peaceful human community as both the cause (while alive) and cure (by his death) of the preceding violence. Upon this foundational murder, all culture rests, and the first instruments of culture are the ritual repetition of the founding murder with sacrificial substitutes, prohibitions designed to circumvent the mimetic rivalries or vengeful cycles that could bring about another crisis, and a myth that misconstrues the death of the innocent victim. Myth, as Girard explains it, bears the general structure of an initial primal chaos, followed by accusations against the victim, the death of the victim, and the founding of the culture.

Myth, ritual, and prohibition provide the structure of all archaic religion, which is irrevocably destroyed by the singular revelation of Gospels, a text that reveals the scapegoating mechanism of culture by insisting on the innocence, not just of Jesus, but also of all victims of mob persecution and violence. Because of Jesus’s death and resurrection, we can no longer be taken in by myth and believe that the victim has done something to deserve their fate or that killing the victim can prevent disaster. Unlike archaic religion with its myths, Christianity and its revelation places all the responsibility on the angry mob and proclaims the innocence of the victim.

Myth and Language

Other Western modes of mythology include the “Solar Myth” theory of philologist Friedrich Max Müller (1823–1900), who proposed that if mythmakers deceived, it was because they *were* deceived. In Müller’s theory, mythic narrative arose from the unavoidable misunderstandings of stories that are committed to memory and passed down through the generations of speakers of a living and therefore changing language. When the vocabulary of the memorized story no longer reflected common speech, speakers forgot that “Dawn was coming over the hill” referred to the sunrise and mistakenly believed that it must refer to someone named Dawn, like the Vedic goddess Uṣas. Thus, all mythology is a side effect of the “Disease of Language.” Though this idea is widely dismissed today, Müller is remembered as a cultural hero in India, whose sacred texts he translated into English, guided by his convictions that to know only one religion is to know none and that introducing Hindu myth and philosophy to a Western audience would “open a new history of the human race, of that race to which we all belong, with all the fibres of our flesh, and all the fears and hopes of our soul” (Müller 2013, xxxviii).

In a similarly linguistic vein, Hermann Usener (1834–1905), focusing on the *Götternamen* (“names of the gods”), used “anthropological techniques to connect the primitive premises of myths, rituals, and linguistic forms to more modern religious custom” and argued that “classical tropes presented responses to the primal human experiences of terror and fear” (Levine 2013, 53). The German-Jewish neo-Kantian philosopher Ernst Cassirer (1874–1945) was influenced by Usener’s work, in which “analysis and critique of the names of the gods are shown to be an instrument which, if correctly used, can open up an understanding of the process by which religious concepts are formed” leading to “a universal theory of *signification* in which linguistic and mythical elements become inseparable correlates” (Cassirer 1955, 22).

Cassirer himself, who was associated early on with the Hamburg group that included the influential art historian Aby Warburg (1866–1929) and the Belgian archeologist and Mithraism specialist Franz Cumont (1868–1947), developed an understanding of myth that placed it alongside language, art, and science as a domain of knowledge, which he understood as a system of symbolic forms that determine a dynamic image-world. After fleeing the Nazis, Cassirer turned his attention to political myths at the end of his career, warning, “We should carefully study the origin, the structure, the methods, and the technique of the political myths. We should see the adversary face to face in order to know how to combat him” (Cassirer 1946, 296).

For Cassirer, understanding myth or any other system of symbolic forms was tantamount to understanding consciousness itself, or at least one particular form of it. An anthropologist by training, the French structuralist Claude Lévi-Strauss (1908–2009) developed a similar theory, drawing on the ideas of the Swiss pioneer of semiotics Ferdinand de Saussure (1857–1913) and their subsequent development by the Russian-American linguist Roman Jakobson (1896–1982). In Lévi-Strauss’s thinking, myth was not merely fanciful but instead employed the sophisticated manipulation of symbols to resolve the binary contradictions of social and biological life, themselves an expression of the binary nature of human consciousness. Seeing the “savage thought” of the indigenous people Lévi-Strauss studied as a science of the concrete (from which we had much to learn) was a departure from earlier colonial notions of “primitive” myth as a less advanced worldview born out of ignorance or, worse, inherent intellectual inferiority.

Myth and Politics

In her essay “*The Iliad* or the Poem of Force,” written during the dark years of 1939–1940, the French philosopher and mystic Simone Weil (1909–1943) wrote of the epic’s brilliant insight that all victors become vanquished in the end and all are subject to the same suffering in the fullness of time. This understanding is a prerequisite for ethics, she argued, because “[he] who does not realize to what extent shifting fortune and necessity hold in subjection every human spirit, cannot regard as fellow-creatures nor love as he loves himself those whom chance separated from him by an abyss” (Weil 1965, 5). A different example of this kind of thinking can be found against the backdrop of the conflict in Vietnam, when the so-called “Harvard School” of American Virgil scholars, represented by Adam Parry (1928–1971), Wendell Clausen (1923–2006), and Michael Putnam (b. 1933), discredited the triumphalist reading of the *Aeneid* in favor of a pessimistic view colored by the growing protest movement against the war.

It is worth considering why the political critique of myth did not develop in the same way in non-Western cultures. The French sinologist and philosopher François Jullien (b. 1951) has argued that

“[the] Chinese world contains virtually no traces of chaos or cosmogonies. So, given that it never was constituted on a mythical basis, Chinese thought never needed to construct itself philosophically (in the mode of logos)” (Jullien and Lloyd 2002, 806). Critique finally came in the twentieth century with the historian Gu Jiegang (1893–1980) and the Gushibian school, who attacked classical Confucian hermeneutics and modeled their interpretative practices after the Durkheimian folklorist Arnold van Gennep (1873–1957).

In India, the problem faced by Bultmann when reading the Bible was at least partially obviated by the hermeneutics of Pūrva Mīmāṃsā philosophy beginning in the third century BCE. One late exponent of this school, Śālika Nātha Miśra (ca. eighth century CE), argued that because they speak of things that are supranormal and not accessible to men except through revelation, the sacred Vedas have no author whose reliability we need to judge and that their words do not have “meaning” but “purpose,” specifically in regard to ritual (Pereira 1976, 98–99). Nevertheless, in India the critique of myth was a central part of critical political discourse in the twentieth century, especially as it challenged the bases of caste and ethnic hierarchies. This is exemplified in the work of the Dalit activist, framer of the Indian constitution, and Buddhist convert Bhimrao Ambedkar (1891–1956), the Marxist historian D. D. Kosambi (1907–1966), and the Tamil separatist E. V. Ramasamy Naicker (1879–1973), who denounced the Sanskrit *Rāmāyaṇa* epic as a text of domination legitimizing North Indian cultural hegemony and was arrested by the British for publicly burning a picture of its mythical protagonist, the god-king Rāma.

In the study of religion, myths are generally understood as stories that express meanings, sentiments, and part or all of a worldview shared by the group of people who tell and retell them. Studying myth has always been a comparative enterprise, since the very act of designating a story as “myth” necessarily requires examining it alongside stories already accepted as mythological. But like many terms used in studying and theorizing religion, the meaning of “myth” has been challenged, refined, and debated by successive generations of thinkers, often with ethical commitments. For some, establishing ethical values and imperatives demands that we unmask the structural violence that myths provide with a cloak of authority, while for others, myths are a way to comprehend ourselves and one another and establish the mutual understanding that is necessary for ethical engagement with the other.

CHAPTER 56

Nature and Human Nature

William D. Hart

Western dualisms (Platonic, Christian, and Cartesian) tempt us to think that our species, *Homo sapiens*, is essentially non-natural; that in addition to natural, non-essential bodies, humans are *nature transcendent* mind, spirit, or idea – a glassy essence. Common sense, scientific, and philosophical views of nature converge and diverge on the question of whether humans are fully natural: whether humans are wholly an *order* of nature or a supernatural, metaphysically unique species, bearing a non-natural essence, a divine spark. In addition to the nature/human dualism, there are divergent perspectives on the nature/non-nature dualism, the naturalness of ethics, and nature as an object of religious devotion. The concept of nature is multifarious, contested, and unstable: a subject of ambiguity, an object of ambivalence.

Three Views of Nature

Reference to “the” common sense, philosophical, and scientific views of nature should not be taken to mean that there is uniformity within these forms of knowledge. Despite considerable internal diversity, this entry can only address ideal types. The common sense view of nature refers to a broad repertoire of non-expert ideas. These ideas are not insular and may be influenced by or converge with expert knowledges on some points. In the first instance, nature refers to anything that is non-human. Humans are non-natural. They stand out and over against nature. In the second instance, humans are viewed as continuous with nature insofar as they are bodily beings. Their bodies connect them with other animate beings; bodies represent their animality, what they have in common with non-humans. On this common sense view, however, humans are more than their bodies and emergent bodily capacities. Humans are body-transcendent spirits. Humans are *both* natural and nature-transcendent. The essence of human nature resides not in its bodily nature but in those body-transcendent capacities that make humans other than animals. This common sense notion that humans are a duality of body and spirit – where the latter is the essential, axiological component – is ancient and widespread across cultures. This perspective, then, reveals a third common sense view: nature as a “regional,” limited reality in contrast with supernature. Supernature or the supernatural is associated with what is really real, what is most valuable and divine. The transcendent part of human nature, that is, spirit/mind is construed as the presence of supernature in nature: the image of God, the divine spark, the oneness of Atman and Brahman are examples.

Philosophy and science reflect critically on common sense. But there are no absolute distinctions among these ways of constructing nature. Philosophical and scientific views both converge and diverge from common sense. As critical dialogues with common sense, philosophy and science have both entrenched and cast skeptical eyes on non-expert views of nature. Considering the three views of nature, science has contributed most to an empirical understanding. Science commits to providing a purely physical and thus non-metaphysical account of ostensibly non-physical phenomena such as mind, consciousness, and normativity. The scientific revolution of the sixteenth and seventeenth centuries undermined the influence of Aristotle's metaphysical (teleological, purpose-driven) biology. Observable and testable forms of inquiry revolutionized our knowledge of nature and humanity's place within it. This empirically-based knowledge includes: the circulation of blood, evolution as descent with modification, the genetic basis of inheritance, the microbiological world, the quantum universe, the 4.5 billion year age of the earth, and the immensity of stellar space, all of which was preceded by Copernicus's heliocentric theory of the known cosmos. In contrast to the fundamental sciences of physics and chemistry or the various earth sciences such as geology, meteorology, and oceanography, the biological sciences are especially identified with the scientific view of nature. This owes no doubt to its subject: the innumerable varieties of life. The nature of human life and its relations with other forms of life is paramount. The biocentric conceptualizing of nature was marked by the revolutionary success of Darwinian-inspired evolutionary thinking. It is within this context that the question of nature and human nature is presented in its starkest form (Wilson 1975, 1978). On one version of this view, humans are *naked apes*. The transformation of humans across historical time and through cultural innovations has left their fundamental nature unchanged. These transformations are epiphenomenal to their perdurant bio-evolutionary nature. The inner ape is always there, peering out like the Wizard of Oz from the curtains of history and culture (Morris 1967).

Three Dualisms

The *body/mind (or spirit) dualism* is metamorphic and mobile. Initially, this metaphysical dualism served as a rampart against racial essentialism rooted in bodily differences which underwrote a rank-ordering of races. (Rooted in a biological error, race is a social reality whose *parent*, racist ideology, was instrumental to capital accumulation in the form of enslaved Africans and dispossessed Indian land.) Under the conditions of imperial/colonial modernity – the triangulation of India, Africa, and America in the European imagination, the conquest of America, and the trans-Atlantic enslavement of African people – the body/spirit dualism manifests as a racial distinction, especially between black and white, with black people as body and white people as mind. In a similar manner, the body/mind distinction is gendered: body is female and mind is male. This mapping occurred in tandem with the emergence of a naturalistic view of human nature. That naturalization should have this consequence appears to be contingent rather than necessary. This hierarchical and invidious construction of naturalism occurred against the backdrop of a new, capitalist-inflected mode of male supremacy and the very colonialism, trans-Atlantic slavery, and racial ideology that constituted European modernity. To put these points in stronger terms, the concept of nature is irreducibly political. Among the founding gestures in modern political thought is the distinction between the state of nature and the political state. Nature is construed as perilous, nasty, and brutal: the uncivilized other, the alterity of politics. Some critics of the

scientific view argue that the dominant modes of conceptualizing scientific practice and the metaphors scientists employ represent a bias against democratic forms of social life. Furthermore, these scientific constructions of nature and human nature reveal a preference for capitalist modes of economic production with their Malthusian notions of scarcity and competition and patriarchal ideas of dominance and combat. These modalities incorporate and reinforce common sense, socially constructed, and hierarchical notions of gender and race. These racial and gendered correlations are hardly innocent (Haraway 1991).

The *nature/human nature distinction* is a piece of common sense that philosophers and scientists inherited and that some have struggled to evade. This distinction is also the subject/object distinction that René Descartes bequeathed to modern philosophy. As minds, humans stand over against matter, that is, everything else. The scientific construction of nature recapitulates the Cartesian subject/object distinction. However, against common sense and philosophical views that construe humans as a body/spirit duality, scientific materialism holds that the mental/spiritual dimension of human nature is an epiphenomenon of matter. Humans are biological, evolutionary matter with brains: that is, a specialized piece of matter that made minds, spirit, hopes, dreams, and the whole range of axiological concerns possible. Science inverts the body/spirit dualism with the body as primary and mind/spirit as secondary. This inversion ramifies as it is mapped onto, if not rearticulated as, a *nature/culture dualism* with culture as a secondary elaboration of a deeper, underlying nature, usually construed in a *genocentric* manner. There are genes and there is everything else. Genes are the prime movers, the subjectless agents of evolutionary change, which is construed as isomorphic with nature. In contrast, “developmental systems theory,” which is a dissident perspective within biology, psychology, and evolutionary theory holds that human nature is not an immanent and unfolding code resident in genes. Rather, human nature is produced by multilevel interactions throughout the life-cycle of organisms. This conceptual frame nullifies the nature/nurture distinction. As multileveled and multi-scaled activity, nurture produces and continuously remakes nature. Thus, developmental system theory argues for a non-dualistic and more capacious view of nature and evolution (Oyama 2000).

Even sophisticated and sensitive thinkers who argue for a capacious understanding of nature often presuppose a human/nature distinction. If we reject the distinction, the fact remains that only humans, as far as we know, can draw such a distinction. Humans are nature fully conscious of its naturalness. This knowledge represents a kind of transcendence within immanence. As *paradoxical animals*, humans know that they are natural and conspicuous. Though produced by evolution and larger cosmic processes, humans stick out of nature like a sore thumb – and a Band-Aid. On the one hand, humans are a “bad fit” within natural processes. Humans destroy habitats, undermine ecologies, and drive forms of climate change that endanger the world system on which all life depends. Through the introduction of carbon and industrial pollutants into the atmosphere, soil, and oceans, humans have become a *geological force* that threatens to change the way the earth as a system of physical processes works. These harmful changes may be irreversible. On the other hand, humans have developed modes of acting and believing that enable them to take responsibility for what they do. This paradoxical, two-sided capacity of humans to destroy if not create on a world system level, is evident in their solicitude for the well-being of non-human species. Insofar as humans imagine themselves as having obligations toward others, human and non-human, including the inorganic elements of water, soil, and atmosphere, we might call it ethics.

Thinking with and against common sense views, philosophers and scientists are in dialogue regarding the nature of nature. Usually, contemporary philosophers concede the greater reliability and authority of scientific accounts of physical nature. The dialogue is better characterized as a scientific monologue with philosophers working at the margins, enhancing the conceptual clarity of scientific claims and questioning problematic metaphors such as “selfish genes.” But insofar as there are forms of nature that are not physical and that cannot be reduced to the elementary features of matter, disagreement if not dialogue persists. Sociobiology and its offspring evolutionary psychology are influential paradigms for thinking about nature in the evolutionary sciences. Though these approaches are *not* strictly deterministic, each reduces human behavior, psychology, and value-making to natural selection and its by-products (Wilson 1975, 1978). Against this scientific reduction to *causes* of what Wilfred Sellars calls the *space of reasons* (consciousness, cognition, and norm-making), the philosophical view holds that biological nature is irreducible to materialist Neo-Darwinism. On that account, physics, chemistry, natural selection, sexual selection, and time tell us pretty much all there is to know about life. The philosophical critic holds that this materialist view is too restrictive and does not tell us all that we need to know to properly account for biological nature. We need some notion of purpose; not the purposes of an intentional agent such as God but a non-intentional teleology, inherent in biological processes, something akin to Aristotle’s notion of metaphysical biology (Nagel 2012).

The philosophical critic of the Cartesian legacy holds that personhood is constitutive of human nature. Humans have a historically mediated personality, an *autobios*. Without denying rule confirming anomalies and hard cases, humans are living persons. Humans are not the union of mind and body; nor can they be understood in a reductive, one-sided way as mind, or as body, or as that part of the body called the brain. Reducing subjectivity to matter and reasons to causes, provides an example of the afterlife of one-sided body/mind dualism in dominant forms of scientific thinking about human nature. Rather than embracing Cartesian dualism or one side, this philosophical view holds that human nature expresses a holistic entity (Hacker 2007). This holism includes a distinctive capacity for symbolic language, counterfactual thinking, and self-assessment, which makes moral subjectivity – the ability to make promises and be held accountable – possible. As Akeel Bilgrami argues, value, aesthetic evaluation, and ethical judgment, though “unscientific” and non-natural in the narrow, constipated sense of those terms, are inherent features of the world (Bilgrami 2010).

Ethics as Natural Phenomenon

Representatives of the scientific view sometimes conflate what is with what ought to be. They make the normative – the good, the right, the *moral ought* – a function of the empirical norm. Or, conversely, they claim that normativity is merely emotive, an expression of genetic programming, and thus illusory. One consequence of the scientific inversion of the spirit/body and subject/object distinctions is that the whole axiological realm – aesthetics and ethics, all forms of value-making – is construed as epiphenomenal, the product of deeper forces, the subjectless agency of genes expressed through an organism’s urge to survive and procreate. In crude versions of this view (and some sophisticated ones also where the authors lose control of their metaphors), the ostensibly subjectless, material, and mechanical forces of nature and evolution are construed narratively as homunculi, “little men,” executives, intentional agents inside otherwise mindless genes.

The question of whether ethical judgments are natural is controversial. The character of nature and ethics, respectively, are controversial in their own right and the nexus of the two is even more so. Traditionally, ethics has centered on questions of good and bad, right and wrong, virtue and vice; on questions of character, consequences, and motivation, on freedom of will and determinism. Humans have the ability to make promises and be held accountable. Humans also have the counterfactual ability to imagine how things ought to be – in a moral and not merely a predictive sense. This normative capacity is widely viewed as distinctively human. Hardly anyone would likely argue that ethics are not natural in the sense that they manifest human nature but they might deny the claim that evolutionary theory, an account of what humans share with other forms of life, from amoeba to blue whales, can explain the normative capabilities of humans. They might argue that ethical judgments imply a transcendence of animality, that the ability to make normative judgments though rooted in evolution is a consequence of abstract, symbolic culture, which progressively liberates humans from the reach of natural selection. Humans are products of evolution by natural selection but also of revolution through culture.

Some experts, often philosophers who have adopted a broadly Darwinian perspective, argue that normative thinking in general and ethical judgment in particular, is a thoroughly natural phenomenon in the sense that its foundational features, its enabling capacities are either a direct product or a by-product of natural selection. A prominent theme in this strain of thought holds that inclusive fitness, especially parental investment and kinship reciprocity, provides the natural, biogenetic basis of prosocial behaviors. In turn, prosocial behaviors are the matrix within which higher-level normativity emerges, including distinctively ethical judgments. Like other species, humans engage in behaviors that are helpful to members of their family, kinship group, species, or others. These prosocial behaviors are based on biogenetic propinquity. The closer the genetic connection, the more intense prosocial motivations are likely to be. Most people are more solicitous of offspring than of third cousins. When prosocial behaviors are reciprocated, social bonds are strengthened and resources are efficiently distributed, which increases the likelihood that more individuals will survive and reproduce. Under these favorable circumstances, individuals are more likely to reciprocate. Invariably, some individuals will exploit the *emerging norm* of reciprocity by cheating: that is, receive benefits without giving any. Through repetitive interactions with others, individuals in social groups learn to distinguish between those who reliably reciprocate and those who do not. From these experiences, norms emerge: “we will scratch their backs because we have experience and can reliably expect them to scratch ours.” This process does not need to be conscious and is unlikely to be so. Rather, easily discerned patterns of reciprocation and failure to reciprocate lead, *habitually*, to norm-governed behavior (Joyce 2006).

Within this matrix of norm-governed reciprocity, distinctively ethical judgments emerge and get a toe hold. Where lower-level, reciprocity-based norms provide reasons for saying “Yes” to this and “No” to that, for desiring some outcomes and fearing others, it does not provide distinctively moral reasons for doing so. The term, *distinctively moral reasons*, refers to judgments about what ought to be, to what is praise or blameworthy, and not merely to what is praised or blamed because someone finds it useful or pleasing to do so. On the contrary, moral reasons are often preference-overriding judgments about what is good, right, and virtuous. Such reasons strike the subject as categorical and unavoidable and, as such, are ends in themselves and not merely instrumental to non-moral ends. A competing view holds that there is no compelling evolutionary account of distinctively moral reasons. To the contrary, evolution by natural selection provides strong evidence against a naturalistic account of moral reasons. While natural

selection may have produced normative beliefs that were instrumentally useful for our ancestors, there is no reason to think that beliefs selected because they were conducive to evolutionary fitness are true (Joyce 2006). The more capacious, metaphysical concept of nature as everything that is, including product and cause, both ontology and cosmology, evades the reach of this argument against the naturalness of ethics. This is not an evasion of the question of distinctively moral reasons. Nor does it change the subject. But it does expand and redefine what it means to claim that ethics are natural.

Nature as Object of Religious Devotion

Some regard nature as sacred. They regard nature as an object of reverence and religious devotion. This is true whether nature is viewed as divine or not and whether divinity is understood in personal or impersonal terms. Even if nature is not an object of worship, it is sacred. Pantheism represents nature deified. Every aspect of nature, every particle and wave, manifests God. God pervades all. Panentheism describes a similar but competing view: more capacious than nature, God encompasses all. Strictly speaking, panentheism is not a naturalistic view insofar as it posits a reality, God, which is more than nature. Panentheism represents a highly sophisticated version of the *nature/supernature distinction* where God is both in and beyond nature, both encompasses and shoots through nature – both immanent and transcendent. In contrast, the classic exposition of pantheism holds that God and nature are the same. Nature is cause and effect, process and product: nature naturing and nature natured, the whence and wherefore of everything.

A radical version of pantheism, which seems to displace the very concept, holds that God is neither the same nor greater than nature. Rather, god (lower case “g”) is one of innumerable orders within nature. God is an *order* of nature not the *Orderer* of nature. Otherwise put, god is a sacred fold within nature. God is no less a creature of nature than humans or any other natural order. God is no more or less real than humans or rocks. Rather, god is one order of reality among countless orders. Like traditional pantheists, the radicals use the language of “god.” But they radically reconstruct the very idea. God has none of the attributes of a person. Rather, god is a placeholder for the various potencies within nature, the depth dimensions, the wild, and the opaque – nature in its self-surpassing and ecstatic capacities. These potencies are neither conscious nor intentional. If we use psychoanalytic language, then we might say that god is the latent rather than the manifest dimensions of nature, that is, god is the unconscious of nature. Though god is an expression, a modality of nature, nature as such is not deified in the manner of traditional pantheists. Rather, god is a creature of the fundamental fissure between *natura naturata* and *natura naturans*: between nature naturing and nature natured, nature creating and nature created (Corrington 2016).

Some who regard nature as an object of religious reverence see no reason to deify it. Nature is not God. To call nature God is not a compliment. On the contrary, nature is that fundamental and all-encompassing reality within which the very concept of God, *a mere concept*, emerged. Nature is what nature does: both its own cause and product. The gratuitous fecundity of nature inspires awe and reverence in the religious naturalist. Its mind boggling cosmic dimensions, and the intricacy and depths of its seemingly infinite forms, inspires wonder. While recognizing that nature is brimming with mysteries, some that may forever evade understanding, the religious naturalist regards this fact as an invitation to explore and discover. Thus a dual impulse: to celebrate and investigate mystery, to acknowledge

the unknown without consecrating it; to refuse the temptation to exempt mystery from critical scrutiny, or construe the unknown as a taboo object, the investigation of which is an irreligious act, a sacrilege, an impious, irreverent, or arrogant attempt to know what humans should not know. Here, there is no divine monopoly on knowledge or injunction against its vigorous pursuit as there is in the foundational stories of some religious traditions. Knowledge does not disenchant or flatten the cosmos, it enhances wonder. To know and to acknowledge the unknowable: this dual impulse characterizes religious naturalism.

Most forms of religious naturalism are indebted to Charles Darwin's evolutionary theory. The famous last paragraph of *Origin of Species* captures a foundational aspect of the religious naturalist sensibility quite well. After noting the "laws" of geometric reproduction, competition within and among species, natural selection, and the captivating variety that have resulted from these non-intentional processes, Darwin remarks:

Thus, from the war of nature, from famine and death, the most exalted object which we are capable of conceiving, namely, the production of the higher animals, directly follows. There is grandeur in this view of life, with its several powers, having been originally breathed into a few forms or into one; and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved.

(Darwin 1999, 478)

Darwin speaks of grandeur, beauty, wonder, and finitude, which are key elements of various forms of religious naturalism. Though Darwin does not explicitly mention *H. sapiens* as he did in 1871, *Origins* is about nature and human nature: their identity and difference. As many religious naturalists affirm, nature is wilder, weirder, deeper, and the source of greater ecstasies than Darwin ever knew. More capacious than Darwin imagined, nature as its own cause and product is physically and metaphysically ultimate. As such, it is the proper object of religious reverence. Thus nature (of which human nature is a part) comprises nested relations among ontology and cosmology, matter, energy, and space-time, empirical and speculative, earth and sky, biological organisms and inorganic stuff, material and mental; relations among animality, humanity, divinity, and emergent forms of value – what is, what ought to be, and the whence of it all. Folding, enfolding, and unfolding, nature is its own self-sufficient cause and effect.

CHAPTER 57

Soteriology and Enlightenment

Rick Elgendy

“Soteriology” is the study of or a particular account of salvation, a solution to the problem(s) attending human life, while “enlightenment” expresses a conviction that the central challenge or task of human life is the transformation of one’s consciousness in order to better reflect humanity’s true form. “Salvation” may be thought broadly, though with notable exceptions, to reflect theological paradigms of Western religious traditions, while versions of “enlightenment” are more prominent in philosophical and Eastern religious traditions. Both, however, tend to presume a distance between human life as it is typically encountered and as it should be normatively lived, connecting soteriology and enlightenment closely to beliefs about the purpose of creation, the use and abuse of freedom and moral agency, hamartiology (the study of or an account of sin), and eschatology.

Ancient Origins

Soteriology in the Hebrew Bible reflects the wide range of circumstances and perspectives chronicled in its texts. There is abundant emphasis in popular discourse on the “fall” of Adam and Eve, their punishment, and the resulting (or symbolized) predicament for all humanity, from which deliverance is required (Gen. 3:1–24). However, other crucially important themes recur in the thinking of the authors and editors of the Hebrew Bible. In one of the founding events of the Hebrew people, God liberates the enslaved from political domination in the exodus from Egypt. This is often figured and remembered as a redemption accomplished by divine agency (see e.g. Exodus 6:6). During the time of Israel’s establishment as a kingdom, soteriology takes on the tone of political maintenance and moral purification of the Israelites, especially in the midst of ethnic and national tensions in the ancient Near East. Salvation is imagined as the preservation and rescue of the community in the literature produced during and after exile from and occupation of the territories of Israel; here, salvation consists in faithfully singing the “songs of Zion in a foreign land” in hope of a return to their promised land (Psalm 137:4). The wisdom literature – including the Psalms and Proverbs – invoke themes neighboring enlightenment as well, celebrating “wisdom” through personification, which celebration is meant to inspire and cultivate practical reason (Proverbs 8).

Some of the ancient Greek and Roman philosophers also offer accounts of how human life calls for transformation, often focusing on philosophy itself – understood as a falling in love with wisdom and learning how to die well, often through detachment to bodily or sensuous desire – as the paradigm for the enlightenment available to human persons. Plato makes a literary figure of his teacher, Socrates, to provoke a dissatisfaction with everyday life and encourage an ascent of mind and spirit toward the truth. The allegory of the cave from his *Republic* implies the salvation of the human mind achieved in turning from the “shadows” of common (mis)perceptions toward the “form of the good,” that radiant beauty and goodness grounding all things; such is the liberation from the murk of everyday-ness achieved by enlightenment. Stoics such as Zeno of Citium, Seneca the Younger, and Marcus Aurelius located salvation in a unity with nature and necessity: to be enlightened, for them, is to be free from the disturbance of malformed desires as a result of the cultivation of virtue. As a result, Stoicism tends to figure ethics, and especially the development of the person’s conscience in practical wisdom, as the domain of salvation.

In this milieu, the New Testament chronicles the emergence from their Jewish roots of Christian traditions steeped in various soteriologies. The life, death, and resurrection of Jesus of Nazareth gives orientation to the early Christians’ message about God’s redemptive activity in the world, but the meanings and implications of that activity are richly varied. In some moments, early Christians perceive Jesus’s moral exemplarity and teaching, in conversation with the Mosaic Law, as providing an avenue for differentiated living compared to the state of the world (see e.g. Matthew 5–7; John 13:31–35). Other texts emphasize the unmerited grace offered in Christ’s dying on humanity’s behalf to satisfy, on various metaphorical castings, a debt, a legal sentence, or a need for renewal that cannot originate from within humanity unaided by the divine life (Romans 5:1–11; Hebrews 9:23–10:18). Still others depict salvation as the result of a cosmic struggle between the power of God in Christ and the demonic forces – “principalities and powers” – that structure the current age (Colossians 1:15–20; Ephesians 6:12–13). In all of these modes of expression, the New Testament claims that the work of God through Christ achieves, if only partially in this era, a new creation, bringing human life and perhaps all of the cosmos in line with God’s creative intentions and into deeper intimacy with the divine.

Islamic traditions, centered on interpretation and recitation of the Qur’an, appropriate many Jewish and Christian legacies – prominently, narratives about Abraham, Mary, and Jesus – into a vision of salvation based on divine judgment of the person’s submission to God. The law of God is an expression of the cosmic order flowing from God, and one’s moral performance is to be brought in line with the dimensions of that order that pertain to human agency. This is expressed in the “five pillars” – the confession of faith, prayer, alms-giving, observance of the holy month of Ramadan, and making a Hajj to Mecca, as one is able – as well as in general observance of sharia, the divine law. Islamic soteriological traditions also feature ample expressions of divine forgiveness and mercy, however, and manifest in a rich array of mystical, spiritual, and political forms.

Though they situate and characterize salvation differently than the Abrahamic traditions, forms of Hinduism and Buddhism also render human transformation in conversation with themes of agency, illumination, and reorientation. Though it is acutely difficult to generalize about Hindu belief, the Upanishadic period develops and extends from the earlier Vedas the theme of reunification between the individual soul, Atman, with the universal principle or cosmic spirit, Brahman. In some early Upanishads, the task of the soul is to escape the cycle of death and rebirth, often through forms of self-knowledge and purification that will yield spiritual progress toward Moksha, or liberation. This self-knowledge is often figured as a deep sense of the unity of Atman with Brahman itself, which also

constitutes the fundamental oneness of all things. The *Bhagavad Gita* offers three paths, or “yogas,” toward this liberation: the bhakti-yoga, or path of persistent devotion; the karma-yoga, or path of action oriented disinterestedly toward the good; and the jnana-yoga, or path of knowledge and wisdom, particularly of the self in relation to Brahman. To these a fourth path is often added, raja-yoga, or the path of meditation disciplined toward attention to the ultimate. All paths, however, lead to the reunification with Brahman, when diligently, and perhaps over many lifetimes, pursued.

Buddhist traditions often figure salvation and enlightenment as nirvana, a release from the suffering that accompanies the common life. His followers record that Siddhartha Gautama taught four noble truths. First, that life, especially the unceasing restlessness of mundane life, is characterized by suffering, or dukkha. Second, that the origin of this suffering is the grasping at and craving for the fleeting things of this world. Third, that the cessation of suffering comes through disidentification with and relinquishing these forms of desire. Finally, that the path of liberation is eight-fold: right views, right intention, right speech, right effort, right action, right livelihood, right mindedness, and right contemplation. As in many forms of Hinduism, Buddhists often imagine this process as a way out of the karmic cycle of death and rebirth into this world. Most varieties of Buddhism, however, cast this enlightenment as a realization of the impermanence and ultimate unreality of the self: the anatta, or non-self, expresses disbelief in an eternal, individuated soul, seeing the self instead as a cluster of temporary sensations, energies, feelings, dispositions, and like phenomena. Liberation from the illusion of the stable permanence of the self, therefore, is also conversion toward the real, objective reality of which one is a part.

Some Christian Doctrinal Developments

Insofar as Christian traditions have arguably shown the most preoccupation with soteriology, some account of their historical doctrinal development is called for. Though these theological and ethical disputes have used the evidence of the past mediated by Christian scriptures and tradition, they also feature new organizations of the ancient concepts and, perhaps, new concepts going by familiar names.

Augustine of Hippo (354–430) highlights the internal conflict of the will, which leads him to construe salvation as a repose of the restless heart in God enabled by grace. In books seven and eight of his *Confessions*, Augustine recounts his reluctance, driven by a tangle of desires and habits, to commit to the life to which he sensed an intellectual and spiritual vocation. His well-known dictum – “Grant me chastity and continence, but, please, not yet” (Augustine 1991, 145) – suggests his felt duplicity and inner turmoil, which led to a generative wrestling with the motivations of the human heart. While some of his ideological opponents – the “Pelagians,” who followed his contemporary Pelagius – maintain that the grace of God is sufficiently accounted for in creation, publication of the law, and forgiveness, Augustine asserts that these remedies fail to redeem a human heart apart from the work of the Holy Spirit to transform one’s loves and desires. For Augustine and his influential legacy, therefore, salvation is a work of God through and through, even when it is accomplished in and through human agency.

Gregory of Nyssa (335–ca. 395), a theologian and bishop in Cappadocia, articulates a soteriology, influential in the Christian Byzantium and elsewhere, that addresses a distinct set of concerns. Gregory inherits the Alexandrian tradition, constituted by theological polemics engaged in by Cyril and Athanasius, whose slogan was “what has not been assumed has not been redeemed” – that only by bringing humanity into the closest possible intimacy with God, particularly in the divine and human meeting

in Christ, could the human condition be healed of decay and death. His *Address on Religious Instruction* (sometimes also called *The Great Catechism*) casts the remaking of nature that begins in the incarnation as a process finally culminating in *apokatastasis*, the restoration of all things worked by the refining of each through the divine energies, including their separation from all remnants of corruption through death and resurrection. Thus, the new creation is freed to *epektasis*, a constant stretching out or expanding of the soul (in rational beings) in capacity for receiving the presence of God's own life.

Thomas Aquinas (ca. 1225–1274), a Dominican Roman Catholic theologian situated in the emerging European universities, represents one of the high points of medieval synthetic achievement. Though he borrows in large measure from sources such as Augustine and Gregory (and, notably, Aristotle, whom he calls “the philosopher,” as well as Jewish and Islamic thinkers and contemporaries of his own), Thomas recenters soteriology on the reception of the beatific vision: perceiving the face of God by the redeemed. Thomas is well-known for advancing the idea that faith is compatible with reason; even if some of what faith perceives cannot be independently reached by unaided reason, it is coherent, intellectually defensible, and never irrational. Yet, for Thomas, this beatific vision requires something even beyond the cooperation of faith and reason: union with God, accomplished by the agency of God. Salvation is, then, enlightenment of a certain kind for Thomas, but an enlightenment beyond knowledge that exists in the immediacy of a face-to-face “seeing.”

As the late medieval period begins to give way to the European Renaissance, Martin Luther – himself an Augustinian monk at first, and enthusiastic about Augustine's theological legacy – challenges the theological inheritance of the church on the basis of soteriology. While his criticisms of church corruption, epitomized in the sale of indulgences, put him at odds with ecclesial authority, his revisions in soteriology make his theology more than a call for return to familiar apostolic ideals. Luther, reading Paul's claim that “the righteousness of God is revealed through faith for faith,” comes to believe that one is justified – reckoned righteous and acceptable before God – in the moment of receiving faith and apart from any works one has accomplished that may contribute merit to one's case (Romans 1:17). Where the Catholicism that he inherits teaches that saving faith must be formed by love and embodied in appropriate works, Luther argues that faith is a sheer gift of God, given without respect to one's preparation or intentions, which only after it has justified the person entirely will begin to sanctify them, causing them to grow in love. Where the popular beliefs of his day held that one could only hope to be justified by God when one was, in fact, justifiable, Luther revealed in his conviction that he was accepted despite his unacceptability. Though social and political factors play a clear, necessary role in the success and preservation of the Protestant Reformation, the soteriological revisions introduced by Luther name its most central theological stakes and content.

Though early generations of Protestants disagree with Luther and among themselves on a range of issues, often in deadly disputes, this soteriological starting point becomes a defining mark of the Protestant-Catholic divide – frequently crossed by the hurling of polemics – for centuries to come. Reformers such as John Calvin and Huldrych Zwingli maintain that justification comes through faith apart from works, even if they more carefully guard a place for growth in sanctity in Christian life. On the other hand, the Council of Trent, as an institutional expression of the Catholic Reformation, reasserts, if it also clarifies, belief in the necessity of faith and love in mutually expressive works, citing both longstanding tradition in the church and scriptural precedents (cf. James 2:14–26). These positions, often caricatured by the other side, endure to a degree in the official teaching of church institutions and theological bodies today, though there have been attempts to take a more charitable posture toward an

inventory of the actual differences and stakes. Chief among these efforts is the 1999 Joint Declaration on the Doctrine of Justification issued by the Roman Catholic Church and the Lutheran World Federation, suggesting that there exists a consensus understanding of the main features of justification amenable to both sides, despite persistent differences in vocabulary and related issues.

As the Christian West has struggled with the question of God's forgiveness of individual guilt and transmission of saving grace to the believer, the Christian East, in line with Gregory and those like him, has developed soteriologies based on *theosis*, the process of making God's own life the animating force of human life. Though concerned with the remission of sin and moral transformation, this impulse characteristic of Orthodox theologians also addresses more explicitly the renewal of life as such, including the retrieval and remaking of a physical body in and through physical death and resurrection. While *theosis* preserves the difference between God and creation, it asserts that creation in general and humans in particular are incomplete considered in themselves because they are meant to be illumined and enlivened by the presence of the Trinity. A new kind of life, therefore, is available to humanity thanks to the creative and re-creative work of God; one living that kind of life will find the whole sweep of desires, habits, practices, and dispositions transfigured, along with one's very self.

The European Enlightenment

Though not often prominently in conversation with Eastern religious traditions on the concept of enlightenment, many European philosophers of the sixteenth through nineteenth centuries imagine themselves as emerging from an era in which human inquiry was constrained by dogma and prejudice, and therefore working toward an expansion of human knowledge and consciousness. These "Enlightenment" thinkers often devoted serious attention to soteriology in ways that rearranged topics from the theological traditions they both inherit and protest against; three prominent such thinkers, selected from among many, are worth explicating.

Baruch Spinoza (1632–1677), a Dutch philosopher from a Portuguese Jewish family, imbued his master work *Ethics* with a deeply theological rationalism. For Spinoza, God is supremely real and identified with being as such; because God's infinitude includes all possible "attributes," there can be nothing that exists outside God. This means that humanity, and all that is, exists within God as modes of God's being. Because God is a necessary being, the order of all things existing in God flows necessarily, showing the commonplace belief in sheerly spontaneous free will to be false in favor of a certain kind of determinism that works according to natural laws. Spinoza does envision a freedom allotted to humans, however: the use of *conatus*, the impulse toward the preservation of one's own being, toward a detachment from the passions that might rage against one's life, in which quiet one may affirm, according to reason, the being that one is as an expression of God. Salvation, therefore, consists for Spinoza in the ability to say a "yes" to one's own existence.

Immanuel Kant (1724–1804), a Prussian philosopher and author of a famous "critical philosophy," pushes for a God whose reality, insofar as we can postulate it, lies outside the universe. For Kant, the basic problem is the tragic disjunction between human moral obligation and the pursuit of our happiness: we must always act in accordance with the moral law, but this does not guarantee the achievement of our desires in this lifetime. In his *Critique of Practical Reason* and *Religion within the Limits of Mere Reason*, Kant outlines an argument for belief in God and the immortality of the soul as an implication of

the moral life: if our experience of obligation to work in freedom toward the good is to be intelligible, we must assume the possibility of endless progress, which requires an immortal soul, as well as the coincidence of the good and happiness beyond this world, which requires a transcendent God. It is therefore reasonable to hope in a moral salvation: the human must be regenerated, perhaps by the example of one who incarnates the “Word,” but ultimately because of a conversion toward the moral law itself, in hopes of being worthy of ultimate happiness.

Georg Wilhelm Friedrich Hegel (1770–1831) makes an ambitious attempt to explain the progressive features of world history by means of the development of *Geist*, spirit or mind. For Hegel, history is the gradual unfolding of spirit through human intellect, culture, politics, and society, realizing itself in progressing depth of expressions. What is “in-itself” from the beginning in potential moves through stages toward being “in-and-for-itself,” having realized its potential by becoming conscious of itself with a consciousness that can hold its full being. Hegel’s “enlightenment,” as a result, is coming to see oneself and one’s world as manifestations of a larger whole that is working its power within oneself. In theological terms, the whole story of nature and history is a story of God’s creation of a perfect reflection of Godself, meant to carry the full potential of divinity as a living expression of and destination of rest for an eternal consciousness, as the acorn grows into an oak tree.

Salvation and Enlightenment in Recent and Contemporary Ethics

Soteriology is a rich avenue for reflection in recent and contemporary religious ethics. Such developments are organized here thematically, since these motifs recur across contexts and perspectives.

Salvation as Liberation

Liberation theologies of various kinds emerge in the twentieth century, many of which feature soteriology prominently as a way of construing the process of “becoming free” theologically. Latin American Liberation Theology, inaugurated by the 1968 Conference of Latin American Bishops in Medellín, Columbia, refocuses Christian life and thought around the needs of the oppressed using a class-based analysis. In the midst of massive disparities of wealth, these theologians and ethicists call for acts of solidarity with the poor and occasionally voluntary poverty as well. Figures such as Gustavo Gutiérrez, Ada Maria Isasi-Diaz, Leonardo Boff, and many others working from Latin America and the US show the implications for economic and religious life of globalization, consumer culture, resource allocation, and the anonymity of the poor to wealthier global citizens. Salvation consists not only in the amelioration of the poverty of the oppressed, but also for the wealthy in their relocation to the social margins in solidarity.

Black liberation theologies work analogously, largely though not exclusively in the United States, to give a theological account of the struggle for black power and equality in a world imbued with whiteness. James Cone offers a systematic depiction of the theological and ethical implications of God’s liberation from the power of white supremacy into a freedom and affirmation of blackness, in which any who side existentially with the oppressed may participate. This entails that moral judgments about the means of liberation, such as rebellions in cities in the 1960s, ought to be referred to the fundamental purpose of God in the world: the liberation of the oppressed. To be saved from white supremacy is not only an urgent ethical task, but the work of God, which cannot be limited by civil law.

These liberation theologies – and allied feminist and postcolonial theologies – seek to situate the human person, long the primary subject of soteriology, back within her social and political context. The primary site of God's salvific work is the political and social realm, where God is transforming the structures of common life to reflect – perhaps ultimately to instantiate – God's coming reign of justice and peace. Salvation for the individual can be neither understood nor achieved apart from participation in shared forms of life, revealing all salvation to be situated in contexts.

Body and Spirit

Modern soteriologies have seen in their traditional inheritance a persistent split between body and spirit, and a preference for the latter. As a result of increasing interest in the dynamic interplay between, for example, human neurochemistry and personality, many theorists engaged in soteriology have felt a need to understand salvation as transformation of both spirit and body, often itself achieved as a reintegration of what traditional thought and modern life have torn asunder.

Womanist theologians and ethicists, arguing for an intersectional analysis of the multiple forms of social identity all persons inhabit simultaneously, seek to name and resist multidimensional oppressions based on race, class, gender, and other social categories. Emilie Townes, Katie Geneva Cannon, Angela Sims, and others have argued for understanding salvation as wholeness for the abjected. Soteriologies based on the flight of the soul to another world abandon the oppressed to, and therefore at least tacitly authorize, a world of unjust social arrangements; true salvation for those facing simultaneous oppressions must liberate the body from the imposition of unjust labor, characterization by inaccurate stereotypes, judgment according to violent aesthetic norms, and subjection to violence and the threat of violence, among other obstacles for thriving embodied life. Thus, wholeness involves the living presence of God animating the entire person, body and soul, which implicates not only the spiritual but also the social dimensions of human life.

Many have argued in biblical and historical studies – including N. T. Wright, biblical scholar and Anglican bishop – for the clarification among Christian confessions that the resurrection of the body is not identical with the immortality of the soul. Working to loosen the grip of Platonic philosophy of Christian soteriology, these researchers assert a distortion among popularly-held soteriologies that denigrates the body and renders traditional forms of Christian belief, dependent as they are on the unity of body and soul, unintelligible. Soteriologies that fail to appreciate the distinction between the resurrection of the body and the immortality of the soul may reinforce ethical theories and practices of, for example, environmental neglect, since the natural world is not believed to be integrally-related to the destiny of the soul. On the other hand, if a soteriology is formulated in which the whole human person is redeemed and destined to be present for the renewal of the whole world, an impulse emerges that would endow environmental ethics with the full weight of future glory.

Notes on Contributors

Ebenezer Akesseh is a Postdoctoral Teaching Fellow at the University of Notre Dame. He holds a PhD in Theology from Notre Dame with moral theology as his area of specialization. He also has MPhil in Sociology and an MPhil in Human Resource Management from the University of Ghana. His interests include fundamental moral theology, Catholic social teaching, African ethics, political theology, virtue ethics, theology and business ethics, and comparative ethics.

Muhamad Ali is Associate Professor of Islamic Studies and Director of the Middle East and Islamic Studies Program at the University of California, Riverside. He is the author of *Islam and Colonialism: Becoming Modern in Indonesia and Malaya* (2016), *Bridging Islam and the West: An Indonesian View* (2009), and *Teologi Pluralisultikultural* (Multicultural-Pluralist Theology, 2003) as well as book chapters and journal articles on various topics, including an Indonesian legal reasoning of interfaith marriage, Indonesian Muslims' views of Jews and Judaism, Indonesian Islamic moderate and liberal movements, Malaysian progressive Islam and international relations, and Indonesian and Malay Muslim literature on ethics and etiquette.

Maria Antonaccio is Professor of Religious Ethics and the Director of the Humanities Center at Bucknell University. Her books include *A Philosophy to Live By: Engaging Iris Murdoch* and *Picturing the Human: The Moral Thought of Iris Murdoch*. Her current research focuses on the dilemmas of human agency in the Anthropocene and the prospect of fashioning a critical humanism in conversation with posthumanist and new materialist alternatives.

Ankur Barua is Lecturer in Hindu Studies at the University of Cambridge. His primary research interests are Hindu Studies and the comparative philosophy of religion. Under the former, he teaches and researches various historical, philosophical, and conceptual aspects of the Hindu traditions as they have developed in the Indian subcontinent. Further, an integral part of his academic research is the comparative study of religions: in particular, the question of whether Christian terms such as “grace,” “creation,” and “God” have any Hindu analogues, and Hindu terms such as *dharma*, *karma*, and *saṃsāra* have any Christian equivalents.

Mark Berkson is Professor and Chair in the Department of Religion at Hamline University. He teaches courses in the religious traditions of East and South Asia, Islam, and comparative religion. His scholarly work on topics such as Confucian and Daoist thought, religious ethics, and death and dying, has been

published in numerous books and journals. He has released two lecture series with The Great Courses – *Cultural Literacy for Religion and Death, Dying and the Afterlife: Lessons from World Cultures* – and is currently working on a third that will focus on comparative religious thought and practice.

John Ayotunde (Tunde) Isola Bewaji was formerly Jay Newman Professor of Philosophy of Culture, Brooklyn College and Guggenheim Research Fellow in Philosophy of Culture. He is the founding editor of the *Caribbean Journal of Philosophy*; and the founding president of the International Society for African Philosophy and Studies (ISAPS). His books include *Beauty and Culture* (2003), *An Introduction to the Theory of Knowledge* (2007), *Narratives of Struggle* (2012), *Ontologized Ethics* (co-editor, 2013), *Black Aesthetics* (2013), *Introduction to Philosophy and Logic* (co-editor, 2014), *The Rule of Law and Governance in Indigenous Yoruba Society* (2016), *The Humanities and the Dynamics of African Culture in the 21st Century* (co-editor, 2017), *Media Theory, Practice and Ethics* (joint author, 2017), and *Identity Recreation in Global African Encounters* (2019) and *Fragmented Identities of Nigeria* (co-editor, 2021).

Elizabeth Bucar is Professor of Religion and Dean's Leadership Fellow at Northeastern University. She writes and teaches about gender, sexuality, and politics in everyday religious practice. Bucar's books include *Creative Conformity: The Feminist Politics of US Catholic and Iranian Shi'i Women* (Georgetown University Press, 2011), *The Islamic Veil: A Beginner's Guide* (Oneworld Publications, 2012), the award-winning *Pious Fashion: How Muslim Women Dress* (Harvard University Press, 2017), and *Stealing My Religion: Not Just Any Cultural Appropriation* (Harvard University Press, 2022).

Bénézet Bujo is Professor Emeritus at the University of Fribourg where he taught both moral theology and African theology. He has also served as Vice-Rector at the same university (2000–2003). His many works include *Afrikanische Theologie in ihrem gesellschaftlichen Kontext* (1986), *Die ethische Dimension der Gemeinschaft* (1993), *Foundation of An African Ethic* (2001), and *Quelle église pour un christianisme authentiquement africain?* (2021). He is co-editor of the series *Théologie africaine* (Schwabe Verlag).

John Ross Carter (1938–2020) was Professor of Philosophy and Religion and Robert Ho Professor in Asian Studies at Colgate University. He published on the Theravāda tradition, especially in Sri Lanka, and more recently contributed numerous articles on the Pure Land tradition in Japan, while editing works and writing on issues of religious pluralism. He also served as Director of Chapel House at Colgate.

Francisca Cho is Professor of Buddhist Studies at Georgetown University. Her research focuses on East Asian Buddhism and its expression through fiction, poetry, and film. She also looks at the interface between Buddhism and the modern world via the dialogue between Buddhism and science, which entails methodological questions about how to account for changes in religious systems. Her latest book is *Seeing Like the Buddha: Enlightenment through Film* (2017) and her forthcoming book is a study of Buddhism in relation to the category of cinema.

David A. Clairmont is Associate Professor in the Department of Theology at the University of Notre Dame. His research and teaching focus on comparative religious ethics, religious accounts of professional ethics, and the relationship between ethics and spirituality. He is the author of *Moral Struggle and Religious Ethics: On the Person as Classic in Comparative Theological Contexts* (Wiley-Blackwell, 2011), and *Religious Ethics: Meaning and Method* (with William Schweiker, Wiley-Blackwell, 2020). His articles

have appeared in the *Journal of the Society of Christian Ethics*, the *Journal of the American Academy of Religion*, the *Journal of Religious Ethics*, and the *Journal of Moral Theology*.

Mark Csikszentmihalyi is the Marjorie Meyer Eliaser Chair of International Studies and Director of the Group in the Study of Religion at the University of California, Berkeley. For a decade he edited the *Journal of Chinese Religions*, and he has written extensively on premodern Chinese thought. Most recently he was co-editor, along with Michael Nylan, of *Technical Arts in the Han Histories* (2021). He is currently working on a recently excavated biography of Confucius dating from the Han Dynasty.

Vine Deloria, Jr. (1933–2005) was a member of Standing Rock Sioux Tribe of North Dakota. He was Professor of Political Science at the University of Arizona 1978–1990 and Professor of History at the University of Colorado 1990–2000. His books include *Custer Died for Your Sins* (1969), *God is Red* (1973), *Red Earth White Lies* (1996), and *Evolution, and Creationism and Other Modern Myths* (2002).

Frederick Mathewson Denny is Professor of Islamic Studies and the History of Religions in the Religious Studies Department at the University of Colorado at Boulder. He has studied Islamic ritual and devotional practices and Muslim communities in Egypt, Indonesia, Malaysia, and North America. His publications include the widely used textbook *An Introduction to Islam* (2nd ed., 1994).

Segun Gbadegesin is Professor of Philosophy at Howard University, Washington, DC where he teaches African philosophy, ethics, and bioethics. His publications include *African Philosophy: Traditional Yoruba Philosophy and Contemporary African Realities* (1991) and he is the co-author of *Ethics, Higher Education and Social Responsibility* (1996).

Ronald M. Green is Professor Emeritus for the Study of Ethics and Human Values at Dartmouth College. From 1998–1999 he was President of the Society of Christian Ethics, and he has served two elected terms as Secretary of the American Academy of Religion. In 2005, he was named a Guggenheim Fellow. He is the author of nine books, editor of five, and author of more than 170 articles in theoretical and applied ethics. His books include *Religious Reason* (1978), *Religion and Moral Reason* (1988), *Kierkegaard and Kant: The Hidden Debt* (1992), *The Human Embryo Research Debates* (2001), *Babies by Design* (2007), and *Kant and Kierkegaard on Time and Eternity* (2011).

Laura S. Grillo is an affiliated faculty at Georgetown University. Her book, *An Intimate Rebuke: Female Genital Power in Ritual and Politics in West Africa* (Duke University Press, 2018), was a finalist for the Raboteau Prize in Africana Studies. She co-authored the seminal textbook, *Religions in Contemporary Africa* (Routledge, 2019). She served on the editorial boards of the *Journal of the American Academy of Religion*, *Religious Studies Review*, and the Africa section of *Religion Compass Journal*. Her particular interests are gender, ethics, and postcolonial theory.

Vigen Guroian is retired Professor of Religious Studies in Orthodox Christianity at the University of Virginia. He is an Armenian Orthodox theologian whose books include *Incarnate Love: Essays in Orthodox Ethics* (2nd ed., 2002), *The Melody of Faith: Theology in an Orthodox Key* (2010), and *The Orthodox Reality: Culture, Theology and Ethics in the Modern World* (2018).

Barry Hallen was Reader in Philosophy at Obafemi Awolowo University, Nigeria, Professor of Philosophy, Morehouse College, Atlanta, GA, Fellow and Associate of the W. E. B. Du Bois Institute for

African and African-American Research, Harvard University. His publications include *Knowledge, Belief, and Witchcraft: Analytic Experiments in African Philosophy* (rev. ed., Stanford University Press, 1997), *The Good, the Bad and the Beautiful: Discourse About Values in Yoruba Culture* (Indiana University Press, 2000), *African Philosophy: the Analytic Approach* (Africa World Press, 2006), *A Short History of African Philosophy* (2nd ed., Indiana University Press, 2009), *Reading Wiredu* (Indiana University Press, 2021).

Charles Hallisey is the Yehan Numata Senior Lecturer on Buddhist Literatures at Harvard Divinity School. Working in the Asian humanities, with a special focus on the cultural history of Theravāda Buddhism, he has recently published “Works and Persons in Sinhala Literary Culture” in *Literary Cultures in History: Some Reconstructions from South Asia* (2003).

Anne Ruth Hansen is a historian of religion with research interests in the history of Buddhist ethical ideas and modern religious reform and social justice movements in Southeast Asia, Cold War Buddhism, colonial Buddhism, and religion and visual cultures. Her current book projects include a study of Buddhist temporality during the Cold War in modern Southeast Asia as well as work on Buddhist visual ethics of care in nineteenth- and twentieth-century Cambodia. She is the author of *How to Behave: Buddhism and Modernity in Colonial Cambodia, 1860–1930* (2007) and co-editor of *At the Edge of the Forest: Essays on Cambodia, History and Narrative* (2008). She is Professor of History and Religious Studies in the Department of History and Religious Studies Program at the University of Wisconsin–Madison, where she has also served as the Director of the Center for Southeast Asian Studies.

Gardner Harris is an Assistant Professor in the Religion Department at Hampden-Sydney College. His current area of research centers on classical and medieval Tamil literature. In particular, he is interested in ways in which concepts in the classical literature influenced religious ideas in medieval devotional literature. Harris has published on *Māṇikkavācakar*, the renowned ninth- to tenth-century Tamil Śaiva poet-saint, and on the phenomenology of time in classical Tamil poetry.

Paul L. Heck is Professor of Theology in the Department of Theology and Religious Studies at Georgetown University. He received his doctorate in Islamic Studies from the University of Chicago and is a past member of Princeton University’s Society of Fellows (2001–2004). He has published extensively on the history of religious thought (especially its humanistic side), spirituality and ethics, political theology, skepticism, and emotions across religious traditions, specifically Judaism, Christianity, and Islam. His online course, “Theo-Humanism: God’s Ways in Today’s World,” is available on the edX platform. Noteworthy recent publications include the following articles: “The Intolerance of Rationalism” in *Intolerance, Polemics and Debate in Antiquity* (2019), “Skepticism in Classical Islam” in *Skepticism from Antiquity to the Present* (2018), and “How to Restrain the Restrainer” in *Studies in Christian Ethics* (2016).

Maria Heim is George Lyman Crosby 1896 and Stanley Warfield Crosby Professor in Religion at Amherst College. She is also a Guggenheim fellow. Her most recent books are *Voice of the Buddha: Buddhaghosa on the Immeasurable Words* (Oxford University Press, 2018) and *Buddhist Ethics* (Cambridge University Press, 2020). She is currently working on emotions in classical Indian thought.

Philip J. Ivanhoe is the John Findlay Visiting Professor of Philosophy at Boston University. He teaches East Asian and Western Philosophy and specializes in the history of East Asian religious thought and its potential for contemporary ethics. Among his publications are *The Daodejing of Laozi* (2003) and *Ethics in the Confucian Tradition: The Thought of Mengzi and Wang Yangming* (2002). He is co-editor of the anthology *Working Virtue: Virtue Ethics and Contemporary Moral Problems* (forthcoming).

Thomas P. Kasulis is University Distinguished Scholar and Professor of Comparative Studies Emeritus at Ohio State University. Specializing in the comparative study of philosophy and religion, his primary interests are Christianity, Buddhism, and Shintō, as well as the philosophy of religion in both the West and modern Japan. His most recent book is *Engaging Japanese Philosophy: A Short History* (2018). It complements *Japanese Philosophy: A Sourcebook* (2011), which he co-edited with James Heisig and John Maraldo. Currently, his research explores how alternative forms of knowing can arise from body-mind praxes steeped in different cultural and philosophical assumptions.

Damien Keown is Emeritus Professor of Buddhist Ethics at Goldsmiths, University of London, and founding co-editor of the *Journal of Buddhist Ethics*. His publications include *The Nature of Buddhist Ethics* (1992), *Buddhism and Bioethics* (1995), *Buddhism and Abortion* (1999), and *Contemporary Buddhist Ethics* (2000).

Nico Koopman is Vice-Rector for Social Impact, Transformation, and Personnel, as well as Professor of Systematic Theology and Ethics at Stellenbosch University. He was the first Chair of the Global Network for Public Theology, and is a fellow of the Center of Theological Inquiry in Princeton. Two of his most recent publication are a 2020 monograph, co-authored with Robert Vosloo, *Reading Bonhoeffer in South Africa after the Transition to Democracy* (Peter Lang), and the following 2019 essay: “Envision and Criticize: Doing Public Theology When Democracy Seems to Fail” in *International Journal of Public Theology*.

Nancy Levene is Brooks and Suzanne Ragen Professor of Religious Studies at Yale University. Her most recent book is *Powers of Distinction: On Religion and Modernity* (2017) and her current research is on the freedom of interpretation.

Shaul Magid is the Distinguished Fellow in Jewish Studies at Dartmouth College. He is the author of *Hasidism on the Margin: Reconciliation, Messianism and Antinomianism in Izbica/Radzin Hasidism* (2003), editor of *God's Voice from the Void* (2001), and co-editor of *Beginning/Again: Toward a Hermeneutics of Jewish Texts* (2001). He has written numerous scholarly and popular articles in the field of Jewish mysticism and modern Jewish philosophy.

Beverley McGuire is a Professor of East Asian Religions at the University of North Carolina Wilmington. She received a PhD in East Asian Languages and Civilizations from Harvard University, an MDiv from Harvard Divinity School, and a BA in Comparative Literature from Stanford University. Her research focuses on the history of Chinese Religions, especially late imperial and modern Chinese Buddhism. Her book, *Living Karma: The Religious Practices of Ouyi Zhixu* (Columbia University Press, 2014) examines the karmic worldview of an eminent Chinese Buddhist monk and his religious practices of divination, repentance, vows, burning, and bloodwriting.

Christina McRorie is an Assistant Professor of Theological Ethics at Creighton University. Her research uses resources drawn from Christian theology and ethics, political economy, and economics to consider questions about moral agency and obligation in markets. She is currently at work on a manuscript titled *Capitalism as “The World.”*

Eske Møllgaard is Professor of Philosophy at Rhode Island University. Among his recent publications are: *The Confucian Political Imagination* (Palgrave Macmillan, 2018), “Is Confucian Discourse Philosophy?” in *Philosophy East and West*, “The Uneasy Relation between Chinese and Western Philosophy” in *Dao: A Journal of Comparative Philosophy*, and “Problems of Language and Logic in Daoism” in *Dao Companion to Chinese Philosophy of Logic*, edited by Yiu-ming Fung (Springer, 2020).

Anne E. Monius (1964–2019) was Assistant Professor of South Asian Religious Traditions at Harvard Divinity School. She is the author of *Imagining a Place for Buddhism: Literary Culture and Religious Community in Tamil-Speaking South India* (2001).

Ebrahim Moosa is Mirza Family Professor of Islamic Thought and Muslim Societies in the Keough School of Global Affairs at the University of Notre Dame and with appointment in the Department of History. Moosa’s interests span both classical and modern Islamic thought with a special focus on Islamic law, history, ethics, global affairs, and theology. His book *What Is a Madrasa?* was published in March 2015 by the University of North Carolina Press. He is the author of *Ghazali and the Poetics of Imagination*, winner of the American Academy of Religion’s Best First Book in the History of Religions (2006), and editor of the last manuscript of the late Professor Fazlur Rahman, *Revival and Reform in Islam: A Study of Islamic Fundamentalism*. In 2005 Moosa was named a Carnegie Scholar to pursue research on Islamic seminaries in South Asia.

Gene Outka was Dwight Professor of Philosophy and Christian Ethics at Yale University and a former President of the Society of Christian Ethics. He is the author of *Agape: An Ethical Analysis* (1972) and co-editor and contributor to *Norm and Context in Christian Ethics* (1968), *Religion and Morality* (1973), and *Prospects for a Common Morality* (1993).

Roy W. Perrett was formerly Professor of Philosophy at the University of Hawaii, but currently resides in Canberra, Australia. He has published widely on both Indian and Western philosophy, including six authored or edited books. Among the authored books are *Hindu Ethics: A Philosophical Study* (1998) and *An Introduction to Indian Philosophy* (2016). Forthcoming articles include “Forgiveness in Hinduism” and “Moral Motivation and Hindu Ethics.”

Santiago Piñón, Jr. is an Associate Professor of Religion and Ethics in the Religion Department of Texas Christian University. He is also the Director of the Latinx Studies Program. His latest publication is “Losing A Child: A Father’s Methodological Plight” in *Feminist Trauma Theologies: Body, Scripture and Church in Critical Perspective*, edited by Karen O’Donnell and Katie Cross (SCM Press, 2020). Here, he attempts to imagine a new way of understanding gender – being a man.

Jean Porter is the John A. O’Brien Professor of Theological Ethics at the University of Notre Dame. She is a member of the American Academy of Arts and Sciences, and a Past President of the Society of Christian Ethics. Her recent publications include *Natural and Divine Law* (1999), *Nature as Reason* (2005), and *Justice as a Virtue* (2016).

Joseph Prabhu is Professor of Philosophy and Religion at California State University, Los Angeles and co-editor of the journal *ReVision*. He has been a Visiting Professor at many universities in Germany, India, and the USA and a Senior Fellow at Harvard Divinity School. He is editor of *The Intercultural Challenge of Raimon Panikkar* (1996) and *Indian Ethics: Classical Traditions and Contemporary Challenges* (2004).

Devaka Premawardhana is Associate Professor of Religion at Emory University. He is an ethnographer and scholar of global Christianity who conducts field research in southern Africa. His first book, *Faith in Flux: Pentecostalism and Mobility in Rural Mozambique* (University of Pennsylvania Press) received the Society for Pentecostal Studies' best book prize and was also a finalist for a prize from the *Journal of Africana Religions*. Premawardhana has contributed to existential-phenomenological anthropology and religious studies theory, particularly through the forthcoming edited volume *Between Life and Thought: Existential Anthropology and the Study of Religion* (University of Toronto Press).

Hilary Putnam (1926–2016) was Cogan University Professor Emeritus at Harvard University. His books include *Reason, Truth and History* (1981), *Pragmatism: An Open Question* (1995), *The Threefold Cord* (1999), *Renewing Philosophy* (1992), *Realism with a Human Face* (1990), and *Ethics Without Ontology* (2004).

Shyam Ranganathan is a member of the Department of Philosophy and York Center for Asian Research, York University, Toronto. His work spans moral and political philosophy, research methodology, philosophy of language, philosophy of thought, translation studies, Asian and especially South Asian philosophy. His recent book is: *Hinduism: A Contemporary Philosophical Investigation* (Routledge, 2019), and most recent edited volume is *The Bloomsbury Research Handbook of Indian Ethics* (2017). His recent contributions to translation studies includes "Context and Pragmatics" in *The Routledge Handbook of Translation and Philosophy* (Routledge 2018, 195–208).

A. Kevin Reinhart is Associate Professor of Islamic Studies in the Religion Department at Dartmouth College. His research interests are in Islamic law and ethics, Islamic ritual practices, and late Ottoman Islamic ideologies. He is the author of *Before Revelation: The Boundaries of Muslim Moral Thought* (1995).

Abdulaziz Sachedina is Professor of Islamic Studies at George Mason University. He has been conducting research and writing in the field of Islamic law, ethics, and theology (Sunni and Shi'ite). His publications include: *Human Rights and the Conflicts of Culture*, co-authored (University of South Carolina, 1988), *The Just Ruler in Shiite Islam* (Oxford University Press, 1988), *The Prolegomena to the Qur'an* (Oxford University Press, 1998), *The Islamic Roots of Democratic Pluralism* (Oxford University Press, 2002), *Islamic Biomedical Ethics: Theory and Application* (Oxford University Press, 2009), *Islam and the Challenge of Human Rights* (Oxford University Press, 2009), *Islamic Ethics: Fundamental Aspects of Human Conduct* (Oxford University Press, 2021).

Elias Sacks is Director of the Program in Jewish Studies and Associate Professor of Religious Studies at the University of Colorado Boulder. His research focuses on Jewish thought, philosophy of religion, religion and politics, religious ethics, and theories and methods in the study of religion, and his publications include works on medieval and modern thinkers such as Maimonides, Spinoza, Moses Mendelssohn, Nachman Krochmal, Hermann Cohen, Franz Rosenzweig, and Jacob Taubes. He is the author of *Moses*

Mendelssohn's Living Script: Philosophy, Practice, History, Judaism (Indiana University Press, 2017) and published some of the first English translations of Mendelssohn's Hebrew writings.

William Schweiker is Edward L. Ryerson Professor of Theological Ethics at the University of Chicago. His scholarship and teaching engage theological and ethical questions attentive to global dynamics, comparative religious ethics, the history of ethics, and hermeneutical philosophy. A frequent lecturer and visiting or guest professor at universities around the world, he has been deeply involved in collaborative international scholarly projects. His books include most recently *Religion and the Human Future: An Essay in Theological Humanism* (2008, with David E. Klemm), *Dust that Breathes: Christian Faith and the New Humanisms* (2010), and *Religious Ethics: Meaning and Method* (2019–2020, with David Clairmont). He is also Editor-in-Chief of the *Wiley-Blackwell Encyclopedia of Religious Ethics*.

Garry Sparks is Associate Professor of Religious Studies at George Mason University in Fairfax, Virginia. He is author of *Rewriting Maya Religion* (University Press of Colorado, 2019) and the principal author of *The Americas' First Theologies* (Oxford University Press, 2017), and he serves on the editorial board of the *International Journal of Latin American Religions*. With support of the National Endowment for the Humanities and the American Academy of Religion he is currently coordinating a critical translation of the complete *Theologia Indorum* into English and Spanish from K'iche' and Kaqchikel manuscripts.

Jef Van Gerwen (1952–2002) was a member of the Jesuit faculty of the University of Antwerp. His research focused on the Roman Catholic social justice tradition, the ethics of early Christian communities, and contemporary issues in business ethics. His works include *Niet uit eigen macht. De kerk als morele gemeenschap* (1987), *More Europe? A Critical Christian Inquiry Into the Process of European Integration* (co-editor, 1997), *Business en ethiek: spelregels voor het ethisch ondernemen* (2nd ed., 2002), and *Onderweg. Over de navolging van Christus in de 21ste eeuw* (2003).

Kirsten Wesselhoeft is Assistant Professor of Religion at Vassar College. Her research draws on ethnography, intellectual history, and religious ethics to study Muslim social activism and intellectual culture, with a current focus on the modern North Atlantic. She is preparing a manuscript entitled *Fraternal Critique: Muslim Social Ethics in Contemporary France*, which highlights class mobility, racialization, feminist politics, and trans-Atlantic circulation in Muslim Paris. Wesselhoeft's articles have appeared in *Sociology of Islam*, the *Journal of the American Academy of Religion*, the *Routledge Handbook of Islam and Gender*, and the *Oxford Review of Education*.

Todd Whitmore is Associate Professor of Theology and Concurrent Associate Professor of Anthropology at the University of Notre Dame. His work uses ethnographic methods to raise theological questions. From 2005–2013, this took him to war and post-conflict zones in northern Uganda and South Sudan, leading to his book, *Imitating Christ in Magwi: An Anthropological Theology* (Bloomsbury/T&T Clark, December, 2018). Currently Professor Whitmore's work is local, where he serves as a Certified Addiction Peer Recovery Coach for persons with methamphetamine and opioid addictions in northern Indiana. His research asks how Christianity, race, and class work in the construction of public ideas of who counts as an addict.

Ellen Y. Zhang is Professor in and Head of the Department of Religion and Philosophy and Director of the Centre for Applied Ethics at Hong Kong Baptist University. She is editor-in-chief for *International Journal of Chinese and Comparative Philosophy of Medicine* and is on the editorial board for the *Journal of Religious Ethics*. Her research interests include Chinese philosophy (Daoism and Buddhism) and comparative philosophy and ethics. Her recent publications include “Why Sex? Sex-bots from a Daoist Perspective” in *Sex Robots: Their Social Impact and the Future of Human Relations* (2021) and “Informed Consent – A Critical Response from a Buddhist Perspective” in *Religion, Multiculturalism and Bioethics* (2021).

Preface to Volume II – Moral Traditions

David A. Clairmont

The *Encyclopedia of Religious Ethics* introduces readers to basic issues in moral inquiry, a selection of moral traditions, and surveys a range of moral issues. Each of the three volumes covers one of these three elements of religious ethics, and this present Volume II focuses on moral traditions.

What distinguishes “religious” ethics from other approaches to ethics is, first and foremost, its connection to the religions. While there is much debate in modern scholarship about the precise meaning of the term “religion” there is at least a widely shared conviction that there are such things as religions, by which is meant social groups and traditions of thought and practice that are in one way or another about the deepest human questions and the ultimate goal(s) of human life, including but not limited to reverence for divine being or beings. Thought about or practice in relation to what is held to be ultimately real and important seems to be a longstanding feature of human life across historical periods, geography, and cultural traditions.

This volume is organized around a series of what we describe as “moral traditions” by which we mean longstanding historical traditions, some defined geographically and others in terms of shared beliefs and practices. These are, in the order presented in the volume: Judaism, Christianity, Islam, Buddhism, Indian Religions, Chinese Religions, African Religions, and Religions of the Americas. The volume is divided into two parts: (1) Historical and Theoretical Perspectives and (2) Contemporary and Cultural Perspectives. In Part 1, for each moral tradition, the reader will find a series of four entries. The first entry for each tradition considers the terminology of ethics and whether or not it is appropriate to that tradition, considering the various ways that the tradition speaks about values, rules, and what a good and fulfilling human life looks like in that community. The second entry considers the origins of ethics in that tradition, both its earliest forms of moral thinking and acting but also, building on the first entry, how that tradition understood its own early history of thinking about the good and the right in light of later developments. The third entry most often considers differentiations in approaches to ethics in each tradition, highlighting the internal diversity within communities whose members nevertheless share much in common. The fourth entry usually considers trajectories of ethics, examining how current ethical reflection in the traditions links longstanding themes to new forms of engagement with emerging problems.

In Part 2 the reader will find entries, grounded in the traditions covered in Part 1 (although not covering all of them) and grouped around three related topics: (1) Practices and Communities, (2) Modes of Interpretation, and (3) Global Interactions. As an exploration of “Contemporary and Cultural Perspectives” these entries reflect recent developments in the ethical life of the religions but also new

approaches to the study of religious ethics over the past thirty years. For example, the entries on *Practices and Communities* seek to introduce readers to the range of practices in current religious communities that address the various dimensions of the moral life. Our contributors discuss the shape of individual and group practices, how practices developed in response to new moral problems, and also the ways that older community practices have been refocused and in some cases reformulated in light of the challenges these communities face today. In the entries on *Modes of Interpretation*, our contributors consider how the religions interpret oral traditions, texts, and practices from the past but also how individual and community experiences frame questions that are posed to these depositories of community wisdom. In some cases, as our contributors show, new interpretation is occasioned by contact with those outside the community, such as other political, cultural, and religious groups or even the systems of knowledge construction and intellectual persuasion that arose at certain times, such as the programs of European colonialism. At other times, new interpretation results from experiences within the community as it continues a centuries old engagement with the meaning of its foundational stories and inherited ways of life. In the entries on *Global Interactions*, our contributors discuss the history and present situation of global inter-traditional contact and exchange. In some cases, our contributors examine historical global interactions in an attempt to discern the effect of past encounters on current practice. In other instances, they review new global encounters that have been occasions for both inter-traditional cooperation but also contestation and even conflict. The contributors to this volume also demonstrate a commitment to exploring new areas of scholarship, approaches to the study of religion and ethics, and an awareness of the current global social, political, and economic situations affecting people around the world.

Reading the entries in Part 2 together, we encourage readers to look for the similarities and differences between religions in how these traditions understand their own practices and communities, their modes of interpretation, and their historical and contemporary global interactions. No attempt has been made to impose on our contributors a single view of the topics on which they were invited to contribute entries, and thus the reader will find some entries that support and other entries that critique the very structure of how moral traditions are explored here. We judge this spirited conversation to be an important (albeit probably inevitable) and beneficial feature of religious ethics as a field. It is our hope in the future, in possible later editions of the *Encyclopedia*, to expand coverage of the traditions examined in Part 2 and also to further refine and differentiate those explored in Part 1.

In his entry “On Religious Ethics” that introduces each volume of the *Encyclopedia*, William Schweiker speaks of religious ethics as a field of study that undertakes three interrelated tasks – critical, comparative, and constructive – from what he describes as a hermeneutical standpoint. Schweiker argues that “precisely as hermeneutical in character, religious ethics labors between and among traditions rather than [focusing] on the incommensurability of language-games, distinct action guides, or even moral world-views”. That “labor among traditions,” rather than focusing on a single tradition, highlights the importance of what Schweiker further along in this entry describes as a multidimensional approach to religious ethics. The interlocking *dimensions* of reflection – descriptive, normative, practical, fundamental, and metaethical – arise from the persistent questions that surround human existence and that “demarcate a space of human existence determined by the problem of how one ought to live religiously.” The *Encyclopedia* as a whole enacts this multidimensional approach insofar as the three volumes present for scholarly reflection “the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide

conduct”. As such the complexity of ethics, no less than the complexity of the religions themselves, supports an approach to ethical study that matches the complexity of the subject under investigation.

While the editors of the three volumes of the *Encyclopedia* support, to varying degrees, a hermeneutical approach to religious ethics, to view the field of religious ethics as presented in these volumes as proceeding from a hermeneutical standpoint is less a prescriptive than a descriptive statement – and even an invitation. Readers are invited to engage in the critical, constructive, and comparative tasks themselves as they consider the entries in each volume of the *Encyclopedia*. The entries in this volume on moral traditions allow readers to begin the project of thinking with the religions, considering the insights that they provide both for moral theory in the study of ethics and for the perennial human questions and practical concerns about how to live well in right relation to one’s neighbors.

INTRODUCTION

On Religious Ethics

William Schweiker

The publication of the *Blackwell Companion of Religious Ethics* in 2005 represented a defining moment for religious ethics. Happily, this new *Encyclopedia of Religious Ethics*, incorporating and updating the entirety of the *Companion* and published fifteen years later, continues the work of defining the meaning, task, and forms of religious ethics. Ethicists, historians of religion, theologians, philosophers, political theorists, and other experts have explored the moral outlooks and practices of the world's religions. Drawing on and revising religious resources, basic themes in Moral Theory as well as a host of contemporary moral and political problems are treated. The *Encyclopedia's* three volumes mirror the structure of the *Companion* but now greatly expanded: Volume I on issues in Moral Theory; Volume II on Moral Traditions; Volume III on Moral Problems. Throughout the volumes, topics will be explored in depth and in most cases comparatively even as the individual authors express their reasons and judgments on the topics.

Given the comprehensive nature of this work, the purpose of the present entry is not to provide a detailed "introduction" to the volumes. Such an introduction is not possible given the sheer size of these volumes and insofar as this is a collective work rather than a single line of argument. This entry is meant to provide orientation to the range of questions and kinds of thinking found in the various parts of *The Encyclopedia of Religious Ethics*.

Religious Ethics?

Anyone who works in religious ethics confronts an immediate and obvious problem. "Ethics" or "moral philosophy" is not indigenous to the world's religions. Inspired by Socrates and other sages, Greek and Roman thinkers engaged in the rational analysis and justification of norms, practices, forms of character, and ways of life believed to secure human happiness or well-being (*eudaimonia*). The inspiration of Socrates, and the memory of his conviction and execution on the charge of impiety, meant that ethics was also a challenge to the authority of religious and traditional moral beliefs. What is more, the conception of a good human life advocated by Hellenistic philosophers is foreign to the religions. Religious traditions obviously sustain reflection on human well-being, happiness. However, these accounts are set within an order defined by beings, realms, ideals, purposes, and practices not limited to human life and flourishing.

The scope of concern found in the world's religions is thereby wider than the discourse of ethics and Hellenistic ideas about human well-being. It is quite unremarkable, then, that the world's religions have generally not used the idea of ethics to specify the character of their outlooks on what defines a good life, right conduct, noble character, and proper social relations. For scholarly purposes, *ethics*, as used in this *Encyclopedia*, is the term for a discipline of thought that interprets, critically assesses, and, often, applies the *morality* of a religious community or tradition. *Morality*, accordingly, is the actual rules, duties, goods, rituals, practices, and values of a community used to orient life.

Similar problems surround the idea of "religion." None of the historical legacies explored in this *Encyclopedia* initially defined themselves as a religion. The term seems to have arisen from the Latin *religare*, meaning to tie or to bind. Religion specified how one was bound to the origins of the city of Rome as itself a sacred reality. Other ideas of religion developed, especially during the seventeenth to twentieth centuries, in order to facilitate the study of the beliefs, practices, values, and histories of human communities. As explored in the following volumes, definitions range from religion as belief in gods or one God, claims about sacred power, ultimate concern, to the charge that religion is about concealed mechanisms of domination.

Most contemporary scholars agree that a religion includes several features: convictions about what is most important in life (experiences like birth and death, sex and sorrow) in relation to what is believed to be ultimate, sacred, holy, or divine, ritual actions, beliefs about the whence and whither of existence, codes of conduct, communal life and its structures, and also experiences of transcendence (e.g. enlightenment, redemption, mystical insight), religious leaders. However, these features of religion are disputed and bear different meanings in diverse cultures and traditions. Again, for scholarly purposes, this *Encyclopedia* holds that the distinctive feature of *religions* from other human sociocultural forms is that they are about what is ultimately important and real for some community of people. That is to say, the referent or object of religious devotion and/or practice is not just what is important or valuable to people, but it must also, in some way, be real, defined in many ways. Likewise, what is real (however defined) is not the referent or object of religion if it is not ultimately important to some human community. While variously conceived, some social and cultural form or practice is not *religious* if it does not bind together importance with something, someone, or some condition that is held to be real.

The idea of "religion," just like "ethics," is a scholarly invention. As rightly noted in the various parts of this *Encyclopedia*, these ideas are not native to traditions, much less necessary categories of the human mind. They are tools for inquiry and reflection. What is more, one must keep distinct, if sometimes related, the morality or ethics of a religion (the actual ways of life, beliefs, values, norms, and outlooks of a people) from the intellectual labor of scholars and thinkers called "ethics" and/or "religious ethics." What is sought in these volumes and this entry is an account of the intellectual enterprise of religious ethics ever mindful of complex connections to ways of religious and moral living.

Given the conceptual problems surrounding religion and ethics, it is not surprising that one finds different options in the intellectual pursuit of religious ethics. Some distinct approaches have typified the field, although there are manifold subtypes and variations (Schweiker 1998; Twiss and Grelle 1998, 11–33). First, some religious ethicists have sought to specify a unique concept, phenomenon, rational structure, or set of practices called religion more or less manifest in what are conventionally seen as the "religions." Often called the *formalist* approach to religious ethics, the task is to show the place and import of religion for the moral life (see Green 1978; Gamwell 1990). Others adopt, second, a *sociolinguistic* approach. These thinkers explore specific action guides recommended by communities and/or

how communities specify through ritual, myth, discourse, and belief often incommensurable ways of life (see Little and Twiss 1978; Stout 1988). Third, there are scholars who develop versions of *ethical naturalism*. This approach is concerned with the particularity of moral outlooks, but also “treats a system of beliefs as a whole and refuses to isolate moral propositions for analysis from propositions about how things are in the world and how they come to be that way” (Lovin and Reynolds 1985, 3). More recently, a group of scholars, headed by Elizabeth Bucar and Aaron Stalnaker, have written about a third wave of work in comparative ethics focused especially on cultural and moral diversity (Bucar and Stalnaker 2012). This has opened the field to cultural and ethnographic studies without loss of a normative purpose. Each of these approaches in religious ethics, as well as various permutations on them, can be found in this book. No attempt, thankfully, has been made to demand agreement among them.

Another way of conceiving religious ethics is now in view and it finds expression throughout this *Encyclopedia* and other works (see Schweiker and Clairmont 2020). The remainder of this entry gives an account of this *hermeneutical* and *multidimensional* option alongside other approaches to the field. Like formalists, a multidimensional approach specifies a structure for ethical thinking necessary to examine specific traditions, but is not reducible to their distinctive languages and practices. Yet, as shown below, it moves beyond most formalist proposals in terms of how knowledge and disciplines are conceived. With the sociolinguistic and naturalistic options, a hermeneutical approach to religious ethics examines the distinctive outlooks of traditions. However, precisely as hermeneutical in character, religious ethics labors between and among traditions rather than focusing on the incommensurability of language-games, distinct action guides, or even moral worldviews. And with more recent accounts of Comparative Ethics, a hermeneutical approach insists on understanding the cultural and social location of the religions even as it seeks to draw on them as resources for constructive and religious ethics. “Religious ethics,” on this account, is defined in terms of critical, comparative, and constructive *tasks* of moral inquiry into religious resources undertaken from a hermeneutical *standpoint* and with respect to interlocking *dimensions* of reflection. My contention is that this account captures something of the scope and spirit of this *Encyclopedia of Religious Ethics*.

Of course, it must be stressed that what follows is a proposal for religious ethics, developed in view of this work. There is no assumption that every author or editor will agree or even ought to agree with this depiction or, for that matter, any other depiction of religious ethics. As a field of inquiry, part of the vitality of religious ethics is precisely that it must constantly engage in appraisals of its purposes, methods, and criteria of adequacy. In fact, this *Encyclopedia* must partly be seen as engaged in that kind of appraisal.

We turn next to the question of how to characterize the *tasks* and *dimensions* of religious ethics in order that the full import of these volumes can be grasped.

Tasks and Multidimensional Inquiry

There are many ways to define ethics and also many ways to carry out ethical reflection. Contemporary scholarship in *religious ethics* undertakes to a greater or lesser extent several related *tasks*.

Religious ethics entails the *critical* inquiry into complex ways of religious and moral life, but often also indicates the *constructive* use of religious sources in meeting current problems. Each of those tasks, the critical and constructive, is often bound to the work of *comparison*. As found in Volume II, a scholar

critically explores a tradition by comparing its expressions through time and/or seeing it in relation to other cultural and social dynamics, including other religions. Constructive work, like that undertaken in Volume III, compares accounts of how to live with other proposals in order to assess duties and values binding on people. The question – explored in Volume I of this *Encyclopedia* – becomes: how ought we to define religious ethics as a discipline, an intellectual practice?

With the rise of the modern Western world there were extensive debates about what constituted a discipline of thought. There emerged the conviction that any genuine discipline must have a distinct, or unique, subject matter, even as there was the need to define a “system of the sciences” around a fundamental principle or scientific method in order to ensure the coherence of knowledge. The core of the modern project was to understand the world and free human beings from ignorance and illusion. One did so by specifying the method, purpose, and criteria of various disciplines in such a way that each was *autonomous* and yet consistent with all others because they shared a *rational* structure. As Stephen Toulmin has noted: “In the underlying European worldview, then, the value of a single all-embracing system of theories, into which phenomena of all kinds could eventually be fitted, was taken for granted right up until the twentieth century” (Toulmin 2001, 87). Ethics, for instance, had to be about a distinctive domain of human conduct, say, about obligation or utility, which was different than other sciences, and yet founded rationally or empirically in the same way as other sciences. This led to the radical distinction between ethics as a *normative* discipline and other *descriptive* approaches to human behavior even if they shared similar cognitive commitments. One finds, interestingly enough, residues of this modern outlook in formalistic approaches to religious ethics. Even those who reject the modern enterprise, from the Romantics to some sociolinguistic thinkers and ethical naturalists and the cultural turn in ethics, assume that definition of a discipline only to deny it. They often contest the modern account through ad hoc or unsystematic approaches to inquiry.

This *Encyclopedia* aptly shows that the aspiration to isolate one formal structure of reason built on a single principle or to specify one scientific method as alone adequate for research is insufficient given genuine moral, religious, and cognitive diversity. Still, as formalists have long seen, there is also the need to define and characterize the discipline of religious ethics as an intellectual pursuit. Further, the modernist desire to establish the autonomy of ethics around some *sui generis* dimension at action (e.g. the moral “ought” or obligation or virtue) fails to indicate how moral reflection can and must interact with other intellectual practices in order to address exceedingly complex problems and phenomena. A crucial aspiration of much contemporary discourse is to move beyond the formal rationalism of the modern project as well as its denial by Romantics and others. It is to grasp a more humane, practical form of reasonableness. Yet in order to be apt for religious ethics, this construal of ethics must also, as naturalists, sociolinguistic, and cultural/ethnographic approaches show, explore the connections among “moral” beliefs and actions and other convictions and practices of actual living communities.

There is an important turn of late in providing an account of knowledge that bears promise for religious ethics. This is what can be called *multidimensional* thinking. What is rejected by a range of thinkers in various fields is a depiction of knowledge gained and justified through autonomous disciplines tenuously held together by *one* formal rational structure or method of inquiry. As the moral philosopher Mary Midgley has astutely noted:

We exist, in fact, as interdependent parts of a complex network, not as isolated items that must be supported in a void. As for our knowledge, it too is a network

involving all kinds of lateral links, a system in which the most varied kinds of connection may be relevant for helping us to meet various kinds of questions.

(Midgley 2003, 25)

In this light, the burden placed on any intellectual practice aimed at knowledge is to specify those points at which it is linked to other disciplines given shared interests, norms, and even values. Knowledge is a complex, reflexive network; it is a space of warranted intelligibility or reasonability.

This depiction of knowledge is important not just for addressing shared interests. It is basic to the determination of the cogency, scope, and integrity of a discipline. Rather than focusing on the *autonomy* of a “discipline,” one will be interested in the *lateral links* wherein reflection and information move in and out of an intellectual practice (see Gustafson 2004). *Scope*, rather than *autonomy*, will be essential in deciding the validity, the truth, of claims. Accordingly, a discipline is best defined in terms of the basic questions it seeks to answer. When carefully examined these basic questions naturally pose other questions that, if answered, implicate a form of reflection in other modes of inquiry pursuing their own questions. A method must be devised not on one formal model of rationality but in order to match the problems and questions that need answering.

A multidimensional account of rational inquiry seems particularly apt for religious ethics. In very different ways, what scholars call the *religions* provide guidance for human living through rituals, myths, exemplars, doctrines, and teachings that answer a range of questions surrounding human existence. These questions demarcate a space of human existence determined by the problem of how one ought to live religiously – say, live as a Protestant Christian, a Shi’ite Muslim, or a Tibetan Buddhist. *Morality*, the religious ethicist can insist, is a term for the space or network of questions within which human life transpires and the answers a community gives to those questions in order to shape character and guide conduct. From the perspective of actual traditions, religious ethics must be conceived as examining various features of how the moral space of life, as we can call it, is conceived and enacted in life. Viewed as a whole, this *Encyclopedia* can be seen to enact just this kind of examination of religious moralities.

If one takes seriously recurring questions found in the legacies of religions and formulates them at an appropriate level of generality, it is possible to adduce the multidimensional shape of religious ethics (see Schweiker 1995; Schweiker and Clairmont 2020). At least five deeply interrelated questions ground the dimensions of inquiry used to engage in its comparative, critical, and constructive tasks. What is more, each of these dimensions of ethics probe various tensions, or *aporia*, in order to isolate analogues among religious outlooks. The questions that found the dimensions of ethics are not related in a sequential or deductive manner; they are not a checklist to be applied to thinkers, texts, or practices. They arise out of tensions in human life and constitute the interacting “dimensions” of ethics that aim to explicate a religion’s account of and directions for orienting existence and conduct in the moral space of life. And insofar as religions use stories, rituals, and exemplary characters in order to guide life, these dimensions explicate and analyze the moral meaning of these phenomena. Further, the dimensions are important for the reader of this work in order to understand what specific questions a scholar is answering, even as the religious ethicist is held accountable for questions not answered but which are in the background of a religious outlook.

This account of moral inquiry articulates an approach for religious ethics that labors alongside *formalists* and those working *sociolinguistically*, *naturalistically*, and *cultural/ethnographic* approaches to reli-

gious traditions and communities. The account admits with formalists that a construal of ethics is an intellectual construct, but it denies that one dimension alone defines ethics and it specifies, like the other approaches, questions and answers of ethics from within the resources of real traditions. In this way religious ethics escapes the modernist reduction of a discipline to one rational principle or method, while also avoiding relativistic forms of postmodernism. What, then, are the multiple and interacting dimensions of ethical inquiry that represent a distinctive option for religious ethics and can provide orientation for reading these volumes? Recall, these are not ordered in any hierarchical way; they are mutually interactive and informative.

Dimensions of Ethics

The Descriptive Dimension

Human beings live and act in specific places, times, and sets of relations. How a situation is described, defined, and interpreted has implications for the possibilities and limits on actions and relations. In its widest compass, some construal is given of the moral context of the entirety of human life, often enough through myths, ideologies, or a moral worldview. Specific moral situations will be described, defined, and interpreted with reference to the wider outlook.

So when, for example, a Buddhist practitioner must decide in a situation what to do, there is the need to answer a basic question, “what is going on?” This is a difficult question not only because of the complexity of any situation, its openness to multiple interpretations, and the limitations of human perception and attention. The question is rendered all the more difficult because someone (authority figure, practitioner) must sort out what reality or perspective on reality is at issue, one marked by conventional truth or one rooted in *Dharma*. A devout Muslim too must determine “what is going on” in a specific situation. This requires not only a description of that case, but also knowledge of how Allāh is acting, the import of *Shari’a* on a case, and also specific reasoning skills. Behind these religious teachings is a basic human perplexity: how is genuine insight into a situation related to and blocked by human “blindness” to what is the case? Importantly enough, the religious often explore the dialectic of blindness and insight.

While each tradition provides answers to the question “what is going on?” they do so in wildly complex and different ways. Ethics has a *descriptive* dimension that is linked to other interpretive or hermeneutical disciplines, aimed at genuine insight, ranging from studies of myth to specific analyses of events and situations that provide ways to construe and understand moral situations. Religious ethics draws on a range of resources, experiences, types of discernment, and even beliefs about reality. These resources provide the means to describe and analyze a situation in terms of its moral meaning.

The Normative Dimension

Deciding “what is going on” in any concrete situation is never a disinterested activity. The descriptive dimension of ethics is necessarily related to some norms and values that orient thinking and action. These norms and values allow some realities to appear within moral perception; they also can conceal realities, and hence the tension of blindness and insight. Christian ideas about neighbor love, for instance, might allow a perception of human worth and vulnerability even for those deemed enemies. This

depends, of course, on how neighbor and love are normatively understood. “What norms and values ought to guide human life?” That too seems to be a basic question asked repeatedly in the legacies of religious traditions. A religious ethics has a *normative* dimension.

A bewildering diversity is found among the religions on the normative question. In many traditions there are distinct and sometimes conflicting *sources* for defining what norms and values ought to guide life. One source is the native intelligence of human beings struggling to live together; it is reason and intelligence. Another source is the ultimate binding claims and teachings, the revelation, of the community. Consider aspects of Jewish thought. Rooted in the so-called Noahide covenant, Jewish thinkers have long insisted that every person can at some level grasp moral principles. Yet, for the Jewish community, this knowledge is rudimentary in light of the revelation of the divine will in Torah. Not surprisingly, there are debates within religious traditions about the relative authority of the various *sources* of norms and values and how these ought to relate in living religiously. The sources drawn upon in moral thinking also link to other intellectual practices, especially ones interested in human valuing, social norms and goods, and debates about moral intelligence.

Disputes about the sources of moral norms and values also turn on the *content* of and *relations* among norms and values. Generally speaking, religious traditions acknowledge and seek to sustain a range of goods, like bodily integrity, family, education, art, and, at the highest level, moral excellence and righteousness (see Finnis 1983; Nussbaum 2000). How these goods are understood differs between traditions and even within a tradition; they constitute another link to disciplines, from economics to anthropology, which explore basic goods. Classical Hindu accounts of caste show, for example, that the meaning of bodily integrity shifts between the warrior caste (Kṣatriyas) and the priestly caste (Brahmans). Nevertheless, some domain of goods or values is protected and promoted by living morally. There are also debates about the norms for deciding how to respect and enhance goods. African beliefs about what is owed ancestors as the norm for human choice are decidedly different than, say, the Ten Commandments in the Hebrew and Christian Bibles. In each case, norms protect and promote goods within religious living.

However, matters are more complex. Just as the descriptive dimension of religious ethics probed the tensions between blindness and insight in human moral thinking, normative reflection has to address the question of whether or not the divine, sacred, or ultimate is beyond our conventional distinctions of good and evil or not. In fact, most religious traditions, despite their profound differences, hold that the sacred, ultimate, or divine somehow transcends or exceeds the common sensical distinctions of good and evil or not. And if that is so, then, normative and descriptive dimensions of inquiry are reflexively related at the level of perception and decision-making. They link ethics to other ways of articulating, describing, and valuing human actions and relations. Adducing these dimensions from widespread questions in no way shields us from the stark differences between and within traditions. Attention to these dimensions facilitates critical, comparative, and constructive work.

The Practical Dimension

When people ask about what is going on and what are the norms and values that ought to orient their living, they do so for practical rather than merely theoretical reasons. Whatever else we want and must say about the religions, they are first and foremost ways of orienting human life. They are ways of addressing the tensions, the *aporia*, of perplexity and wisdom in human life, fighting perplexity in the

name of wisdom. While the ethicist or religious thinker will develop complex epistemological theories or debate the nature of value and the validity of some conception of a norm, this is not the concern of most people. For example, as the Bhagavad Gītā opens, Arjuna, standing beside Kṛṣṇa, watches a bloody battle unfold between members of his family. Should he join the battle? In the struggle of decision, a host of forces might be active, the advice of a god (Kṛṣṇa), duties bound to class or social role, bonds of love. Here too is a basic question: “what ought I or we to do?” Where is wisdom to be found?

Religious ethics has a decidedly *practical* dimension, no matter how theoretical and speculative moral inquiry becomes. It is related to other disciplines that focus on decision-making and judgment. Little wonder that so many religions link their ethics to law as well as the demand to imitate moral saints or to participate in practices of divination or study and commentary. Traditions develop complex and subtle patterns of moral reasoning in order to answer the practical questions of life. Confucian teachings about how to live the scholarly life are decidedly different than Jewish patterns of *Halakhic* reasoning. Each is, nevertheless, a response to the practical question “what ought I or we to do?” Of course, it might be illuminating to explore how *Halakhah* throws light on Confucian practices of moral reasoning and vice versa. Comparison is always possible in religious ethics.

It is also clear that this “I” or “we” is never some kind of isolated and ghostly being, but someone in relation to others. What I ought to do is related to what we ought to do. Who we are is related to other communities, who speak of “we.” While certain traditions have emphasized a radical individualism in moral action, by and large there is profound awareness that moral quandaries find people amid others. Therewith develop patterns of communal reasoning and judgment; that is, the formation of a political ethics. The point is that some form of practical reasoning and judgment will be found. The work of scholars in other fields (law, social analysis, rhetoric) can aid the religious ethicist. Noting the practical dimension of ethics facilitates, rather than delimits, critical, comparative, and constructive thinking.

The Fundamental Dimension

Insofar as individuals and communities confront questions about how to orient life, something is asserted about the moral structure of reality and human beings as creatures with the power to act and choose in concert with others and thereby influence reality, themselves, and others. That is, ethics is about the proper conduct of agents, human and otherwise. Human beings can be and ought to be aware of themselves in relation to others, the context of life, and with respect to norms and values about how rightly to live. But, ironically, human beings confront here too a tension, the one between freedom and bondage. We are – to some extent – freely acting beings but in a world and universe that constrains our freedom even as we can be (and usually are) in bondage to powers beyond ourselves, say, addictions, or political forces, genetic makeup, family structures, or economic necessity. Any ethics aims, thereby, to answer a question seemingly presupposed in other moral questions: “what does it mean to be a moral agent within the wider compass of reality?” From philosophy to neuroscience, religious ethics is linked with other fields of inquiry into human being and doing and the nature of reality itself.

Religions present fantastically complex accounts of agency and the moral context of life. This is what is meant by the subject matter of the *fundamental* dimension of ethics. A good deal of modern Western ethics defined an “agent” as a being with reason and will, who can act intentionally, bring about changes in reality, others, and the agent’s self, and have accountability for actions imputed and/or ascribed to him or her (see Gewirth 1978). The scope of the moral world is determined by the interactions, cooperatively

or not, among these agents. Each of the defining attributes of agency has of course been hotly debated. What do we mean by reason or will or intentionality or accountability or moral ascription? How do we best understand the formation of moral character, say through the virtues? There has been reflection on the limitations of agency, the nature of corporate agency, and questions about moral self-understanding.

Work in religious ethics is challenging and amending modern Western conceptions of agency by attending to non-human agencies and also the wider realms of reality. Human beings can be – and often are – in bondage to powers beyond themselves even as they also retain a measure of freedom. In the Christian tradition, what it means to be an agent is defined not only in terms of the power to act and to be held accountable. It is also defined by patterns of relation in which the self exists in God and in others through faith and love before God's kingdom. Further, faith and love are understood with reference to the divine activity, and this means, paradoxically, that at least two agents, the human and the divine, act in any genuinely good action. Sin, or a broken relation to God and others, is marked not just by wrong acts, but, more profoundly, by an estrangement in which one must act alone and for one's own purposes and good. God's judgment on sin is really the withdrawal of the divine presence such that the agent is left to his or her own devices. In traditional African ethics what it means to be an agent is rendered complex by the fact that the ancestors are operative agencies in the world. This is also why, as noted above, practical and normative issues in Buddhism hinge in part on the distinction between conventional and Dharmic truth and so on a distinction between "self" and "person." Insofar as the root problem is craving that gives rise to suffering, one can only speak of an agent or person through conventional terms. In the light of the teachings of the Buddha, ultimately, there is no-self.

In the religions, forces other than self, insofar as we can speak of a self, are at work in the world and in the individual. Each of the religious traditions, furthermore, examines complex psychological and sociological mechanisms that lead to moral failure, delusion, and conflict – mechanisms like inordinate craving (Buddhism), distorted loves (Christianity), ritual impurity (Hinduism), violation of ancestral bonds (African and Native-American ethics), and systemic, social distortion. An agent is set amid forces that must be considered in attaining valid understanding. Inquiry into what it means to be an agent within these rich accounts of moral reality is the fundamental dimension of religious ethics simply because these ideas are presupposed, and so *fundamental*, in all other moral questions.

The Metaethical Dimension

If one looks at the legacies of religion, there seems to be one further general question that helps to constitute the shape of religious ethics. It arises from the tensions between truth and illusion in human experience. The Buddha insisted that anyone could test the truth of his teaching in actual life. Jesus is reported to have said, "I am the way, the truth, and the life." Hindu ways of life claim to accord with the truth about the cosmos and also the specific tenor and form of individual life. Muslims believe that the Qur'an gives the final and ultimate revelation of the will of God. Every religion, despite what modern critics hold, purports to be truth seeking and truth teaching. Communities and traditions implicitly pose the question and provide some account of the truth of their morality and their picture of how to orient existence in the moral space of life. Of course, claims to truth differ and so too the means for showing their validity (experience, teaching, revelation, etc.). To enter into this kind of reflection is to engage in what is often called by scholars, somewhat unhappily, "metaethics." Reflection centers on clarifying moral concepts, strategies of validating claims, and forming judgments about the relative weight the

evidence and interpretations from other fields of inquiry can and ought to have in guiding life. This is meant to sort out truth from illusions the confusion of which too often befalls human life. The question of validity or truth is posed from within the religions. This too is a dimension of religious ethics, both about a religious morality and about the discipline of religious ethics itself.

The question of the truth of a moral outlook is without doubt one of the most vexing issues for religious ethics. While the ethicist might explore dimensions of a tradition's morality, how does one judge the truth of an entire religion? How does one show that a constructive religious ethics is true? On one level, the religious ethicist can address this question comparatively and critically. In Volume II of this *Encyclopedia*, readers will see scholars examine the ways in which one or several traditions go about showing the truth of their moral beliefs and practices. Further, if the religious ethicist is working within a specific tradition, say, Shi'ite Islam or Zen Buddhism, then, presumably, its strategies of validation will be in play, a matter also explored in parts of this *Encyclopedia*. Finally, when a thinker attempts to offer a constructive religious ethics, comparatively or not, then some account of how the position is validated must be given.

When the ethical task is to speak critically, comparatively, and constructively across traditions about shared human problems, matters become pressing. It poses a question implied in the very undertaking of religious ethics: from what *standpoint* is inquiry carried out and what criteria of adequacy or truth pertain to its work?

Hermeneutical Standpoint

The *dimensions* of inquiry gleaned from persistent questions and perplexities of human life aim to provide a coherent way to undertake, singularly or collectively, the comparative, critical, and constructive *tasks* of religious ethics. They also signal the kinds of questions engaged by scholars represented in every part of this work. Moral knowledge is thereby depicted as a network of intelligibility, a space of reasons, about how rightly to orient life that is held and enacted by some tradition or community and examined by scholars and religious leaders through multidimensional reflection. The religious ethicist might also make constructive claims about how rightly to live. This is a proposal for the orientation of conduct and life that is responsive to the complexity of the "religions" and also shifts in the way knowledge and disciplines are conceived. The account of the scholarly labor of religious ethics in this *Encyclopedia* does not prejudice one set of moral beliefs over another, say African over Confucian; nor does it specify only one kind of ethics, say virtue ethics or deontology, as best for a normative understanding of the religions and meeting present-day challenges. It is an inductively developed *method* for, or *approach* to, religious ethics. Working alongside other options in the field, this proposal is, hopefully, subtle enough to facilitate the examination of the moral outlooks and practices of the world's religions. Through its dimensions, religious ethics interacts with many fields of inquiry.

However, we have been led to the thorny question of the standpoint and criteria of religious ethics. For those who take a *formalist* approach, the contention is that despite empirical differences among religions one can discern or articulate philosophically a basic structure shared by the religions that facilitates critical, comparative, and constructive work. One seeks to develop an ethics outside of substantive connections to any tradition or the surrounding life-world (see Benhabib 1992). The criterion of adequacy must be determined with respect to moral rationality itself and/or through a metaphysical vision. Those who

pursue a *sociolinguistic* approach in the discipline insist that the sheer diversity among religions and cultures means that material differences rather than formal similarities must be basic to method in religious ethics. Moral rationality, on this account, is tradition-constituted rationality (see MacIntyre 1990). The means to validate a position are internal to a tradition or they emerge at the intersection of competing traditions. *Ethical naturalists*, for their part, insist that norms and values must be grasped and evaluated in terms of their place in a whole outlook on life. And those who adopt a *cultural/ethnographic* approach grant the sheer differences in moral outlooks. The standpoint of the religious ethicist, thereby, is to engage in the examination of a community's moral worldview even while acknowledging the substantive outlook that backs her or his inquiry.

Shifts in how to describe moral knowledge enable one to conceptualize religious ethics in a new way. Similarly, there are developments afoot that demand a standpoint in religious ethics somewhat different than the other approaches in the field. While the method of religious ethics is aptly described as *multidimensional*, its standpoint can also be conceived as fully *hermeneutical* in character conjoined to specific criteria of adequacy. The importance of this standpoint is found in the moral significance of recent global developments that parallel shifts in the construal of human knowledge.

Recent Developments

Developments that characterize the present age warrant a hermeneutical standpoint in religious ethics. These recent developments, and others too, are charted throughout these volumes. A prominent one is the growing awareness around the world of the diversity of religious and moral beliefs, practices, and convictions. A good deal of modern moral theory seemed to efface the particularity of outlooks out of a concern to isolate general features of human existence deemed of universal ethical relevance. The need nowadays is to understand and to explain the moral vision of communities and cultures on their own terms without an initial judgment of truth or goodness. This requires interpretive engagement with the forms of thought, types of texts, practices, rituals, and organization of religions and societies.

The present awareness of global diversity has spawned the critical and comparative tasks of religious ethics, both in formulating more adequate categories of thought (Volume I), by exploring the legacies of traditions (Volume II), and in order to address shared moral problems (Volume III). However, understanding beliefs and practices, no matter how critical that might be, is not the same as justifying them, determining their truth. In a world in which the religions too often and too readily sanction violence and hatred of others, neglect or denigration of the environment, and also back excessive preoccupation with one's religious condition, judgments about what counts as a valid policy for living are required. Present worries about moral diversity provoke inquiry into how one is to establish norms that transcend particular systems of authority in order to address shared human concerns. This seems to require that the standpoint of religious ethics be neither so formal as to efface differences nor so historically particularistic that normative judgment across moralities becomes impossible.

The awareness of moral and religious diversity is just one development in the current situation that challenges how one conceives of the standpoint of religious ethics. The age of "globality," as it is called, is marked by multiple forms of reflexivity, ranging from economic processes to cultural and informational flows (see Schweiker 2004). Reflexivity is the ability of an acting entity to respond to information coming from elsewhere and to adjust its self-understanding and actions in this light. Human persons can

respond to recommendations and judgments on their actions, say, from others, a sage, moral saint, or a god, and then seek to live and act better. Reflexivity is then a kind of self-examination. Increasingly, one is aware of the ways in which social systems, cultures, and religious traditions are, analogically, reflexive or learning and self-testing beings. Global reflexivity works through economic, cultural, imaginary, and legal mechanisms shaping human and non-human life.

The reflexive dynamic of global flows has brought with it new and unexpected developments. During the twentieth century, many scholars of religion defined their work in terms of secularism. The modern world was supposedly a time in which ideas and experiences of religion or transcendence or the sacred were being effaced by the pressure of differentiated social structures and the march of science to demystify the world. Similarly, the legacies of colonialism demanded that peoples around the world adjust their lives and cultures to the secular order (see Appadurai 1996). Throughout this *Encyclopedia*, and especially Volume II, one can trace the ways religious traditions have responded to secularism, colonialism, and modernism.

The noonday of the secular world never really came, or it only appeared in faint glimmers. The present age is characterized by nothing so much as the force and movement of the religions on the global scene. Global reflexivity, the ways in which communities appear in the “gaze of the other,” is of great moral import. One can witness the transformation of traditions in and through interactions with and resistance to other global forces, including other religious traditions, rather than the pressure of secularization. This also seems to require a hermeneutical standpoint in religious ethics insofar as hermeneutics examines the dynamics of human understanding through encounters with divergent claims to meaning, encounters in which transformation of life as well as conflict are possible.

The awareness and worries about moral diversity and global reflexivity arising out of the contours of the emerging age are deeply intertwined with shifts in moral sensibilities. These shifts in sensibility are other developments that impinge on the standpoint of religious ethics. The modern world from the seventeenth to twentieth centuries saw the apotheosis of human power in technology, political organization, the media, and economic systems, and with these developments an exclusive concentration on human flourishing. Ironically, modern anthropocentrism turned against itself. Holocausts, genocides, terrorism, grinding poverty, and horrific wars scarred the twentieth century and now too the twenty-first century. Massive suffering and violence have sparked deeper sensitivity to the vulnerability and preciousness of persons (see Gaita 2000; Glover 2000). Conjointly, there is growing awareness of the interdependence of every form of life on this planet. People around the world are imaging the scope of moral value to include but also to exceed human well-being. This ecological sensibility has challenged long-standing beliefs about moral value and standing. In various ways, moral sensibilities for the worth of all realms of life are spreading around the world. This is sorely needed insofar as the religions continue to take violent expression and to foster ignorance and the neglect of finite, planetary resources. Emerging sensibilities can and must aid in the transformation of the traditions that spawn but also thwart moral aspirations.

The realities of moral diversity, global reflexivity, and emerging moral sensibilities are obviously inter-related developments. Taken together, these demarcate some of the contours of the current moral space of life. In order to understand and respond to them, religious ethics must carry out critical, comparative, and constructive work. Because of the deeply interrelated nature of current dynamics, religious ethics obviously needs to be defined beyond modern conceptions of what constitutes a discipline or an intellectual practice. Furthermore, something important is at stake in an account of an ethical standpoint once

the reflexive dynamics of cultural interactions amid human diversity in global times is seriously considered. The religious ethicist does not simply exist within or outside actual traditions. She or he is always thinking at the *lateral connections* among communities, traditions, and intellectual practices. What does this fact mean for the standpoint of religious ethics?

Standpoint and Criteria

In order to specify the standpoint of religious ethics in the light of current global developments, one can reclaim terminology from the Hellenistic world that arose within its religious and cultural imagination prior to the development of “ethics.” The standpoint of religious ethics is *hermeneutical*. Derived from the Greek god Hermes, hermeneutics is reflection on the possibilities and limits of understanding ambiguous meanings won through the act of interpretation and thereby how meanings are conveyed from one realm to another. In the Homeric texts, the virtual sacred literature of that culture, Hermes conveyed meanings from the gods to mortals. Other religions, as found in this volume, explore the conveyance of meanings across boundaries in revelations, divinizations, rituals, exegetical strategies, and mystical insights.

The point is certainly not to reclaim Greek ideas in order to define the standpoint of religious ethics! The insight is that religious ethics conceived as a hermeneutical enterprise moves between traditions or among expressions of one tradition, seeking understanding and the orientation of conduct and life. No doubt that movement will always be marked by the ethicist’s “home tradition,” religious or secular. One remains a Chinese or Japanese Buddhist religious ethicist or an African Christian or a postmodern European Aristotelian. No one (thankfully) must necessarily sacrifice their identity for the sake of undertaking religious ethics. Yet the standpoint, the posture of thinking, takes place at the reflexive connections of traditions and other forces working in the world. The religious ethicist on this picture enacts the lateral links among the dimensions of ethics and other forms of inquiry into the moral beliefs and practices of the religions. In the process some degree of knowledge and understanding is attained, a shared world of meaning is partly disclosed, even as identities can be confirmed or tentatively transformed. The religious ethicist participates in the enacting of a complex network of moral knowledge, never complete yet nonetheless attained. This hermeneutic action is achieved by undertaking the adventure of thought signified through the various dimensions of religious ethics.

How then are we to judge the validity or truth of the work of a religious ethicist? This is a question hotly debated in the pages of this *Encyclopedia*, particularly in Volume I. Generally stated, two *criteria* bear on a hermeneutical standpoint in ethics. First, any adequate ethical claim, whether about the beliefs and practices of a specific tradition or a proposal for meeting a current moral problem, must prove its great adequacy to relevant material in argumentative exchange with other accounts. A position is truer than some other insofar as it answers more comprehensively and coherently the range of questions specified in the dimensions of ethics. It must, accordingly, meet demands entailed in the act of multidimensional inquiry, as well as be error reducing with respect to rival positions or interpretations (see Taylor 1990). Again, scope rather than autonomy is basic to the adequacy of an ethics. This is a *procedural* criterion. It means that a religious ethics is never justified prior to lively engagement with other positions. Additionally, a position must afford some advance in thinking by provoking or providing deeper insight into a moral problem or way of life. This second *heuristic* criterion is more illusive than

the procedural one. What counts as insight, let alone “deeper” insight? Nevertheless, a moral position can claim greater adequacy, greater truth, if it enables one to apprehend, understand, and respond to factors really pressing on human lives but missed by other moral positions. *Heuristic* and *procedural* criteria are applicable to the scholarly labor of criticism and comparison as well as to constructive ethics. These criteria can, of course, be elaborated in much greater detail, a task not needed in this Introduction but one explored throughout the *Encyclopedia* as a whole (see Schweiker and Clairmont 2020).

There are good reasons within the religions as well as those found in global dynamics to adopt a hermeneutic standpoint in moral inquiry. The religious ethicist can isolate and articulate these various reasons as backing for her or his work. Abiding by the criteria of a hermeneutical standpoint within multidimensional inquiry, religious ethics can, but need not, aid in the reconstruction of religious identities around criteria of ethical truth, rather than subjecting the question of truth to communal identity. In this way, a thinker critically and comparatively releases the resources of traditions and communities for constructive thought about how rightly to orient human life.

Conclusion

This entry has sought to address terminological, methodological, and also criteriological issues within the ongoing work of religious ethics. It has sketched an approach to the discipline working alongside others in terms of *tasks*, *dimensions*, and *standpoint*. This proposal is meant to aid the reader in exploring the richness of the thought represented in this *Encyclopedia*, as well as to outline a new possibility for religious ethics itself. One should not expect all scholars represented here to use this proposal, nor is that needed. As noted before, part of the vitality of the field is to keep constantly in play the appraisal of its work and adequacy. Yet by enlisting a vast range of renowned scholars from various disciplines, traditions, and cultures, the labor of religious ethics now crosses disciplinary boundaries that have for too long inhibited its development. *The Wiley-Blackwell Encyclopedia of Religious Ethics* presents an exciting vision of moral inquiry engaged with the fantastic resources of the world’s religions, open to other fields of reflection on the human adventure, and dedicated to understanding and addressing moral challenges and possibilities emergent in our global times.

1 Judaism

CHAPTER 58

Jewish Ethics?

Hilary Putnam[†]

It would require scholarship on biblical archeology, the Jewish Bible, Second Temple Judaism, rabbinics, Jewish philosophy (from Philo to Levinas), the Jewish movements during and following the Enlightenment, and more besides to write a “comprehensive” account of “Jewish ethics.” Instead of attempting the impossible, I shall employ the traditional Jewish teaching method of focusing on a single passage in the Talmud and proceeding from there. The passage is a fanciful description of how God spends his day:

Rab Judah said in the name of Rab: “The day consists of twelve hours; during the first three hours the Holy One, blessed be He, is occupying Himself with the Torah, during the second three He sits in judgment on the whole world, and when He sees that the world is so guilty as to deserve destruction, He transfers Himself from the seat of Justice to the seat of Mercy; during the third quarter, He feeds the whole world ... during the fourth quarter He sports with the leviathan, as it is said, There is leviathan, whom Thou hast formed to sport there-with.” Said R. Nahman b. Isaac: Yes, He sports with His creatures, but does not laugh at His creatures except on that day. (TB Avodah Zarah 3b)

In this passage, study of the Torah¹ is conceived of as worthy of occupying a quarter of God’s day! God does not engage in trivial pursuits. This passage tells us that study is truly a divine activity.

The point of this chapter will be that *this*, the very special value attached to *study*, indeed, the identification of study and discussion of sacred texts (when conducted in the right spirit and in the right way) with the truest human flourishing, is *the* distinctive feature of “Jewish ethics”.

But Why Call This “Ethics”?

The reason for calling this “ethics” is that in the Greek tradition (and “ethics” is, after all, a notion we acquired from Greek philosophy), the *central* ethical question was not “what are the right rules of conduct?” (although that was an important question), nor even “what are the several virtues?” but “what

[†]Deceased.

1 The oldest stratum of the Talmud is the Mishnah, a corpus of Jewish law (in Hebrew) traditionally held to have been codified by Judah ha-Nasi (ca. 135–ca. 220). The other stratum is the Gemara, a corpus of interpretations of the Mishnah (in Aramaic). The flexible concept “Torah” can mean just the Pentateuch, or the whole Tanakh (the Jewish Bible), or all this plus the “Oral Torah,” and the latter can include not just the Talmud but also the exegesis and the legends that have grown up during and after (and in some cases even before) the Talmudic period.

should be the supreme aim of a well-lived human life?” If studying Torah (and expressing one’s learning in one’s actions), and similarly studying the discussions and controversies which grow out of the study of Torah, and doing all this in the service of God (*l’shem sh’mayim*) as well as the service of humanity, is seen as the inclusive human end for Jews, then it is appropriate to say that *study* – in this inclusive sense – is the Jewish equivalent to the Greek notion of *eudaimonia*.

But the study in question is described as the study of “Torah.” And is not this too *particularistic* to count as a notion of universal human flourishing?

I shall say two things in response. First, traditional Judaism did aspire to universality, for it is part of the belief in the eventual coming of the Messiah and a final Redemption which was a vital part of the Jewish religion for at least two millennia that at the end of days all of humanity would be converted to Judaism. And in this Messianic age, everyone will presumably study Torah just as God is pictured as doing in our passage from the Talmud. Second, there is a more immediate (and yet complicated) sense in which the study of Torah is part of the ideal flourishing of a gentile life as well as a Jewish one, even prior to Redemption. What makes it a “complicated sense” is that the “Torah” the ideally virtuous gentile studies is *not* the Jewish Torah.

The Gentile’s Torah and the Jews’ Torah

The Talmud teaches:

R. Meir used to say, “Whence can we learn that where a gentile occupies himself with the study of Torah he equals [in status] the High Priest? We find it stated: ... ‘*which if a man do he shall live in them,*’ [Leviticus 11:21] it does not say ‘priests, Levites and Israelites,’ but ‘*a man,*’ which shows that even if the gentile occupies himself with the study of the Torah he equals [in status] the High Priest!” – That refers to their own seven laws. (TB Sanhedrin 59a)

The Torah that Rabbi Meir imagined a gentile occupying himself with is, thus, the seven Noachide Laws. The Jewish tradition holds that every human being is a son or daughter of “the covenant of Noah” (see Genesis 9). While Jews are obligated to observe the entire Halakhah, every non-Jew is obliged to obey the (universal, minimal) moral obligations of this Noachide covenant (TB Sanhedrin 56–60). According to the rabbis of the Talmud, a non-Jew who accepts these obligations is a *ger-toshav* (resident foreigner) or even a “semi-convert” (TB Avodah Zarah 64b). The seven Noachide commandments as traditionally enumerated are (Roth and Wigoder 1996 XII: 1190): the prohibition of idolatry, blasphemy, bloodshed, sexual sins, theft, and eating from a living animal, as well as the injunction to establish a legal system (TB Sanhedrin 56a).² They are derived from divine commands addressed to Adam (Genesis 2:16) and Noah (see TB Sanhedrin 59b), the ancestors of all humankind.

2 The prohibition of idolatry was understood to mean that the gentile does not have to “know God” but must abjure false gods. For references, see the article in *Encyclopedia Judaica* (Roth and Wigoder 1996, 1189–1191) cited in the text. It must also be mentioned that there are indications that in the Tanaitic period (the period during which the Mishnah – the oldest stratum of the Talmud – was composed) there was disagreement on the number and the contents of the Noachide laws. (See Roth and Wigoder 1996.)

If the valorization of “study of Torah” is thus universalized, there is still a sense in which Jewish ethics is particularistic. There is a special virtue reserved for those who obey the *mitzvah* (commandment) to study because it is commanded to do so (that is, commanded by the halakhah) and not simply because their natural inclination or their religious sensibility leads them to do so. We see this in the Talmudic tractate *Baba Kama* (38a). In the passage I have in mind, Mar ben Rabana has just interpreted a biblical verse by saying: “It only means that even were they [the gentiles] to keep the seven commandments they would receive no reward,” and this is immediately objected to (by the anonymous redactor), who cites the passage we just discussed. At this point, someone (presumably Mar ben Rabana, qualifying his original statement) says:

I mean [in saying that they would receive no reward] that they will receive reward not like those who having been enjoined perform commandments, but like those who not having been enjoined perform good deeds: for R. Hanina has stated: Greater is the reward of those who having been enjoined perform good deeds than of those who not having been enjoined [but merely out of good will] do good deeds. (TB *Baba Kama* 38a)

What is remarkable to a modern secular ear is the idea that although there is merit in a gentile’s studying the principles of universal morality (the gentile “Torah” or Noachide laws), there is *less* merit in this than the Jew’s studying the Jew’s Torah *because the Jew does it to obey a divine command and does not simply do it of his own free will*. Here we seem to encounter both the familiar (the idea that at least some basic norms are universally valid) and the unfamiliar (being commanded is better than spontaneously doing good)!

The Question of “Legalism”

It is impossible, in this connection, not to face the longstanding controversy between traditional Christianity and traditional Judaism concerning the merit of obeying *mitzvot* (commandments). Ever since St. Paul famously contrasted “the law” which “worketh wrath” (Romans 4:15) and “faith without the deeds of the law” by which we are “justified” (Romans 3:28), Judaism has been denounced as a soullessly legalistic religion (although there has been considerable rethinking of this in the Christian world in the last century). Here is an example of the polemical use of this contrast by a Protestant theologian (a liberal one, noted for his “liberation theology,” his feminism, etc.). Robert MacAfee Brown explained that in the time of Ezra and Jeremiah the Jews “developed a way of life based on adherence to a set of rules” (Brown 1985, 248–249). He tells us that by the end of the Old Testament period Jews had “613 different laws or rules,” and says: “You are ‘good’ if you obeyed the rules, and ‘bad’ if you disregarded them.” Brown then asks the rhetorical question “What happens?” and answers as follows:

It is clear what happens. You become so worried about breaking one of the rules, or one of the rules about rules, or one of the rulings about the rules about one of the rules – that all your time is taken up with a meticulous observance of these details. And the notion of a living relation with God (which is what the law was originally all about) is lost and forgotten. So is the idea of loving your neighbor. Who would dare to do a spontaneous act of kindness for his neighbor when such an act might violate one of the demands of the law? (Brown 1985, 249)

Traditional Jews think this is nonsense. For them, the joy of obeying a divine command and the love of one's neighbor are not incompatible, but mutually supporting parts of a complex religious way of life. The valorization of doing something virtuous *because God commanded us to do it* even above doing it simply out of spontaneous good will is a distinctive feature of the traditional Jewish ethical outlook and so is the love of one's neighbor.³

In response to Brown's claim that in Judaism the notion of a living relation with God and the idea of loving your neighbor are "lost and forgotten," it should suffice to point out that in all of its versions, Judaism has always portrayed God as being tremendously concerned with our morality. At times one's duty to God seems to be identified with ethical behavior, as when the Bible tells us:

Will the LORD be pleased with thousands of rams, or with ten thousands of rivers of oil? Shall I give my firstborn for my transgression, the fruit of my body for the sin of my soul? He has told thee, O man, what is good; and what does the LORD require of thee, but to do justly, and to love mercy, and to walk humbly with thy GOD? (Micah 6:7–8)

And in the Talmud, we learn the famous story of Hillel who, when asked by someone to summarize the whole Torah with utmost brevity ("while standing on one foot"), replied: "That which is hateful to thee, do not do unto thy neighbor. That is the whole Torah – the rest is commentary – Go study!" (TB Shabbath 31a).

Indeed, the picture of the traditional Jew living a life of constant worry about breaking one of the rules is a gross caricature. In every religion, people who lead traditional lives have so internalized not just the "rules," but also attitudes and customs, that following the way of life is what comes naturally. This is not to deny that there are people who make Judaism or any other religious way of life burdensome and oppressive. That type is well known. But it is not characteristic of Judaism.

Study, Innovation, and Interpretation

For traditional Jews, there is no conflict between finding joy in carrying out God's commandments and "loving one's fellow creatures." And we are told that the observance of the commandment to study "surpasses them all" (TB Shabbat 127a). But there is something important I need to add.

Study, especially of sacred texts, is often associated with traditionalism. But in the Talmud it is associated *both* with traditionalism and *anti-traditionalism*, and the struggle runs through large stretches of the Talmud (see Fisch 1997; Hartman 1999). In particular, we find a continual willingness to reinterpret both the Bible and the Mishnah when they conflict with the rabbis' moral sensibility.

The ways in which the Talmud avoided imposing capital punishments prescribed by biblical law and even avoided imposing capital punishments prescribed by halakhah itself illustrates this willingness. For example, Deuteronomy 21:18–21 prescribes that the father and mother of a "stubborn and rebellious son" shall bring him out to the elders of the town and say, "This son of ours is disloyal and defiant; he

³ I wish to emphasize that in this entry I am not taking the view (because I don't believe it) that any one form of Judaism is "normative Judaism," although traditional rabbinic Judaism (today known as "Orthodox" Judaism) was the Judaism of the overwhelming majority of Jews for the better part of two millennia, which justifies the attention that we are giving it here.

does not heed us. He is a glutton and a drunkard. Thereupon the men of his town shall stone him to death.” The Talmud, through interpretation, restricted the possibility of carrying out the death penalty against such a son to the point where they made it completely impossible in actual practice to carry out this law! (Elon 1994 I, 365).

Similarly, in Deuteronomy 13:13–17, we encounter the law that “If you hear it said” that someone has persuaded the inhabitants of a town in the land of Israel to become idolators, we are to (1) “investigate and inquire and interrogate thoroughly”; and (2) if “the fact is established,” we are to “put the inhabitants of the town to the sword” and “burn the town and all its spoil entirely.” The sages hedged this law around with restriction after restriction. Thus:

- 1 “If you hear it said of one of your towns.’ But not if you are the source yourself.” In other words, only if the report comes to your attention unbidden are you to investigate; you are not to investigate on your own initiative. (*Midrash Tannaim*, Deuteronomy, 66)
- 2 “If you hear it said of one of your towns.’ But not by one who roams around to eavesdrop.” (*Sifrei*, Deuteronomy, Re’eh, sec. 92, 153)
- 3 “Jerusalem cannot have the status of an idolatrous town, for the Torah says ‘your towns’ – and Jerusalem was not allocated among the [Israelite] tribes.” (TB Baba Kama 82b)
- 4 “R Eliezer says: Every town that contains even one *mezuzah* cannot have the status of an idolatrous town, since it is written: ‘Burn the town and all its spoil entirely.’ This, however, is not possible where there is a *mezuzah*.” (TB Sanhedrin 113a, 71a)

As we see from these examples, the words of God are not read as if their meaning were self-evident. Rather, their meaning is expected to emerge from the ongoing and admittedly fallible process of arguing about the text and of finding ever new and additional meanings in it. Study, innovation (*hiddush*), and interpretation are always linked.

This study and interpretation was supposed to be engaged in by every male Jew (alas, the tradition was chauvinistic!). Indeed, every Jewish community was obligated to support universal education precisely so that this should be possible. We discussed a negative view of all this study. I wish to close by describing a different view. David Hartman writes:

The word, then, at the deepest, most fundamental level of Torah culture, embodies the living reality of God. And, contrary to the standard interpretation of Paul’s description of mitzvah and Halakhah ... the phrase that best describes the essence of rabbinic religiosity is not “the burden of the law” but “*simcha shel mitzvah*,” the joy of mitzvah. (Hartman 1999, 8)

Two reasons may make this difficult for moderns to grasp. The first is the common assumption that study of religious texts involves unquestioning acceptance of tradition. As we have seen, the rabbis delighted in finding ever-new interpretations of the text. As Hartman describes this:

Rabbi Akiva read the Bible as an intimate love letter. He read and reread the words; he, so to speak, felt the parchment and examined the handwriting, the shapes of the letters, and the marks on the page, always looking for signs and clues to secret meanings and hidden messages. In modern terminology, the medium became part of the message, conveying the rich and subtle complexity of the divine world. (Hartman 1999, 9–10)

The second reason is our tendency to assume that seeing a text as ambiguous, complex, difficult, must involve seeing it as creating a *distance* between the recipient and the author. But this is not the way the rabbinic tradition experienced matters. If there is a fundamental novelty in rabbinic religiosity, it is that the sages saw figuring out what God means by his words as a form of *intimacy* with God. Judaism is an interpretive tradition, and as Hartman puts it, “In the interpretive tradition, God never abandons you, because His word is always with you” (1999, 11).

Conclusion

In this entry I have described a unique aspect of the ethical vision of traditional Judaism. That aspect – the valorization of study – is shared by the contemporary Jewish denominational movements, and some trace of it, however attenuated, can be discerned in the thought of most independent Jewish thinkers. That is my justification for calling what I have described “Jewish ethics” and not simply “the ethics of the Talmud.”

CHAPTER 59

Foundations of Jewish Ethics

Ronald M. Green

Any effort to describe the origins and foundations of Jewish ethics faces an immediate problem. If we take “ethics” to mean systematic, reasoned reflection about the norms governing human conduct, then the phrase “Jewish ethics” is inadequate to describe the centuries-long Jewish tradition of ethical thought. A concern only with reasoned reflection leads one to focus on Jewish philosophical discussions in the medieval and modern periods and bypass the vast corpus of moral norms and moral deliberation found in classical Jewish religious law (*halakhah*) (Kellner 1978, 3–18).

The secondary place given to systematic rational reflection in classical Jewish thought stems from the fact that Judaism developed independently of the two traditions that have shaped Western approaches to ethics: the Greco-Roman tradition of moral philosophy, and the Christian tradition of ethical teaching. Ethics focuses on those forms of behavior, intentions, character traits, and moral ideals that pertain to all human beings. “Legalism,” “ceremonialism,” and “parochialism,” too often associated with Jewish teaching, become synonyms for unethical behavior.

I do not want to suggest that these distinctions are simply artifacts of the Western tradition. Many of the distinctions found in “ethics” are implicitly recognized in Jewish thought, and are even addressed in ways that acknowledge their importance. Nevertheless, what is lacking in Jewish ethical teaching, at least in its formative expressions, is any explicit systematic analysis of ethics in terms of these issues or distinctions. The effort to understand the bases and development of Jewish ethics must present the organic, developing body of teachings on the moral life that originates in the Hebrew Bible, continues through the formation of Jewish law in the Talmudic period, and only develops systematic reflection about its bases and problems in the medieval and early modern periods.

Foundational Texts

The Hebrew Bible or Torah forms the heart of the Jewish ethical tradition. The multitude of commandments (*mitzvot*) found in the Pentateuch became the core of Jewish ethical teaching. These were further illuminated by the many narrative and homiletic elements found elsewhere in the Bible, including the book of Genesis, the historical writings, the books of the prophets, and various books of the wisdom tradition (especially Proverbs and Ecclesiastes). Within this vast landscape of moral requirements, ideals, and

complex portraits of virtue and vice, we can identify at least two foundational texts that shape Jewish teaching from the beginning.

Genesis

Genesis establishes a profoundly universalistic motif in Jewish ethics. It does so, first, by locating God's purposes in relation to the history of human race as a whole, not just the national life of Israel. This motif reappears elsewhere in the Bible, especially in prophetic writings like Isaiah 2:3 where Israel's national mission is presented as educating the entire world to God's nature and lofty moral standards. This universalistic vision, eventually a part of Judaism's messianic expectations, is a component of the ethical legacy inherited from the Bible by both the Christian and Islamic faiths.

For Jewish thought, this universalistic motif was further reinforced by the statement in Genesis 1:27 that "God made man in His own image." While the concept of the "divine image" eventually gave rise to diverse interpretations in Jewish ethical, philosophical, and mystical literature it was always understood to encompass human beings' ability to understand and heed moral requirements. Hence, "the divine image" served to ground a Jewish sense of human freedom and moral responsibility. In addition, this text reinforced the Jewish commitment to the dignity and sanctity of each individual human being regardless of the person's worth, social status, or skills. The Mishnah, the compilation of the earliest post-biblical teachings by the sages, tells us that judges in capital cases are required to warn witnesses against giving false testimony by reminding them of the descent of the entire human race from one person (see M Sanhedrin 4.5).

In the Jewish tradition, this motif finds expression in diverse texts that extend God's compassion beyond the confines of Israel. In one text dealing with the Exodus account, God chastises the angels for celebrating the death of the Egyptian pursuers. "My children are drowning in the sea, and you are singing songs?" (TB Megillah 10b). In other texts, the rabbis generalized this respect for the worth of each person to include not just the protection of physical life, but regard for the dignity of each person. They condemned conduct that abased or humiliated one's fellow human being and permitted the suspension of any prohibitory law of Torah to spare another person from indignity (see TB Shabbat 81b).

Jewish philosophers have debated whether Judaism possesses a concept of natural law like that found in the Christian, and especially Roman Catholic, moral tradition. Those who defend the presence of this concept in Jewish thinking have looked to the Genesis narratives and to the related rabbinic concept of "the seven laws of the descendants of Noah" in support of their arguments. As presented in the Talmud, these norms precede the specific laws of the covenant and are regarded as pertaining to all human beings. They include one positive requirement, the establishment of a judicial system in society, and six prohibitions: against (1) blasphemy (2) idolatry (3) the wanton destruction of human life (4) adultery, incest, homosexuality; and bestiality (5) robbery, and (6) eating the flesh a living animal (TB Avodah Zarah 8:4; TB Sanhedrin 56a). Rabbinic speculation on Noachide legislation only makes explicit what was already implicit in many Biblical texts preceding the giving of the Torah: that all human beings by their very nature are capable of understanding and respecting the moral norms governing civilized life (Novak 1998). Such "natural law" thinking forms a "precondition" for the very ideas of revelation and covenant that are so central to Jewish ethics.

Although these observations capture an important aspect of Jewish ethical thinking, we must also recognize that some features of Western natural law have no presence in Jewish ethical thought. Jewish ethical thinking could never accept the distinction, so closely associated with natural law theory, between norms based on reason and those based on revelation. From a traditional Jewish perspective, both the Noachide laws and any moral norms rationally accessible by human beings are regarded as inseparable from God's creative activity. The revelation of God's moral purposes for humanity begins with creation, continues through the bestowal of norms on all humanity prior to the covenant, and reaches its culmination in the giving of the Law to the Israelites at Sinai.

The Genesis narrative also furnishes Jewish ethics with a specific understanding of human sexuality and human beings' place in the natural order. Like their Christian counterparts, Jewish thinkers utilized the narratives surrounding Adam and Eve to identify heterosexuality, marriage, and family as created goods and morally required patterns of conduct. However, unlike the Christian tradition, Jewish ethics tended not to elaborate these ideas into a veneration of existing patterns in nature or biological "vitalism" in any form. Jewish thinkers generally permitted the modification of nature in order to improve the circumstances of human life. Thus, despite the conviction that "healing is from God" almost all Jewish thinkers rejected passivity before disease processes and permitted human medical interventions. Although specific forms of birth control were prohibited as violating the perceived commandment against the "wastage" of (male) seed, broad latitude was provided for female contraceptive measures (see Genesis 38, 8–10; Feldman 1974). For some Jewish thinkers, the "unfinished" nature of creation and human beings' creative role in it was signaled by the ritual event of circumcision. The need for this was explained by the rabbis under the principle "Whatever was created in the first six days requires further preparation" (Genesis Rabbah 11.3 in Freedman and Simon 1939; see also Green 1998, 1999). Also important as a basis for resistance to biological vitalism and passivity before nature is the extreme sacredness of human life in Jewish teaching and the generally "death averse" sensibility that prevails. In Jewish law, the preservation of life is such a central value that it takes precedence over even the most important ritual requirements, such as Sabbath observance or the annual day of fasting at Yom Kippur. The theme of the preeminence and sacredness of each and every human life is fundamental to the tradition.

A final and very important reason for Jewish resistance to biological vitalism is also based on features of human life depicted in Genesis. This is the understanding of the human being as a psychosomatic unity and the perception of the goodness of the material world and embodied existence in all their forms. While it is not right to say that Judaism lacks a sense of the dangerous power of human material or sexual desires, the tradition always resisted any kind of dualism that elevated the spiritual aspects of human life and denigrated the corporeal. One Talmudic passage focuses on the "evil impulse" or *yetzer harah*, the indwelling aspect of lust and greed in human nature that drives so much wrongdoing. Noting that God declares each day's creation to be "good," the text asks, whether the "evil impulse," then, is also good? Yes, it replies, for "were it not for that impulse, a man would not build a house, marry a wife, beget children or conduct business affairs" (M Avot 3:18). It follows from this acceptance of human nature in its entirety that the Jewish ethical tradition rejected radical asceticism as a religious value. This distinctive appreciation of the physical world and embodied existence also explains a host of Jewish practices and beliefs, ranging from the care given the body in funerary rituals through the relatively "this-worldly" messianic hope of restored national existence in the land of Israel.

Exodus and Covenant

Despite its sequential priority within the Biblical texts, Genesis probably takes second place to the narratives concerning the Exodus and Sinaitic Covenant in terms of its importance for Jewish ethics. Together, these constitute the central “story” of the Jewish ethical tradition (Dorff 2002). Within this corpus, at least four key motifs emerge that profoundly shape subsequent Jewish ethical thought as well as Jewish ways of “doing ethics.”

Redemption and Social Justice

The first motif is one anchoring the whole body of Jewish law and commandments in God’s activity in redeeming the people from slavery and oppression. The Hebrews agree to obey God not merely because of his awesome power, but because of his demonstrated justice, righteousness, and compassion. This theme, echoed again and again in Biblical and later Jewish texts, confounds the simple oppositions introduced by later ethical theory between heteronomy and autonomy, reason and revelation (Green 1988, ch. 4). That God’s will, embodied in his commandments, must to be obeyed is a cornerstone of all traditional Jewish thought. But equally important is the conviction that God’s will is righteous. In Jewish thought, faith and ethics cannot conflict. For Judaism, faith is not merely belief in God but the confidence that, despite any appearances to the contrary, God’s will and purposes are righteous.

This redemptive motif also founds the intense commitment to social justice that characterizes all expressions of Jewish ethics from the ancient to the modern period. It is not accidental that the Ten Commandments, which begin with the thundering reminder “I am the Lord your God, who brought you out of the land of Egypt, out of the house of bondage” (Exodus 20:2), are followed by an extensive body of legislation requiring compassion for the poor, the sojourner, the widow and orphan. Having experienced conditions of marginality and oppression, God’s covenanted people are presumed to have special insight into how evil these states are. As a result, they are required to avoid practices that create new suffering for the powerless or marginal in their midst. “You shall not wrong a stranger or oppress him, for you were strangers in Egypt. You shall not afflict any widow or orphan” (Exodus 22:21–2).

These themes are not confined to the Exodus narratives but sweep through the whole tradition. In the Pentateuch they take form in numerous commandments that make provision for the poor. These include the tithing of harvests (Deut. 14:28–29), the right of the poor to gleanings (Lev. 19:10), the cancellation of debts in the Sabbatical year of release (Deut. 15:1–2); and the return of alienated property in the Jubilee year (Lev. 25:9–13). In the prophetic writings, social justice becomes pivotal, as the Israelites’ failure to observe covenantal requirements pertaining to the poor becomes the most frequently mentioned reason for God’s wrath. Following the Roman War in 70 CE, the center of Jewish communal life moved from the agricultural environment of Israel to the more urban communities of the diaspora. In these new circumstances, the rabbinic sages elaborated under the headings of “Zedakah” and “Gemilut Hasadim” a new set of rulings and norms designed to express this commitment to social justice. “Zedakah” included the legally enforced payment of poor taxes, while “Gemilut Hasadim” encompassed the more open-ended and voluntary obligations of interpersonal charity. So extensive were these requirements that everywhere across the diaspora, Jewish communities took the form of “a modified welfare city-state, with its special functionaries who collect the compulsory levy and act as trustees for the poor and the needy” (Twersky 1963: 137–158).

The Ethical Impulse to Law

This conversion of ethical norms into concrete legal (*halakhic*) requirements is the second major motif found in the Exodus-Covenant narratives formative for Jewish ethics. From the start of this tradition, the ethical impulse takes expression as law: concrete, publicly known, authoritative enactments meant to govern the conduct of all members of the community. The core of this legal corpus is the 613 commandments identified in scripture. Beyond this core is a vast and growing penumbra of legislation hinted at and authorized by the Biblical text itself. Anticipating the need to apply the numerous covenantal commandments to the ongoing life of the community, Deuteronomy 17 establishes a process whereby controversies and disputes will be brought for decision before the “Levitical priests” and “the judge who is in office in those days.” The authority of these officials is final.

Eventually, this mandate for ongoing judicial interpretation results in a vast body of recorded debates, opinions, and ruling, some of which come to be regarded as parts of an “Oral Torah” revealed to Moses at Sinai. This was viewed as an extended explanation of how the written laws should be executed and followed. Many of these teachings are gathered in the text of the Mishnah (literally, “repetition”) produced by the earliest sages (*Tanaim*) who worked during the inter-testamental period. In turn, the Mishnah forms the basis of a further commentary tradition (optimistically called “Gemara” or “completion”). Together with Mishnah, this material was developed over several hundred years from 200 to 500 CE by a later generation of rabbinic scholars known as the *Amoraim*. This compilation forms the Talmud, which, in its larger and more authoritative Babylonian version, contains sixty-three tractates (comprising seventeen volumes in the Soncino English translation). Although much of the text is *halakhic* in nature, recording important debates and rulings on legal materials, the Talmud also contains substantial *aggadic* (narrative, speculative and homiletic) material, forming, as it does, a portable culture for a people in exile. Since the need for normative reflection and enactment never ends within an ongoing community, the *halakhic* tradition continues beyond the Talmud in efforts to codify the accumulated body of norms and in rabbinic rulings and interpretations (*responsa*) elicited in each generation by new circumstances of life.

The impulse to law is partly explained by a major ethical conviction of Jewish faith: that for moral requirements and ideals to be taken seriously, they have to be actively embodied in the life of a community and must be incumbent on every member of that community. While it is good to advocate demanding moral requirements and lofty ideals, these become realities only when their performance is expected of all community members and when their neglect is subject to punishment or censure. A law-creating ethic of this sort can become a “monument of inflexible injunctions and prohibitions.” There is also the danger that “spontaneity and inwardness in ethical decision may shrivel into a deadening conformity to the book of statutes” (Schulweis 1995, 34). This problem has sometimes evidenced itself in the life of the Jewish community. Although these dangers are always present, there are corresponding dangers in leaving ethical matters to individual decision making and abandoning efforts to shape the abiding public norms that govern communal life. Faced with these twin dangers, Jewish ethics from its inception opted for the risks of law.

Jewish thinkers tried to moderate this risk by introducing into legal analysis a series of principles that permitted and in some cases required individuals to go beyond the bounds of the law. Perhaps foremost among these was the principle of *lifnim mishurat hadin*, signifying conduct “beyond the line of the law.” This principle is often used by the rabbis to identify conduct in which one does more than the law

requires or presses one's legal rights less strictly than the law permits. For example, according to rabbinic teaching, a sales contract is not complete until goods have been transferred (TB Baba Metzia 47b; see Lauterbach 1951, 288). This provides a window of time during which a merchant might legally renege on an agreement. Someone who refuses to do this is regarded as acting "beyond the line of the law." In these and other instances the rabbis were prepared to extend the "fence" around the law to encompass forms of supererogatory behavior.

Hermeneutic Autonomy

Superficially regarded, Judaism's reliance on a fixed and revealed set of norms would seem to be the antithesis of moral rationality and practical reasoning. Not only are the commandments regarded as having their source in God's eternal will, as opposed to human reason, but also, once understood, they must be strictly obeyed without concessions to human needs or inclinations. Despite this appearance of absoluteness, however, Jewish ethics gives enormous scope to human reason and knowledge in its frank recognition and authorization of the interpretive task. This third major motif of the Jewish ethical tradition, rooted in covenant and also implicit in Deuteronomy 17, where, side by side with the admonition against deviating "to the right hand or the left," the authority for applying the law to current disputes is given to "the judge who is in office in those days." The Talmud reinforced this impulse to judicial interpretation. Pirke Avoth, the "Chapters of the fathers," one of the most ethically explicit texts of the Mishnah, begins with the famous observation

Moses received Torah from Sinai and delivered it to Joshua, and Joshua to the elders, and the elders to the prophets and the prophets delivered it to the men of the great synagogue. These said three things: "Be deliberate in judging, raise up many disciples, and make a fence around the Torah." (M. Avoth 1)

Use of the word "fence" here is particularly apt. Within the Jewish tradition, the interpretive judicial task was not usually conceived as one of innovation. Rather, it was protection of the once-given body of divine legislation. However, since a fence necessarily extends beyond what it protects, the interpretive task assumed from the start the character of an expansive enterprise.

The process of expansion was guided by the two fundamental beliefs. One was the conviction that the interpretive enterprise rests inescapably on human reason and human experience. A key text here was Deuteronomy 30:11–12: "... this commandment which I command you this day is not too hard for you; neither is it far off. It is not in heaven, that you should say, 'Who will go up for us to heaven, and bring it to us ...'" In later Jewish thinking, the principle "it is not in heaven" becomes, negatively, a rejection of any supernatural appeals or charismatic assertions of religious authority. According to the rabbis, God's direct and supernatural communication came to an end in the prophetic period. From that time forward, God's will is instantiated in the revealed law.

Positively, the phrase "it is not in heaven" founds reliance on the rational interpretive rules and "democratic" procedures established over the generations in countless rabbinic debates. Foremost among these is the requirement that final authority in the settlement of all *halakhic* disputes rests with the majority of a community's rabbinic scholars and decisors. In the Talmudic tractate *Baba Metzia* (59b), this teaching finds imaginative expression in the account of a debate about a minor point of ritual law between

Rabbi Eliezer and Rabbi Joshua. When Rabbi Eliezer sees that Rabbi Joshua's opinion commands majority assent, he invokes a series of miraculous events to support his own position, a sequence that culminates in a Divine voice from heaven (*bat kol*) asking "What have you against Rabbi Eliezer? The law is always as he says." In response to this intervention, Rabbi Joshua stands up and declares: "It is not in heaven," reminding God himself of the authority invested in the rabbinic majority. The narrative ends with the report that on that day, God smiled and declared, "My children have defeated me, my children have defeated me."

Paradoxically, this mandate for reasoned interpretation of the law was strengthened by a rabbinic belief that would seem to limit the scope of human moral autonomy: the conviction that the law was complete in its revealed content as this was found in scripture and the received oral law. There was never a question for the rabbis of creating or discovering new laws. Nevertheless, the plenitude of scripture, and the confidence that every word, letter, or punctuation mark was expressive of divine intent afforded limitless opportunities for morally creative innovations that could respond to emergent problems or evolving moral sensibilities. One of the more famous examples of hermeneutic freedom based on textual literalism is the replacement of the *lex talionis* of Exodus 21:24 ("an eye for an eye") by a requirement of monetary compensation for personal injuries. Drawing on Numbers 35:31, "You may not accept a ransom for the life of a murderer who is guilty of a capital crime" the rabbis concluded that this explicit prohibition of monetary compensation in capital cases means that monetary payment is required in all lesser circumstances of personal injury (TB Baba Kama 83b).

Taken together, this reliance on reasoned rabbinic decision and the provision of considerable hermeneutic freedom ensured that the norms emerging from the *halakhic* process would provide continuity with the received tradition while being able to adapt to new circumstances and questions. What emerged was a "quasi-democratic theocracy" in which collective wisdom replaced revelation and continual deliberation about the moral norms governing communal life became a central feature of Jewish identity. Within this context, the contrast between a "heteronomous" revealed law, and an "autonomous" law of reason or conscience makes no sense (see Ross 1968, 5–16).

Study and Obedience

Above all, deliberation about the law and obedience to it had religious significance (see Walzer et al. 2000). A fourth major motif of Jewish ethics is the profound liturgical and ritual dimension of the *halakhic* enterprise. Once again, the texts recording the Exodus and Covenant events establish this sensibility. There we learn that the commandments do not just order Israel's life and govern social conduct. Their deeper aim is to create a "holy people" that evidences God's nature and purposes in the world. The law is meant to "separate" this people from the profane world and confer upon them the kind of purity and sanctity – holiness – associated with divine things.

A distinctive feature of this tradition is the fact that the central purificatory ritual is the *halakhic* process itself: the ongoing task of achieving higher levels of *halakhic* observance. Things that depart from *halakhah* defile and must be avoided and cleansed because they distance the people from God and impair their role as mediators between God and man, a nation of "holy" priests. The goal is to create a morally and religiously pure community. This means that all members participate in the common effort and share a common fate. The moral excellences of some enhance the community's stature and invite God's favor, while the failures of even a few blemish the community and alienate God.

This commitment to collective purity, also explains the tendency of Jewish religious law to interweave both ritual and moral requirements. The seemingly indiscriminate juxtaposition of profoundly moral injunctions, such as the requirement to “love your neighbor as yourself” (Leviticus 19:18), with rules against making a garment out of two kinds of cloth (Leviticus 19:19), has led to the assumption that Jewish law is only secondarily driven by moral intent and that Judaism itself is “a religion of pots and pans” (Kellner 1978, 3–18; Green 2016). This impression is reinforced by repeated insistences that all the commandments are equally mandatory and are to be equally obeyed. Thus Pirke Avot (2:1) admonishes man to be “heedful of a light precept as of a grave one.”

The reality of Jewish teaching and practice was otherwise. From the earliest date, sages and rabbis perceived important differences between the commandments enjoining ritual matters and those that related to the human interpersonal realm. They were informed in this by prophetic utterances like Amos’s imprecation, “I hate, I despise your feasts; and I take no delight in your solemn assemblies ... but let justice roll down like waters, and righteousness like an ever-flowing stream” (Amos 5:21–24). This sensibility is carried over into the Talmud and expressed by a consistent permission to subordinate ritual requirements to urgent human needs. Ultimately, the rabbis ruled that any commandment could be disobeyed – except for the three foundational ones prohibiting idolatry, murder, or incest – in order to save a human life (TB Sanhedrin 74a).

There are at least four explanations for this odd pattern of giving operative priority to moral requirements while affirming the equal bindingness of them all. First, the Rabbis could not formally impose a hierarchy among commandments that are laid down with undifferentiated obligatoriness in the Torah. If choices had to be made in favor of commandments protecting human beings and community life, this was to be done by means of hermeneutic reasoning rather than by a direct assault on the unity of scripture. Second, the rabbis perceived that adhering to any commandment, ritual, or moral, required the kind of self-discipline and subordination of personal desire that was essential for any striving toward moral integrity. Such self-discipline and self-denial were part of the holiness and purity to which the people had been called. Third, some of the commandments had indistinguishable moral and ritual significance. This was particularly true of those dealing with sexuality. In both the Bible and Talmud, homosexual behavior, bestiality, and forms of incest are not only viewed as morally repugnant, they were seen as physically defiling and destructive of the kind of purity to which the holy people had been called (Kirschner 1988, 450–458). Finally, obedience to all the commandments, even the most seemingly trivial and irrational, was understood as a matter of loyalty. Throughout history, Jews suffered an unending succession of trials and hardships as a consequence of the cultural distinctiveness created by obedience to the law. To abandon that distinctiveness was construed as an act of betrayal of God and one’s forbears.

Conclusion

In the medieval period, partly in response to the encounter of Jewish thinkers with other cultural traditions, we begin to see the appearance of Jewish treatises specifically devoted to “ethics.” In imitation of Greco-Roman or Christian ideas, many of these elaborate suprallegal norms and ideals, or stress inner character, moral self-development, and personal virtues. Whether they are influenced by Aristotle or remain more closely rooted in Jewish values, however, these discussions do not represent the

mainstream of Jewish ethics. Instead, this is found in the tradition of law that extends back to the Bible and forward into the ever-evolving tradition of *halakhic* deliberation.

Within this *halakhic* tradition, detailed laws or rulings governing all areas of life and lofty encouragements to saintly behavior exist side by side. What bound this together was the effort to produce a community that mirrored the perfection of a just and compassionate God. Sometimes, this effort fell short of its mark. But if this happened, it was because the task was so demanding and not because Judaism mistook law for ethics or placed ritual over ethics. Whenever it was necessary, Jewish thinkers showed themselves capable of prioritizing ritual, legal, and ethical norms. Nevertheless, they resisted the pressure to make these distinctions and continued to adhere to the Jewish vision of an organic unity of the moral, communal, and religious life.

CHAPTER 60

Ethics Differentiated from the Law

Shaul Magid

The field of Jewish ethics encompasses the entirety of the Jewish literary tradition, from the Bible to contemporary Jewish thought. However, while ancient and medieval Jewish texts speak of ethics, defined here simply as interhuman relations, it is arguably the case that “Jewish ethics” as a scholarly discipline is an exclusively modern phenomenon. Judaism is built on the foundation of covenant – a reciprocal relationship between God and the Israelite people forged in the desert of Sinai. The fulcrum of the covenant is a system of mitzvot, commandments the Israelites and their descendants are obliged to guard and fulfill, thereby executing their covenantal relationship to God. In the Bible these mitzvot comprise both ritual and ethical acts without any inherent distinction between divine–human and interhuman commandments. In classical Judaism, the sages of the Talmud distinguish between divine–human and interhuman mitzvot. In the rabbinic mind, however, this distinction did not result in ethics as an independent category of mitzvot. Ethical mitzvot (interhuman commandments) were still viewed within the larger framework of Israel’s covenantal relationship to God (divine–human commandments) (see M Yoma 8:9; BT Rosh ha-Shana 18b; Yoma 85b, 86b; cf. Maimonides *Mishneh Torah*, “Laws of Repentance,” 2:8, 9).

In the Middle Ages, Jews began to rethink this distinction in light of exposure to other ethical systems. Moses Maimonides, for example, built his Jewish ethical theory on the golden mean of Aristotle, reread through the lens of classical Jewish sources, but still did not posit ethics as a sovereign realm of Jewish discourse (see *Mishneh Torah*, “Laws on Moral Dispositions,” ch. 1). For Maimonides, ethics, even as it is rationally justified and philosophically constructed, is still always intertwined with Israel’s covenantal relationship to God, resulting, *inter alia*, in a particularized hierarchy whereby ethics is defined differently between Jew and Jew and Jew and Gentile. While certainly more universal than the rabbis, Maimonides’ philosophical ethics still does not break out of the rabbinic model that ties ethics to the divine–human realm (Dan 1986, 13). The question as to the universal nature and implementation of Jewish ethics and the formulation of ethics as independent of, although not in conflict with, human devotion to God (i.e. severing the dependence of interhuman relations to divine–human relations) is thus a product of modernity, specifically as formulated by Jews writing in light of the Enlightenment.

My concern in this entry is not with the origin of Jewish ethics or how modernity impacts how Jews think (or can think) about ethics (Gibbs 2000). My intention is to question the conventional claim that Jewish ethics, even in modernity, is always framed in terms of its relationship to the law (*halakha*). The claim is that Judaism is reluctant, or perhaps unable, to construct an ethics not born out of, or already

encompassed in, the performance of the law. I argue that Hasidism, a late eighteenth-century Jewish pietism built on the foundations of classical Jewish mysticism, disentangles ethics from the law by assuming that the law, while essential, does not and cannot fully cultivate the ethical personality. This entry thereby explores a twofold “differentiation” in Jewish ethics: (1) the differentiation of Hasidic thought and practice from other forms of Judaism, and (2) the problem of the possibility of differentiating law and ethics in Jewish life.

Jewish Ethics and the Law: Contemporary Views

Traditional Judaism posits that *halakha* is the exclusive vehicle for devotional behavior, its fulfillment being the sum total of covenantal living. This is built on the foundation of the oft-cited rabbinic dictum that “God only dwells within the four ells of the law” (BT Berakhot 8a). In an attempt to address the relationship between ethics and the law, traditional Jewish thought, which is devoted to the all-encompassing nature of *halakha*, focuses on supererogatory behavior as a foundation for discussing Jewish ethics. Jews who advocate supererogation as part of, yet not identical to, *halakha*, argue that the origin of supererogation is rooted in the Bible. The Bible, in its delineation of specific rituals and positive law, also contains various general directives to behave beyond the letter of the law (see Lev. 19:2; Deut. 6:18; and Nahmanides’ comment ad loc.). However, the biblical exegetes who introduce this biblical charge of supererogation are quick to add the caveat that these directives, while more general than the law, are not outside and thus not independent of the law (see Halivni 1978; Sagi 1998, 230–256). One significant challenge to Jewish ethicists, especially those who write from a traditional and philosophical perspective, is how to forge a Jewish ethical system that protects the commandedness of *halakha* (its heteronymous origin, at least as depicted in classical Judaism) while affirming the principle of autonomy and human freedom basic to ethics. For this reason, law (*halakha*), understood as commandment, plays such a prominent role, and is such a serious problem, in any discussion of Jewish ethics (Siegel and Gertel 1977, 124–132). If ethics were completely outside the sphere of commandments (i.e. if there really were an “ethic independent of *halakha*”), how would ethical behavior be tied to the covenant of commandment forged at Sinai, and, more alarmingly, how would Jews protect the commandments from an external ethical critique?

In his seminal essay on Jewish ethics, Aaron Lichtenstein (1978) explores the notion of supererogatory behavior (*lifnim m’shurat ha-din* – beyond the letter of the law) in rabbinic and post-rabbinic legal code literature to determine whether and to what extent supererogation is part of the law. The sources indicate that if supererogation exists independent of the law (i.e. if it is not required or actionable), then the answer to the question as to whether Judaism accepts an ethic outside *halakha* would be affirmative. Lichtenstein’s final answer is equivocal (1978, 119). He argues that *lifnim m’shurat hadin* is surely not simply *halakha* (if it were, then it would not be *lifnim* – beyond or inside). However, he continues, the sources indicate that supererogation is also not independent of the law. The rabbinic and post-rabbinic readings of biblical passages that refer to ethical behavior not tied to any specific mitzvah are absorbed into the larger halakhic system, occupying a special status in that system that Lichtenstein seeks to explore. What Lichtenstein accomplishes in acknowledging the need for a segment of the law to be “outside” normative *halakha* (supererogation), but to deny that segment any power to alter the halakhic system, is twofold. First, it tacitly acknowledges that formal law is, by itself, insufficient to produce

ethics. Second, it protects the halakhic system from any ethical critique that cannot be justified within tradition. The distinction between law and ethics is maintained, albeit in an attenuated way, while the destabilizing potential to wage an ethical critique against the law is diffused.

This last point is precisely what others find so problematic in Lichtenstein's argument. By tying supererogation so intimately with *halakha*, Lichtenstein prevents the "ethical impulse" the rabbis wanted to cultivate in their readers from scrutinizing the construction of certain dimensions of the *halakha* itself. Eugene Borowitz (1987) argues that the ethical impulse so clearly a part of Rabbinic Judaism is stifled by Lichtenstein's analysis and that, without so much as saying so, the rabbis wanted us to look outside the law in order to strengthen it. Borowitz notes the status of women in Judaism as an example. While he essentially agrees "historically" with those who argue that "the so-called ethical impulse behind the women's issue is a gentile importation into Judaism," the "impulse" to offer supra-legal responses to ethical issues, even those born outside rabbinic discourse, is part of the spirit of Rabbinic Judaism's concept of supererogation (1987, 501; see also Rose 1993: 31–32). On the question as to whether there is an ethic independent of *halakha*, Borowitz claims there is an ethical impulse inside, and thus a part of, the *halakha* that may, at times, require Jews to look outside the *halakha* in order to resolve ethical issues that arise in the *halakha*. This is the case precisely with issues that arise as a result of our confrontation with other cultures and ethical systems.

David Novak takes this discussion in a different direction by stating, "if 'ethics' is defined *prima facie* as a system of rules governing interhuman relations, then 'Jewish' ethics is identified with Jewish law. It is *Halakha*" (1998, 63). He quickly rejects that identification. For Novak, the difference between ethics and law, and the independence of ethics from law, is that ethics is not about "rules" or "cases" (*halakha*), but about principals that govern how rules are determined. Ethics "is about governance and not just guidance" (1998, 76; see also Dan 1986, 2–5). That is, ethics is a kind of *ta'amei hamitzvot* (reasons for the commandments) that determines the meaning of the law but is not determined by it. While *ta'amei ha-mitzvot* only arises from a system of law, it is not bound by the specifics of the law and can offer rationalizations of the commandments that address larger universal claims (see Heinemen 1954; Stern 1998). *Ta'amei ha-mitzvot* consists of two major categories: the historical and the rational. The historical category determines laws (primarily ritual and communal laws) that are exclusive to those who share a particular historical experience (Jews). The rational category determines laws that have no historical basis but result from natural law. This is the category of Jewish ethics. "There can be no idea of natural law in Judaism unless there is an authentic Jewish ethics, part of which is not exclusive to Jews" (Novak 1998, 72).

While establishing a modern category of Jewish ethics through natural law, independent of and even determining the law, Novak laments what he sees as the modern Jewish attempt to conflate ethics with Judaism, making ethics the dominant if not exclusive expression of the Jewish covenantal experience. The destructive nature of the modern conflation of Judaism and ethics is that it destroys the covenant as constituted by tradition, a covenant that has God as the noumenal partner who, through mitzvot, mediates between himself (the ideal) and the real world. In equating Judaism with ethics, God becomes incarnate in the ethical ideal, fully realized and rationally (naturally) determined, leaving no unknowable covenantal partner with whom to relate. While this idea may be aligned with basic tenets of Christianity (incarnation and reconciliation), Novak argues it cannot be born out of Jewish sources (Wyschogrod 1983, 181–182). In this sense, Novak claims that thus far Judaism, traditionally construed, cannot survive the Kantian and post-Kantian critique without rejecting the very premises of that critique,

premises that he believes are essentially true. Divine election, and Jewish particularism, cannot be forsaken, even for the sake of a universal ethics (see Sagi 1998, 316–334; Novak 1995, 50–77). However, universal ethics need not be sacrificed in order to maintain halakhic Judaism.

Novak strikes a kind of dialectical synthesis between Lichtenstein and Borowitz by locating Jewish ethics in a universal source (natural law), seemingly independent of *halakha*, yet functioning within the particularistic frame of the covenant (*halakha*). In this way, ethics can indeed criticize the law (Borowitz), but it cannot change the law without the law. That is, it cannot change the law unless that change can be validated and supported by a particularistic covenantal construction (i.e. via classical Jewish texts). This is not because ethics is a species of the law (Lichtenstein), but because Jewish ethics is the particularistic expression of the universal and must be validated through that particularistic lens.

The cases noted thus far typify the range of options in Jewish thought about “ethics” after the classical period. The law either limits (Lichtenstein), serves as the impulse for (Borowitz), or the contextual frame of (Novak), Jewish ethics. In the two Hasidic cases that follow, the question of *halakha* rarely arises. What is at stake is not the law or its performance (which are taken for granted), but a kind of existential disposition necessary to function as an ethical human being, understood in these texts simply as the ability to love another, be it God or the neighbor. The law, while remaining alive and sacred, is surreptitiously problematized in the pietistic and existential imagination of these Hasidic thinkers.

Hasidism: A Short Introduction

Hasidism can be described as a Jewish revivalist movement beginning in the last third of the eighteenth century in the provinces of Poldolia and Volhynia of Eastern Europe (what now constitutes parts of Poland and the Ukraine). Its enigmatic and mysterious founder, Rabbi Israel ben Eliezer, known as the Baal Shem Tov (“Master of the Good Name,” 1700–1760), used earlier Jewish traditions of kabbalah and medieval pietism as a foundation for a Jewish renewal of religious praxis based on joy (*simha*) and ecstatic devotion. The Baal Shem Tov’s charismatic personality and his reputation as a faith healer and miracle worker attracted other Jewish mystics and pietists and even some prominent rabbinic figures to his circle of disciples (see Rosman 1996; Etkes 2000, 54–162). Many of these disciples became the inner circle of the Baal Shem Tov’s admirers. After his passing in 1760, some of these figures began to develop pietistic circles of their own, migrating into the cities and environs of Poland, Lithuania, White Russia, Galicia, Hungary, and other parts of Eastern Europe, spreading the Baal Shem Tov’s popular and populist message of serving God with joy, challenging the asceticism of earlier pietistic movements and the hierarchical rabbinical class structure that had come to dominate much of the traditional Eastern European Jewish landscape.

One of early Hasidism’s great contributions to Jewish life and letters is its construction of a piety not dominated by the neoplatonic division of body–soul and matter–spirit, but on the search for God in the mundane and everyday. This resulted in, among other things, a kind of non-ascetic Jewish piety. While remaining committed to an ultra-traditionalist lifestyle, Hasidism widened the scope of how one can serve God and, in some very significant ways, problematized the rabbinic dictum cited earlier that “God only dwells in the four ells of the law.” But like other movements in traditional Judaism, Hasidism does not have a word for ethics. In this sense it faithfully inherits the rabbinic and later pietistic traditions of the past. However, Hasidism understands “ethics” (interhuman relations) as an expression of an internal

disposition that *halakha* alone cannot fully cultivate. *Halakha* is defined as the formal set of requirements each Jew is obligated to perform in order to live in a full covenantal relationship with God. While *halakha* may encourage such a disposition of piety – that is, it may have ethics as part of its goal – it does not formally (i.e. legally) require it. Moreover, the fulfillment of *halakha*, even in a supererogatory manner, may not always result in ethical behavior. The disposition that the following Hasidic texts speak of is one of absorbing divinity, allowing it to become so much a part of one's being that one acts in the world as divine and subsequently treats the world (both the individual and the collective) as divine.

R. Menahem Mendel of Vitebsk and Incarnational Ethics

It has often been said that Jewish ethics is an expression of the divine self/soul who relates to the “other” as a divine image, using the divine attributes of mercy and kindness as models for interhuman relations (BT Shabbat 133b; Sota 14a and Sifre “Torat Cohanim” to Leviticus, “Kedoshim,” 86; see also Shapiro 1978, 127; Greenberg 1997, 387ff.). While this is surely supported by a myriad of sources, it is too simplistic a definition for Hasidism. For Hasidism, a Jewish pietism that focuses on the innate divinity of the person, the notion of divine image does not adequately capture its provocative position. R. Menahem Mendel of Vitebsk was a contemporary of the Baal Shem Tov and later became an influential part of the circle of the Maggid of Mezeritch (one of the spiritual heirs of the Baal Shem Tov). He immigrated to Palestine in 1777, living in Safed and Tiberias, where his collected writings and letters were completed. He is considered one of the most prominent figures in the first two generations of Hasidism.

His collected writings, entitled *Pri Ha-'Aretz* (lit. “fruits of the land”), presents a nuanced version of the Jewish idea of humanity's divine image and the part it plays in the expression of ethics (Mendel 1987). The first part of the text addresses the question of preliminaries; that is, what is the existential posture necessary to create the possibility of being overcome by the divine. What is suggested is a stance of absolute impotence, emptying oneself of will to make room for the influx, and subsequent incarnation, of God.

This preliminary state of absolute impotence is required because R. Menahem Mendel holds that the core of one's humanness is the autonomous will that invariably interprets human action as sovereign and severed from God. Human beings, acting as independent volitional agents, will always see their actions as sovereign and independent of God. As a result, humans *qua* human cannot love, because love is divine. God is love and only God can love. And the only object of love is God. Therefore, in order to love, and thus to act ethically, one must become filled with God – one must create the context allowing love (God) to descend and overcome the volitional self. This emerges from a creative rendering of a midrashic passage. In describing the simultaneity of God's transcendence and immanence, the midrash states: “God is the place of the world but the world is not his place” (Genesis Raba 78:9; Pesikta Rabati, 21). One half of this phrase is employed here, in one variant subtly substituting “world” for “human-kind.” That is, God's true residence in this world is the human being (see Vital 1864, 182d).

To be fully human is to become God-like. For R. Menahem Mendel, this requires the dissolution of volition. This experience of radical indwelling, which I maintain crosses over into incarnation, has two immediate consequences: first, it experientially affirms the human impotence that was merely posited earlier; second, and more importantly, it enables the individual to love.

This [expression of] love results in connecting him to all creatures (*b'eyi 'olam*) and all human beings after realizing that this love is a love of grace that he did not merit in his own soul (M. Rosh

Ha-Shana 1:2; Maimonides, *Mishneh Torah*, “Laws of Sabbatical and Jubilee Years” 13:13; and “Laws of Kings” 8:10). This is because it is impossible to create or merit this divinity. It is the will of God that it is given as a gift. If he gives this gift of love to another, his friend would be similarly inspired. And, his friend would realize that this gift is not from him [but from God]. (Mendel 1987, 121, 122)

This experience of incarnation enables one to love all things because one sees how all things, even those that are evil (i.e. transgressors), share a divine source. The difference between one who loves and transgressors is that the latter have not yet opened themselves up to the experience of “incarnation” (divine indwelling) and still see themselves acting independent of God. One’s ability to elevate those souls is equal to one’s ability to love, for love, being divine, is that which elevates (elevation here being the act that reunites a thing with its source).

This ability is not procured simply by following the law. In fact, the law presents certain challenges to this ideal because the practitioner can easily err in seeing herself as an autonomous agent.

This is not the case with one who envisions himself as having the autonomy and strength to study and fulfill the entire Torah. This person is considered as one who hates Jews and “it is as if he has no God” (Babylonian Talmud, Avodah Zara, 17b). He is surely worse than all the transgressors, *like a troubled sea* (Isaiah 57:20) (see BT Sota 8a). This person empowers the demonic forces more than all transgressors and descends to the greatest depths. This individual is a *querulous man* (Proverbs 18:8, 26:22) who *alienates his neighbor* (Proverbs 17:9). He severs the trait of fear, which is the Shekhina (divine presence) from all of life by saying “This is not divine but the work of my hands.” Thus Hillel the Sage, who surely was a very humble man, said, “If I (*ani*) am here everything is here” (BT, Sukkah, 53a). That is, in every place Hillel finds himself, he finds all of humankind – [because he realizes that] he is like one of them and it is only God who is his redeemer. When he ascends, they all ascend with him. (Mendel 1987, 122)

This admonishment of autonomous righteousness is quite stark and uncharacteristically framed around the practitioner of Torah and mitzvot. Why is this righteousness (“fulfilling the entire Torah”) worse than transgression, and why is such a person one “who hates Jews” and “one who has no God”?

The basis of these comments is taken from the conventional kabbalistic idea that the demonic is empowered by utilizing the holy (Torah and mitzvot) (see Vital and Agasi 1990, 122–25; Tishby 1984, 28–32). Autonomous righteousness can only be false (and thus demonic) because, as autonomous (i.e. without God), it cannot be based on love. Such a person “hates Jews” because the Torah she lives is an expression of Torah without love, love only being possible through “incarnation.” A Torah without love does not result in elevation (of the self or another) but descent (“and descends to the greatest depths”). R. Menahem Mendel seems to be saying that hatred is exclusively a human trait, perhaps subtly invoking Genesis 6:5, whereas only the divine can love. Therefore, in order for humankind to love, it must become divine, or at least be overcome with its own divinity.

Having established an incarnational ethics whereby love is dependent on the realization of one’s inner divinity, R. Menahem Mendel turns back to the question of how that posture is cultivated.

One must [always] contemplate: who do I fear? It is God, who fills all possible worlds, without whom nothing exists. What is the source of my existence? It is God. Where I am destined to go? Toward God. If that is so, what am I? There is no fear except the fear of God's glory. When one achieves this fear he will comprehend that it is also created by God and contains divine effluence, without which it would not exist. If one draws down this fear of God from its lofty place it will become compacted [in human experience] as love because any divine life force that is drawn down and implanted in this world is love. This will evoke love of God, resulting in "the descent of a thread of grace from the source of blessing" (Babylonian Talmud Hagigah 12b). From there, *you will be like a watered garden, like a spring whose waters do not fail* (Isaiah 58:11). (Mendel 1987, 122)

"Who am I?" I am God's residence on earth, which enables me to love others whose divine potential I can also see. This love is the basis of ethics for R. Menahem Mendel because only love creates love, resulting in an interhuman (ethical) world that is really a Divine-divine world. To love is to be (fully) God-like, for only then can the divine in others be recognized. To be God-like is to be full of God and empty of self – it is to be incarnate.

R. Levi Isaac of Berditchev: Ethics and the Universalization of the Covenant

R. Levi Isaac of Berditchev, a younger contemporary of R. Menahem Mendel, is one of the most celebrated disciples of the Maggid of Mezeritch. His collected teachings, entitled *Kedushat Levi*, remains a popular and important work of the early period of Hasidism. R. Levi Isaac attempts to reframe the relationship between the divine-human and interhuman realm first suggested in the Talmud. In doing so, he argues for an ethics built on the foundation of unity – first the unity of God, and second the unity of humanity (or, at least, the community that recognizes divine unity). The covenant and its ethical expression is an outgrowth of that dual unity. The first unity creates the possibility for the second; the second unity serves as the earthly embodiment of the first. The surprising end to this approach is that the transference from the divine to the collective results in the universalization of the covenant, or the Judaization of humanity.

R. Levi Isaac begins by juxtaposing two seemingly contradictory passages in the Talmud.

On the rabbinic dictum "[the aspiring convert asked Hillel the Sage] 'Teach me all of the Torah on one foot.' Hillel the Sage responds 'what you would hate another to do to you, do not do to him.'" (TB Shabbat 31a)

Other rabbinic sages teach that the first commandments *I am the Lord your God* and *Do not have any other gods before me* were both heard from the mouth of God (*m'pi ha-gevurah*) (see TB Makkot 24b; TB Horayot 8a; Exodus Raba 33:7). [This means] the entire Torah is included in them. That is, all its reasons and secret hints are included in the notion of divine unity (*ahdut ha-Shem*) [as expressed in those two commandments]. All the reasons are hinted at [in these two commandments] in order that we recognize them when we bind ourselves and serve the Creator. So it is that all the esoteric teachings teach that all the mitzvot only serve to teach us of the unity of God. (Isaac 1992: 141a/b)

Given the opportunity to “teach the *entire Torah* on one foot,” Hillel cites a negative version of “Love your neighbor as yourself” (Leviticus 19:18), one of the standard biblical verses employed to define Jewish ethics (see *Sefer Mitzvot Gedolot* (SM’G), positive commandment no. 9; and *Sefer Ha-Hinukh*, commandment no. 243).

However, R. Levi Isaac continues, we have another talmudic dictum that states that the *entire Torah* was communicated and is embodied in the first two commandments, referring to the doctrine of divine unity (*ahdut ha-Shem*). If this is so, why didn’t Hillel cite these two commandments and their interpretation to the aspiring convert? He answers by interpreting the talmudic distinction of divine–human and interhuman mitzvot.

However, it is widely known that the mitzvot of the Torah are divided into two distinct categories. The first category is mitzvot between Israel and their Father in Heaven, such as ritual fringes (*zizit*), phylacteries (*tefillin*), and sacrifices (*korbanot*). The other category is mitzvot that are interhuman, which can be encapsulated in *Love your neighbor as yourself* (Leviticus 19:18), as it says, “Rabbi Akiba says, this [*Love your neighbor ...*] is the great principle of the Torah” (Palestinian Talmud, Nedarim, p. 30b). We must understand that interhuman mitzvot are included in the principle of divine unity, as we said *I am the Lord Your God*, and *Do not have any other gods ...* were heard directly from the mouth of God and encompass the entire Torah. (Isaac 1992: 141b)

The foundation of ethics presented here (Hillel’s remark) is the result of the transference of the divine unity realized at Sinai to the unity of Israel as one body. When R. Levi Isaac says, “we must understand that interhuman mitzvot are included in the principle of divine unity,” he means that the interhuman, as Hillel frames it, is only possible by first realizing divine unity through the first two commandments (Sinai). The consequence of realizing that unity is the realization of the unity of the community as one body. We act ethically toward our neighbor (here, only our Israelite neighbor) because we identify with him or her as part of the unified self that is forged at Sinai (hearing the first two commandments). The covenant with God fostered through the recognition of divine unity is the basis of the covenant with human beings fostered through the realization that any community that recognizes divine unity is “a community that stands as one.”

Up to this point R. Levi Isaac supports the normative idea that covenant and divine election underlie the foundation of Jewish ethics. The commandment “love thy neighbor,” as interpreted by the rabbis, refers only to the Israelite neighbor and Israel is defined as that collective and their progeny who share, either directly or by proxy, the historical experience of Sinai (*ahdut ha-Shem*). This is necessary as only Israel, who hears the first two commandments, has a notion of the community as a unified body that makes religious ethics possible. From our earlier discussion of different approaches of relating law and ethics, this would support an ethics that exists within and not independent of *halakha*, both born out of a shared experience at Sinai.

However, R. Levi Isaac does not stop here. He is curious about why the rabbinic discussion of Hillel’s declaration of Jewish ethics is framed in a conversation with an aspiring convert. Turning from Hillel’s answer to the underlying premise of the convert’s question, R. Levi Isaac problematizes the idea that election, and thus ethics (“love thy neighbor”), is limited to the original community at Sinai. The aspiring convert wants to know how interhuman relations (ethics) are connected to divine–human relations. He knew that one need not be Jewish to be ethical or to serve God. Being Jewish here is now defined precisely as understanding the dependence of ethics on divine unity (*ahdut ha-shem*). According to R. Levi

Isaac's reading, the convert in this talmudic passage serves as a metaphor for those civilizations that did not experience the historical beneficence of the Sinai covenant but desired to understand how ethics relates to depiction of that Sinaitic God.

Hillel's answer is that ethics is born out of a realization of the unity of the human community that emerges out of the Sinaitic revelation (the unity of God). Ethics results from the transference of divine unity to humankind that is born out of a particular collective human experience of God. While Sinai provides this for Israel, the realization of divine unity can also be cultivated in reverse, that is, by first realizing the unity of the human community and, by extension, the unity of God. This seems to be R. Levi Isaac's idea of conversion. Instead of conversion simply being the ability of others to share in the historical covenant of Israel, R. Levi Isaac suggests that conversion, in an expansive sense, is the deconstruction of the particularistic nature of divine election – or, the substitution of the historical for the universal. “Therefore, all the nations (*ha-'amim*) must become one nation (*'am ehad*).” This is a creative play on the prophetic declaration that, “in that day, the Lord will be One and His Name will be one” (Zechariah 14:9). Universal recognition of divine unity, and universal religion, is realized by the recognition of the unity of humankind, the place where the historical meets and is subsumed in the universal. “This will result in the transformation of all nations to a nation of God.” Becoming one nation through ethics results in the universal realization of divine unity and the completion of the Israelite mission to the world.

That is why Hillel responds to the convert with “love your neighbor” (the universal) and does not bring up the first two commandments (the historical). Those commandments only work for those who heard them directly from God (Israel). For those at Sinai, the experience and completion of divine unity must translate into ethics via the transference of divine unity to the unity of the community. For those not at Sinai, however, the way to that unity begins in ethics, culminating in the transference of humankind's unity to divine unity. When the non-Israelite community realizes this connection, both communities actually meet and become *'am ehad* via living the ethical ideal as one community – it is just that they begin from opposite places.

Conclusion

This brief presentation of two examples of Hasidic ethics disentangled from *halakha* serves as an alternative model to the contemporary discussions of Jewish ethics discussed in the first section of this entry. R. Menahem Mendel suggests that ethics is an outgrowth of divine love achieved through a kind of incarnation of God into the emptied human vessel. This love serves to elevate all of creation by evoking the divinity in one's neighbor as a recipient of that love, that is, in receiving God's grace. In this case, while the law may indeed serve as an obligatory and necessary component for the Jew, the law does not produce or even cultivate this love – this love is achieved via suprallegal means, through contemplation and the practice of emptying the self of one's ego and will. In R. Menahem Mendel's reading, the rabbinic dichotomy between divine-human and interhuman collapses into a “trinitarian” relation. The divine self is completed via incarnation in the individual and, as divine, discovers and relates to the divinity in the other through love. Love of God and love of the neighbor become fused.

In the three contemporary approaches to law and ethics discussed in the first section, ethics was tied very tightly to the mitzvot (*halakha*), either as part of the system of *halakha* (Lichtenstein), implied in the spirit of the *halakha* (Borowitz), or that the *halakha*, as covenantal expression, was the particularistic

frame of ethics (Novak's "postmodern" alternative that presented ethics as natural law and Jewish ethics as part of divine election). R. Menahem Mendel's approach, while not directly addressing these constructions, offers a model of ethics that is, in a significant way, "independent of *halakha*."

R. Levi Isaac's text is more relevant to our modern interpreters, as he directly addresses the rabbinic dichotomy of divine-human and interhuman mitzvot. Instead of simply locating interhuman relations in divine-human relations, something that David Novak claims is fundamental to classical Judaism and largely disappears in modern Jewish ethics, R. Levi Isaac presents interhuman relations for Israel ("love thy neighbor") as an outgrowth of divine-human relations ("I am the Lord your God"), but uses that correlation to construct a universal message of Judaism that, if manifested successfully, deconstructs the particularistic formulation of divine election. The interhuman moves beyond being exclusive to Israel and includes anyone who recognizes the unity of God, even as that unity is achieved through ethics (the universal) and not via Sinai (the historical). For the non-Israelite who did not (and does not) partake in the historical covenant at Sinai, interhuman relations are the source for divine-human relations (i.e. Hillel's answer to the convert). Moreover, the success of this universal message to the convert is that Israel and the rest of humanity forge one world community, all elected because they all recognize the unity of God, each feeling equally obligated to live ethically. While the historical roots of each community may remain distinct (an issue R. Levi Isaac never addresses), the shared recognition of the unity of God creates a universal ethics out of the transference of divine unity to the human community and vice versa. If this is not an ethic "independent of *halakha*" it is surely an ethic that transcends *halakha*, because it applies to those who have no share in the historical roots of the halakhic system.

This entry does not claim to offer a definitive account of Hasidic ethics. What it claims is that Hasidism, seen through the window of these select texts, offers a vision of ethics disentangled, albeit not severed, from the law. Both examples subtly criticize the notion of the exclusivity of the law as the sum total of Jewish living. Whereas even modern thinkers, in different ways, wed ethics to the law, these Hasidic texts offer an alternative showing how the ethical personality is cultivated and nurtured in Judaism. By disentangling ethics from the law, Hasidism challenges some basic conventions about Judaism, both as envisioned from within and from without. The breakdown of those conventions may provide new ways of thinking comparatively about Jewish ethics as part of the larger discourse in the study of religion.

CHAPTER 61

From Law to Ethics ... and Back

Nancy Levene

R. Simlai said: Six hundred and thirteen commandments were given to Moses, 365 negative commandments answering to the number of days of the year, and 248 positive commandments answering to the number of a person's members.

Then David came and reduced them to eleven: "Lord, who shall dwell in Your tabernacle? Who shall sojourn in Your holy mountain? He that walks uprightly, works righteousness, speaks truth in his heart; has no slander upon his tongue, nor does evil to his fellow, nor reproaches his neighbor; in whose eyes a vile person is despised, but honors those who fear the Lord. He swears to his own heart and doesn't change. He does not lend his money on interest, nor take a bribe against the innocent. He that does these things shall never be moved." [Ps. 15]

Then came Isaiah, and reduced them to six: "He that walks righteously, and speaks uprightly, he that despises oppressors, who shakes his hand from bribes, who stops his ear from hearing about bloodshed, and shuts his eyes so as not to see evil – he shall dwell on high." [Isa. 33:15–16]

Then came Micah, and reduced them to three: "It has been told you, O man, what is good, and what the Lord requires of you: only to do justly, and to love mercy, and to walk humbly before your God." [Mic. 6:8]

Then Isaiah came again, and reduced them to two: "Thus says the Lord: keep justice and do righteousness." [Isa. 56:1]

Then came Amos, and reduced them to one: "Seek the Lord and live" [Amos 5:4]. Or one may say, then came Habakkuk, and reduced them to one: "The righteous shall live by their faith." [Hab. 2:4]

Babylonian Talmud, Makkot 24a (Trans. excerpted in Borowitz and Schwartz 1999, 222–223)

It is sometimes worthwhile simply to pause over a text such as this one from Makkot, a talmudic tractate devoted to the judicial procedures concerning false witnesses and other prohibitions. It provides a striking window into classical Jewish reflection on the relationship of law and ethics, quite in contrast to what one finds in contemporary literature, which is beset by such questions as: What do law and ethics have to do with each other? How should they be related? How can one think about the relationship between them without feeling the pressure of Christian appraisals of the law? Is there an ethics outside of law? A law outside of ethics? Should there be? These questions are in fact only the tip of a rather large iceberg (see Lichtenstein 1978, 222–223; Kellner 1978; Dorff and Newman 1995; Fox 1975; Newman

1995; Gibbs 2000; Goodman 1998; Rose 1993). “What iceberg?” ask the rabbis of Makkot, and in one creative exegetical gesture, bring what seems a perfectly lucid ancient solution to a modern problem. Or is it a modern solution to an ancient problem?

I want to offer a few reflections on this suggestive text before moving to the question of how one might think about contemporary trajectories in Jewish ethics in light of rabbinic reasoning. There will be some interesting cross-pollinations: Judaism, Kant, the rabbis, modernity. It is frequently Kant who gets blamed for bifurcating, for ruining, what the Talmud holds together (law, ethics), and Kant who thus occupies a kind of negative centrality in Jewish thought. Kant, the stranger to Judaism, is the one who makes it so painfully clear why Jews are forever strangers in the modern West. Or so it is usually argued. I want to say something else: that Kant has much more in common with the Hebrew Bible and the Talmud than one might think, and this is to notice at least three curious things: (1) that “modernity” may be a concept that is indigenous to a Judaism that originates in antiquity; (2) that Kant’s Enlightenment may be less a threat to Jewish thought than a working out of its central premises; and (3) that the traditional historiography of Judaism that sees modernity as an unwelcome divorce from a medieval world that successfully integrates law and ethics may need to be entirely reversed. I cannot prove these claims in any detail in this entry, but I want to raise them as food for thought.

An Arrestingly Simple Logic

According to the text quoted above, the commandments given to Moses numbered 613, divided into positive and negative laws – for example, keep the Sabbath with joy in your heart and refrain from work on that day. Here is what we call in English “the law” – those things that are to guide conduct, restrain passion, and promote fellowship and social harmony in the spheres of family, civil society, and polity (with rabbinic interpretations, they ultimately number far more than 613).

What happens next? “Then David came and reduced [*he’emidan*] them to eleven,” a trope that is then repeated throughout the remaining five paragraphs. Each successive reduction involves bringing a biblical passage which comments upon the previous one and leads to the next, culminating in the final passage in which there is only one commandment, interpreted variously in Amos and Habakkuk. The effect of the whole is of a seamless commentary on Jewish values, which begins with the law, condenses this law ever more potently into ethical maxims, and then arguably (suggestively, indirectly) reopens law at the end through the notions of “life” and “faith.” It is also, not incidentally, a condensation of what Jews call the Tanakh (Bible), containing words of “Torah” (the five books of Moses), “Nevi’im” (prophets), and “Kethubin” (writings, or wisdom literature). Finally, and perhaps most importantly, its words are biblical – the Bible (all three components) being the touchstone for ethical reasoning in Judaism, yet its “composition” is rabbinic (“R. Simlai said”) – the rabbis of the Talmud being the preeminent source of law in the tradition.

To be sure, what I am calling “seamless” here is not quite as it seems. The key depends on the interpretation of the word *he’emidan*, to reduce, to found. Reduction implies paring down. But why do that? We are given 613 commandments. Is this too many? Is nine easier to understand? Is six easier than nine? Is ease of understanding even the issue? Reduction has other meanings. To reduce is to concentrate, as in here is the law in its essence. But why essence? Does this help to follow it better? Is it to motivate, or perhaps to explain the law to others?

One might fruitfully trace the entire history of Jewish ethical reasoning through the various avenues opened by this single passage. Taken alone, it has the tone of responding to a general question, such as “how should a person live?” One might deduce, from the source of the compilation and from the surrounding narratives of the revelation on Mount Sinai, that the passage only concerns Jews, but there is otherwise no indication that there is a specific audience intended. On the basis of the passage alone, Moses could be understood to be God’s emissary for all persons, and the revealed commandments relevant to all.

This ambiguity is noteworthy, because one well-attested way of distinguishing law from ethics – and indeed what is often at stake in doing so – is to claim that law (or positive law) refers to a particular people, while ethics (or natural law) is universalizable. Hence, to move from law to ethics in this case is to move from Judaism to all the nations, without any clear sense of how to move back. On this reading, what is happening with the reduction is that the yoke of the law given to Moses is instantly relieved by David – law is *translated* into ethics without remainder – and from then on it is a matter of acquiring a list of qualities (uprightness, honesty, integrity, goodheartedness, humility, and so on) rather than obeying a set of prescriptions. Alternatively, one could read the translation as internal to law itself – what is translated is not law *into* ethics, but legal prescriptions into legal norms and maxims. In this latter version, one moves from law as commandment to ethics as one might move from the US Constitution to its Bill of Rights (amendments), a movement of greater generality within a single class. It follows that there would still be a need to ask how one moves back – that is, how one holds together the ultra-general with the ultra-specific – but this is presumably far less strenuous than trying to retrieve the law having moved in a unidirectional flight away from it.

These are two of many interpretations possible, but they do capture a tension that the passage makes no effort to hide (see Novak 1998). It almost seems to dare the reader to take the antinomian way out, declaring that since faith and righteousness are what the commandments *amount to*, they themselves are not necessary. But the passage evinces no particular concern about this conclusion, and it would be left to later rabbis and philosophers to close off this option. On its face, there is no compelling reason to read it in an antinomian way, no reason to agonize about whether ethics goes further than or takes one away from the law, or whether one of them translates or interprets the other out of existence, or into existence, or neither. We have Moses and we have Amos and Habakkuk, and everything in between, and it is all as “R. Simlai said.” The law can be reduced to ethics, and, one gets the sense, ethics can be reduced to law (or would one speak of reconstitution here?), and this is as it should be.

But, of course, Jews *have* agonized. One could even say that the history of Jewish ethics just is this agonizing. In part this is due to the proximity of Christianity through the ages, and its claim to “fulfill” the law through ethics (see Gal. 2:16; Rom. 3:31). If Judaism, then, is going to have an “ethics,” it cannot be sovereign; it cannot lead away, but must in fact lead back to the law. With the advent of liberal Judaism and the philosophies of the Jewish enlightenment, this defensiveness was turned inward as Jewish defenders of the centrality of law battled those who pushed ethics – in the form of ethical monotheism – to the fore. In all cases there is this palpable anxiety concerning – in the language of our passage – the move from Moses to David, as if the movement is one of stepping off a cliff. Where is one going? How might one get back ... to the law? For it *is* about law, as even R. Simlai knew – without it, there is no ethics. And it *is*, equally, about ethics, as R. Simlai knew – without it, there is no law. I will come back to this point in due course. Let me turn now to the question of trajectories in Jewish ethics.

The Modern Challenge: Law to Ethics

The greatest challenge of thinking through trajectories in Jewish ethics is confronting the modern history of the term, which has tended to interpret the reduction in our passage literally – as an act of diminution. More precisely, law and ethics have been siphoned off as independently existing entities, with ethics emerging as the prime focus of philosophical energy. From Immanuel Kant, of course, we are bequeathed the notion that a true ethics is one that is independent of any modifier: there can be no “Jewish” ethics, just as there can be no “French” or “left-wing” or “feminist” ethics. From modern Judaism, and especially from Kant’s strongest Jewish reader Hermann Cohen, we are bequeathed the contrary notion that ethics must be grounded in its sources, that is, it must emerge out of the reasoning of a people, community, set of texts, and life-world (see Cohen 1995). One hesitates to see this as a distinction between autonomy (independence, universality) and heteronomy (dependence, particularity), since to do so would seem already to grant to Kant the terms of the debate, and thus to privilege the autonomy he privileges, to the distinct disadvantage of Judaism (*pace* Cohen). But for modern readers, unlike for R. Simlai and his cohort, there may be no easy way to avoid the question that Kant raises for us, namely, how is Jewish ethics possible?

The question is not only whether Judaism (or any tradition) can count as generating a foundational ethics if it clings to the communal priority of its own members; the question is also can Judaism provide an ethics that is achievable? As Kant is wont to put it, human beings *ought* to be ethical, therefore they must be able to be (Kant 1960, 55). This simple statement is crucial for Kant because it rules out the classical project of *imitatio Dei*, the imitation of God that, according to the Jewish and Christian Bibles, was to constitute the highest human end. While the Christian story of the life of God in Jesus may have seemingly made this imitation more doable, the injunction comes from God’s words to the Israelites in Leviticus 19:2: “You shall be holy [*kadosh*], for I, your God, am holy.” Both Jews and Christians have had to struggle with this exhortation, for the narratives in which God acts in both traditions are various, complex, and sometimes contradictory. Kant wanted to do away with the uncertainty of this project altogether, though not with imitation *per se*. In his model, it is the moral human being I am to imitate in my conduct, and I need look no further for the model than my own heart. *Prima facie* this would seem to insist that insofar as Judaism has an “ethics,” this ethics cannot be (solely) Jewish.

Of course, Kant is not the only thinker to dominate ethical reasoning in the modern world, and certainly the starkness of his ethics, and responses to this starkness, are attested elsewhere in Western philosophy. Indeed, the struggles over what counts as ethical in the West have historically tended to vacillate between satisfying the condition of universality as Kant understood it and attending to the particular details and priorities of a given situation or community – a given ethos. Yet Kant was enormously influential for modern Jewish philosophy, and more importantly, the particular problem he addressed is one that goes to the heart of the project of “reducing” Jewish ethics (Seeskin 2001). The question is not only the alternation of ethos versus universality. The question is whether Jewish ethics presents another case study in this same alternation, or does it add yet a third condition – the “religious” – that disturbs the relationship between human and human assumed both by ethics rooted in ethos and ethics as universality?

The provisional answer to this question has to be yes: Jewish ethics is religious ethics, and therefore presents to the Kantian position a particular kind of counterview. At the very least, and again, these

terms are Kant's, it involves the distinction between rooting the source of obligation in God and conceiving the end of ethics to culminate in God. Kant insisted on the propriety of the second as strongly as he took issue with the first. If God is the source, he reasoned, I am not solely the author of my own moral actions. It is not just that I would be acting morally *for* God but that my ability to act morally would be dependent on a being other than myself. For Kant, Jewish ethics is not possible because ethics just means independence and independent is the one thing the partners to a covenant with a law-giving God seem not to be (see Seeskin 2001, 233).

The question is, though: Is Kant's question – “How is Jewish ethics possible?” – a Jewish one? Need Jewish ethics respond to a critique that challenges its most foundational terms – that assails its right to reveal a uniquely Jewish contribution to the problems and challenges that beset the achievement of moral aims and conduct? In asking, moreover, whether Kant's question is Jewish – more specifically, whether it can be justified in Jewish terms and/or whether Jews do or should ask it – a second series of questions seems also to come to the fore. What is modern about Jewish ethics? How has modernity impacted ethical reasoning in Judaism and how has Judaism impacted ethical reasoning in modernity? This connection between Kant, Judaism, and modernity was suggested historically by the Jewish philosopher Moses Mendelssohn, whose final Jewish work, *Jerusalem*, contended (in so many words) that Kant's universalism posed no problem at all for Judaism. Jews, like all other rational beings, were able to attain the knowledge of universal truths (such as the moral law) irrespective of tradition, while tradition, in the form of a revealed law, could give sustenance to Jews on their path towards holiness (Mendelssohn 1983, 126–139). In his own way Mendelssohn dismissed the possibility of religious ethics altogether by making religion and ethics part of distinct and irreconcilable conceptual planes.

Contemporary Options?

For Jewish ethics, then, Kant presents a singular challenge, even for those thinkers who *mutatis mutandis* aligned themselves with his worldview. The thinkers most committed to retrieving Jewish ethics from the narrowness of the modern debates initiated by Mendelssohn and Kant have been those who refuse the Kantian question altogether. For Martin Buber and Emmanuel Levinas, the question of the nature of *Jewish* ethics is not even asked. What they both ask is, simply, what is ethical? What does the ethical demand of me now and what will it demand of me tomorrow? Both draw freely on classical Jewish sources, but neither could be said to be reasoning *out of* these sources in the way that Hermann Cohen is. For the Buber of the classic work *I and Thou*, “in the beginning is relation,” a “wholeness,” he says, in which “persons are still embedded like reliefs without achieving the fully rounded independence of nouns and pronouns. What counts is not these products of analysis and reflection but the genuine original unity, the lived relationship” (Buber 1970, 69–70). Levinas expresses something similar in the dense knots of his *Totality and Infinity* (1961) when he speaks of the ethical (which one accesses as metaphysics) as the foundation of existence: “Meta-physics, transcendence, the welcoming of the other by the same, of the Other by me, is concretely produced as the calling into question of the same by the other, that is, as the ethics that accomplishes the critical essence of knowledge” (1961, 43). At the heart of these works is a conception of ethics as “first philosophy,” as the groundwork, the primordial place of origin, out of which all human possibility, as well as corruption, emerges

(Levinas 1989). Both thinkers also have their “Jewish” works in which they grapple explicitly with concepts like covenant, revelation, tradition, law, and text (see Buber 1967; Levinas 1990a, 1990b, 1994). But their commitment to an ethical refashioning of philosophy is what each most contributes to modern thought. In a curious way, it could be said that in refusing the Kantian question, each is following Kant in his insistence that ethics not be hyphenated. Their Judaism can be seen to impact their thinking in the same way that Kant’s Protestant Christianity impacted his, providing simply a vocabulary, a set of values, a vernacular.

But something plagues these Jewish standpoints (beyond the charge that they are not Jewish enough), as it plagued Kant. The translation of law into ethics – or ethics into law – still sees the ethical as something to be retrieved, something disconnected from the ordinary, even (or precisely) as it is placed at the center of thinking. “When man truly approaches the Other,” Levinas writes, “he is uprooted from history” (1961, 52). There is a flavor of overcompensation here, as if “otherness” can coexist with “history” only by (provisionally) banishing it. Like the distinctions between ethics and law, or even Athens and Jerusalem, Greek and Jew, German and Jew, there is the sense that in modernity the terms are straining away from each other at the very moment of contact (see Derrida 2002). The very locution “religious ethics” seems unconsciously to reflect this strain, glossing over these uncomfortable pairs in a breezy hybrid.

When the question is asked how modernity has impacted Judaism and Judaism modernity, it is with these uneasy distinctions that one must wrestle. It is these distinctions that most envelope the Jew in the modern and the modern in the Jew. In the modernity of Mendelssohn and his heirs, these distinctions between Judaism and its others and within Judaism itself become uncoupled and strange, calling not for “reduction” in Rav Simlai’s sense but rather for redress, mediation, therapy.

Yet if modernity is a problem for Judaism because law and ethics are seen to have radically distinct spheres, this is surely the flip side of medieval Jewish philosophy and its classical Greek sources, where the thrust was to domesticate dualities in one of two ways: either via Aristotle, according to whom one thing cannot at once be itself and something else, or Plato, according to whom difference is ultimately (from the perspective of the one) illusory. The first asserts that thinking about difference is thinking about contradiction and incommensurability; the second that it is about shadows and appearances. In deducing that Jewish dualities were threatening, modern thinkers were doing nothing less than following out the conceptual trajectory laid down by Maimonides, whose philosophical work displays both the Platonic and the Aristotelian impulses. What emerges from Maimonides is the ultimate identity of a purified ethics and the laws of God, without giving up the notion that they are contradictory kinds of things (1972, 379–380). Indeed, this topos is the Christian medieval anxiety in a nutshell: theology and philosophy can be harmonized only if it is absolutely clear that they are incommensurate. Is it Kant who troubles this Maimonidean serenity? Certainly, the Maimonidean legacy was precisely the circulation of a purified ethics as the *solution* to modern Judaism and its conceptual dilemmas. But in so doing, all modern Judaism did was to conceal the either/or of contradiction or illusion (identity) at the heart of medieval Jewish thinking.

Ethics is made therapeutic, serving to unify the Jew unhappily bifurcated between law and ethics – ethics becomes the standard of both itself and the law. And the modern Jew is conceived as escaping, narrowly, the medieval mindset which would have forced a choice – Jew or modern – only by siphoning off the ethical as an end – or a beginning – in itself. How do we get around the violence (“war”) that presents itself through the very “exercise of reason,” Levinas asks at the beginning of *Totality and Infinity*? “A primordial and original relation with being is needed” that begins and ends with the face of the particular other,

beyond reason (1961, 21–22). This beautifully captures the ambiguity of the move from law to ethics in the passage from Makkot. What it does not reveal as clearly is the way back. For if what the law shows is that in the beginning was ethics, how will ethics itself account for the origin of law?

Ethics and Law

There is a temptation in modern Jewish ethics to conjure an eden, an original, “before the law,” from which one would be protected from the constant, unremitting labor – the agon, as Gillian Rose often put it – of lawful resistance: to war, to injustice, to thoughtlessness. We moderns stumble over this eden precisely because it is so foreign to the ordinary terrain we walk on, where the distinctions between law and ethics seem to shift with ground under our feet. This eden is not, though, the fault of Kant, or “modernity,” or even Buber and Levinas, who do, to be sure, romanticize the ethical moment. Indeed, what enables Rav Simlai to move (via reduction) from Moses to David is what Judaism *shares* with Kant, over against the Maimonidean (dis)union of ethics and law. For in Rav Simlai, as Kant and his Jewish inheritors, Buber and Levinas, struggle to embody, the insistence seems to be that there can be no bifurcation between law and ethics, just as there can be no identity between them. The one can be reduced to the other precisely because each is only true if contained, reductively, in the other; each can become the other *with remainder* ... such that there can always be a movement back.

The difference between autonomy and heteronomy is not between ethics and law; the difference is between an ethics that struggles with law (a law that struggles with ethics) and one that seeks to bypass these struggles with recourse to a commanding source. It is possible to see this recourse as at the heart of Judaism; this has certainly been the Jewish argument with Kant, however much he is then rehabilitated. But it is also possible to see that what Kant insisted upon was no different than what Rav Simlai teaches courtesy of David, Isaiah, Micah, Amos, and Habbakuk, namely that commandments must be founded upon righteousness, which lives in and through them, and that righteousness is, above all, law. That those commandments were “given” to Moses makes hardly more difference than the moral law being “given” to humanity from who knows where (Kant 1993). The point in both cases is the same, namely that ethics is sorted out in the law of interpretation and the interpretation of law. One could say that the maxim “the righteous shall live by their faith” is commanded 613 times so that those who miss it the first time can still learn how to live by it.

Contemporary Jews stumble, perhaps, over what Rav Simlai passes over gracefully because unlike him, we have learned to see this struggle as a problem to be concluded. We have learned to feel anxious about whether we have the resources to wage a battle for the ethical in the heart of the struggle between commandment and freedom. It is not that the grace of the rabbis was subsequently broken by modernity. Even Rav Simlai appears to know that the “reduction” involves breakage, if only through the language of *he'emidan*. Perhaps this breakage and its constant repair is from a Jewish perspective the human task *par excellence*. Certainly, it is just as possible to see the rabbis as moderns solving an age-old problem as it is to see them as ancients hauled in to respond to a specifically modern problem. What they see for us, with us, is that ethics cannot be hyphenated, except by the laws (whenever they happen to be) that are its eternal partner. The question, then, “How is Jewish ethics possible?” is not just Kant’s question. It is a question Judaism asks from the beginning; a question that shows us the way back to the law even as it makes the way itself the point.

2 Christianity

CHAPTER 62

Christian Ethics?

Gene Outka

The Question of Appropriateness

Does Western discourse about “ethics” afford an appropriate way to think about the moral life of Christianity? On one highly general but non-trivial level, let us stipulate that “ethics,” Christian, Western, and otherwise, is self-conscious inquiry into a human activity as common as cooking or doing sums. This activity is *judging* (e.g. that certain kinds of actions are right or wrong, that certain kinds of character are good or bad). “Ethics” examines everyday normative judgments concerned with human actions, character, and social arrangements; in short, with the “guidance of life.” It reflects upon, theorizes about these; it describes, analyzes, and assesses them.

Although the activity is common, two considerations suggest complexity and ambiguity. First, when we consider actual moral judgments across centuries and regions, we find differences, disagreements, and clashes, together with similarities, agreements, and overlaps. Often conflicting judgments are not provisionally held. Adherents within many traditions who are committed to certain judgments do not look tolerantly on the positions of those in the same or other traditions who disagree. Yet their efforts to persuade may fail. Moreover, each tradition may explain disagreements differently.

Second, religious traditions bring distinctive commitments and conflicts, including the multiple “sources” employed in reaching judgments. Christians take two sources as basic to their own identity. One is the Bible, which retains indispensable, nontransferable authority. References to the biblical God may then reverberate in various judgments. The other is tradition, which makes attention to the institutional church also indispensable. With Western thinkers, Christians employ three other sources: practical reason, experience (including emotions and desires), and human learning (in both the sciences and humanities).

Christians bring this combination of sources to every culture in which they find themselves. Yet Western discourse presents peculiar challenges. It offers inquiries exceptional in variety and volume. Christians encounter diverse movements and figures (e.g. Platonic, Aristotelian, Kantian, Hegelian, utilitarian, and feminist). And Christians must make their way among elaborate disputes on all manner of ethical subjects; for example, how to regard distinguishable domains (actions, consequences, virtues, and motives), divergent normative theories (deontological and consequentialist), and rival estimates of status and justification (ethical relativism, ethical objectivism, “universalist” and “particularist” claims about morality).

From these preliminaries, we draw out three more determinate ways that Christians address the question of appropriateness.

First, how Christians employ the multiple sources to which they are committed characteristically generates a line of division between what we shall call *intramural* and *extramural* questions. Intramural questions assume that the Bible and tradition retain non-transferable authority for depicting the moral life of Christianity. The questions focus on action guidance within the church, on the manner of life that Christians enjoin on one another. Extramural questions shift attention to surrounding social worlds, including ethical and political standards, theories, and institutional arrangements, various forms of cultural life, and so on. These two sets of questions represent more than a convenient starting point for discussion; they indicate a permanent orientation. Christian ethics as self-conscious inquiry ordinarily distinguishes the two sets, though it includes asking how continuous or discontinuous the intramural and extramural are with one another. Answers to the latter influence estimates of appropriateness.

Second, many Christians themselves deliberate on whether they may cross the line between intramural and extramural in one significant way. They ask how far they may *vindicate* certain moral insights that arise outside their tradition and incorporate these into a depiction of the moral life that they themselves present as true. Here Christians feel the force of the question of appropriateness from the inside. They take over the question, and articulate certain types of answers to it.

Third, Christians also confront the question of appropriateness when they offer judgments on particular normative topics. One topic serves here as an extended illustration: the ethics of peace and war. We meet a central case where the Christian tradition's self-description is evident, and some of its own continuities of conflict are embodied. We further suggest how the line of division and the question of vindication described above affect the judgments made.

Let us now sketch these three determinate ways more fully.

Intramural and Extramural Questions: Christian Ethics as Self-Conscious Inquiry

First, we face intramural questions about the content of the manner of life displaying Christian convictions. What is discernibly Christian in such a life? Can Christians locate a pattern of discipleship for all centuries, or only changeable patterns for different centuries? If a single pattern perdures, how should we specify it? Does the pattern consist in attitudes and virtues only, or fixed sorts of behavior also? Can we find a key notion or category to which we might always appeal as we carry out the work of specification? How much homogeneity should the church demand in its common life? Are there lifestyles and values that it requires everyone to exemplify and uphold? Is a whole pattern of normative thought implied which we can trace and apply to issues left unaddressed?

Second, we face extramural questions about the moral and political values and institutional arrangements with which surrounding cultures confront the church. If we are in the church, which of these values and arrangements can we positively assimilate? Which may we indifferently leave alone? Which should we resist as incompatible? Should we specify a general strategy for the church's relation to the world? If so, should the strategy be communal withdrawal, qualified participation, or attempted dominance? Should the church proceed rather in a piecemeal or ad hoc way, confronting forms of daily life and various issues one by one?

Intramural questions often correlate with “thick” moralities (rich and detailed, for a particular community); extramural questions often correlate with “thin” moralities (minimal prohibitions of actions found to be destructive of the bonds of any human community). Finally, Christian versions of the contrast between thick and thin often correlate with a distinction between the Christian community, or the “religious–spiritual” government, on the one side, and the civil community, or the “civil–moral” government, on the other side. A shorthand referent is “the doctrine of the Two.” This doctrine exerts enormous influence on Western ethics and politics. Insofar as the doctrine of the Two mandates divided loyalties and circumscribes the competence of the civil–moral government, it conflicts with totalizing schemes, both theocratic and secular (e.g. fascism and certain variants of Marxism). According to such schemes, one explicit worldview, one complete way of life, governing a whole society, culture, or civilization, should be singly promulgated, comprehensively preferred, and coercively enforced. To be sure, the doctrine of the Two is hospitable to a view of the church as a thick community (in this regard, the language of “religious–spiritual” should not obscure social and political dimensions). But partly because this thick community excludes a full range of coercive activities (“banning” and “excommunication” may occur, yet these do not rely necessarily on civic policing and “crime control”), it resists mandating a single society that intervenes and enforces coercively, from top to bottom.

How Far Should Christians Vindicate Moral Insights that Arise Outside?

Certain types of answers to this question that Christians give make their several estimates about appropriateness more precise. How many and which insights should be vindicated? Some Christians limit them to the Decalogue as prohibiting actions destructive of the bonds of any community. Other Christians put the question more ambitiously: Should Christians subscribe *qua* Christians to any comprehensive ethical scheme whose intelligibility is established and sustained *independently* of Christian convictions? We can link this question to the matter of “sources.” Do some ethical schemes systematically subordinate the first two sources (the Bible and tradition) to a combination of the other three? Western discourse formidably advances a variety of such comprehensive ethical schemes. Practical reason (say) puts the ingredients of an ethical scheme in place and adjudicates. Christians give at least three answers to this ambitious version of the question of appropriateness (Outka 1996).

First, some reject the terms of subordination and deny that any such scheme contains positive insights that Christians should incorporate. Christian ethics depends on comprehensive convictions to which there is no universal epistemic access. It specifies behavioral thickness that is not generalizable to those outside. Between patterns inside and outside, normative discontinuities reign.

Second, some reject the terms of subordination, and are prepared at most to vindicate certain moral insights that arise outside, after they review, modify, and integrate them. Still, Christian ethics depends on comprehensive convictions, and these include a doctrine of creation that presents more than a morally structureless world. Appropriations should always bear the marks of particularist convictions. Christians should not commit themselves to justifying any part of their morality in terms that are wholly available to them before they encounter the Christological paradigm. Between patterns inside and outside, they find complex encounters, where normative continuities and discontinuities both obtain.

Third, some accept the terms of subordination with regard to morality, because what the Christological paradigm discloses is never at odds with what rational persons apprehend morally, when their practical reasoning is in good order. Alan Donagan accepts, for instance, the claim on behalf of a Kantian scheme that morality “does not presuppose the truth of the Christian faith, but is presupposed by it” (Donagan 1993, 54). A similar claim about what Christianity presupposes is sometimes made on behalf of the natural law and the cardinal virtues. To be sure, the Christological paradigm discloses more than this (e.g. about a relation to God). But again, what the paradigm discloses morally is continuous with what persons can apprehend when they do not fail as moral reasoners. When the paradigm tells them something that is morally incompatible with what they tell themselves, this is because they have in fact failed as reasoners, or have been corrupted by erroneous moral theories or deformed cultural practices.

We amplify as we turn to the ethics of peace and war.

The Status of Pacifism and the Just War: Interlocking Judgments

Christians elucidate and defend two stances, “pacifism” and the “just war.” (We leave aside notions of the “holy war,” or the “crusade,” because so many Christians have progressively subjected them to critique, denying them the fixed place that the other two now occupy)

Pacifism covers several distinguishable views. Traditional pacifists judge that it is intrinsically wrong to participate *directly* in *killing* in *all* wars. “Abolitionists” dwell on war’s palpable evils and believe that we may reasonably hope to eliminate it. “Non-violent resisters” actively oppose evil and seek effective non-violent means to pursue justice. Evangelical Anabaptists and Quakers exemplify pacifist views (Yoder 1992).

Evangelical Anabaptists press normative differences between intramural and extramural ways of life. Regarding the former, they claim that Christians identify a pattern of discipleship for all centuries, not changeable patterns for different centuries. The pattern depends on historically particular events, yet is not itself historically variable. It seeks to imitate Christ, and dwells on specific exhortations such as the Sermon on the Mount and on crucifixion. The New Testament teaches what characteristic attitudes and virtues and fixed sorts of behavior discipleship requires. Pacifism is not only an acceptable stance; it is the only acceptable stance.

Extramural questions receive these replies. We leave the sword alone both in our church life and in our relations to neighbors outside the church, and so witness *consistently*. Whether the church should follow a general strategy of communal withdrawal or qualified participation is a question on which Christian pacifists differ. Quakers discriminate among the uses of force. They accept policing but disallow soldiering. In some measure, they seek “peace through politics.” For them, the civil–moral government presents constructive as well as destructive possibilities.

Just war doctrine stems from the Christian tradition as well, though secular sources play important roles too (e.g. the chivalric code of the knightly class and the *jus gentium*). The doctrine’s roots go back to Augustine, but its classic form appears at the end of the Middle Ages. Later, it receives articulation in secular international law (Johnson 1975). It interacts with Western discourse about ethics and politics in extensive ways. Indeed, it serves increasingly in certain societies as a normative point of reference.

We may plot responses to intramural and extramural questions within the Augustinian legacy as follows. Christians identify a pattern of discipleship for all centuries, and appeal not only to the Sermon

on the Mount and to the crucifixion, but also to the double love commandment, to justice, and to the Decalogue, among other things. Love for God and love of neighbor predominate. Augustine lauds peace as a richly active condition. Yet to regard pacifism as the only acceptable stance for Christians leaves innocent neighbors at the mercy of the unscrupulous. This prospect offends against care for the needy that Jesus enjoins. Discipleship requires a comprehensive depiction where love rather than non-violence per se integrates its myriad commitments. The depiction further requires that we attend to creation, human sinfulness, and eschatology, together with Christology and ecclesiology.

Extramural questions receive these replies. As we extend care, we meet social worlds where injustice and brutality call for judgments that are both diminishing to weigh and unloving to ignore. One such judgment is that it can be loving for societal representatives to intervene, in order to enforce the prohibition against murder. The estimate is that more, not fewer, benefits accrue from organized efforts of the civil community to restrain unjust coercion by counter-coercion. Such counter-coercion need not be sheerly arbitrary, although it is permanently corruptible. Policing and soldiering as vocations in civil society deserve better than to be condemned or placed outside the sphere of what Christians might do.

These replies to extramural questions lead us neither to equate policing and soldiering nor to separate them entirely. Both are sad necessities. Yet policing is liable to a greater measure of public oversight. To bring soldiering under moral evaluation, we look to the just war doctrine, and uphold both parts of its distinction between *jus ad bellum* (criteria for limiting resort to war) and *jus in bello* (criteria governing just conduct in war).

Alliance and Misalliance with Ethics

Christian defenders of pacifism and the just war find different points of alliance and misalliance with Western discourse. Christian pacifists sometimes appeal to “all persons of good will” to banish war’s horrors. The timbre of these appeals is “universalist.” They are justified without necessary recourse to particular beliefs and practices. More frequently, however, Christian pacifists find “particularist” accounts of morality more appropriate. They embrace historically oriented moral philosophy that views traditions and local cultural agreements as not accidental but essential to moral knowledge. They may also invoke “postmodern” critiques of “universalist” moral schemes. Here they purport to “unmask” legitimations of violence and domination that universalist schemes simultaneously hide from view and perpetuate.

Some Christian defenders of just war seek to address two overlapping audiences, one that is Christian and another that is wider. Their defense stems overall from particularist Christian warrants; for example, the way Augustine in some cases extends charity to a mournful acceptance of force. Yet they also hold that their verdicts do not confront a structureless moral world where every normative appeal is exhaustively subject to historical variation and cultural change. Hence a second audience can come into view. Its members need not formulate just war teachings out of their own resources. But they may find them intelligible following exposure, and come to make them their own.

Other Christian defenders of just war articulate a natural law theory that is “logically independent” of Christian convictions (Finnis 1996). They present the basic tenets of just war as binding on all persons of good will. These tenets map the moral landscape of war for good. Christian convictions that increase

awareness are not at odds with what we apprehend morally as rational persons. Teachings on just war are permanently valid, though we must combat moral blindness.

While Christianity is emphatically a world religion, its long history in the West requires continued engagement here as well as elsewhere, and renewed attempts to make the most of interactions already bequeathed. We have seen that no single answer to the question of appropriateness persuades all Christians, but that certain considerations lend structure to their several answers. One is a recurrent line of division between intramural and extramural questions. Another is a series of answers to the question of vindicating moral insights that arise outside the tradition, where the matter of appropriateness is felt from the inside. Still another is where Christians face their own continuities of conflict (e.g. the ethics of peace and war). Christians address this conflict by referring to the line of division, and by choosing parts of Western discourse that ally themselves most closely with what defenders of pacifism and just war each extol. The balance of views canvassed here suggests that for the moral life of Christianity to retain its own identity, Christians should at the end of the day keep their own counsels about everything, including Western discourse.

CHAPTER 63

Origins of Christian Ethics

Jef Van Gerwen[†]

It may be useful at the outset to clarify a number of issues that are related to early Christian ethics, so that we get a distinct picture of the typical limits and characteristics of the subject.

First, this study is not limited to the moral teaching of Jesus of Nazareth or to New Testament ethics. It covers the debates and texts on Christian morality during the entire period of late antiquity from the first to the fifth century CE. This larger scope opens some interesting perspectives for interpretation, since it does not only focus on the founders of this tradition, but also on the enculturation of Christianity outside its original Jewish setting. Christians gradually integrated elements of Greek, Roman, and other Mediterranean cultures into their ethical codes of conduct as the Christian message spreads far beyond the limits of the Holy Land.

Second, ethics for early Christians was a matter of attitudes or habits, rather than just rules and commandments. Although the Jewish Law (especially the Ten Commandments) played a central role in it, Christian morality was primarily based on the practice of a number of virtues, such as love, hope, justice, forgiveness, and patience. Consequently, it was committed to fight vices such as hate, envy, lust, sloth, and anger. Early Christian ethics resembles more closely other antique schools of ethics, such as Aristotelianism or Stoicism, than our modern Kantian and utilitarian paradigms.

Third, our present knowledge of early Christian ethics is biased because of the selection process to which the primary sources have been subjected throughout history. All the texts of early Christianity (called Patristic literature, or Patrology) have been transmitted to us mostly by monks. These members of religious orders tended to show more interest in the ascetical and mystical aspects of Christian life than in the urban and professional life of married lay Christians. As celibate males living in a patriarchal culture, their gender perspective was one-sided, to say the least. They were often involved in long disputes between heretic and orthodox movements within Christianity, and this may also have led them to exclude or to misrepresent a number of positions on doctrine and ethics.

New Testament Ethics

The ethical teaching of Jesus of Nazareth fits perfectly into the tradition of prophetic and early rabbinical representatives of Jewish ethics. In the line of the prophets, Jesus stresses the importance of the virtues of justice and mercy over the ritualistic ethics of purity and cult offerings that had been developed in the

[†] Deceased.

Jewish Law (the books of Leviticus and Deuteronomy). In his interpretation of the Mosaic Law (Matthew 5–7) he focuses on the purity of intention of the agent, rather than on the mere act of trespassing a rule of law. The intentions of his followers are to be trained by the virtues of justice, humility, hope, patience, and forgiveness within the communal setting of the group of disciples. Their primary virtue is love, as God himself is love (1 John 4, 9). Christian love should not be identified with friendship or erotic passion, but rather with hospitality and attention to the needs of neighbors, especially strangers and the poor. This type of solidarity is suggested by the typical Christian term for love, which is charity (Latin: *caritas*; Greek: *agape*).

Jesus' moral teaching demonstrates a tendency towards ascetic radicalism, which was a typical corollary of the prevalent Messianic and eschatological expectations of his day. The Messiah is the "Anointed one," a righteous prophet-king who would restore Israel to its ideal state; "Christ" is the Greek synonym for Messiah. He proposed a radical ethic of pacifism, common property, voluntary celibacy, and renouncement of family ties, in order to prepare oneself for the imminent coming of the Kingdom of God. In doing so, he followed an original course among other Jewish movements, dissociating himself from collaborators with the Roman occupying forces (Sadducees), from armed rebels (Sicarii, Zealots), as well as from more secluded desert communities (Essenes). Similarly, he did not comply with the popular image of the Messiah as a mighty military and religious leader, but rather chose to give a different meaning to Messianism by accepting the role of the humble and suffering servant of God (see Isaiah 53). After his death, when the end of times (and the related Second Coming of Christ) failed to occur as soon as the first generation of Christians had expected, the Christian movement needed to redefine its place in history and in society. This adaptation was already initiated in the New Testament letters of Paul and Peter, in which the believers are admonished to adopt a long-term perspective of the future, and to get settled as citizens and church members.

The New Testament, with its 27 different writings (including Gospels, Acts, Letters, and the book of Revelation), includes a plurality of ethical stances, rather than one uniform position. All New Testament authors, however, agree on the following main issues:

- 1 All moral commitments depend on a prior acceptance of God's redemptive coming into the world in Jesus of Nazareth. This affirmation of faith offers the foundation for any ethical orientation. As a consequence, ethics is understood as a way of imitating Christ, following the way of Jesus in daily practice.
- 2 The love of God and the love of neighbors are intimately linked in one commandment, which represents the core of Christian (and Jewish!) ethics (Mark 12:30–31).
- 3 The message of Jesus cannot be limited to a Jewish audience; it has a universal meaning. However, some authors, such as Paul and Luke, move further than others in directing the Christian message to non-Jewish followers.

The writings in the New Testament may present divergent ethical orientations on many other topics. This is the case, for example, with the relationship between faith and good works as a basis for the justification of the believers (the letters of Paul versus the letter of James or the gospel of John), or with the respect that is due to political authorities (Paul's letter to the Romans, ch. 13, versus Revelation, ch. 13).

Each of the four gospels also presents a particular perspective on Jesus' teaching, reflecting its specific social setting. The gospel according to Mark focuses on the ethics of discipleship, stressing the paradox of human fulfillment through a process of self-abnegation (the acceptance of the Cross). Matthew, writing for a community of Jewish Christians, offers the most thorough reinterpretation of the Jewish

Law as a code of righteousness. Luke pays attention to the ethics of riches and poverty, and to practices of healing and service to the needy. John's gospel is built on the opposition between the community of brotherly love of the faithful over against the evil nature of the outside world.

Apostolic Fathers

The texts of the New Testament were composed between 50 and 120 CE. As such they reflect the doctrinal and ethical attitudes of the first generations of Christians. Not all early Christian texts of that period were included in the biblical canon. A wide variety of non-biblical sources has been conserved, such as the Apostolic teachings, Gnostic literature, and Apologetics, that provide us with valuable information on the moral life of Christians in the first and second centuries.

Among the collection of Apostolic teachings, a most interesting source for ethical reflection is the Teaching of the Apostles (*Didache*), especially the teaching on the Two Ways (of life and death) that refers to the Sermon on the Mount (Matthew 5–7) and to the lists of virtues in the letters of Paul (e.g. Galatians 5:19–22). The anonymous letter to Diognetus offers an excellent short treatise on Christian lifestyle written for a non-Christian audience. One may find a third type of approach in the Shepherd of Hermas, which represents a more rigoristic doctrine on sin and penance in a rich symbolic (“hermetic” = hard to disclose) language.

The moral teachings of the Apostolic Fathers move between two poles. On the one hand, they contain a faithful commentary to the canonical writings; on the other hand, they incline more or less to the doctrines of Gnosticism and rigorism that exerted a strong influence on the worldview of Greek-speaking Christians during the first two centuries CE. Gnosticism is a religious philosophy that is derived from neoplatonism, a rather popular philosophy in antique Mediterranean society. *Gnosis* means “knowledge,” referring to a mystical type of insight into the world of eternal ideas. It is based on a dualistic view of reality: material reality is considered as inferior to the realm of ideas, and so is the human body with regard to the soul. The passions, such as erotic affection, anger or envy, are seen as sources of evil and corruption for the good life. Salvation is possible: a divine seed has been detached from the divine being by one of its aeons (higher spiritual beings, usually identified by Christian Gnostics with Christ as the preexisting Son of God). This spark of light has been introduced into the human body as a living soul, where it is held prisoner. By asceticism and spiritual growth, the soul will be set free and enabled to enter into communion with the divine mystery.

For most of its Christian adherents, the Gnostic movement called for a rigoristic ethics (Greek: *Encratism*, from the word *egkrateia*, temperance or continence), which moved beyond the ethical radicalism of Jesus and his disciples. Instead of an ethics in view of the imminent coming of the Kingdom, a permanent attitude of abstinence from sexual intercourse was considered a superior mode of conduct to married life. The use of cosmetics and the consumption of meat, wine, and other luxury goods are to be avoided, whereas practices of frequent fasting and of frugality are promoted. Many Christians opt for a solitary life in the desert, rather than pursuing their professional activities in an urban setting. As a consequence, a fundamental distinction appears between two classes of believers: the *gnoostikoi* (those who know, who strive after perfection) and the *koine pistis* (the ordinary believers). This distinction was institutionalized in the hierarchical structure of religious orders with the clergy over against the laity. The first group must follow a more radical ethics of the evangelical counsels (poverty or community of

goods, celibacy, and obedience to an abbot or bishop); the second group has to obey to the ethics of the mandates (i.e. the Ten Commandments). Gnostic sources include figures such as Marcion, Montanus, Tatian, Basilides, and Valentinus, and non-official gospels (called Apocrypha) such as the gospel of Thomas.

Starting from the second century, Christian intellectuals were also answering anti-Christian critiques coming from political and philosophical circles. The ethical critiques often focused on accusations of atheism, anthropophagy, and promiscuity. The issue of atheism was raised in relation to the official cult of the emperor as a sacred or divine ruler, to which Roman citizens owed a public display of loyalty. Christians were accused of forming a secret society with an attitude of disloyalty to the emperor and to the public order. They believed in one God, and failed to pay respect to the deities of other religions. The other accusations originated in misunderstandings concerning the rituals of the Eucharist and baptism. Outsiders supposed that the “eating of the body of Christ” included some form of cannibalism and human sacrifice, and that the baptism of adult people led to sexual promiscuity or orgiastic excesses. Christian authors such as Justinus Martyr (*Apology*), Athenagoras (*A plea for the Christians*), Clement of Alexandria (*Christ the Educator*; *Can Rich Men Be Saved?*), Irenaeus (*Against Heresies*) and Tertullian (*Apologeticum*; *Treatises on Marriage*; *The Chaplet*; *Spectacles*; *On Idolatry*) wrote a number of treatises to defend the position of Christians for a non-Christian public. The works of Clement and Origen had a strong influence on subsequent developments, because they were speaking as trained philosophers of the school of Alexandria. Their thoughts on the nature of evil and on anthropology provided the first systematic framework for Christian ethics, finding a third way between the rationalism of classic Platonism and the deterministic views of neoplatonism, with its Manicheistic and Gnostic overtones. They did so in stressing simultaneously the fundamental goodness and transcendence of God, the freedom of human beings (including responsibility for their wrongdoings) and the human need for divine grace.

Tertullian, born in Carthage as the son of a Roman centurion, presents another interesting source for ethics, because he comments on a number of concrete ethical cases, such as the participation of Christians in the public life of the empire, and the apparel of women. Generally speaking, Tertullian defends a rigoristic position. Christians should not bear arms as soldiers in the Roman army; neither should they accept administrative positions in the empire, nor assist in the spectacles of the amphitheater or the theater, because all these public activities are tainted by idolatry and the contempt for human life. Indeed, human sacrifices were not uncommon in theater plays and circus events. Women should show modesty in dress and behavior. Christian marriage is interpreted as an indissoluble and exclusive bond between husband and wife; sexual intercourse is justified for the cause of procreating offspring only, not for the sake of pleasure. On this last point, Christians tended to agree with the Stoic teachings of their era.

The Church Fathers of the Third and Fourth Centuries

The split between the Eastern and Western parts of the Roman empire also led to a growing divergence between the Eastern and Western Latin churches. Active centers of Latin Christianity were found in North Africa (Numidia), Italy, and Gaul; the major centers of Eastern Christianity were situated in Alexandria, Byzantium, Greece, and Cappadocia. During this period Christianity was slowly evolving

from a marginal social position as a semi-secret society, prone to persecution, towards an established religious institution. As the social position of Christians is rising, political leaders, including the emperors, start to take an active interest in church organization (e.g. the formulation of the common Symbolum of Faith by the Synods of Nicea (321) and Chalcedon (381), guaranteeing the unity of the church in the empire). In the domain of ethics, Christian positions were moving toward a less radical stand, especially in economic and political matters, as Christians start to take active responsibility in the public domain. This is demonstrated, for example, in the writings of Ambrose (Letters, On the Duties of the Clergy) and Augustine (*The City of God*). Examples of this shift toward an ethics of responsibility are the appearance of the just war theory and the deontology of public office.

With regard to the former issue, Christians had initially been defending a pacifist ethic: the believers could not use violence, and Christian converts had to leave the army. Gradually, however, Christians started to accept the right to defend oneself against an aggressor, especially in order to protect the weak; later, the right to legitimate self-defense was also accepted. As a result, Christian authors such as Augustine developed a theory of just war (see his Reply to Faustus the Manichean), in which the ethical criteria to start and continue armed struggle were strictly defined. Also in the realm of economic ethics, Christian communities had initially accepted a radical critique of wealth and private property, asking the believers to sell their possessions for the benefit of the poor, and to organize a system of common goods in the local church. At the end of the second century, Clement of Alexandria had already defended a more pragmatic position, in which the rich could be saved, not by actually distancing themselves from their wealth. Rather, they should manage their property in a spirit of inner detachment for the good of their households and the surrounding community. Eventually, this ethic of responsible management (or stewardship) became the dominant ethic for laypersons. Only monks were supposed to follow the more radical ethic of poverty and sharing of all goods within the monastic community.

These adaptations were stimulated to a great extent by the decline of the Roman empire in the West. As the public administration of the empire was crumbling under the weight of Germanic invasions, the church leaders took over more tasks that belonged to the public domain, ranging from schooling and transportation to public defense and administration. In order to do so, they needed a new type of political and economic ethics, taking into account the conditions of effective government. In the East, however, the Roman empire continued to function for several centuries. As a consequence, the Eastern churches were in a different position. On the one hand, they were used by emperors as an instrument for maintaining the unity of the empire, and are kept under the control of his political power. This led to a regime of “Caesaropapism,” in which the emperor imposed himself as the effective head of the church. But on the other hand, several groups of believers, and especially the members of religious orders, maintained a critical distance and autonomy with regard to their political rulers. Such critical attitude can be observed, for example, in the Two Treatises against Julian the Emperor by Gregory of Nazianzus, and in the Twenty-One Homilies on the Statues of John Chrysostom. Other important authors in the Eastern empire are Basilios and Gregory of Nyssa. In the West, next to Ambrose and Augustine, one may consult the works of Lactantius (*The Divine Institutes*) and Prudentius (*The Spiritual Combat*) to get a good view on Christian virtue ethics in the fourth century.

In matters of sexual ethics, including marriage and celibacy, Christians changed their positions. The initial ideal to give equal consideration to men and women in Christian communities (cf. Paul’s letter to the Galatians 3:28) was abandoned for a more traditional patriarchal conception of gender relations,

including a tendency towards misogyny. Typically, most fourth-century writings on the subject of women address the position of virgins as a model of Christian lifestyle and organization. Virgins and widows represented a socially vulnerable position in a patriarchal society, in need of social protection. By giving a specific status to virgins as a sort of precursor to female religious orders, the early Christians were pursuing a social aim (solidarity) as well as a gender (submission) and an ascetical (abstinence) agenda.

New ethical debates appeared in the context of church discipline. Church leaders (mostly bishops) not only faced persecutions and criticisms coming from outside, but also faced divisions within their churches on matters of doctrine and morality. Countless schisms and heretical movements flourished, as Christianity spread fast over the entire Roman empire (and even outside it, into Ethiopia and the Middle East). The church organization still remained decentralized. Ethical discipline was established gradually, for example through the initiative of Cyprian, bishop of Carthage (The Lapsed, The Unity of the Christian Church) and by Zephyrinus and Callistus, bishops of Rome. These bishops argued for a more lenient position against the rigoristic camp on the issue of penance and the forgiveness of sins. The crucial question they faced was the reacceptance into the church of “the fallen brothers and sisters” (i.e. those who had forsaken their faith during persecutions). The rigorists wanted to exclude those defectors permanently, since they had broken their faith commitment. The lenient party argued that Christians had to meet the gospel demand of forgiving sinners, and pleaded for a procedure of public penance (temporary exclusion from the liturgy, public confession) for those who had committed serious sins. Serious sins were considered to be homicide, adultery, and idolatry – the last sin included those who had left the church during persecutions. After fulfilling their penance requirement, they had to be readmitted into the communion of the church. Later, under the influence of the Irish monks, this practice of penance would develop into a ritual of private confession and moral counseling.

The experience of persecutions also led to the recognition of the importance of martyrdom, meaning public witness of the faithful, even if this would imply public execution and a violent death. These martyrs became the objects of public veneration, which evolved later into the popular practice of venerating local saints as role models of Christian life. The stories of martyrs and church founders provide an important source of narrative Christian ethics, not only in antiquity, but also during the Middle Ages. Interesting early examples are the *Life of Cyprian*, written by his deacon Pontius, the *Life of Macrina*, written by her brother Gregory of Nyssa, and the *Life of Anthony* by Athanasius of Alexandria.

Conclusion: Trends in Early Christian Ethics

The demarcation line between early Christian ethics and medieval ethics is not a clear one, even if one accepts the fall of the Western Roman empire (476 CE) as a major historical marker. The orientations that had been set in place by the authors of the fourth century continued to influence ethical thought and practice during the subsequent centuries: authors such as Boethius, Cassiodorus, Benedictus, and Isidorus continue to build on the tradition of antique Christianity. The same was true even to a greater extent in the Eastern empire, where the political regime remained intact. Nevertheless, the fourth century represents a clear demarcation line for sociological reasons: during that century, Christianity left behind its marginal status and become a major established religion in the Roman empire. Medieval society would be organized, indeed, around the dyadic structure of the “two kingdoms,” one directed

toward the pursuit of temporary interests (the state, the empire) and another to eternal values (the church, the pope, and the bishops).

If one looks for a synthetic overview of this rather complex period, one should at least consider the following five major factors that have shaped early Christian ethics.

Eschatology and an Open-Ended Future

Christians regularly needed to adapt their views on time and history during this period. They started with the short-term perspective of eschatological literature, expecting the return of Christ and the Kingdom of God to come soon and to introduce the end of the known world. The death and resurrection of Jesus became indeed a symbolic turning point of history, but it did not immediately introduce the end of time or of this world. As a consequence, Christians had to resituate themselves with regard to a long-term and unknown future, learning to deal with the power structures of the present social order. This process ended with Augustine's *City of God*, in which even the fall of the Western Roman empire no longer foretold the end of time, but was accepted as a secular event. This process of reinterpretation relied on the neoplatonic scheme of a dualistic worldview, distinguishing clearly between heaven and earth, and between the heavenly and the earthly city. In the Jewish view of history, these two symbolic spheres had always remained united: the Kingdom of God was a transcendent reality, a gift of grace, but it had to be realized gradually within this world, and not referred to some afterlife outside the realm of human history. In Augustine's view, the distinction had become almost a separation. This reinterpretation also implied a more compromising attitude towards the logic of power and of the secular world. Christians have to avoid absolutizing the importance of the earthly city, but they can deal with it, rather than opting for a principled course of withdrawal.

Radicalism and Compromise

This second characteristic flows as a logical conclusion from the previous point. For historical as well as institutional reasons, early Christians came to accept a double strategy of church membership and ethics. On the one hand, they maintained a radical ethics for the clergy and the religious orders, which reflected more directly the ascetical demands of original Christianity as an other-worldly community, based on poverty, celibacy, discipleship, non-violence, and strict obedience to a spiritual leader. On the other hand, they developed an ethics of lay Christians, of soldiers, traders, and married couples, living in households that from an outside perspective could barely be distinguished from non-Christian households. Lay Christians followed an ethics of compromise with the existing world, while holding fast to the Ten Commandments and to the central virtues of love, justice, and forgiveness as beacons for Christian life. This double strategy produced great results in the organization of Christian hospitality, schooling, political order, and economic stewardship. It proved to be better adapted to the use of power and of institutional government than the prophetic ethic of the founders of Christianity. By accepting such adaptations, the church tried to find a middle ground between faithfulness to its origins and the necessity to adapt to the new era. But the tension between the two types of ethics remained present in subsequent church history, and the ethics of compromise would regularly be put to the test by new movements of radical reform.

Jewish and Non-Jewish Cultural Contexts

The Jewish people inherited a rich tradition of Semitic culture, with its roots in Egyptian and Mesopotamian societies. Christianity emerged within this same environment, but soon had to translate its message into a variety of other cultures, such as Greek, Roman, Celtic, and Germanic settings. This transfer posed a formidable challenge to Christian philosophers, missionaries, and teachers alike, which they met with considerable creativity and inspiration. Nevertheless, some crucial insights of Jewish thought may have been lost in the process, and this had a far reaching effect on the future of Christian doctrine and ethics. The concept of God among the Jews and Greeks, for instance, was not an identical one. Jews tended to stress the intersubjective and intrahistorical qualities of Yahweh, who is a God of a concrete people, the God of Abraham, Isaac, and Jacob. Most Greek philosophers, on the contrary, represented God as an absolute and unchangeable being, functioning as the cornerstone of the universe. Many ethical differences follow from this fundamental distinction. The Greek belief in the eternal existence of the soul may not have the same meaning as the Jewish concept of the resurrection of the body; Greek concepts of virtue (prudence, justice, magnanimity) do not find their counterpart in Jewish virtue ethics, or have different connotations. The Greeks had different ideas on the reality of radical evil, and on the role of the human will and conscience, than those that were implied in the Jewish concepts of freedom, guilt, and redemption. And last but not least, the sexual and gender ethics of the Gnostics, Stoics, and neoplatonists had a long-lasting effect on later Christian morality. Early Christians had no choice but to enculturate their faith in new settings, as they felt called to establish a worldwide, multicultural community of God. By doing so, they also wanted to express the correspondence of their faith with the insights of reason, and the universal significance of their vision. But from time to time, a call would be heard to “return to the (New Testamentic, Jewish) sources” once the enculturation process has gone astray.

Internal Pluralism, No Uniformity

The early church started as a multiform charismatic movement, not as a well-disciplined institution. Initially, the highest authority resided in the circle of the Twelve Apostles, but divergent attitudes between Greek and Jewish Christians emerged as soon as missionary efforts led to the establishment of various local Christian communities. Faced with an unending series of internal schisms and conflicts, the Christian churches made continuous attempts to maintain a unity of hearts and of faith, based on one canon of scripture, one creed, and on a vast communication network between local churches and their leaders. Nevertheless, efforts to maintain unity often failed, as doctrinal controversies, such as the one between rigorists and lenients, continued to divide the faithful. Also, in liturgical customs and in ethical practice, a great plurality could be observed from the start. Eventually, greater organizational uniformity was established, both under the influence of the bishops of major centers (Rome, Carthage, Byzantium, Alexandria) and because of political pressure by the emperors, who saw in the unity of the Christian church a means to reinforce the unity of the empire.

Ethics of Virtue

Early Christians all agreed that morality was a matter of training in the basic virtues, rather than just the application of a universal set of rules or rational principles. These approaches stress the particular features of moral education in a concrete sociohistorical community. Morality depends on the training of

character, and seeing and imitating concrete examples, such as Jesus Christ, the saints, or the ordinary faithful. This ethical approach is not contrary to reason. The insights of Greek philosophy and of Roman legal thought were also readily integrated into the Christian tradition. But the moral outlook of early Christians did not depend as exclusively on the role of reason and on the ideal of the self-sufficient individual as was usual within the rationalistic logic of Platonism or late Hellenistic thought.

CHAPTER 64

Differentiation in Christian Ethics

Vigen Guroian

For the purposes of this entry, differentiation may be defined as the process of growth and diversification of ethical attitudes and judgments that results from the response of a religion to changing conditions of life. In this sense, differentiation inevitably is an accompaniment of history. Every religion, Christianity included, has a vital interest to ensure that moral beliefs and behaviors are consistent with a complex of convictions, rules, activities, and institutions that comprise the whole of the religion. Thus, differentiation, though it inevitably attends history, is never a neutral thing from the standpoint of a religion. For it can strengthen a religion or weaken it, measured by that religion's internal criteria of orthodoxy and heterodoxy. Within Christianity, results of differentiation are judged good and creative or deleterious and destructive according to core beliefs about the character of God, nature and grace, human goodness and human sin, and valuations of the course of human history and God's purposes within it.

Though differentiation may be an inevitable concomitant of history, the Christian faith, by affirming divine and human freedom and rejecting fatalism and determinism, is bound to regard differentiation as something that can and ought to be controlled and directed. Of the three major traditions that comprise historic Christianity, Protestantism is decidedly the most "open" to differentiation. Protestantism seems highly fissiparous, producing a continuous stream of new denominations and sects. While this dynamism of Protestantism can reinvigorate ossified forms or help to shed old for new and suppler "skin," it also can weaken legitimate authority and threaten the essential unity of the church. Even the most free-spirited Protestant, who is thoughtful, will agree with more tradition-conscious Orthodox and Roman Catholic co-religionists that differentiation in ethics is almost always a two-edged sword.

This entry examines differentiation in Christian ethics that has defined the distinctive character of the three great Christian confessions: Orthodoxy, Roman Catholicism, and Protestantism. First, however, it is important to take a look at another kind of differentiation that effects how Christian ethics is understood in relation to the faith as a whole and as an academic discipline. This concerns an ongoing debate, internal to the faith, over whether a distinction should be made between ethics and other dimensions and expressions of the Christian religion, and, if so, how sharply that distinction ought to be drawn.

Differentiation of Ethics and Christian Life in Modern Thought

Since the European Enlightenment there has been a strong impulse within some sectors of Christianity to treat ethics as a subject or discipline separate from other parts of Christian life, such as worship, sacraments, dogma, and pastoral practice. This impulse is closely associated with a debate over the so-called autonomy of ethics. Immanuel Kant defined the terms of this debate with his attempt to demonstrate that universalizable moral judgments are grounded in practical reason and cannot be derived from or verified by religious beliefs and practices. Kant's analysis has heavily influenced modern Protestant ethics and to a lesser degree Roman Catholic ethics. Each in its own fashion has taken up the challenge to give a systematic account of Christian ethics and clearly establish its foundations either in reason, as Kant would have it, or faith, or both.

Until Kant, Protestantism did not strongly distinguish between ethics and theology or moral norms and ecclesial discipline, and ethics has continued to function within Protestant Christianity as a pedagogical tool (Gustafson 1978, 3–4). Much of Protestant ethics has been built upon the dual concepts of law and gospel as elaborated by both Luther (1483–1546) and Calvin (1509–1564). Within that vision, biblical law plays a role in Christian ethics insofar as it exposes the fallen and sinful character of human existence and leads the repentant sinner to Christ. Calvin describes a third use of the law as a teacher to spur Christians “to learn what that will of God is which they aspire to follow” (*Institutes* 2.7.12). Both Luther and Calvin agree, however, that the law compels and convicts, whereas the gospel of love is a gift of justification, forgiveness, and salvation. The gospel of love is the good news (“gospel”) of the release of sinful humanity from the condemnation of the law that Jesus Christ has accomplished by his own willing and pure sacrifice on the cross and resurrection from the dead. Jesus summed up the ethical heart of the gospel of love as love of God and love of neighbor as oneself and promised that those who live by this double commandment will inherit the Kingdom of God (Mark 12:29–30, 34). Under Kant's influence, Protestant ethicists have endeavored to found this rule in practical reason or the rational will, giving it a formal claim to universality that does not need to be secured in a particular religious vision of the ultimate good.

From early on, Roman Catholic moral theology was closely allied with canon law. The medieval canon lawyers mastered the art of moral casuistry and made it useful to priestly confessors, in whose hands Catholic moral theology was applied to daily living. Under these conditions, Catholic moral theology assumed a distinctively juridical character tied closely to church order and penitential practices. Thomas Aquinas (ca. 1225–1274) expounded a Christian natural law ethics in detail. Aquinas drew from Aristotle (388–322 BCE) for his ethical theory and relied upon St. Augustine (354–430) for theological muscle. The main idea in Catholic natural law theory is that by creating human persons as rational beings God has built into them – into human nature itself – a capacity for discerning the divine law, whether they immediately recognize it as such or not (see Rom. 2:14–15). As propounded by Aquinas, natural law morality is theonomous. It is a mode of participation in the divine law that leads to mystical communion with God. Morality is tied closely to prayer, the sacraments, blessing, and doxology. Over time, however, especially as impacted by the Renaissance and Enlightenment, proponents of natural law commenced upon a project to stand natural law on its own. Similar to the attempts of some modern Protestant ethicists to ground the law of love in a doctrine of man and only secondarily a doctrine of God, some modern Catholic theorists have argued that natural law is a rational standard of morality fixed in human nature. There it obtains an autonomous standing that makes it

accessible and knowable for all human beings. This has enabled contemporary Catholic theologians to argue that there is no fundamental difference between Christian ethics and all the rest of human morality (see Curran 1976).

Of the three major traditions of the Christian faith, Eastern Orthodoxy is least drawn to this modern project to ground, or “reground,” Christian ethics in reason and/or nature with the goal of a universal morality that transcends religious boundaries. Orthodox theologians and ethicists have judged that these endeavors narrow the meaning and content of Christian ethics and the Christian faith as a whole. Eastern Orthodox writers have hesitated even to speak of Christian ethics as a separate discipline. As Stanley Harakas writes:

For Orthodox Christianity, doctrine and ethics may be distinguished but they may never be separated. It is only the “division of labor” in which some theologians of the church turn their attention to things, which in the words of St. Athanasios, “make known the word concerning Christ, and the mystery regarding him,” on the one hand, while other theologians concern themselves primarily with the Christian teaching, again in the words of St. Athanasios, whose intention is “to point to the correction of habits.” (Harakas 1983, 1)

Orthodox theologians, however, are not the only ones that hold this view. Important contemporary Protestant and Roman Catholic theologians and ethicists have argued similarly against the autonomy of ethics and the assimilation of Christian ethics to a “cosmopolitan” ethics that substitutes formal rules and principles for religious teachings and norms.

In the ethics of the Eastern church, morality has to do principally with the goal of faith itself, the restoration of the image of God in human beings and their *theosis* or growth in holiness and god-likeness. Love is the “sacrament” or “medicine” that cures humanity’s sinful and mortal condition and the energy that unites persons in communion with God. There is no room in this vision for the autonomy of ethics. Rather, ethics is a peculiarly human mode of apprehending and living the truth of existence. The twin ends of human morality are holiness and immortality. In the human person the ontological “is” posits a moral ought. God has implanted this ought in the human “heart” as an “inner” imperative, a “natural” dynamic principle of life (Guroian 2001, 21–22).

Orthodox Christianity has not elaborated a formal theory of natural law with a hierarchy of divine, natural, and civil law. Nor is the duality of law and gospel the fulcrum of its ethics. It does not draw the sharp distinction between nature and grace that is often entailed in natural law theory and also the law and gospel formula. Rather, the Incarnation demonstrates that the ontological gulf between God and creature may be bridged by love once sin is removed and death is overcome. Redemption is not merely a corrective or remedy for original sin. Just as important, it is the continuance of God’s creative and perfecting action in the world. Its aim is that all creatures, but most especially the one whom God has created in his very own image, be drawn into an evermore intimate communion with God’s Triune Being.

According to this view, Christian ethics is Christocentric and theocentric. It depends upon conversion (*metanoia*) and faith in the truth of salvation and eternal life revealed fully by God in Jesus Christ. The Christian is made a new creature by baptism, as he or she is transformed and renewed in mind and heart. This is not merely metaphor: it is sacramentally and ontologically real and actual. The Christian yearns for God and his Kingdom. She is moved to deeds of love from the gratitude she has for what God has done for her and for his abundant grace that transforms her from within and assimilates her into the

divine life. It is in this sense that Christian ethics is singular if not, in fact, *sui generis*. The ascetic and mystic Pseudo-Macarius (fourth to fifth centuries) sums up this Orthodox stance. He admonishes and corrects Christians of his own day who believe that whatever differences there are between Christians in their belief and behavior and others are merely matters of form or externals. Although “many Christians believe the difference does lie in some eternal sign ... it is through the renewing of the mind and the tranquility experienced in our thoughts and the love of God and love of heavenly things that every new creation of Christians distinguishes them from the men of this world. For this reason did the Lord come” (Maloney 1992, 64–5, homily 5:4–5).

The modern project to establish the autonomy of ethics – or at least a basis for Christian ethics that ensures it is fully accessible even to non-Christians – reflects a broader concern shared by contemporary religious and secular people alike to identify universal norms of conduct that might be employed to address and negotiate a vast array of moral issues and problems confronting pluralistic modern societies. Such issues and problems include biotechnology, environment, poverty, weaponry, wars of insurgency, and international law. This modern project may be judged foolish or wise from the standpoint of Christian faith. But there is no doubt that it is an instance and example of differentiation in Christian ethics.

Differentiation and the Beginnings of Christian Ethics

The lodestar of all Christian ethics is the person and ministry of Jesus Christ. His story is told by the gospels and explicitly applied to Christian living and the church’s mission by the Pauline, Johannine, and other epistles of the New Testament. Early Christianity turns to the entirety of scripture, both Old and New Testaments, as the source of moral guidance and help with judgments and decisions about behavior befitting the saints. Late first- and second-century apostolic writers, such as the author of the “Didache,” Clement of Rome, and Ignatius of Antioch, describe a new life in Christ embarked upon through baptism and repentance, nourished by Eucharistic worship, and perfected by the Spirit in the communion of the saints. The book of Acts reports that on Pentecost many to whom Peter preached in Jerusalem were “cut to the heart” and repented, being “baptized ... in the name of Jesus Christ for the remission of sins” and received “the gift of the Holy Spirit” (Acts 2:37, 39). After their repentance and baptisms these new Christians “devoted themselves to the apostle’s teaching and fellowship, the breaking of bread, and the prayers (Acts 2:42). In like manner, St. Paul instructs the Christian community in Rome to “present your bodies as a living sacrifice, holy and acceptable to God, which is your spiritual worship,” adding: “Do not be conformed to this world, but be transformed by the renewal of your mind that you may prove what is the will of God, what is good and acceptable and perfect” (Romans 12:1–2).

The early Church Fathers and Mothers conceive of ethics as integral to the whole of the Christian religion. For example, 1 Clement, a late first-century apostolic letter written from Rome to the church of Corinth, assumes that Christian prayer, doxology, and good works are interwoven, framed by the eschatological hope for the full and final advent of the Kingdom of God:

The good workman receives the bread of this labor with boldness; the lazy and careless cannot look his employer in the face. Therefore we must be prompt in well-doing, for all things are from him [Christ]. For he warns us: “Behold the Lord cometh, and his reward is before his face to pay each according to his work. He exhorts us therefore if we believe in him with our whole heart not

to be lazy or careless in every good work.” Let our glorying and confidence be in him; let us be subject to his will; let us consider the whole multitude of his angels, how they stand ready and minister to his will. For the Scripture says, “Ten thousand times ten thousand stood by him, and thousand thousands ministered to him, and they cried Holy, Holy, Holy is the Lord of Sabaoth, the whole creation is full of thy glory.” Therefore, we too must gather together with concord in our conscience and cry earnestly to him, as it were with one mouth, that we may share in his great and glorious promises. (Lake 1998, 1 Clement 34)

The early church did not invent its ethics out of whole cloth or from within a hermetically sealed community. In his parenetic admonitions and advice on right and appropriate Christian conduct, St. Paul sets the pattern and tone for relations with the secular order. He and his immediate followers in the apostolic age are influenced by a variety of “external” sources and pressures. First, they are indebted to the ethical thought of Judaism in the Hebrew scriptures, although they interpret it strictly in light of the Christ event. Second, they seek and find analogies for their ethical reasoning in Stoicism and Platonism. For example, Origen (ca. 185–ca. 254), Gregory of Nyssa (ca. 330–ca. 395), Ambrose of Milan (ca. 339–97), John Chrysostom (ca. 347–407), and Augustine of Hippo (354–430) employ “the early ethical terminology of the philosophers but also” assimilate into their Christian ethics “the philosophical ideal of a practice of virtue that led to fellowship with, and likeness to, the Divine” (Norris 1986, 453).

Our contemporary debate about the autonomy of ethics, along with the issue of whether or not there is a singularly distinct or *sui generis* Christian ethics, genuinely would have puzzled these early Christian writers. While the ethics of Christians certainly could overlap with pagan and philosophical ethics, they thought that salvation in Jesus Christ is an objective fact that transforms human ethics just as it transforms human life.

Differentiations in Premodern Christian Ethics

If we apply the concept of differentiation to premodern Christian ethics, what comes immediately into view is, of course, the major division of world Christianity into Eastern and Western, and subsequently Orthodox, Roman Catholic, and Protestant churches. Just as these major divisions of the Christian church reflect real differences in worship and doctrine, so too, as we have begun to see, they express and embody differences of ethical content and vision. Nevertheless, in their classical and magisterial forms, all three of these traditions hold together the relationship of ethics with worship and dogma. This distinguishes the classical phase of differentiation from differentiation that has happened in contemporary Christian ethics. In their classical forms, Eastern Orthodoxy, Roman Catholicism, and Protestantism (Lutheran and Reformed) are quite conscious that Christian ethics originates in baptism – that, in other words, Christian ethics is simply inconceivable apart from conversion and the freely given grace of God – and is oriented toward salvation and eternal life.

The remainder of this entry explores more deeply this classic differentiation in Christian ethics through an examination of two subjects with which Christians have wrestled from the very start. The first is the nature and purposes of Christian marriage and family and the second is church and state relations. These two issues are connected in at least two important ways. First, both draw upon and ground

themselves in the Christian understanding of the human person as a social being created in the image of a triune and personal God. Second, whereas the first concerns the microcosm of Christian life and morality, the latter addresses the macrocosm of church and world. Over time, Orthodox, Roman Catholic, and Protestant responses to these issues have assumed quite different forms from within a broadly shared faith.

Before beginning a discussion of these two issues in which differentiation marks off the three great Christian confessions, another type of differentiation has to be mentioned, although there is not room here to discuss it. In addition to differentiation that follows the threefold division of Orthodox, Catholic, and Protestant, historically there occurs also differentiation that stretches *across* classical confessional boundaries. One example is Luther's redefinition (as I mention below) of marriage that rejects Roman Catholicism's sacramental and contractual interest in that institution, yet draws nearer to the Orthodox vision of marriage as a churchly vocation.

Marriage

Questions about the moral dimensions of marriage arise early in the history of the Christian faith. For Christianity, the state of marriage presupposes also the valid choice of singleness. St. Paul sets down the terms for a debate in the Patristic era and Middle Ages over the relative good of each of these ways of life. He favors a life of singleness and continence over the married state (1 Cor. 7:25ff.). A variety of factors influence his opinion. The most noteworthy is Paul's evident expectation that the *parousia* is imminent and that therefore marriage may detract from preparation for that event. Gnosticism and other currents of extreme asceticism deprecating the human body and sexuality, some condemning marriage outright, also challenge the church. Paul is aware of these also and rejects them. Thus, even as he favors singleness, Paul affirms the goodness of the body and the psychosomatic wholeness of the human person. He therefore commends marriage "in the Lord" as a legitimate way of life for Christians who cannot or do not want to remain single and celibate.

By the middle of the second century, important writers launch a strong defense of marital monogamy as a valid arena for Christian askesis and sanctification. Celibacy and singleness certainly remain serious options, as witnessed by the rapid spread of Christian monasticism from the third century forward. Indeed, the medieval Roman Catholic Church propounds a formal teaching that elevates celibacy above marriage as morally and spiritually superior. It interprets the beatitudes of the Sermon on the Mount as marking off two distinct paths or "tracks" for Christians. For those who choose a "religious" vocation, the beatitudes are strict counsels of perfection, whereas for lay and married persons the beatitudes may be received merely as general precepts for moral guidance. Not until Vatican II (*Gaudium et Spes*, 50) does the Catholic church officially revise this teaching and declare that religious and lay life are equally valuable and honorable paths.

The Eastern church has left undecided which if any form of Christian living is the more perfect or honorable. It never has spoken officially of Christian ethics as on two tracks or as two-tiered. Early, there even arose strong voices in the East who insisted that marriage and not celibate life is the more difficult school of holiness. In the second century, Clement of Alexandria (ca. 150–ca. 215) argues "true manhood is shown ... by him, I say, who in the midst of his solicitude for his family shows himself inseparable from the love of God and rises superior to every temptation which assails him through children and wife and servants and possessions." He "who has no family is in the most respects untried" (Meyendorff 1984, 95).

Some Eastern Patristic writers criticize those in the church who excuse laity from the highest standards of Christian morality and holiness. They argue that this teaching contradicts the Christian doctrine that God proffers salvation to all men and women. St. John Chrysostom states that it is unthinkable and absolutely inconsistent with God's love that the beatitudes do not apply to married people every bit as much as the monk. The beatitudes, he insists, should not be viewed as "spoken to solitaries only." For Christ himself "permitted marriage" and he would not have barred the way for the vast majority of humankind to enter the kingdom of heaven (Chrysostom 1890, 402, homily on Hebrews 7). There are, of course, some in the East, especially among the severe ascetics, who do insist that celibacy is a superior life. Nevertheless, the view of Clement and Chrysostom that marriage is no less high and demanding a vocation as monastic living retains a strong place in the Eastern tradition.

In Western Christianity, Martin Luther breathed new life into this vision of marriage as a high Christian calling. Like Chrysostom, Luther objects to a double-track Christian morality. He argues that this demotes the lives of the vast number of Christians to an inferior status unworthy of God's love or of human freedom and potential. Luther condemns celibacy and monasticism as well as the Catholic teaching of marriage as a sacrament. Protestantism, in general, comes to the view that marriage and its ethical core are summed up as a sacred partnership of male and female entered by *free consent* for the purposes of Christian living and family.

Orthodoxy and Roman Catholicism have continued to teach that marriage is a sacrament that belongs to the church and is in its own right a vehicle of salvation. Despite a rich harvest during medieval times of profound mystical writings on the love of man and woman as metaphor and symbol of the soul's union with God and the church's marriage to Christ, Roman law made a distinct impact on the Catholic Church's interpretation of marriage. Roman legal tradition stipulated that the essence of marriage is in the free consent of the couple. The canon lawyers laid a heavy veneer of contractualism and legalism over the mystical and sacramental vision of marriage as conjugal union in Christ. In the East, the principle of free consent arrived late and never made the impact on its theology of marriage that it did on the Roman Catholic Church. Emphasis remained on the conjugal union as the heart of marriage. For example, in the Greek Orthodox version of the rite of holy matrimony there is no exchange of vows. In other Orthodox churches, these vows are added under Western influence.

In the Roman Catholic Church, a legalistic interpretation of marriage would obscure the deeper theological meaning of marriage as covenant and weaken the ancient ecclesial and soteriological, even eschatological, vision of marriage. In the East, the understanding of marriage as a "small church" and school of the virtues of the heavenly kingdom remained strong. St. John Chrysostom stands out as the great champion of this view of marriage. The goods of marriage are strictly the conjugal love, union, and procreation, in that order. The ultimate end of the sacrament of marriage is to render persons fit to inherit the Kingdom of God. Therefore, marriage requires a self-denying love that secures the union of the husband and wife in mutual self-giving and ensures the good upbringing of children. The crowning of the bride and groom in Orthodox weddings signifies not only that the marriage is a sacrament of the Kingdom but that in holy union the spouses put to death their selfish desires and bravely in humility endure whatever discomforts come along the way. The crowns, therefore, are not just the crowns of a king and queen but also crowns of martyrdom (i.e. a witness to holy and righteous living).

God holds parents responsible for disciplining and educating their children in virtue, not merely to make them good citizens but, first and most important, to make them saints. One's children are not only one's nearest neighbors; also, they are the weak and the vulnerable, deserving of special care. Christian

marriage (and family) is a moral calling precisely because it is an ecclesial, soteriological, and eschatological entity. “If we regulate our households [properly] ... we will also be fit to oversee the Church, for indeed the household is a little Church,” Chrysostom insists (Chrysostom 1986, 57, homily 20 on Ephesians).

Virtually everything that the Eastern Christian tradition believes about marriage as a special location of self-sacrificial love and moral perfection may be found in Protestant and Roman Catholic interpretations of marriage. Protestantism and Roman Catholicism, however, lend to these themes lesser or greater emphases that, in turn, introduce significant variances of meaning and practice. Different ecclesiologies and sacrament theologies account for a large part of this. For instance, the Anglican Church interprets marriage as a sacred covenant between a man and woman, not a sacrament. Nevertheless, Anglicans may speak of marriage as “an image of divine reality” and “divine love.” Like other Protestants (and the Roman Catholic Church), however, Anglicans hold that the bride and groom marry each other and that the church merely witnesses to the union. In other words, bride and groom are the ministers (or officiates) of their own wedding. In sharp contrast, the Orthodox tradition states that the church marries the couple and accepts them into its ecclesial body. According to the former interpretation, marriage may be an “image of divine reality” but is not necessarily regarded as an ecclesial entity or a vehicle of salvation. “It does not denigrate marriage to say that it belongs to creation rather than to redemption,” states the Anglican theologian Helen Oppenheimer. “It is made, not by prayer, but by the consent of the spouses” (1986, 366–367). One sees, from this example alone, that the marital virtues of self-sacrificial love, fidelity, and mutual assistance, which rank high in all three of the great Christian traditions, obtain significantly different meanings due to differences of ecclesiology and sacramentology.

Politics

The story of the early relations of the Christian church with the Roman empire through Constantine has been told many times. The sources of the tension between the first-century church and the Roman imperial power were broader and deeper than mere politics. After Pentecost, the church’s initial problems with the Roman state were not centered on formal relations, for these did not yet exist. The early Christians certainly bore no inherent objections to secular rule. Jesus did not oppose offering tribute in taxes to the state (Mark 12:17). And St. Paul called for obedience to the secular powers (Rom. 13:1–7), since they are ordained by God to keep order and justice in a sinful world. However, the book of Revelation also graphically depicts the empire as a demonic beast arisen from the abyss ready to consume the saints. This reflects the early Christian conviction that the empire was inherently idolatrous, witnessed by its insistence upon worship of the emperor and its claim to universal and everlasting dominion over the whole human race. The church struggled to gain sufficient freedom and space within this world order so that it might organize openly and pursue its evangelical mission.

The argument often is made that the source of the church’s tension with the empire was a world-denying faith accompanied by a radical expectation of the imminent *parousia*. This is not true. The church did not deny the value of this world created by a good and loving God, but it did have a different vision of the world’s origin, condition, and destiny than the empire’s civil religion. The church believed that this world obtains lasting value strictly through its relationship to God as its creator and redeemer, and the fulfillment of the Kingdom of God. The early church was not anti-world or anti-empire: it was pro-Kingdom of God. This put the church at odds with the imperial ideology that identified Rome as the

eternal city. Nor was it mere opportunism that moved the church to “accept” the “invitation” by the Emperor Theodosius I in 380 to become the legally established religion of the empire. There was a sincere, though perhaps misguided, desire on the part of the church to render a “holy service” for society, to exorcise the imperial idolatry, and give the world back to its true Lord (Guroian 2001, 145). At the start, the church in the Greek- and Latin-speaking West held a common vision of a unified Christian society in which the two entities of church and state cooperated and essentially joined together to ensure that the commonweal prosper.

Ideologies developed differently, however, as the empire divided politically and geographically, and then ecclesiastically, with Constantinople and Rome issuing mutual anathemas against one another in 1054. The different visions of a *corpus Christianum* are commonly identified as Caesaro-papism in the East and theocracy in the West. Nevertheless, both East and West made two fundamental theological errors in articulating their distinct visions. The first was “in thinking that the authority of Christ could be identified with the political *power* of the state.” The second was “in considering that the *universality* of the gospel is definable in political terms” (Meyendorff 1978, 143). In the fifth century, Pope Gelasius I articulated the key terminology of the Western theocratic idea in his doctrine of the two swords. Christendom, he said, is ruled by two independent powers, the church represented by the pope and the imperial state by the emperor or king. This idea was used to secure sufficient freedom for the church to enable it to maintain independence from the state. It even opened the opportunity and justification for the papacy to dominate in a politically weakened empire. Meanwhile, the Byzantine Emperor Justinian I lent classic expression to the East’s conception of the Christian empire as a “symphony” of church and state under the rule of the emperor.

Caesaro-papism and theocracy are misleading terms, however. They do not accurately describe or contrast the situations that develop in East and West. It makes more sense to identify two deep and differing metaphysical biases: monism in the East and dualism in the West. These two biases, respectively, bear quite different fruits in the organization of empire and relations of church and political order. Eastern monism and Western dualism have theological, ethical, juridical, and institutional dimensions. The West’s dualism may be traced back to the language of Pope Leo I’s (d. 461) famous tomb on Christology that figured prominently at the fourth Great Ecumenical Council of Chalcedon in 451, wherein he offered a doctrine of two natures in Christ that was suspected in many Eastern locations as scented with the Nestorian error of virtually dividing the One Lord, Jesus Christ, in two: into a human entity and divine entity who were joined but not truly united in one person. Leo may not have committed the Nestorian error, but his bias was toward dualism.

In the Latin West, this dualistic bias was not restricted to Christology; it also obtained juridical expression and emphasis, as the church quite deliberately defined itself vis-à-vis the state as a legal entity in order to gain leverage and power over it. The centrifugal force of the Protestant Reformation and the later dismemberment of political Christendom into nation-states, however, undercut the imperial church’s efforts to maintain its independence and equal (if not superior) legal relationship with the state. These events and processes gave rise, ultimately, to national churches that for a time kept alive the vision of Christendom in their own separate territories. All the same, the national churches fell increasingly under state control and supervision. This is called Erastianism within Protestantism and Josephism (or Febronianism) within Roman Catholicism. The Enlightenment crystallized a process of secularization that was prompted and furthered by the Western dualism, and the churches’ influence diminished in virtually all locations. In some instances, as under fascism and communism in the twentieth century, the churches even lost their legal status and freedom to practice the faith openly. Elsewhere in Europe,

national churches continued to function under increasing pressures of religious pluralism. In America a system of complete disestablishment came about that resulted in a separation of church and state. It may be that the dualism embraced by the Western churches, both Catholic and Protestant, is no longer sustainable and over the long term will bring about its very negation under a thoroughly autonomous state and a unitary secularism.

The bias toward monism within Orthodox Christianity has borne different fruit. This monism is traceable to the East's emphasis on the hypostatic union of humanity and divinity in Christ and an extension of that dogma to the vision of the *corpus Christianum*. This monistic bias was reflected in the modification made by the Second Council of Constantinople (553) to the Christological formula of Chalcedon. It emphasized the more monophysitically oriented Christological teaching of St. Cyril of Alexandria (d. 444). Thus, the East envisioned Byzantium as a unified Christian society, fully church and fully imperial order, mirroring the doctrine that Jesus Christ is wholly God and wholly human being and still a single indivisible person. A powerful realized eschatology that got joined to this vision made trouble for the church. The resulting utopian ideology did harm to the freedom of the church. The idea that the Kingdom of God was being realized already in the temporal realm permitted the emperor and Byzantine state to dominate over the church.

Yet it is a misconception to interpret this in juridical terms, as the term Caesaropapism invites. There was not an understanding of one juridical entity, the church, subordinated to another juridical entity, the state. The Byzantine idea of symphony conceived of just one subject, not two. The church got defined as a function of the state – not an independent juridical entity, but a sympathetic sacramental organ whose function it was to bring the world increasingly under the rule of Christ and thus make the Kingdom of God present on earth. By accepting this role, the Byzantine church forgot two fundamental perceptions about its relationship to the world that it inherited from the ancient church. First, it forgot that this world is fallen and mortally sick. The church, having said *yes* to the invitation to render the empire holy before God, did not say *no* to the claim that the imperial realm was also the Kingdom of God brought to earth. Second, the church permitted itself to be defined as a hierarchy, with the *authority* of spiritual dogmas and the *power* of sacramental grace, at the awful price of losing sight of its calling as a *free community of faith*, whose presence in the world is also a judgment and limitation upon the inordinate and inevitably corrupt claims to power and authority of all earthly kingdoms (Guroian 2001, 147): “For better or worse, the unity of the Eastern Christian commonwealth was not broken as it was in the West.” Byzantium did not shatter into pieces, but fell hard and whole to the alien forces of Islam. Georges Florovsky concludes: “Byzantium collapsed as a Christian kingdom, under the burden of its tremendous claims” (1974, 123–124). Byzantium failed as an experiment in Christian politics, but it left no experience or legacy of the secular and autonomous state in which there exists a plurality of Christian denominations. This helps to explain why, even after the collapse of the Soviet Union and communist regimes in Eastern Europe, there has been little enthusiasm for adopting an American model of separation of church and state and an almost equal unwillingness to give strong legal sanction to religious pluralism.

Differentiations in the Contemporary Scene

The future will tell how church and state issues are worked out in the Orthodox countries of Eastern Europe and the former Soviet Union. But however things turn out, in the interim, the church and state issue may actually take more classic form in these locations than in the West, although the results may

differ from legal arrangements in the West. The so-called national Orthodox churches of the East lay much more powerful claim on the imaginations and memory of the people than do the deracinated Christian denominations in America and the highly eviscerated churches of Great Britain and Western Europe. Whereas the immediate danger in Western nations in which Roman Catholics and Protestants predominate is assimilation into a unitary secular society, the danger in the East seems inherently related to Orthodoxy's historically monistic and mystical biases. The national Orthodox churches bethink themselves as representatives of the ethnos and nation and are tempted habitually to imagine that collaboration with state authority and special privileges gained from the state will secure their legitimacy and an influence over the nation. Thoughts of being compromised through such concordats do not come easily to these churches that have thought of themselves as the soul of the nation.

The church and state issue as it is unfolding in the "new" nations of Africa, Latin America, and Asia forms the contemporary horizon of this analysis. In most African, Latin American, and Asian countries, Christianity is represented predominantly by Roman Catholicism and/or Protestantism and so developments follow patterns of separation of church and state truer to the dualistic and juridical biases described above than in Orthodox lands. Nevertheless, in Africa and Asia, especially, strong forces of nationalism enter the mix in ways that especially invite comparison with events in Eastern Europe and the former Soviet Union. This is a reminder also that differentiation in Christian ethics is not limited to the historic divisions of Orthodox, Roman Catholic, and Protestant, but often crosses boundaries.

CHAPTER 65

Trajectories in Christian Ethics

Jean Porter

During the course of the last century, the field of Christian ethics has been characterized by a bewildering profusion of approaches, methodologies, and concerns. On first inspection, this diversity appears as an embarrassment of riches, too complex to be sorted through. Yet on closer examination, it is given form by the recurrence of certain key motifs, which serve as touchstones for the development of specific theories. These recurrent themes set trajectories of reflection, which provide the Christian moral tradition with much of its coherence. Given the scope of this entry, I will confine myself to examining three trajectories that have historically been central to Christian moral reflection, and will conclude with a brief look at recent developments. In the modern and contemporary period, I will focus primarily (but not exclusively) on Anglophone authors.

Moral Norms as Divine Commands

The image of God as a lawgiver, and correlatively, an approach to moral norms that construes them as God's commands or laws, is central to the Hebrew Bible. Even though later Christian reflection emphasized the contrast between the supposed legalism of the Old Testament and the orientation to grace characterizing the New Testament, more recent biblical scholarship has underscored the fact that God is characterized as a lawgiver in parts of the Christian scriptures as well (Meeks 1993, 119–210). This is what we would expect, since the Jewish and Christian conception of God as both a supreme being and a personal reality lends itself to a perception of morality as a set of divine decrees. Among Christians, this idea was expanded to include dominical commands, that is, the authoritative moral teachings of Jesus, which for many Christians carry divine authority. Given this scriptural orientation, it is scarcely surprising that an approach to moral norms that emphasizes their authoritative status as expressions of God's will emerged very early in Christian moral reflection.

This trajectory continued throughout the Patristic and medieval period. It is particularly evident in the moral thought of Augustine (354–430 CE), who placed great emphasis on the authoritative status of morality, seen as an expression of God's eternal law. Augustine's influence, in turn, helped to guarantee that an emphasis on the authoritative status of morality as an expression of God's will continued to play a central role in Christian thought, at least in the West. In the medieval period, this tendency was re-enforced by a juridical approach to sin and repentance. This approach reflected early medieval

practices of penance, which were governed by penitentials in which sins were carefully defined and their appropriate penalties were set out in some detail. Later theological reflections on sin and developments in the practice of private confession led to more sophisticated and humane practices of reconciliation, but this practice continued to reflect a juridical model of sin and repentance throughout the medieval period (and among Roman Catholics, up until the modern period).

Yet it would be misleading to characterize either Patristic or medieval conceptions of morality as versions of a divine command ethics, as that term later came to be understood. Divine command theories are characterized by the fact that they distinguish God's will or authority from other aspects of the divine reality and identify this aspect as the ground of morality, whether as a foundation which grounds and encompasses other sources of morality, or as the sole source of morality which is set over against other putative sources of moral obligation. Certainly, Christian ethical reflection has always traced morality back to some aspect of God's will, wisdom, or providential love, but until the later middle ages, God's will was not set over against other aspects of the divine reality in such a way as to give rise to a divine command morality in the strict sense. While moral norms were thought to reflect God's will, they were also seen as reflections of God's wisdom or benevolence, insofar as they reflected exigencies of reason or human nature. Medieval theologians did raise the theoretical possibility that moral norms might depend on God's authoritative will alone, but in general they resisted separating this aspect of morality from its rational or naturalistic aspects.

The first theologian to defend a divine command theory of ethics appears to have been Duns Scotus (1266–1308). Scotus claimed that God's will is not bound by any considerations of order or justice, or any rational considerations save the law of non-contradiction, since on his view the will is nobler than the intellect and cannot be constrained by it. Hence, only those laws governing our relationship to God are natural laws in the strict sense, because only these follow by strict necessity from the divine nature. The laws of nature pertaining to our relations with one another are seen as expressions of God's ordained power, but not God's absolute power. That is, God forbids (for example) murder and adultery, but absolutely speaking, God could have commanded otherwise, rendering such actions just and right. Scotus' fellow Franciscan William of Ockham (ca. 1285–1349) took this line of argument one step further, arguing that absolutely speaking, God could even have commanded us to hate God. Similar considerations led both Martin Luther (1483–1546) and John Calvin (1509–1564) to affirm that God is the ultimate source of justice and morality. Not only does this mean that moral norms derive from God's will; it also implies that God's actions cannot be evaluated by our standards of justice and consistency.

Similar concerns to preserve God's complete and unconditional priority to, and independence from, impersonal structures of reason, justice, or even consistency have continued to shape theological ethics up to the present. One of the most influential expressions of this approach was offered by Søren Kierkegaard (1813–1855) in *Fear and Trembling*, in which he takes God's command to Abraham to sacrifice Isaac as the starting point for raising the possibility of a teleological suspension of the ethical, in which God's direct command may supersede the demands of universal morality. This treatise, one of Kierkegaard's pseudonymous writings, is too complex to be taken as a straightforward defense of divine command morality, but by raising the possibility that God's command can transcend the ethical universal, it has proven to be an influential source for later divine command moralities.

Probably the most influential statement of a divine command theory of ethics in the twentieth century is that developed by Karl Barth in his *Church Dogmatics* (1957, 509–781). For Barth, any attempt to

develop an ethic based on considerations of nature, reasonableness, or the like reflects human rebellion against the sovereignty of God, who confronts the human person with a Word of command that is both heteronomous and absolutely binding. Barth insists on this, not only to uphold the omnipotence of God, but also to uphold God's personal character as one who establishes a relationship of authority and obedience through divine commands. At the same time, through Jesus Christ, God's commands confer liberty, even as they bind us to obedience. God commands us in order to claim us through grace for our ultimate salvation.

Moral Norms as Natural Law

Since classical antiquity, the idea of law has been interpreted in at least two ways, that is, as authoritative command and as intrinsic principle of order. The first line of interpretation lends itself to a divine command approach to morality; when the latter approach to law is emphasized, we see the emergence of a second central trajectory in Christian ethics, namely, the construal of moral norms as a natural law. There have been many forms of natural law morality, including both moralities that stress the intrinsic moral significance of pre-rational natural processes, and those that ground it in the exigencies of reason. What these have in common, however, is a view of morality which grounds it in intrinsic, ordered structures of being, in contrast to approaches that emphasize authoritative will. So understood, the idea of natural law appears to have originated with the Stoics, and we find it expressed near the beginning of the common era by the Roman philosopher Cicero (106–43 BCE).

It might seem that the Hebrew scriptures, with their strong emphasis on God as lawgiver, would not lend themselves to a natural law interpretation of morality. However, the psalms and wisdom literature place great weight on God's law as an expression of wisdom, more excellent than the philosophical wisdom of any other nation; even within Deuteronomy, we read that the excellence of God's law will be acknowledged by all the nations of the earth (Deut. 4:6–8). This strain of Hebrew scriptures lends itself to an interpretation of God's law which emphasizes its origins in God's wisdom, and which therefore opens the way to presenting it as an expression of natural law (Barton 1998, 58–76). In the Jewish philosopher Philo (b. ca. 10 BCE), writing roughly a generation after Cicero, we find precisely this interpretation; according to Philo, the Law of Moses represents the law of nature in perfect written form. Similarly, St. Paul's appeals to nature and conscience as a source for moral norms, and as the basis for a law that stands parallel to the Law of Moses for the Gentiles (Rom. 2:14–16), were foundational for later Christian theories of the natural law.

When we turn to the Patristic era, we once again find Augustine playing a decisive role in setting an agenda for later Christian moral thought, at least in the West. We observed above that Augustine placed great emphasis on the authoritative status of law. Yet he also understood law as an intrinsic principle of order, along the lines of classical accounts of the natural law. These two approaches to law came together in his conception of God's Eternal Law, which Augustine understands as an expression of God's ordering wisdom as well as God's authoritative will. In addition, Augustine, together with many other Patristic authors, took the Golden Rule to be the fundamental principle of the natural law inscribed in the conscience of every human person, and the Decalogue to be a summary of its basic precepts.

In the medieval period, the natural law approach came to dominate Christian moral reflection, at least among the scholastic jurists and theologians whose work laid the foundations for so much later work in Christian ethics. The most influential medieval exponent of a natural law approach to ethics is Thomas Aquinas (ca. 1225–1274). For Aquinas, the natural law in its primary sense consists of basic, self-evident principles of practical reason (for example, the principle that the good is to be pursued and done and the bad avoided), which are analogous to first principles of speculative reason, such as the law of non-contradiction. In a secondary sense, the natural law consists of precepts ordered around basic human inclinations to live, to reproduce, to seek the truth about God, and the like; Aquinas also endorses the almost unanimous view that the Decalogue offers a summary of the precepts of the natural law. Seen from yet another perspective, the natural law represents the human person's participation in God's eternal law, understood in Augustinian terms, but with a stronger emphasis on the eternal law as an expression of God's wisdom, rather than God's will (Porter 1999, 92–95).

In the modern period, natural law reflection took a new turn. Under the influence of the early modern revolution in mathematical and scientific thought, moral thinkers began to aspire to a theory of the natural law based on deductions from first principles, which theory would have the same perspicuous rational force as a mathematical system such as Euclidean geometry. On this view, distinctively theological claims have no foundational or essential place in a theory of the natural law, although they may serve to confirm, correct, or supplement the moral code generated by moral reasoning. This approach also led to a greater emphasis on the discrete rules that comprise the natural law. This approach to the natural law, in turn, lent itself to the more pronounced emphasis on the natural law as an expression of God's authoritative will, and at this point, the two trajectories, divine command ethics and natural law ethics, began to come together in the work of such theologians as Suarez (Schneewind 1998, 58–78, 118–38).

Luther's radical critique of the idea of salvation through works kept the idea of natural law from taking much hold in Protestant theology, although it continued to play some role in Anglican and Reformed thought. However, versions of the natural law similar to that developed by Suarez continued to be foundational to Catholic moral theology up until the twentieth century. In the years just before and after Vatican II, the idea of an immutable natural law was sharply criticized by Catholic theologians, and these criticisms, together with controversies over questions of sexual ethics after Vatican II, seriously undermined the credibility of the natural law among Catholic theologians.

More recently, there has been a revival of interest in natural law approaches to ethics. One of the most influential contemporary versions is the "new theory of the natural law" (Grisez 1983, 173–274; Finnis 1998, 103–131). On this view, moral laws are derived from an apprehension of certain basic goods, which are known to be such as soon as they are experienced, together with norms of practical reasonableness which determine how we are to relate to these goods. This version of the natural law places great emphasis on its rational character, and allows only a very limited place for the moral significance of pre-rational human nature. However, recent developments in biotechnology, medicine, and ecology have led to a revival of interest in the moral significance of pre- or non-rational nature, among both Protestant and Catholic scholars (Gustafson 1981; Pope 1994). At the same time, a renewed interest in human or natural rights has led to the revival of other strands of the natural law tradition (Nussbaum 2000, 34–110; Tierney 1997, 1–12; Schweiker 1995). Finally, it should be noted that some Protestant scholars have recently argued for an account of moral norms similar to that associated with the natural law, but grounded in explicitly theological principles such as Christian love (Ramsey 1967).

Ideals of Virtue

In recent years, the topic of virtue has received a great deal of attention from Christian ethicists as well as philosophers. In fact, there are many theologians who argue that, correctly understood, Christian ethics is predominantly or even exclusively an ethic of virtues, rather than an ethic of rules. Yet this would not have been obvious at every point in Christian history.

The virtues as such do not seem to have been a central theme for early Patristic thought, although we do find discussions of the traits of character appropriate to, or contrary to, the Christian life in this period. Augustine offers a reformulation of a Stoic conception of virtue as wisdom, according to which Christian love is the fundamental virtue that other virtues express in specific circumstances. However, the best-known aspect of Augustine's treatment of virtue is his severe critique of classical Roman ideals of virtue, which on his view were at best vitiated by pride and a failure to know and love the true God (Rist 1994, 148–202).

Virtue began to be a central topic for Christian ethics in the medieval period. By the mid-twelfth century, two distinctive approaches to virtue ethics had emerged, exemplified by Peter Abelard (1074–ca. 1142) and Peter Lombard (ca. 1100–60), respectively. According to Abelard, the virtues are human excellences that can be attained even without grace. They existed among the best of the pagans, and were adequately described in philosophical terms. Lombard, in contrast, understood the virtues in Augustinian terms as expressions of Christian charity, which as such presuppose grace. For most of the later scholastics, however, these alternatives are too stark, and they attempt to synthesize them by developing accounts of the virtues, which allow for them to be understood both as human attainments and as gifts of grace. Typically, the complex character of virtue is spelled out in terms of a distinction between the political virtues, which can be attained through human ability alone and understood in philosophical terms, and theological virtues that presuppose grace and can only be identified through revelation. The former are generally identified with the classical cardinal virtues of prudence, justice, courage and temperance, the latter with the Pauline triad of faith, hope, and love.

We find a different approach to synthesizing these two conceptions of virtue in Aquinas, who offers the most influential scholastic theory of the virtues and their place in the Christian life. In the place of the widely accepted distinction between political and theological virtues, Aquinas introduced a distinction between the acquired virtues, which can be attained through human effort, and the infused virtues, which can only be attained through grace and which correlatively provide the operative principles through which grace becomes an effective principle for action. The acquired virtues include both the traditional cardinal virtues and other traditional virtues that are analyzed as derivative from these four. The infused virtues include the three theological virtues, but they also include infused counterparts to the acquired virtues. These latter resemble their acquired counterparts in some respects, but differ insofar as they are directed towards a distinctive end, that is to say, union with God as opposed to human well-being understood in purely rational terms.

In the early modern period, theologians began to question the suitability of the idea of virtue as a category for Christian moral reflection. One of the most thoroughgoing such critiques was offered by Luther, for whom an emphasis on virtue reflected a more general tendency to attempt to guarantee one's salvation through personal works, in contrast to relying on God's free grace. Yet Luther also insisted that the Christian life is marked by stable dispositions such as joyfulness and a readiness to be of service to

others. While he did not speak of these dispositions as virtues, there are clear affinities between this aspect of his thought and virtue ethics, and some contemporary Lutheran theologians have taken the relevant aspects of his thought as a starting point for a distinctively Lutheran virtue ethic (Meilaender 1984, 100–126; Stock 1995).

Catholic thought in the modern period continued to use the traditional language of the cardinal and theological virtues, yet these were increasingly reduced to organizing principles for moral rules, while many of the traditional concerns of virtue ethics were relegated to the study of spirituality or mysticism. Yet during the modern period the idea of virtue continued to play an important role for some Protestant and secular thinkers. The Puritan theologian Jonathan Edwards (1703–1758), the greatest American theologian before the twentieth century, devoted a treatise, *On the Nature of True Virtue*, to developing a Christian theory of virtue out of elements of the moral sense theory. True virtue consists in benevolence towards Being in general, and as such it goes beyond natural virtue to take in love for God as supreme Being. Only true virtue can be considered to be an effect and sign of election to salvation. Yet natural virtue is good in itself, and it is not destroyed, but transformed by true virtue (Edwards 1960). Even more significant is the work of Friedrich Schleiermacher (1768–1834). Schleiermacher offers an interpretation of virtue as a capacity to grasp and to act upon the concrete implications of the moral law, which is similar in some respects to the Aristotelian idea of practical wisdom. However, Schleiermacher's overall theology has probably been more important, from the standpoint of contemporary virtue ethics, than his remarks on virtue per se. According to him, all genuine religion is grounded in an awareness of an infinite and eternal source of all finite realities, together with a sense of our absolute dependence on that infinite source. For the Christian, this awareness takes the form of reverence for Christ as the mediator between God and the human person. In our own time, this approach to theology has inspired an ethics of piety or Christian dispositions, among both English speaking and German theologians (see Gerrish 1984; Gustafson 1981, 1984).

During the early part of the twentieth century, virtue was not a major theme among either Catholic or Protestant theologians. Among Catholics, one of the earliest and most influential such attempts to reclaim virtue theory was that of Bernard Häring (1965), who provided a moral theology based on charity, understood as the paradigmatic Christian virtue. Similarly, the Jesuit moral theologian Gerard Gilleman (1959) attempted to retrieve Aquinas' account of charity as the root of the Christian moral and spiritual life, and his fellow Jesuit Karl Rahner (1969) developed an account of love as a fundamental option which lends itself very readily to a virtue-oriented moral theology. More recently, a number of theologians, predominantly but not exclusively Catholics, have turned to Aquinas to provide starting points for a contemporary Christian virtue ethics (Abbà 1983; Cates 1996; Keenan 1992; Porter 1999; Rhonheimer 1994).

Among Protestant theologians, advocates of a return to virtue ethics argue that it provides the best way to understand the distinctive character of discipleship within the Christian community (Hauerwas 1981). The Christian community is rooted in ideals of non-violence and communal solidarity quite different from those which prevail in the dominant culture. Christian ethics should reflect these differences by focusing on the virtues which enable the individual to live in a truly Christian fashion. During the last decades of the twentieth century, there has been a revival of virtue ethics among philosophers (MacIntyre 1984). The trajectory set by reflection on the virtues as well as divine commands and natural law continues to play an important role in Christian moral reflection.

Recent Developments in the Field of Christian Ethics

To a considerable degree, the diversity within the field of Christian ethics has reflected the variety of concerns faced by Christians in the twentieth century. At the beginning of the last century, the plight of workers within an increasingly industrial and global economy gave rise to the social gospel movement, most closely associated today with Walter Rauschenbusch. His *Christianity and the Social Crisis* (1991) combined searching social critique and deep optimism for the possibilities for communal reform and regeneration. Yet this very optimism led to widespread critiques, including most notably Reinhold Niebuhr's widely influential Christian realism, which emphasizes the tension between the ideal of Christian love and the harsh necessity of sustaining justice in a fallen world (see Niebuhr 1941–1943).

The challenges posed by war and peace continued to be central to Christian ethics throughout the twentieth century, culminating in a widely influential revival of a principled Christian pacifism (see Yoder 1994; Hauerwas 1981). At the same time, however, beginning in the 1960s, other social issues emerged as central concerns for Christian ethics. This was of course a decade of social ferment and concern for the previously marginalized, including women, historically disadvantaged minorities, and sexual minorities. These concerns shaped Christian ethics in a variety of ways. Around this time, feminist voices began to emerge within Christian ethics (Daly 1973; Ruether 1975; Harrison 1985), while at the same time liberation theology inspired a new attentiveness to the concerns of the poor and marginalized around the world (Gutiérrez 1973). In the United States, the liberation paradigm was quickly applied to the situation of African Americans and other marginalized groups (Cone 1969; West 1982). Finally, during the last decades of the past century, scholars in Christian ethics increasingly turned their attention to the challenges presented by globalization, the need to defend human rights in a pluralistic world, new possibilities in biomedicine, and the imperative to protect the environment.

In addition to the varieties of Christian ethics generated by specific social concerns, this field has also been diversified through the adoption of a variety of theoretical perspectives and methodological approaches. One of the most influential early works of twentieth-century social ethics, Ernst Troeltsch's *The Social Teaching of the Christian Churches* (1995), fostered an interdisciplinary approach to Christian ethics through its appropriation of sociological theory. This approach continues to provide a starting point for discussions of the interaction between Christian beliefs and the wider society (see Niebuhr 1951). In addition, H. Richard Niebuhr pioneered the appropriation of American pragmatism, which he developed into his own distinctive theory of Christian ethics as a form of responsiveness to, and responsibility in the face of, the divine initiative (Niebuhr 1963). This approach has proven to be widely influential. It was developed by James Gustafson (1981, 1984) with serious attention to the constraints of contemporary science and social theory. Still more recently, “responsibility ethics” has been enriched through the appropriation of European hermeneutical theory and discourse ethics in order to develop a more robust account of what is involved in construing a situation from a theistic viewpoint (Schweiker 1995). The “responsibility ethics” approach has also been adopted by some Catholic moral theologians, most notably Charles Curran (1999).
